Chlorides Dissolve 2.0 g in 60 ml of hot water, heat on a water bath, add a quantity of ethanol (about 8 ml) dropwise with constant stirring to discharge the colour completely. Transfer the solution to a 100 ml volumetric flask, add water to volume, mix well and filter. Carry out the limit test for chlorides (Appendix VII A), using 25 ml of the filtrate. Any opalescence produced is not more intense than that of a reference using 5.0 ml of sodium chloride standard solution (0.010%).

Sulfates Carry out the limit test for sulfates (Appendix VII B), using 25 ml of the remaining filtrate obtained in test of Chloride. Any opalescence produced is not more intense than that of a reference using 2.0 ml of potassium sulfate standard solution (0.040%).

Assay Dissolve about 0.8 g, accurately weighed, in freshly distilled water in a 250 ml volumetric flask and dilute to volume, mix well. To 25 ml of oxalic acid (0.05 mol/L) VS, accurately measured, add 5 ml of sulfuric acid solution (1→2) and 50 ml of water; then add quickly from a burette about 23 ml of the test preparation, heat to 65°C and

keep it for 30 seconds. Perform a blank determination and make any necessary correction. Each ml of oxalic acid (0.05 mol/L) VS is equivalent to 3.161 mg of KMnO₄.

Category Disinfectant and antiseptic.

Storage Preserve in tightly closed containers.

Preparation Potassium Permanganate Tablets for External Use

Potassium Permanganate Tablets for External Use

Potassium Permanganate Tablets for External Use contain not less than 95.0% and not more than 105.0% of the labelled amount of potassium permanganate (KMnO₄).

Processing Mix thoroughly dried potassium permanganate with a quantity of finely powdered boric acid and compress into tablets.

Description Black violet tablets.

Identification Comply with the tests for Identification described under Potassium Permanganate.

Other requirements Comply with the general requirements for tablets, except disintegration test (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powdered tablets equivalent to about 0.8 g of potassium permanganate, carry out the Assay as described under Potassium Permanganate. Each ml of oxalic acid (0.05 mol/L) VS is equivalent to 3.161 mg of KMnO₄.

Category As described under Potassium Permanganate.

Strength (1) 0.1 g (2) 0.3 g

Storage Preserve in tightly closed containers.

Povidone Iodine

[25655-41-8]

Povidone Iodine is 1-ethenyl-2-Pyrrolidinone homopolymer compound with iodine. It contains not less than 9.0% and not more than 12.0% of available iodine (I), calculated on the dried basis.

Description A yellowish-brown to reddish-brown amorphous powder.

Soluble in water or ethanol; insoluble in ether or chloroform.

Identification Carry out the test according to following methods, using a solution of 0.5 g in 5 ml of water. (1) Add 1 drop of the solution to a mixture of 1 ml of starch TS and 9 ml of water, a deep blue colour is produced.

(2) spread 0.5 ml of the solution over an area of about 7.5 cm × 2.6 cm on a glass plate, and allow it to air-dry overnight at room temperature in an atmosphere of low

readily in water.

Loss on drying Dry about 5 g, weighed accurately, at 105°C for 4 hours, weigh and continue to weigh, once every hour until the difference between two successive weightings at 1 hour intervals is not greater than 5.0 mg; it loses not more than 8.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the Residue on ignition; not more than 0.002%.

Arsenic Mix 1.3 g with 0.5 g of calcium hydroxide and about 2 ml of water. Allow to dry, heat gently until it is thoroughly charred and then ignite at 600°C until the incineration is complete. Cool to room temperature, add 5 ml of hydrochloric acid and 23 ml of water and carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.00015%.

Nitrogen content Weigh accurately about 0.50 g and carry out the method for determination of Nitrogen (Appendix VIII D, method 1); not less than 9.5% and not more than 11.5% of N, calculated on the dried basis.

Iodine ion Dissolve about 0.50 g, weighed accurately, in 100 ml of water in a 250 ml conical flask. Add dropwise sodium bisulfite TS until the colour of iodine has disappeared. Add accurately 25 ml of silver nitrate (0.1 mol/L) VS and 10 ml of nitric acid and mix well. Titrate the excess of silver nitrate with ammonium thiocyanate (0.1 mol/L) VS to light brick red colour, using 0.5 ml of ferric ammonium sulfate TS as the indicator. Perform a blank determination and make any necessary correction. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 12.69 mg of I, the percentage of iodide ion is obtained by subtracting the percentage of available iodine under Assay from the percentage of total iodine calculated on the dried basis. Not more than 6.6%, calculated on the dried basis.

Assay Dissolve 1 g, accurately weighed, in 120 ml of water and shake. Carry out the method for potentiometric titration (Appendix VII A), titrate with sodium thiosulfate (0.1 mol/L) VS. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 12.69 mg of I.

Category Topical anti-infective.

Storage Preserve in tightly closed containers, protected from light, stored at a cool and dry place.

Preparation (1) Povidone Iodine Cream
(2) Povidone Iodine Gel
(3) Povidone Iodine Solution
(4) Povidone Iodine Suppositories

Povidone Iodine Cream

Povidone Iodine Ointment contains not less than 0.85% and not more than 1.15% (g/g) of povidone iodine, calculated on available iodine (I).

Description A brown-red cream.

Identification To 1 g add 20 ml of water, shake to dissolve povidone iodine. The solution complies with the test for Identification described under Povidone Iodine.

Other requirements Comply with the general requirements

with 120 ml of water, on a water bath at 50°C with shaking occasionally to dissolve povidone-iodine and cool to room temperature. Carry out the method for potentiometric titration (Appendix VII A). Titrate immediately with sodium thiosulfate (0.1 mol/L) VS until the brown colour disappears. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 12.69 mg of I.

Category As described under Povidone Iodine.

Strength 10%

Storage Preserve in tightly closed containers, protected from light and stored at a cool place.

Povidone Iodine Gel

Povidone Iodine Gel contains not less than 8.5% and not more than 11.5% of the labelled amount of povidone iodine, calculated on available iodine (I).

Description A water soluble, reddish-brown, viscous liquid.

Identification (1) To about 5 g add 20 ml of water, stir to dissolve. The solution complies with the test for Identification described under Povidone Iodine Solution.

Acidity To about 4.0 g add 20 ml of water, stir to dissolve. pH 3.5-4.5 (Appendix VI H).

Viscosity Carry out the method for determination of Viscosity (Appendix VI G, method 2), using NDJ-1 rotating viscosimeter and No. 4 rotator with the rotation speed of 6 rpm, the kinetic viscosity at 25°C is 30-50 Pa · s.

Other requirements Complies with the general requirements for gel (Appendix I U).

Assay Transfer an accurately weighed quantity, equivalent to about 1.0 g of povidone iodine, to a beaker, add 120 ml of water, stir to dissolve. Carry out the method for potentiometric titration (Appendix VII A), titrate with sodium thiosulfate (0.1 mol/L) VS. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 12.69 mg of I.

Category antiseptic-disinfectant.

Strength (1) 5 g : 0.25 g (containing 0.5% available iodine)
(2) 5 g : 0.5 g (containing 1% available iodine)

Storage Preserve in tightly closed containers, protected from light and stored in a cool place.

Povidone Iodine Solution

Povidone Iodine Solution contains not less than 8.5% and not more than 12.0% of the labelled amount of povidone iodine, calculated on available iodine (I).

Description A reddish-brown colour liquid.

Identification (1) To 1-5 drops add 10 ml of water and 1 drop of starch IS; a dark blue colour is produced.

(2) Transfer 10 ml to a 50 ml conical flask, avoiding contact with the neck of the flask. Cover the mouth of the flask with a piece of glass paper, and moisten it with 1 drop of

pH value 3.0-6.5 (Appendix VI H)

Content variation Comply with the requirements (Appendix X F).

Assay Transfer an accurately measured volume equivalent to about 1.25 g of povidone iodine to a beaker and dilute with water to 125 ml. Carry out the method for potentiometric titration (Appendix VII A), titrate with sodium thiosulfate (0.1 mol/L) VS. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 12.69 mg of I.

Category As described under Povidone Iodine.

Strength (1) 1% (2) 2.5% (3) 5% (4) 7.5% (5) 10%

Storage Preserve in tightly closed containers, protected from light and stored at a cool place.

Povidone Iodine Suppositories

Each Povidone Iodine Suppository contains not less than 0.017 g and not more than 0.023 g of povidone iodine, calculated on the available iodine (I).

Description A brownish-red suppositories.

Identification To 1 suppository add 20 ml of water, shake to dissolve povidone-iodine. The solution complies with the tests for Identification described under Povidone-Iodine.

Other requirements Comply with the general requirements for suppositories (Appendix I D).

Assay To 5 suppositories in a iodine flask add 120 ml of water, stopper, shake to dissolve povidone iodine. Titrate immediately with sodium thiosulfate (0.1 mol/L) VS towards the end of titration, add 3 ml of starch TS and continue the titration to the disappearance of blue colour. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 12.69 mg of I.

Category As described under Povidone Iodine.

Storage Preserve in tightly closed containers, protected from light.

Pralidoxime Iodide

$C_7H_9IN_2O$ 264.07

Pralidoxime Iodide is 2-formyl-1-methylpyridinium iodide oxime.

Description Yellow granular crystals or crystalline powder; odourless; taste, bitter; deteriorated easily on exposure to light. Soluble in water or hot ethanol; slightly soluble in ethanol; insoluble in ether.

Melting range 220-227°C, with decomposition (Appendix VI C).

Specific absorbance Protect from light throughout the

per ml in hydrochloric acid solution (9→1000) at 294 nm within 1 hour (Appendix IV A). The value of A (1%, 1 cm) is 464-494.

Identification Dissolve 0.2 g in 20 ml of water, carry out the following tests.

(1) To 5 ml of the solution add a few drops of potassium iodobismuthate TS; a red brown precipitate is produced.

(2) To 10 ml of the solution add 1 drop of ferric chloride TS; a yellow colour is produced. Add 1 more drop of ferric chloride TS; a brown precipitate is produced (distinction from pralidoxime chloride).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of pralidoxime iodide (Appendix XVI).

Cyanides Complies with the limit test for cyanides (Appendix VII F, method 2), using 0.40 g. The absorbance produced is not greater than that of a reference using 1.0 ml of potassium cyanide standard solution (0.0005%).

Free iodine Dissolve 0.10 g in 3 ml of water, add 0.5 ml of starch IS; no blue or violet colour is produced.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the test for heavy metals (Appendix VIII H, method 2), using the residue obtained under the test for Residue on ignition; not more than 0.001%.

Total iodine Dissolve about 0.5 g, accurately weighed, in 50 ml of water, add 10 ml of dilute acetic acid and 10 drops of eosin sodium IS, titrate with silver nitrate (0.1 mol/L) VS, until the colour changes from rose red to violet red. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 12.69 mg of I. It contains not less than 47.6% and not more than 48.5% of I, calculated on the dried basis.

Category Antidote.

Storage Preserve in tightly closed containers, protected from light.

Preparation Pralidoxime Iodide Injection

Pralidoxime Iodide Injection

Pralidoxime Iodide Injection is a sterile solution of pralidoxime iodide in Water for Injection. It contains not less than 90.0% and not more than 105.0% of the labelled amount of pralidoxime iodide ($C_7H_9IN_2O$).

5% of glucose may be added to the injection as a stabilizing agent.

Description A clear, colourless or almost colourless liquid.

Identification Dilute 10 ml with water to produce 25 ml. The resulting solution complies with the tests (1) and (2) for Identification described under Pralidoxime Iodide.

pH value 3.5-5.0 (Appendix VI H).

Cyanide Carry out the limit test for cyanides (Appendix VII F, method 2), using 2.0 ml. The absorbance is not greater than that of a reference using 2.5 ml of potassium cyanide standard solution (0.00025%).

Free iodine To 4 ml add 0.5 ml of starch IS; no blue or

Decomposition products Protected from light throughout the procedure. Measure the absorbance of the solution obtained under Assay at 294 nm and 262 nm within 1 hour (Appendix IV A); the ratio of the absorbance at 294 nm to that at 262 nm is not less than 3.1.

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 2 ml per kg of the rabbit's weight.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Protected from light throughout the procedure. Transfer 5 ml, accurately measured, to a 250 ml volumetric flask, dilute with hydrochloric acid solution (9→1000) to volume and mix. Transfer 5 ml of the solution, accurately measured, to another 250 ml volumetric flask, dilute with hydrochloric acid solution (9→1000) to volume and mix. Measure the absorbance of the resulting solution at 294 nm within 1 hour (Appendix IV A). Calculate the content of $C_{19}H_{24}N_2O_2$, taking 479 as the value of A (1%, 1 cm).

Category As described under Pralidoxime Iodide.

Strength (1) 5 ml : 0.15 g (2) 20 ml : 0.5 g

Storage Preserve in well closed containers, protected from light.

Praziquantel

$C_{19}H_{24}N_2O_2$ 312.41

[55268-74-1]

Praziquantel is 2-(cyclohexylcarbonyl)-1,2,3,6,7,11b-hexahydro-4H-pyrazino[2,1-a]isoquinolin-4-one. It contains not less than 98.0% and not more than 102.0% of $C_{19}H_{24}N_2O_2$, calculated on the dried basis.

Description A white or almost white crystalline powder; taste, bitter. Freely soluble in chloroform; soluble in ethanol; insoluble in ether or water.

Melting range 136-141°C (Appendix VI C).

Identification (1) The light absorption of a solution of 0.5 mg per ml in ethanol exhibits maxima at 264 nm and 272 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of praziquantel (Appendix XVI).

Acidity Dissolve 0.50 g in 15 ml ethanol (neutral to methyl red IS), add 1 drop of methyl red IS and 0.10 ml of sodium hydroxide (0.01 mol/L) VS, a yellow colour is produced.

Related substances Carry out the method as described under Assay. Dissolve a quantity of the substance being examined, accurately weighed, in methanol to produce a solution of 1.2 mg per ml [solution (1)] and of 60 mg per ml [solution (2)]. Inject 10 μ l of solution (1) into the column. Adjust

10 μ l each of solution (1) and (2), accurately measured, into the column. Record the chromatogram for twice the retention time of principal peak. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with solution (2) is not greater than the area of the principal peak obtained with solution (1).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VII L).

Residue on ignition Not more than 0.1% (Appendix VII N); use 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2). Using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (100 : 40) as the mobile phase. Detective wavelength is 263 nm. The resolution factor between the peaks of praziquantel and internal standard complies with related requirements.

Internal standard solution Dissolve a quantity of α -asarone in methanol to produce a solution of 0.4 mg per ml, mix well.

Procedure Dissolve about 100 mg of praziquantel CRS, accurately weighed, in 5 ml of the internal standard solution, measured accurately, shake to dissolve praziquantel. Dilute with methanol to 10 ml, mix well, as reference solution. Inject 10 μ l of the reference solution into the column and calculate the correction factor. Repeat the operation, using the substance being examined instead of praziquantel CRS, calculate the content of $C_{19}H_{24}N_2O_2$.

Category Anthelmintic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Praziquantel Tablets

Praziquantel Tablets

Praziquantel Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of praziquantel ($C_{19}H_{24}N_2O_2$).

Description White tablets.

Identification To a quantity of the powdered tablets equivalent to about 10 mg of praziquantel add 20 ml of ethanol. Shake to dissolve praziquantel and filter, discard the initial filtrate. The light absorption of the successive filtrate exhibits maxima at 264 nm and 272 nm (Appendix IV A).

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of hydrochloric acid solution (9→1000) containing 2 mg of sodium lauryl sulfate per ml as the dissolution medium, adjust the rotational speed of paddle to 50 rpm. Withdraw 10 ml of the solution after exactly 60 minutes and filter. Measure the absorbance of the successive filtrate (for strength 0.2 g) at 263 nm, or dilute the successive filtrate with the dissolution medium to produce a solution of 0.2 mg per ml, measure the absorbance of the resulting solution (for strength 0.6 g) at 263 nm (Appendix IV A). Dissolve a quantity of praziquantel CRS, accurately weighed, in dissolution medium to produce a solution of 0.2 mg per ml. Repeat the operation. Calculate

than 75% the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the assay described under Praziquantel. Weigh accurately and pulverize 20 tablets. To a quantity of the powdered tablets equivalent to about 100 mg of praziquantel, accurately weighed, in a 10 ml volumetric flask, add accurately 5 ml of the internal standard solution, shake thoroughly, dilute with methanol to volume. Mix well and filter. Inject 10 μ l of the successive filtrate into the column, proceed as described under the Assay of Praziquantel and calculate the content of $C_{19}H_{21}N_5O_4$.

Category As described under Praziquantel.

Strength (1) 0.2 g (2) 0.6 g

Storage Preserve in tightly closed containers, protected from light.

Prazosin Hydrochloride

$C_{19}H_{21}N_5O_4 \cdot HCl$ 419.87

[19237-84-4]

Prazosin Hydrochloride is 1-(4-amino-6,7-dimethoxy-2-quinazolinyl)-4-(2-furoyl)-piperazine hydrochloride. It contains not less than 98.0% of $C_{19}H_{21}N_5O_4 \cdot HCl$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; tasteless. Slightly soluble in ethanol; practically insoluble in water.

Identification (1) To about 0.1 g add an equal amount of sodium carbonate in a dry test tube, mix well. Ignite, fumes are evolved which turn a filter paper moistened with 1% 1,2-naphthoquinone-4-sodium sulfonate solution to violet.

(2) The light absorption of a 5 μ g per ml solution in ethanol exhibits a maximum at 251 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of prazosin hydrochloride (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.30 g in 20 ml of water, filter, the filtrate pH 3.0-4.5 (Appendix VI H).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and ethyl acetate-diethylamine (95 : 5) as the mobile phase. Apply separately to the plate 10 μ l each of two solutions of the substance being examined in a mixture of chloroform-methanol-diethylamine (10 : 10 : 1) containing (1) 5.0 mg per ml, (2) 50 μ g per ml. After developing and removal of the plate, dry it in air, examine under ultraviolet light (254 nm). Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Isoamyl alcohol Dissolve about 1.0 g in 10 ml of water,

and use the supernatant liquid. Carry out the method for gas chromatography (Appendix V E, method 4), using a column packed with porous polymer beads of divinyl benzene-ethyl vinyl benzene with a diameter of 0.25-0.18 mm, maintain the column temperature at 150°C. The content of isoamyl alcohol is not more than 0.1% (g/g).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N); use 1.0 g.

Heavy metals Use the residue obtained in the test for Residue on ignition, carry out the limit test for heavy metals (Appendix VIII H, method 2); not more than 0.002%.

Assay Dissolve about 0.3 g, accurately weighed, in 20 ml of glacial acetic acid and 6 ml of mercuric acetate TS, add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour change to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 41.99 mg of $C_{19}H_{21}N_5O_4 \cdot HCl$.

Category Antihypertensive.

Storage Preserve in tightly closed containers, protected from light.

Preparation Prazosin Hydrochloride Tablets

Prazosin Hydrochloride Tablets

Prazosin Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of prazosin hydrochloride ($C_{19}H_{21}N_5O_4 \cdot HCl$).

Description White tablets.

Identification (1) Triturate a quantity of powdered tablets, equivalent to about 20 mg prazosin hydrochloride, with 1.5 ml of 10% sodium hydroxide solution for 5 minutes. Add 10 ml of chloroform, shake for 15 minutes, allow to stand. Separate the chloroform layer and filter, evaporate the filtrate to dryness. The residue complies with test (1) for Identification described under Prazosin Hydrochloride.

(2) The light absorption of the solution obtained in the Assay exhibits a maximum at 251 nm (Appendix IV A).

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Related substances Complies with the test described under Prazosin Hydrochloride but for solution (1) use the supernatant liquid obtained by shaking a quantity of the powdered tablets with a solution of chloroform-methanol-diethylamine (10 : 10 : 1) to produce a suspension containing 3.0 mg of prazosin hydrochloride per ml. For solution (2) dilute solution (1) with the same solvent to produce a solution containing 45 μ g of prazosin hydrochloride per ml.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Triturate 1 tablet in a mortar with 3 ml of water. Transfer to a 100 ml volumetric flask with about 80 ml of ethanol in portions. Shake thoroughly to dissolve prazosin hydrochloride, dilute with ethanol to volume, mix well and filter. Measure accurately a quantity of the successive filtrate, dilute with ethanol to produce a solution of 3 μ g per ml. Measure the absorbance of the resulting solution as described under Assay.

method 2), using 900 ml of 0.1 mol/L hydrochloride acid solution as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw a quantity of the solution after exactly 30 minutes and filter. Measure the absorbance of the successive filtrate at 246 nm (Appendix IV A). Dissolve 20 mg of prazosin hydrochloride CRS, accurately weighed, with ethanol and dilute to 100 ml, mix well. Transfer accurately 2 ml to a 200 ml volumetric flask, dilute to volume with the dissolution medium, repeat the operation. Calculate the dissolution of $C_{19}H_{21}N_5O_4 \cdot HCl$ from each tablet. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately 20 tablets and powder finely. Transfer a quantity of the powdered tablets, accurately weighed, equivalent to about 15 mg of prazosin hydrochloride to a 100 ml volumetric flask, moisten with 3 ml of water, shake thoroughly, then add 60 ml of ethanol. Heat gently on a water bath and shake for 30 minutes, cool to room temperature, dilute with ethanol to volume, mix well. Filter, measure accurately 2 ml of the successive filtrate to another 100 ml volumetric flask, dilute with ethanol to volume, mix well. Measure the absorbance of the resulting solution at 251 nm (Appendix IV A). Calculate the content of $C_{19}H_{21}N_5O_4 \cdot HCl$, using a 3 µg per ml solution of prazosin hydrochloride CRS as the reference.

Category As described under Prazosin Hydrochloride.

Strength (1) 0.5 mg (2) 1 mg (3) 2 mg

Storage Preserve in tightly closed containers, protected from light.

Prednisolone

$C_{21}H_{28}O_5$ 360.45

[52438-85-4]

Prednisolone is 11β, 17α, 21-trihydroxypregna-1,4-diene-3,20-dione. It contains not less than 97.0% and not more than 102.0% of $C_{21}H_{28}O_5$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless, taste, slightly bitter; hygroscopic. Soluble in methanol or ethanol; sparingly soluble in acetone or dioxane; slightly soluble in chloroform; very slightly soluble in water.

Melting range 225-236°C, with decomposition (Appendix VI C).

Specific optical rotation +96° to +103°, in a solution of 10 mg per ml in dioxane (Appendix VI E).

Specific absorbance Measure the absorbance of a solution of 10 µg per ml in ethanol at 243 nm (Appendix IV A), the value of *A* (1%, 1cm) is 400-430.

Identification (1) Dissolve 10 mg in 1 ml of methanol, add

(2) Dissolve about 2 mg in 2 ml of sulfuric acid, a scarlet colour without fluorescence is produced gradually; add 10 ml of water, the colour disappears and a grey flocculent precipitate is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of prednisolone (Appendix XVI).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of dichloromethane-ether-methanol-water (77 : 12 : 6 : 0.4) as the mobile phase. Apply separately to the plate 5 µl each of two solutions of the substance being examined in chloroform-methanol (9 : 1) containing (1) 3 mg per ml, (2) 60 µg per ml. After developing and removal of the plate, dry in air and then at 105°C for 10 minutes, cool and spray with alkaline tetrazolium blue TS. Not more than 3 secondary spots are obtained in the chromatogram of solution (1) and any secondary spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with an octadecylsilane bonded silica gel and using methanol-water (65 : 35) as the mobile phase. Detection wavelength is 240 nm. The number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of prednisolone; the resolution factor between the peaks of prednisolone and internal standard is not less than 3.5.

Internal standard solution Prepare a solution of 1.5 mg per ml norethisterone CRS in methanol.

Procedure Dissolve a quantity of prednisolone CRS accurately weighed, in methanol to produce a solution of about 1 mg per ml in the reference solution. Measure accurately 5 ml each of reference solution and internal standard solution to a 50 ml volumetric flask, dilute with methanol to volume, mix well, inject 10 µl into the column and calculate the correction factor. Repeat the operations using a quantity of the substance being examined instead of prednisolone CRS, calculate the content of $C_{21}H_{28}O_5$.

Category Corticosteroid.

Storage Preserve in tightly closed containers, protected from light.

Preparation Prednisolone Tablets

Prednisolone Tablets

Prednisolone Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of prednisolone ($C_{21}H_{28}O_5$).

Description White tablets.

Identification To a quantity of finely powdered tablets equivalent to 50 mg of prednisolone add 30 ml of chloroform, stir until prednisolone is dissolved, filter and evaporate the filtrate to dryness on a water bath. The residue complies with tests (1) and (2) for Identification described under Prednisolone.

X E). Triturate 1 tablet with ethanol and transfer to a 50 ml volumetric flask, add ethanol to volume, shake thoroughly. Filter, discard the initial filtrate, transfer 5 ml of the successive filtrate, accurately measured, into another 50 ml volumetric flask, add ethanol to volume and mix well. Measure the absorbance of the resulting solution at 243 nm (Appendix IV A), calculate the content of $C_{21}H_{28}O_5$, taking 415 as the value of A (1%, 1 cm).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and pulverize 20 tablets. To an accurately weighed amount of the powder equivalent to 20 mg of prednisolone in a 100 ml volumetric flask add 75 ml of ethanol, shake for 30 minutes, add ethanol to volume and mix well. Filter, transfer accurately 5 ml of the successive filtrate into another 100 ml volumetric flask, dilute with ethanol to volume and mix well. Measure the absorbance of the resulting solution at 243 nm (Appendix IV A), Calculate the content of $C_{21}H_{28}O_5$, taking 415 as the value of A (1%, 1 cm).

Category As described under Prednisolone.

Strength 5 mg

Storage Preserve in tightly closed containers, protected from light.

Prednisolone Acetate

$C_{23}H_{30}O_6$ 402.49

[52-21-1]

Prednisolone Acetate is 11β , 17α , 21-trihydroxy-pregna-1,4-diene-3,20-dione-21-acetate. It contains not less than 96.0% and not more than 102.0% of $C_{23}H_{30}O_6$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; taste, bitter.

Slightly soluble in ethanol or chloroform; practically insoluble in water.

Specific optical rotation $+112^\circ$ to $+119^\circ$, in a solution of about 10 mg per ml in dioxane (Appendix VI E).

Specific absorbance Measure the absorbance of a solution of 10 μ g per ml in dehydrated ethanol at 243 nm (Appendix IV A), the value of A (1%, 1 cm) is 355-385.

Identification (1) Dissolve about 20 mg in 1 ml of methanol by warming, add 1 ml of hot alkaline cupric tartrate TS; an orangish-red precipitate is produced.

(2) Dissolve about 2 mg in 2 ml of sulfuric acid, allow to stand for 5 minutes; a rose red colour is produced. On adding 10 ml of water, the colour disappears and a grey flocculent precipitate is produced.

(3) The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay.

(4) The infrared absorption spectrum (Appendix IV C) is

acetate (Appendix XVI).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of dichloromethane-ether-methanol-water (385 : 60 : 15 : 2) as the mobile phase. Apply separately to the plate 5 μ l each of two solutions of the substance being examined in chloroform-methanol (9 : 1) containing (1) 4 mg per ml, (2) 0.12 mg per ml. After developing and removal of the plate, dry it in air and then at 105°C for 10 minutes, cool and spray with alkaline tetrazolium blue TS. Any spot in the chromatogram obtained with solution (1) other than the principal spot is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C , loses not more than 0.5% of its weight (Appendix VII L).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (70 : 30) as the mobile phase. Detection wavelength is 240 nm and the number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of prednisolone acetate. The resolution factor between the peaks of prednisolone acetate and internal standard complies with the related requirements.

Internal standard solution Prepare a solution of fluocinonide CRS of about 0.50 mg per ml in methanol.

Procedure Dissolve a quantity of prednisolone acetate CRS accurately weighed in methanol to produce a solution of about 0.50 mg per ml as the reference solution. Measure accurately 5 ml each of reference solution and internal standard solution to a 25 ml volumetric flask, dilute with methanol to volume, mix well, inject 5 μ l into the column and calculate the correction factor. Repeat the operations using a quantity of the substance being examined instead of prednisolone acetate CRS. Calculate the content of $C_{23}H_{30}O_6$.

Category Corticosteroid.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Prednisolone Acetate Cream
(2) Prednisolone Acetate Injection
(3) Prednisolone Acetate Tablets

Prednisolone Acetate Cream

Prednisolone Acetate Cream contains not less than 90.0% and not more than 110.0% of the labeled amount of prednisolone acetate ($C_{23}H_{30}O_6$).

Description A white cream.

Identification (1) Dissolve 1 g in dehydrated ethanol, shake vigorously, filter and allow the filtrate to evaporate to dryness on a water bath. Add sulfuric acid TS to the residue and mix well, a red colour is produced. Add 10 ml to 15 ml of water, the red colour disappears and a white precipitate is produced.

(2) To 15 g add 70 ml of dehydrated ethanol, warm by heating in the water bath, shake well, cool in an ice bath and filter. Evaporate about 30 ml of filtrates on a water bath to dryness. Add 1 ml of methanol to the residue, allow it to dissolve by heating and add warm copper tartrate TS, a reddish-orange precipitate is produced.

Other requirements Complies with requirements for cream

Assay Reference preparation To 20 mg of prednisolone acetate CRS, weighed accurately, in a 100 ml volumetric flask add a quantity of dehydrated ethanol, shake and allow it to dissolve. Add dehydrated ethanol to volume and mix well.

Test preparation To about 4 g of the cream equivalent to 20 mg of prednisolone acetate, weighed accurately, in a beaker add about 30 ml of dehydrated ethanol, heat on a water bath, stir vigorously. Cool in an ice bath, filter and transfer the filtrate to a 100 ml volumetric flask. Repeat this operation for three times. Combine the filtrates, add dehydrated ethanol to volume and mix well.

Procedure To 1 ml each of two preparations, accurately measured, in separate dry test tubes with stopper add 9 ml of dehydrated ethanol and 2 ml of triphenyltetrazolium chloride TS, accurately measured, and mix well; then add 1 ml of tetramethylammonium hydroxide TS, accurately measured, and mix well. Allow to stand in dark place at 25°C for 40-50 minutes. Measure the absorbance at 485 nm (Appendix IV A). Calculate the content of $C_{23}H_{30}O_6$.

Category Corticosteroids.

Strength (1) 4 g : 0.02 g (2) 10 g : 0.05 g

Storage Preserve in tightly closed containers, stored at cold place.

Prednisolone Acetate Injection

Prednisolone Acetate Injection is a sterile suspension of prednisolone. It contains not less than 90.0% and not more than 110.0% of the labelled amount of prednisolone acetate ($C_{23}H_{30}O_6$).

Description A suspension of minute granules which deposit on standing, a homogeneous creamy white suspension is obtained on shaking.

Identification Complies with tests (1) for Identification described under Prednisolone Acetate.

pH value 4.2-7.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B)

Assay Reference preparation Dissolve 25 mg of prednisolone acetate CRS, weighed accurately, in a 100 ml volumetric flask with dehydrated ethanol, dilute to volume with dehydrated ethanol and mix well.

Test preparation Dilute 1 ml of the injection, accurately measured, equivalent to 25 mg of prednisolone acetate in a 100 ml volumetric flask with dehydrated ethanol to volume and mix well. Allow it stand to deposit, use supernatant liquid as the test solution.

Procedure To 1 ml each of above two preparations, accurately measured, in dry test tubes with stopper add 9 ml of dehydrated ethanol, accurately measured, and shake well. Use 10 ml of dehydrated ethanol as the blank solution. To each tube, add accurately 1 ml of triphenyltetrazolium chloride TS and 1 ml of tetramethylammonium hydroxide TS and mix well. Allow to stand in the dark place 25°C for 40-50 minutes. Measure the absorbance at 485 nm (Appendix IV A). Calculate the content of $C_{23}H_{30}O_6$.

Category As described under Prednisolone Acetate.

Strength (1) 1 ml : 25 mg (2) 5 ml : 125 mg

Prednisolone Acetate Tablets

Prednisolone Acetate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of prednisolone acetate ($C_{23}H_{30}O_6$).

Description White tablets.

Identification Triturate an amount of finely pulverized tablets, equivalent to 0.1 g of prednisolone acetate, with 30 ml of chloroform in divided portions, filter, evaporate the filtrate to dryness on a water bath. The residue complies with tests (1), (2) and (3) for Identification described under Prednisolone Acetate.

Content uniformity Comply with the requirements (Appendix X E). Triturate 1 tablet with a quantity of dehydrated ethanol to dissolve prednisolone acetate, and dilute with dehydrated ethanol to produce a solution of 10 µg per ml, filter. Measure the absorbance of the filtrate at 243 nm (Appendix IV A). Calculate the content of $C_{23}H_{30}O_6$, taking 370 as the value of A (1%, 1 cm).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder finely 20 tablets. To a quantity of the powder, accurately weighed, equivalent to 20 mg of prednisolone acetate in a 100 ml volumetric flask, add 60 ml of dehydrated ethanol, shake thoroughly for 15 minutes, dilute with dehydrated ethanol to volume, mix well. Filter, transfer, accurately 5 ml of the successive filtrate to another 100 ml volumetric flask, dilute with dehydrated ethanol to volume and mix well. Measure the absorbance of the resulting solution at 243 nm (Appendix IV A). Calculate the content of $C_{23}H_{30}O_6$, taking 370 as the value of A (1%, 1 cm).

Category As described under Prednisolone Acetate.

Strength 5 mg

Storage Preserve in tightly closed containers, protected from light.

Prednisone

$C_{21}H_{26}O_5$ 358.43

[53-03-2]

Prednisone is 17α, 21-dihydroxypregna-1,4-diene-3,11,20-trione. It contains not less than 97.0% and not more than 102.0% of $C_{21}H_{26}O_5$, calculated on the dried basis.

Description A white or almost white, crystalline powder; odourless. Slightly soluble in chloroform or ethanol; practically insoluble in water.

Storage Preserve in tightly closed containers, protected from light. With decomposition: insert the

Specific optical rotation $+167^{\circ}$ to $+175^{\circ}$, in a solution of 5 mg per ml in dioxane (Appendix VI E).

Specific absorbance Dissolve an accurately weighed quantity in ethanol to produce a solution of 15 μ g per ml, measure the absorbance at 240 nm (Appendix IV A), the value of A (1%, 1 cm) is 405-435.

Identification (1) Dissolve about 5 mg in 2 ml of sulfuric acid, allow to stand for 5 minutes; an orange colour appears. Pour it to 10 ml of water; it changes to a yellow colour and then gradually changes to bluish-green.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of prednisone (Appendix XVI).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with silica gel and a mixture of chloroform-methanol (98 : 2) as the mobile phase. Detection wavelength is 254 nm. The number of the theoretical plates of the column is not less than 2500, calculated with reference to the peak of prednisone and the resolution factor between the peaks of prednisone and adjacent impurity complies with the related requirements. Dissolve a quantity of the substance being examined, with mobile phase in a brown volumetric flask to produce a solution of about 1.25 mg per ml as the test solution (1). Measure accurately 1 ml of the test solution into a 100 ml brown volumetric flask and dilute to volume with mobile phase as the reference solution (2). Inject 20 μ l of solution (2) into the column, adjust the attenuation so that the peak height of the principal peak in the chromatogram is about 25%-30% of full scale of the chart. Inject separately 10 μ l of the solution (1) and (2) into the column and record the chromatogram for 2.5 times of the retention time of the principal peak. In the chromatogram of solution (1), the area of any secondary peak is not greater than the area of the principal peak in the chromatogram of solution (2), the sum of the areas of all secondary peaks is not greater than twice the area of the principal peak of solution (2).

Loss on drying When dried at 105°C , loses not more than 1.0% of its weight; use 0.5 g.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with an octadecyl silane bonded silica gel and a mixture of water-tetrahydrofuran-methanol (688 : 250 : 62) as the mobile phase. The detection wavelength is 254 nm, number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of prednisone. The resolution factor between the peaks of prednisone and internal standard complies with related requirement.

Internal standard solution Prepare a solution of acetanilide in dilute methanol (1 \rightarrow 2) with a concentration of about 0.11 mg per ml.

Procedure Prepare a solution in dilute methanol (1 \rightarrow 2) of an accurately weighed quantity of prednisone CRS of about 0.2 mg per ml. Transfer accurately 5 ml of the solution and 5 ml of internal standard solutions to a 50 ml volumetric flask, add dilute methanol (1 \rightarrow 2) to volume and mix well; inject 10 μ l into the column and record the chromatogram. Repeat the operation, using the substance being examined instead of prednisone CRS. Calculate the content of $\text{C}_{21}\text{H}_{28}\text{O}_5$.

Category Corticosteroid.

Storage Preserve in tightly closed containers, protected from light.

Prednisone Acetate

$\text{C}_{23}\text{H}_{28}\text{O}_6$ 400.47

Prednisone Acetate is 17 α , 21-dihydroxypregna-1,4-diene-3,11,20-trione-21-acetate. It contains not less than 97.0% and not more than 102.0% of $\text{C}_{23}\text{H}_{28}\text{O}_6$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless, taste, bitter.

Freely soluble in chloroform; sparingly soluble in acetone; slightly soluble in ethanol or ethyl acetate; insoluble in water.

Melting range $235\text{--}242^{\circ}\text{C}$, with decomposition (Appendix VI C).

Specific optical rotation $+183^{\circ}$ to $+190^{\circ}$, in a solution of 10 mg per ml in dioxane (Appendix VI E).

Specific absorbance Measure the absorbance of a solution of 10 μ g per ml in dehydrated ethanol at 238 nm (Appendix IV A), the value of A (1%, 1 cm) is 373-397.

Identification (1) Dissolve about 1 mg in 2 ml of ethanol, add 2 drops of 10% sodium hydroxide solution and 1 ml of triphenyl-tetrazolium chloride TS; a red colour is produced. (2) Dissolve about 5 mg in 1 ml of sulfuric acid, allow to stand for 5 minutes; an orange colour is produced. Pour the solution into 10 ml of water, the colour changes to yellow and subsequently to bluish-green.

(3) The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay.

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of prednisone acetate (Appendix XVI).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and dichloromethane-ether-methanol-water (385 : 60 : 15 : 2) as the mobile phase. Apply separately to the plate 5 μ l each of two solutions of the substance being examined in chloroform-methanol (9 : 1) containing (1) 4.0 mg per ml, (2) 80 μ g per ml. After developing and removal of the plate, dry in air and then at 105°C for 10 minutes, cool and spray with alkaline tetrazolium blue TS. Any spot in the chromatogram obtained with solution (1) other than the principal spot is not more intense than the principal spot obtained solution (2).

Loss on drying When dried to constant weight at 105°C , loses not more than 0.5% of its weight (Appendix VIII L).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with an octadecylsilane bonded silica gel and using methanol-water (58 : 42) as the mobile phase. The wavelength of the detector is 240 nm. The number of theoretical plates of the column is not less than 2000, calculated with reference to the

the peaks of prednisone acetate and internal standard complies with the related requirements.

Internal standard solution Prepare a solution of hydrocortisone CRS of about 0.30 mg per ml in methanol.

Procedure Dissolve a quantity of prednisone acetate CRS, accurately weighed, in methanol to produce a solution of about 0.40 mg per ml, as the reference solution. Measure accurately 10 ml each of reference solution and internal standard solution to a 25 ml volumetric flask, dilute with methanol to volume, mix well, inject 10 μ l into the column and record the peak area in the chromatogram. Repeat the operations using a quantity of the substance being examined instead of prednisone acetate CRS. Calculate the content of $C_{23}H_{28}O_6$.

Category Corticosteroid.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Prednisone Acetate Eye Ointment
(2) Prednisone Acetate Tablets

Prednisone Acetate Eye Ointment

Prednisone Acetate Eye Ointment contains not less than 90.0% and not more than 110.0% of the labelled amount of prednisone acetate ($C_{23}H_{28}O_6$).

Description Light yellow eye ointment.

Identification Place 2 g of the eye ointment in a stoppered conical flask, add 30 ml of petroleum ether, shake thoroughly until the eye ointment base is dissolved. Filter, wash the residue with several portions of petroleum ether, then dissolve the residue in 10 ml of dehydrated ethanol by warming and stirring, cool in an ice bath and filter again. Evaporate the filtrate on a water bath to dryness, dissolve the residue in 5 ml of chloroform, the solution complies with test (2) for Identification described under Prednisone Acetate Tablets.

Other requirements Complies with the general requirements for eye preparation (Appendix I G).

Assay Reference preparation Place 25 mg of prednisone acetate CRS, accurately weighed, in a 100 ml volumetric flask, add dehydrated ethanol to volume and mix well.

Test preparation Place 5 g of the eye ointment equivalent to 25 mg of prednisone acetate, accurately weighed, in a beaker, add 30 ml of dehydrated ethanol, heat on a water bath and stir thoroughly, cool in an ice bath and filter into a 100 ml volumetric flask. Repeat the extraction twice more, combine all the filtrates in the same volumetric flask, add dehydrated ethanol to volume and mix well.

Procedure Transfer separately 1 ml each of the two preparations, accurately measured, to stoppered test tubes, add to each tube exactly 9 ml of dehydrated ethanol and 2 ml of triphenyltetrazolium chloride TS, mix well, add exactly 2 ml of tetramethylammonium hydroxide TS and mix well. Allow to stand in the dark at 25°C for 40 minutes and measure the absorbance at 485 nm (Appendix IV A). Calculate the content of $C_{23}H_{28}O_6$.

Category As described under Prednisone Acetate.

Strength 0.5%

Prednisone Acetate Tablets

Prednisone Acetate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of prednisone acetate ($C_{23}H_{28}O_6$).

Description White tablets.

Identification To a quantity of powdered tablets equivalent to 0.1 g of prednisone acetate add 50 ml of chloroform, stir until prednisone acetate is dissolved and filter, use the filtrate for the following tests.

(1) Evaporate the filtrate to dryness on a water bath, the residue complies with tests (2) and (3) for Identification described under Prednisone Acetate.

(2) Dissolve prednisone acetate CRS in chloroform to produce a solution of 2 mg per ml as reference solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and dichloromethane-ether-methanol-water (385 : 60 : 15 : 2) as the mobile phase. Apply separately to the plate 5 μ l each of the filtrate and the reference solution. After developing and removal of the plate, dry it in air and then at 105°C for 10 minutes, cool and spray with alkaline tetrazolium blue TS. The principal spots in the chromatogram obtained with the two solutions are identical in position and colour.

Content uniformity Comply with the requirements (Appendix X E). Moisten 1 tablet with 5 drops of dehydrated ethanol and triturate it with a quantity of dehydrated ethanol then transfer to a 50 ml volumetric flask with 40 ml of dehydrated ethanol in divided portions, shake thoroughly to dissolve prednisone acetate, dilute with dehydrated ethanol to volume, mix well, filter with a dry filter paper. Discard the initial filtrates. Measure accurately 5 ml of the successive filtrate to another 50 ml volumetric flask, mix well. Measure the absorbance of the resulting solution at 238 nm (Appendix IV A). Calculate the content of $C_{23}H_{28}O_6$, taking 385 as the value of A (1%, 1 cm).

Dissolution Carry out dissolution test (Appendix X C, method 2), using 600 ml of 0.25% sodium lauryl sulfate solution as the dissolution medium, adjust the rotational speed of paddle to 100 rpm, take a quantity solution after exactly 45 minutes and filter, using successive filtrate solution as test solution. Dissolve a quantity of prednisone acetate CRS, accurately weighed, in dehydrated ethanol and dilute to about 1 mg per ml. Withdraw 2 ml of the resulting solution, accurately measured, transfer to 200 ml volumetric flask, dilute with dissolution medium to volume and mix well as reference solution. Measure the absorbance of two solutions at 242 nm and 267 nm (Appendix IV A). By the difference between two absorbances, respectively. Calculate the dissolution of $C_{23}H_{28}O_6$ from each tablet. Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (60 : 40) as the mobile phase. Detection wavelength is 240 nm, and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of prednisone acetate.

Procedure Weigh accurately and powder 20 tablets. To a quantity, weighed accurately, equivalent to about 5 mg of

acetate dissolved, then dilute with methanol to volume, mix well and filter, take the successive filtrate as the test solution. Inject 20 μ l of the test solution into the column and record the chromatogram. Dissolve a quantity of prednisone acetate CRS, accurately weighed, with methanol to produce a solution of about 0.1 mg per ml as the reference solution. Repeat the operations using the reference solution instead of the test solution, calculate the content of $C_{23}H_{28}O_6$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Prednisone Acetate.

Strength 5 mg

Storage Preserve in tightly closed containers, Protected from light.

Primaquine Phosphate

$C_{15}H_{21}N_3O \cdot 2H_3PO_4$ 455.34 [63-45-6]

Primaquine Phosphate is N^4 -(6-methoxy-8-quinoliny)-1,4-pentanediamine phosphate (1 : 2). It contains not less than 98.0% of $C_{15}H_{21}N_3O \cdot 2H_3PO_4$, calculated on the dried basis.

Description An orange-red crystalline powder; odourless; taste, bitter.

Soluble in water; insoluble in chloroform or ether.

Melting range 200-205°C, with decomposition (Appendix VI C).

Identification (1) Dissolve 10 mg in 5 ml of water, add 1 ml of 5% ceric ammonium sulfate solution in dilute nitric acid; a deep violet colour develops.

(2) The light absorption of a solution of 15 μ g per ml in 0.01 mol/L hydrochloric acid solution exhibits maxima at 265 nm and 282 nm; the absorbance is about 0.50-0.52 and 0.49-0.51, respectively (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of primaquine phosphate (Appendix XVI).

(4) Dissolve about 50 mg in 5 ml of water, add 2 ml of sodium hydroxide TS, filter. The filtrate, neutralized with dilute nitric acid, yields the reactions characteristic of phosphates (Appendix III).

Acidity Dissolve 0.50 g in 50 ml of water, pH 2.5-3.5 (Appendix VI H).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of ethyl acetate-isopropanol-concentrate ammonia solution (43 : 35 : 5) as the mobile phase. Apply separately to the plate 10 μ l of each of the following solutions in water-methanol (1 : 1) containing (1) 10 mg per ml, (2) 0.2 mg per ml, (3) 0.1 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air, examine under ultraviolet light (254 nm), not more than two secondary spots are

Any secondary spot obtained with solution (1) is not more intense than the principal spot obtained with solution (3); not more than one secondary spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Assay Dissolve about 0.15 g, accurately weighed, in 40 ml of glacial acetic acid. Carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 22.77 mg of $C_{15}H_{21}N_3O \cdot 2H_3PO_4$.

Category Antimalarial.

Storage Preserve in tightly closed containers, protected from light.

Preparation Primaquine Phosphate Tablets

Primaquine Phosphate Tablets

Primaquine Phosphate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of primaquine phosphate ($C_{15}H_{21}N_3O \cdot 2H_3PO_4$).

Description Sugar coated tablets with orange red core.

Identification (1) Dissolve a quantity of the powdered tablets equivalent to about 60 mg of primaquine phosphate, in 10 ml of water with coating removed, filter. The filtrate complies with tests (1) and (4) for Identification described under Primaquine Phosphate.

(2) Dissolve a quantity of the powdered tablets in hydrochloric acid solution (0.01 mol/L) to produce a solution of 15 μ g per ml and filter. The filtrate exhibits maxima at 265 nm and 282 nm (Appendix IV A).

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Triturate 1 tablet with hydrochloric acid solution (0.01 mol/L) in 100 ml volumetric flask, dilute with hydrochloric acid solution (0.01 mol/L) to volume, mix well and filter. Measure accurately 3 ml of the successive filtrate to another 25 ml volumetric flask, add hydrochloric acid solution (0.01 mol/L) to volume and mix well, carry out the method as described under Dissolution.

Dissolution Comply with the requirements for dissolution test (Appendix X C, method 1), using 900 ml hydrochloric acid solution (0.01 mol/L) as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw 10 ml of the solution at 60 minutes and filter. A quantity of the successive filtrate, as test solution. Measure the absorbance of the resulting solution at 342 nm (Appendix IV A). Calculate the content of primaquine phosphate ($C_{15}H_{21}N_3O \cdot 2H_3PO_4$), from each other, taking 342 as the value of A (1%, 1 cm). Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh and powder 50 tablets with coating removed. Weigh accurately a quantity of the powder equivalent to about 0.3 g of primaquine phosphate, carry out the method for dead-stop titration (Appendix VII A), titrate with sodium nitrite (0.05 mol/L) VS, the galvanometer sensitivity is changed to 10^{-8} A per unit scale. Each ml of sodium nitrite (0.05 mol/L) VS is equivalent to 22.77 mg of $C_{15}H_{21}N_3O$.

Category As described under Primaquine Phosphate.

Strength 13.2 mg

Storage Preserve in tightly closed containers, protected from light.

Primidone

$C_{12}H_{14}N_2O_2$ 218.26

[125-33-7]

Primidone is 5-ethyl-5-phenyl-4,6 (1*H*, 5*H*)-Pyrimidine-dione. It contains not less than 98.5% of $C_{12}H_{14}N_2O_2$, calculated on the dried basis.

Description A white crystalline powder; odourless; taste, slightly bitter.

Slightly soluble in ethanol; practically insoluble in water, acetone or benzene.

Melting range 280-284°C (Appendix VI C).

Identification (1) Warm 0.1 g with 5 ml of chromotropic acid TS on a water bath for 30 minutes; a purple colour is produced.

(2) Ignite 0.1 g with 0.1 g of anhydrous sodium carbonate, ammonia vapor is evolved which turns a moistened red litmus paper blue.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of primidone (Appendix XVI).

Chlorides Shake 1.0 g with 50 ml of water for 5 minutes and filter. Carry out the limit test for chlorides (Appendix VIII A), using 25 ml of the filtrate. Any opalescence produced is not more intense than that of a reference using 7.0 ml of sodium chloride standard solution (0.014%).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VII N); use 2.0 g.

Heavy metals To the residue obtained in the test for Residue on ignition add 1 ml of nitric acid, evaporate to dryness and completely expel the nitrogen oxide vapour. Add 2 ml of hydrochloric acid and evaporate on a water bath to dryness. Add 5 ml of water and evaporate to dryness. Dissolve the residue in 15 ml of water and 4 ml of acetate BS (pH 3.5) by warming, add water to produce 50 ml and mix well. Carry out the limit test for heavy metals (Appendix VIII H, method 1), using 25 ml of the resulting solution; not more than 0.001%.

Zinc Transfer the remaining 25 ml of the solution obtained in the test for Heavy metals to a 50 ml Nessler cylinder, add 4 ml of hydrochloric acid solution (1 → 2) and 3 ml of potassium ferrocyanide TS, add water to volume and mix well. Any opalescence produced is not more intense than that of a reference using 2.0 ml of zinc standard solution [dissolve 44 mg of zinc sulfate ($ZnSO_4 \cdot 7H_2O$), accurately weighed, in water in a 100 ml volumetric flask, add water to volume and mix well. Measure accurately 10 ml to

the substance being examined. (0.002%).

Assay Carry out the determination of nitrogen (Appendix VII D, method 1), using 0.2 g, accurately weighed. Each ml of sulfuric acid (0.05 mol/L) VS is equivalent to 10.91 mg of $C_{12}H_{14}N_2O_2$.

Category Anti-epileptic agent.

Storage Preserve in tightly closed containers, Protected from light.

Preparation Primidone Tablets

Primidone Tablets

Primidone Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of primidone ($C_{12}H_{14}N_2O_2$).

Description White tablets.

Identification To a quantity of powdered tablets equivalent to about 0.25 g of primidone add 30 ml of ethanol, warm to dissolve primidone and filter. Evaporate the filtrate on a water bath to dryness, the residue complies with tests (1) and (2) for Identification described under Primidone.

Dissolution Comply with the requirements for dissolution test (Appendix X C, method 2), using 900 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw 10 ml of the solution at 60 minutes and filter. The successive filtrate as a test solution. Dissolve 25 mg primidone CRS in water in 100 ml volumetric flask, ultrasonicate to dissolve the primidone, cool to room temperature and add water to volume as a reference solution. Measure the absorbance of the resulting solution at 257 nm (Appendix IV A). Calculate the dissolution of $C_{12}H_{14}N_2O_2$ from each other, not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 15 tablets. Weigh accurately a quantity equivalent to about 0.25 g of primidone, carry out the determination of nitrogen (Appendix VII D, method 1). Each ml of sulfuric acid (0.05 mol/L) VS is equivalent to 10.91 mg of $C_{12}H_{14}N_2O_2$.

Category As described under Primidone.

Strength (1) 50 mg (2) 100 mg (3) 250 mg

Storage Preserve in tightly closed containers, protected from light.

Probenecid

$C_{13}H_{19}NO_4S$ 285.36

[57-66-9]

Probenecid is 4-[(dipropylamino) sulfonyl]-benzoic acid. It contains not less than 98.5% of

Description A white crystalline powder; odourless; taste, slightly bitter.

Soluble in acetone; sparingly soluble in ethanol or chloroform; Practically insoluble in water; soluble in dilute sodium hydroxide solution; practically insoluble in dilute acids.

Melting range 198-201°C (Appendix VI C).

Identification (1) To about 5 mg add 0.2 ml of 0.1 mol/L sodium hydroxide solution and water to produce 2 ml (pH about 5.6-6.0), add 1 drop of ferric chloride TS; a creamy precipitate is produced.

(2) To about 0.1 g add a small quantity of sodium hydroxide, heat gently to fuse for a few minutes and cool. Add a few drops of nitric acid to the residue, dissolve and acidify with hydrochloric acid, then dilute with a small quantity of water and filter. The filtrate yields the reactions characteristic of sulfates (Appendix III).

(3) Add ethanolic hydrochloric acid [to 2 ml of hydrochloric acid solution (9→1000) add ethanol to produce 100 ml] to produce a solution of 20 µg per ml. The light absorption of the solution exhibits maxima at 225 nm and 249 nm; the absorbance at 249 nm is about 0.67 (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of probenecid (Appendix XVI).

Acidity To 2.0 g add 100 ml of freshly boiled and cooled water, warm on a water bath for 5 minutes with shaking, cool and filter. To 50 ml of the filtrate add a few drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. The sodium hydroxide (0.1 mol/L) VS consumed is not more than 0.25 ml.

Chlorides To 1.6 g add 100 ml of water and 1 ml of nitric acid, warm on a water bath for 5 minutes with shaking, cool and filter. Carry out the limit test for chlorides (Appendix VIII A), using 25 ml of the filtrate. Any opalescence produced is not more pronounced than that of a reference using 7.0 ml of sodium chloride standard solution (0.018%).

Sulfates Carry out the limit test for sulfates (Appendix VIII B), using 25 ml of the remaining filtrate obtained in the test for chlorides. Any opalescence produced is not more pronounced than that of a reference using 1.0 ml of potassium sulfate standard solution (0.025%).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and *n*-butanol-1.7% ammonia solution (15 : 3) as the mobile phase. Apply separately to the plate 20 µl each of two solutions of the substance being examined in a mixture of 1.7% ammonia solution-ethanol (1 : 9) containing (1) 10 mg per ml, (2) 50 µg per ml. After developing and removal of the plate, dry in air and examine under ultraviolet light (254 nm). Any spot in the chromatogram, other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Dissolve 1.0 g in 10 ml of sodium hydroxide TS, add water to produce 25 ml, carry out the limit test for heavy metals (Appendix VIII H, method 3); not more than 0.001%.

Assay Dissolve about 0.6 g, accurately weighed in 50 ml of

drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 28.54 mg of C₁₃H₁₉NO₄S.

Category Gout suppressant.

Storage Preserve in tightly closed containers, protected from light.

Preparation Probenecid Tablets

Probenecid Tablets

Probenecid Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of probenecid (C₁₃H₁₉NO₄S).

Description White tablets.

Identification (1) To a quantity of the powdered tablets equivalent to 0.25 g of probenecid add 30 ml of acetone to dissolve probenecid and filter. To the filtrate add dropwise a quantity of water until a precipitate is produced. Filter, wash the precipitate with several portions of water, dry at 105°C; it has a melting point of 198-201°C (Appendix VI C). The remaining precipitate complies with tests (1) and (2) for Identification described under Probenecid.

(2) The light absorption of the solution obtained in the Assay exhibits maxima at 225 nm and 249 nm (Appendix IV A).

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of simulated intestinal fluid as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw 10 ml of the solution at 30 minutes and filter. Discard the initial filtrate, transfer accurately 5 ml of the successive filtrate, to a 100 ml volumetric flask, dilute with 0.4% sodium hydroxide solution to volume and mix well. Measure the absorbance at 244 nm (Appendix IV A) and calculate the dissolution of C₁₃H₁₉NO₄S from each tablet, taking 359 as the value of *A* (1%, 1 cm). Not less than 80% of the labelled amount dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. To an accurately weighed quantity equivalent to about 60 mg of probenecid in a 200 ml volumetric flask add 150 ml ethanol and 4 ml of hydrochloric acid solution (9→100), warm on a water bath at 70°C for 30 minutes, cool to room temperature, add ethanol to volume and mix well. Filter and discard the initial filtrate. Measure accurately 5 ml of the successive filtrate to a 100 ml volumetric flask, add 2 ml of hydrochloric acid solution (9→100), add ethanol to volume and mix well. Measure the absorbance of the resulting solution at 249 nm (Appendix IV A), calculated the content of C₁₃H₁₉NO₄S, taking 338 as the value of *A* (1%, 1 cm).

Category As described under probenecid.

Strength 0.25 g

Storage Preserve in tightly closed containers, protected from light.

Probucol

$C_{31}H_{48}O_2S_2$ 517.86

Probucol is 4,4' [(1-methylethylidene) bis (thio) bis [2,6-bis (1,1-dimethylethyl) phenol. It contains not less than 98.5% and not more than 102.0% of $C_{31}H_{48}O_2S_2$, calculated on the dried basis.

Description A white or almost white crystalline powder; odour, characteristic.

Very soluble in chloroform; soluble in ethanol; insoluble in water.

Melting range 124-127°C (Appendix VI C).

Identification (1) To about 5 mg, add 1 ml of *n*-hexane in a dry test tube and shake to dissolve. Add gently 0.5 ml of formaldehyde-sulfuric acid TS along the inner wall of the test tube, a yellowish-green colour is produced and then turns to brownish-red on standing between the two layers.

(2) The retention time of the principal peak of probucol in the substance being examined in the chromatogram obtained in the Assay is identical with the principal peak of probucol CRS in the chromatogram of the reference solution correspondingly.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of probucol (Appendix XVI).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with silica gel and a mixture of dehydrated ethanol-*n*-hexane (1 : 4000) as mobile phase. Detection wavelength is 242 nm and the number of the theoretical plates of the column is not less than 4000, calculated with reference to the peak of probucol. Dissolve a quantity of the substance being examined in the mobile phase and dilute to produce a solution of 1 mg per ml as test solution. Measure accurately 1 ml of the solution, into a 100 ml volumetric flask, dilute with the mobile phase to volume and mix well as reference solution. Inject 20 μ l of the reference solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% of the full scale of the chart. Inject separately 20 μ l each of the test solution and the reference solution into the column, and record the chromatogram for twice the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with the test solution is not greater than the area of the principal peak in the chromatogram obtained with the reference solution.

Loss on drying When dried in vacuum to constant weight at 80°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

with octadecylsilane bonded silica gel and a mixture of acetonitrile-water (85 : 15) as the mobile phase. Detection wavelength is 242 nm and the number of the theoretical plates of the column is not less than 2500, calculated with reference to the peak of probucol.

Procedure Dissolve about 25 g, accurately weighed, in a 50 ml volumetric flask with mobile phase and dilute to volume, mix well. Transfer accurately 3 ml of the solution, in a 10 ml volumetric flask, dilute with the mobile phase to volume and mix well. Inject 20 μ l of the solution into the column, record the chromatogram, and calculate the content obtained in the chromatogram. Repeat the operation, dissolving a quantity of probucol CRS instead of the substance being examined in the mobile phase and diluting to produce a solution of 0.15 mg per ml, calculate the content of $C_{31}H_{48}O_2S_2$.

Category Antihyperlipoproteinemic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Probucol Tablets

Probucol Tablets

Probucol Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of probucol ($C_{31}H_{48}O_2S_2$).

Description Film coated tablets with white or almost white core.

Identification (1) To a quantity of the powdered tablets, obtained in Assay, equivalent to about 10 mg of probucol, add 2 ml of *n*-hexane, shake to dissolve probucol and filter. The filtrate complies with the test for Identification (1) described under Probucol.

(2) The retention time of the principal peak of probucol in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of probucol CRS in the chromatogram of the reference solution.

(3) Dissolve a quantity of the powdered tablets, obtained in Assay, in dehydrated ethanol to produce a solution of 20 μ g per ml and filter. The light absorption of the filtrate exhibits a maximum at 242 nm (Appendix IV A).

Other requirements Comply with the general requirement for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography as described under Probucol in the Assay. Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powder equivalent to about 25 mg of probucol in a 50 ml volumetric flask, add a quantity of the mobile phase and ultrasonicate for 10 minutes to dissolve probucol. Cool to room temperature, dilute to volume with the mobile phase, mix well and filter. Measure accurately 3 ml of the successive filtrate, carry out the Assay described under Probucol, beginning at the words "in a 10 ml volumetric flask...". Calculate the content of $C_{31}H_{48}O_2S_2$.

Category As described under Probucol.

Strength (1) 0.125 g (2) 0.25 g

Storage Preserve in tightly closed containers, protected from light.

Procainamide Hydrochloride

$C_{13}H_{21}N_3O \cdot HCl$ 271.79

[614-39-1]

Procainamide Hydrochloride is 4-amino-*N*-(2-diethylaminoethyl) benzamide monohydrochloride. It contains not less than 99.0% of $C_{13}H_{21}N_3O \cdot HCl$, calculated on the dried basis.

Description A white to pale yellow crystalline powder; odourless; hygroscopic.

Freely soluble in water; soluble in ethanol; slightly soluble in chloroform; very slightly soluble in ether.

Melting range 165-169°C (Appendix VI C).

Identification (1) Dissolve 0.1 g in 5 ml of water, add 1 drop of ferric chloride TS and 1 drop of concentrated hydrogen peroxide solution, heat gently to boiling; a violet-red colour is produced, turns to dark brown and then to brownish black.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of procainamide hydrochloride (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 1.0 g in 10 ml of water, pH 5.0-6.5 (Appendix VI H).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.3% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), use 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VII H, method 2), using the residue obtained in Residue on ignition; not more than 0.001%.

Assay Weigh accurately about 0.55 g. Carry out the method for dead-stop titration (Appendix VII A). Titrate with sodium nitrite (0.1 mol/L) VS. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 27.18 mg of $C_{13}H_{21}N_3O \cdot HCl$.

Category Local anesthetic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Procainamide Hydrochloride Injection
(2) Procainamide Hydrochloride Tablets

Procainamide Hydrochloride Injection

Procainamide Hydrochloride Injection is a sterile solution of procainamide hydrochloride in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of procainamide hydrochloride ($C_{13}H_{21}N_3O \cdot HCl$).

Description A clear colourless liquid.

per ml water exhibits maxima at 280 nm (Appendix IV A).
(2) Yields the reactions characteristic of primary aromatic amines and chlorides (Appendix III).

pH value 3.5-6.0 (Appendix VI H).

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 0.5 ml per kg of the rabbit's weight.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately 5 ml, add 40 ml of water and 10 ml of hydrochloric acid solution (1→2), heat to boiling quickly and cool immediately to room temperature. Carry out the method for dead-stop titration (Appendix VII A), titrate with sodium nitrite (0.1 mol/L) VS. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 27.18 mg of $C_{13}H_{21}N_3O \cdot HCl$.

Category As described under Procainamide Hydrochloride.

Strength (1) 1 ml : 0.1 g (2) 2 ml : 0.2 g
(3) 5 ml : 0.5 g (4) 10 ml : 1 g

Storage Preserve in well closed containers, protected from light.

Procainamide Hydrochloride Tablets

Procainamide Hydrochloride Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of procainamide hydrochloride ($C_{13}H_{21}N_3O \cdot HCl$).

Description White to pale yellow tablets or sugar coated tablets.

Identification (1) Shake a quantity of powdered tablets with water, filter, discard the initial filtrate, dilute the successive filtrate with water to produce a solution of 5 µg per ml. The light absorption (Appendix IV A) exhibits a maximum at 280 nm.

(2) Shake a quantity of the powdered tablets equivalent to 0.1 g of procainamide hydrochloride with 5 ml of water and 0.5 ml of dilute hydrochloric acid, filter. The filtrate yields the reactions characteristic of primary aromatic amines (Appendix III).

(3) The above filtrate yields the reactions characteristic of chlorides (Appendix III).

Dissolution Carry out dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid solution (9→1000) as dissolution medium, adjust the rotational speed of basket to 100 rpm. Withdraw 10 ml of the solution at 75 minutes and filter. Dilute 2 ml of the successive filtrate, accurately measured, with 0.1 mol/L sodium hydroxide solution to 50 ml, mix well. Measure the absorbance of the resulting solution at 273 nm (Appendix IV A), calculate the dissolution of $C_{13}H_{21}N_3O \cdot HCl$, taking 605 as the value of A (1%, 1 cm), from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Shake 10 tablets with 50 ml of water in a 100 ml volumetric flask, add water to volume, mix well, allow to stand. Measure accurately 20 ml of the supernatant liquid and carry out the method for dead-stop titration (Appendix VII A), titrate with sodium nitrite (0.1 mol/L) VS. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 27.18

Category As described under Procainamide Hydrochloride.

Strength 0.25 g

Storage Preserve in tightly closed containers, protected from light.

Procaine Benzylpenicillin

$C_{13}H_{20}N_2O_2 \cdot C_{16}H_{18}N_2O_4S \cdot H_2O$ 588.72

Procaine Benzylpenicillin is 2-diethylaminoethyl-4-aminobenzoate (6R)-6-(2-phenylacetamido)-penicillanate monohydrate. It contains not less than 38.0% and not more than 43.0% of Procaine ($C_{13}H_{20}N_2O_2$), not less than 56.2% and not more than 59.6% of Penicillin ($C_{16}H_{18}N_2O_4S$), not less than 1000 Penicillin Units per mg, calculated on the anhydrous basis.

Description A white, microcrystalline powder; inactivated immediately by acid, alkaline, or oxidizing agents. Freely soluble in methanol; sparingly soluble in ethanol or chloroform; slightly soluble in water.

Identification (1) The retention time of two principal peak in the substance being examined in the chromatogram obtained in the Assay is identical with that the two principal peak of Procaine and Penicillin CRS in the chromatogram of the reference solution correspondingly.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of procaine benzylpenicillin (Appendix XVI).

Acidity or alkalinity A suspension of 60 mg per ml in water, pH 5.0-7.5 (Appendix VI H).

Clarity and colour of solution To each of 5 portion add methanol to produce solutions of 60 mg per ml, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y_2 or YG_2 (Appendix IX A, method 1).

Water Not less than 2.8% and not more than 4.0% (Appendix VIII M, method 1).

Consistence A suspension of 1.5 g per 5 ml in water passes readily through a No. 4 $\frac{1}{2}$ hypodermic needle without blockage.

Bacterial endotoxins Complies with the test for bacterial endotoxins (Appendix XI E). Less than 0.01 EU per 100 penicillin units.

Sterility Complies with the test for sterility (Appendix XI H), after being inactivated by penicillinase.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of buffer solution (dissolve 14 g of potassium dihydrogen phosphate and 40% tetrabutylammonium hydroxide solution in 700 ml of water, adjust the pH with 1 mol/L potassium hydroxide

solution to 7.0 and dilute with water to 1000 ml, mix well)-water-acetonitrile (52 : 23 : 25), and adjust the pH with 1 mol/L potassium hydroxide solution or 10% dilute phosphoric acid to 7.5 ± 0.05 , as the mobile phase. Detection wavelength is 235 nm, dissolve phenoxymethylpenicillin CRS with the mobile phase to the solution that contained 2.4 mg of phenoxymethylpenicillin CRS, diluted the solution with the reference solution to a mixture of phenoxymethylpenicillin solution-reference solution (1 : 3), inject the resulting solution into column. The resolution factor between the peaks of penicillin and phenoxymethylpenicillin is not less than 2.0.

Procedure Dissolve about 70 mg of Procaine Benzylpenicillin, accurately weighed, with 30 ml of mobile phase in 50 ml volumetric flask, in ultrasonic bath, dilute with mobile phase to volume, mix well. Inject 10 μ l of the resulting solution into the column. Weighed accurately of penicillin CRS and procaine CRS, dissolve with mobile phase to the solution that contained 0.8 mg of penicillin and 0.54 mg of procaine per ml. Repeat the operation, using penicillin CRS and procaine CRS instead of the substance being examined. Calculate the content of $C_{13}H_{20}N_2O_2$ and $C_{16}H_{18}N_2O_4S$ with respect to the peak area obtained in the chromatogram by the external standard method. Each mg of $C_{16}H_{18}N_2O_4S$ is equivalent to 1780 Penicillin Unit.

Category Antibiotic.

Storage Preserve in hermetically sealed containers, stored in a dry place.

Preparation Procaine Benzylpenicillin for Injection

Procaine Benzylpenicillin for Injection

Procaine Benzylpenicillin for Injection is a sterile mixture of Procaine Benzylpenicillin and Benzylpenicillin Sodium (Potassium) containing suitable buffering and suspending agents. It contains not less than 59.0% and not more than 66.3% of Penicillin ($C_{16}H_{18}N_2O_4S$), not less than 29.1% and not more than 35.6% of Procaine ($C_{13}H_{20}N_2O_2$), not less than 1050 Penicillin Units and not more than 1180 Penicillin Units per mg, calculated on the anhydrous basis. It contains not less than 95.0% and not more than 105.0% of the labelled amount of Penicillin, calculated on the basis of the average weight of content.

Description A white powder.

Identification (1) The retention time of two principal peak in the substance being examined in the chromatogram obtained in the Assay is identical with that the two principal peak of Procaine and Penicillin CRS in the chromatogram of the reference solution correspondingly.

(2) Yields the flame reaction of sodium (potassium) salts (Appendix III).

Colour of solution Add methanol to each of 5 containers to produce solutions of about 67000 units per ml, any colour produced is not more intense than that of reference solution Y_4 or YG_4 (Appendix IX A, method 1).

Water Not more than 3.5% (Appendix VIII M, method 1 A).

Suspending time and consistence Add water to one containers to produce a suspension of 400000 Units per ml; shake thoroughly and allow to stand for 2 minutes; neither

sediment is produced nor the suspension is separated distinctly into layers. The suspension passes readily through a No. 4 $\frac{1}{2}$ hypodermic needle without blockage.

Acidity or alkalinity, Bacterial endotoxins and Sterility

Complies with the corresponding tests described under Procaine Benzylpenicillin.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Procaine Benzylpenicillin, using an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents.

Category As described under Procaine Benzylpenicillin.

Strength (1) 400000 Units [Procaine Benzylpenicillin 300000 Units, Benzylpenicillin Sodium (Potassium) 100000 Units]
(2) 800000 Units [Procaine Benzylpenicillin 600000 Units, Benzylpenicillin Sodium (Potassium) 200000 Units]

Storage Preserve in well closed containers, stored in a dry place.

Procaine Hydrochloride

$C_{13}H_{20}N_2O_2 \cdot HCl$ 272.77

[51-05-8]

Procaine Hydrochloride is 2-(diethylamino) ethyl 4-aminobenzoate monohydrochloride. It contains not less than 99.0% of $C_{13}H_{20}N_2O_2 \cdot HCl$, calculated on the dried basis.

Description White crystals or a crystalline powder; odourless; taste, slightly bitter with local numbness. Freely soluble in water; sparingly soluble in ethanol; slightly soluble in chloroform; practically insoluble in ether.

Melting point 154-157°C (Appendix VI C).

Identification (1) Dissolve 0.1 g in 2 ml of water, add 1 ml of 10% sodium hydroxide solution; a white precipitate is produced, changing to an oily substance on heating. Heat continuously, the vapor produced turns the moist red litmus paper to blue. Warm again until the oily substance disappears, cool, acidify with hydrochloric acid; a white precipitate is produced.

(2) The infrared absorption spectrum (Appendix IV C) is concordance with the reference spectrum of procaine hydrochloride (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

(4) Yields the reactions characteristic of primary aromatic amines (Appendix III).

Acidity Dissolve 0.40 g in 10 ml of water, add 1 drop of methyl red IS. If a red colour is developed, not more than 0.2 ml of sodium hydroxide (0.02 mol/L) VS is required for neutralization.

Clarity of solution A solution of 2.0 g in 10 ml of water is clear.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), use 1.0 g.

Iron To the residue obtained in the Residue on ignition, add 2 ml of hydrochloric acid and evaporate to dryness on a water bath. Add 4 ml of dilute hydrochloric acid, warm gently to dissolve, add 30 ml of water and 50 mg of ammonium persulphate, then carry out the limit test for iron (Appendix VIII G). Any colour produced is not more intense than that of the reference solution containing 1.0 ml of iron standard solution (0.0010%).

Heavy metals Dissolve 2.0 g in 15 ml of water, add 2 ml of acetate BS (pH 3.5) and water to 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1): not more than 0.001%.

Assay Weigh accurately about 0.6 g, carry out the method for dead-stop titration (Appendix VII A). Titrate at 15-25°C with sodium nitrite (0.1 mol/L) VS. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 27.28 mg of $C_{13}H_{20}N_2O_2 \cdot HCl$.

Category Local anesthetic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Procaine Hydrochloride for Injection
(2) Procaine Hydrochloride Injection

Procaine Hydrochloride for Injection

Procaine Hydrochloride for Injection is a sterile powder of procaine hydrochloride. It contains not less than 95.0% and not more than 105.0% of the labelled amount of procaine hydrochloride ($C_{13}H_{20}N_2O_2 \cdot HCl$), calculated on the basis of the average weight of contents.

Description White crystals or a crystalline powder; odourless; taste, slightly bitter with local numbness.

Identification Complies with tests (1), (3) and (4) for Identification described under Procaine Hydrochloride.

Acidity Dissolve 0.40 g in 10 ml of water, add 1 drop of methyl red IS. If a red colour is developed, not more than 0.20 ml of sodium hydroxide (0.02 mol/L) VS is required for neutralization.

Clarity of solution A solution of 2.0 g in 10 ml of water is clear.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Sterility Complies with the test for sterility (Appendix XI D), to each container add sterile water to produce a solution of 30 mg per ml.

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 1 ml of a solution of 10 mg per ml in Sodium Chloride Injection per kg of rabbit's weight.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Weigh accurately a quantity of the mixed contents obtained in the test for weight variation of contents, equivalent to 0.6 g of procaine hydrochloride, carry out the method for dead-stop titration (Appendix VII A), titrate

with sodium nitrite (0.1 mol/L) VS at 15-25°C. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 27.28 mg of $C_{13}H_{20}N_2O_2 \cdot HCl$.

Category As described under Procaine Hydrochloride.

Strength (1) 0.15 g (2) 1 g

Storage Preserve in well closed containers, protected from light.

Procaine Hydrochloride Injection

Procaine Hydrochloride Injection is a sterile solution of procaine hydrochloride in Water for Injection made isotonic by the addition of sodium chloride. It contains not less than 95.0% and not more than 105.0% of the labelled amount of procaine hydrochloride ($C_{13}H_{20}N_2O_2 \cdot HCl$).

Description A clear, colourless liquid.

Identification Complies with test (3) and (4) for Identification described under Procaine Hydrochloride.

pH value 3.5-5.0 (Appendix VI H).

p-Aminobenzoic acid Carry out the method for thin-layer chromatography (Appendix V B), using silica gel H and sodium carboxymethylcellulose as the coating substances and a mixture of benzene-glacial acetic acid-acetone-methanol (14 : 1 : 1 : 4) as the mobile phase. Apply separately to the plate 10 μ l each of two solutions containing (1) 2.5 mg per ml of procaine hydrochloride obtained by diluting the injection with ethanol; and (2) 30 μ g per ml of p-aminobenzoic acid CRS in ethanol. After developing and removal of the plate, dry it in air and spray with 4-dimethyl-aminobenzaldehyde solution (mix 100 ml of 2% 4-dimethyl-aminobenzaldehyde ethanol solution with 5 ml of glacial acetic acid). The spot, corresponding to p-aminobenzoic acid in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity equivalent to 0.1 g of procaine hydrochloride. Carry out the method for dead-stop titration (Appendix VII A). Titrate at 15-25°C with sodium nitrite (0.05 mol/L) VS. Each ml of sodium nitrite (0.05 mol/L) VS is equivalent to 13.64 mg of $C_{13}H_{20}N_2O_2 \cdot HCl$.

Category As described under Procaine Hydrochloride.

Strength (1) 2 ml : 40 mg (2) 10 ml : 100 mg
(3) 20 ml : 50 mg (4) 20 ml : 100 mg

Storage Preserve in well closed containers, protected from light.

Procarbazine Hydrochloride

$C_{12}H_{19}N_3O \cdot HCl$ 257.76

[366-70-1]

Procarbazine Hydrochloride is *N*-(1-methylethyl)-4-[(2-methylhydrazino) methyl]-benzamide monohydrochloride. It contains not less than 98.0% of $C_{12}H_{19}N_3O \cdot HCl$, calculated on the dried basis.

Description A white crystalline powder.

Freely soluble in water; sparingly soluble in ethanol; practically insoluble in ether.

Melting range 218-226°C, with decomposition (Appendix VI C).

Identification (1) Dissolve about 10 mg in water, add 1 ml of sodium carbonate TS and a few drops of potassium permanganate, the colour of potassium permanganate is discharged.

(2) The light absorption of a solution of 10 μ g per ml in hydrochloric acid solution (9 \rightarrow 1000) exhibits a maximum at 232 nm; the absorbance is about 0.49 (Appendix IV A).

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 1.0 g in 100 ml of water, pH 3.0-4.0 (Appendix VI H).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Assay Dissolve about 0.25 g, accurately weighed, in 50 ml of water and 3 ml of nitric acid. Add 20 ml of silver nitrate (0.1 mol/L) VS, accurately measured, and about 3 ml of dibutylphthalate, shake vigorously, then add 2 ml of ferric ammonium sulfate IS. Titrate with ammonium thiocyanate (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 25.78 mg of $C_{12}H_{19}N_3O \cdot HCl$.

Category Antineoplastic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Procarbazine Hydrochloride Enteric-coated Tablets

Procarbazine Hydrochloride Enteric-Coated Tablets

Procarbazine Hydrochloride Enteric-Coated Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of procarbazine hydrochloride ($C_{12}H_{19}N_3O \cdot HCl$).

Description Enteric-coated tablets with white cores.

Identification (1) To a quantity of powder equivalent to about 50 mg of procarbazine hydrochloride add 20 ml of water, shake thoroughly and filter; the filtrate complies with tests (1) and (3) for Identification described under Procarbazine Hydrochloride.

(2) To a quantity of the powder add hydrochloric acid solution (9 \rightarrow 1000) to produce a solution of 10 μ g of procarbazine hydrochloride per ml and filter. The light absorption of the filtrate exhibits a maximum at 232 nm (Appendix IV A).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay R. v. c. i. 15 abls for strength 50 mg) or 25 tablets (for strength 25 mg). Weigh accurately and powder finely. Weigh accurately a quantity equivalent to about 0.25 g of procarbazine hydrochloride and complete the

Assay as described under Procarbazine Hydrochloride. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 25.78 mg of $C_{16}H_{22}N_2O_3 \cdot HCl$.

Category As described under Procarbazine Hydrochloride.

Strength (1) 25 mg (2) 50 mg

Storage Preserve in tightly closed containers, protected from light.

Procaterol Hydrochloride

$C_{16}H_{22}N_2O_3 \cdot HCl \cdot \frac{1}{2} H_2O$ 335.83 [59828-07-8]

Procaterol Hydrochloride is 5-(1-hydroxy-2-isopropylaminobutyl)-8-hydroxy-quinolinone hydrochloride hemihydrate. It contains not less than 98.5% of $C_{16}H_{22}N_2O_3 \cdot HCl$, calculated on the anhydrous basis.

Description A white or almost white crystalline powder; odourless; taste, astringent. Soluble in water, formic acid or methanol; slightly soluble in ethanol; practically insoluble in ether.

Melting range 193-198°C, with decomposition (Appendix VI C).

Identification (1) Dissolve about 2 mg in 5 ml of water, add 1 drop of ferric chloride TS; a dark green colour is produced.

(2) The light absorption of a solution of 7 µg per ml in water exhibits maxima at 234 nm, 259 nm and 295 nm.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of procaterol hydrochloride (Appendix XVI).

(4) Yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.10 g in 10 ml of water, pH 4.0-5.0 (Appendix VI H).

Clarity and colour of solution Dissolve 0.5 mg in 15 ml of water, the solution is clear and colourless; any colour produced is not more intense than that of reference solution Y₂ (Appendix IX A, method 1).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of phosphate buffer (dissolve 11.04 g of sodium dihydrogen phosphate in 1000 ml of water, adjust to pH 3.1 ± 0.05 with phosphoric acid)-methanol (83 : 17) as the mobile phase. Detection wavelength is 259 nm and the number of the theoretical plates of the column is not less than 2500, calculated with reference to the peak of procaterol hydrochloride. The resolution factor between the peaks of procaterol hydrochloride and adjacent impurities complies with the related requirements.

Procedure Dissolve a quantity of the substance being examined in mobile phase to produce a solution of 1 mg per

ml as the test solution. Transfer accurately 1 ml to a 100 ml volumetric flask, dilute to volume with the mobile phase as the reference solution. Inject 20 µl of the reference solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is about 20% full scale of the chart. Inject separately 20 µl of the test solution and the reference solution into the column, record the chromatogram for three times the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with the test solution is not greater than half of the area of the principal peak in the chromatogram obtained with the reference solution.

Water 2.5%-3.3% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Arsenic Mix 0.1 g with 1.0 g of calcium hydroxide, add a small amount of water and mix well. Dry, heat gently until thoroughly charred, and then ignite at 500-600°C until the incineration is completed. Dissolve the cooled residue in a mixture of 8 ml of hydrochloric acid and 20 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 2); not more than 0.0002%.

Assay To about 0.25 g, accurately weighed, add 2 ml of formic acid and heat to dissolve. Add 15 ml of perchloric acid (0.1 mol/L) VS, accurately measured, and 1 ml of acetic anhydride. Heat on a water bath for 30 minutes, cool. Add 60 ml of acetic anhydride and 0.5 ml of naphtholbenzein IS. Titrate with sodium acetate (0.1 mol/L) VS until the colour changes to yellow. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 32.68 mg of $C_{16}H_{22}N_2O_3 \cdot HCl$.

Category β₂-adrenoceptor agonist.

Storage Preserve in tightly closed containers, protected from light.

Preparation Procaterol Hydrochloride Tablets

Procaterol Hydrochloride Tablets

Procaterol Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of procaterol hydrochloride ($C_{16}H_{22}N_2O_3 \cdot HCl$).

Description white tablets.

Identification (1) To a quantity of the powdered tablets equivalent to about 0.25 mg of procaterol hydrochloride add 20 ml of hydrochloric acid solution (1 → 6), shake thoroughly to dissolve procaterol hydrochloride, and filter. To filtrate add 10 mg of crystalline sodium nitrite, shake to dissolve and add 1 ml of sodium hydroxide solution (1 → 5); an orange-yellow colour is produced.

(2) To a quantity of the powdered tablets equivalent to about 100 µg of procaterol hydrochloride add 20 ml of hydrochloric acid solution (9 → 1000), shake thoroughly to dissolve procaterol hydrochloride, and filter. The light absorption of the filtrate exhibits maxima at 259 nm and 295 nm.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Carry out the method

and use the internal standard solution as described under Assay.

Procedure Dissolve a quantity of procaterol hydrochloride CRS, accurately weighed, in mobile phase to produce a solution of 5 µg per ml (10 µg per ml if the strength is 50 µg, both calculated on the anhydrous basis). Accurately transfer 5 ml of this solution and 1 ml (2 ml if the strength is 50 µg) of the internal standard solution into a 10 ml volumetric flask, dilute with mobile phase to volume, mix well, as the reference solution. Transfer 1 tablet to a 10 ml volumetric flask, add 1 ml (2 ml if the strength is 50 µg) of the internal standard solution, accurately measured, add 5 ml of mobile phase, shake for 10 minutes to dissolve procaterol hydrochloride. Dilute with mobile phase to volume, mix well, and filter. Using the successive filtrate as the test solution. Carry out the method as described under Assay and calculate the content of $C_{16}H_{22}N_2O_3 \cdot HCl$ from each tablet. Comply with the requirements for content uniformity (Appendix X E).

Dissolution Carry out the dissolution test (Appendix X C, method 3), using 100 ml of hydrochloric acid solution (3 → 50000) as the dissolution medium, adjust the rotational speed of the paddle to 70 rpm. Withdraw 10 ml of the solution at 10 minutes and filter, using the successive filtrate as the test solution. Dissolve a quantity of procaterol hydrochloride CRS, accurately weighed, in dissolution medium to produce a solution of 0.25 µg per ml (0.50 µg per ml if the strength is 50 µg, both calculated on the anhydrous basis) as the reference solution. Carry out the method as described under Assay. Inject separately 20 µl of the test solution and the reference solution into the column. Calculate the dissolution of $C_{16}H_{22}N_2O_3 \cdot HCl$ from each tablet by the external standard method. Not less than 90% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of phosphate buffer (dissolve 11.04 g of sodium dihydrogen phosphate in water to make 1000 ml, adjust to pH 3.1 ± 0.05 with phosphoric acid)-methanol (83 : 17) as the mobile phase. Detection wavelength is 259 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of procaterol hydrochloride. The resolution factor between the peaks of procaterol hydrochloride and internal standard complies with the related requirements.

Internal standard solution Dissolve a quantity of paracetamol in mobile phase to produce a solution of 40 µg per ml.

Procedure Dissolve a quantity of procaterol hydrochloride CRS, accurately weighed, in mobile phase to produce a solution of 50 µg per ml (calculated on the anhydrous basis). Accurately measure 5 ml of this solution and 10 ml of the internal standard solution into a 50 ml volumetric flask, dilute with mobile phase to volume, mix well. Inject 20 µl of the resulting solution into the column. Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powdered tablets equivalent to about 250 µg of procaterol hydrochloride into a 50 ml volumetric flask, add 10 ml of the internal standard solution, accurately measured, and a quantity of mobile phase, shake to dissolve procaterol hydrochloride. Dilute with mobile phase to volume, mix well, and filter. Inject 20 µl of the successive filtrate into the column. Calculate the content of $C_{16}H_{22}N_2O_3 \cdot HCl$.

Category As described under Procaterol Hydrochloride.

Strength (1) 25 µg (2) 50 µg

Storage Preserve in tightly closed containers, protected from light.

Progesterone

$C_{21}H_{30}O_2$ 314.47

[57-83-0]

Progesterone is pregn-4-ene-3,20-dione. It contains not less than 98.0% and not more than 103.0% of $C_{21}H_{30}O_2$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless, tasteless.

Very soluble in chloroform; soluble in ethanol, ether or vegetable oil; insoluble in water.

Melting point 128-131°C (Appendix VI C).

Specific optical rotation +186° to +198°, measured at 25°C in a solution of about 10 mg per ml in ethanol (Appendix VI E).

Identification (1) Dissolve 5 mg in 0.2 ml of methanol, add about 3 mg of finely powdered sodium nitroprusside, 50 mg of sodium carbonate and 50 mg of ammonium acetate, mix well and allow to stand for 10-30 minutes; a bluish violet colour is produced.

(2) Dissolve 0.5 mg in 1 ml of methanol, add 1 mg of isoniazid and 1 drop of dilute hydrochloric acid, a yellow colour is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of progesterone (Appendix XVI).

Related substances Carry out the method and the solution as described under Assay. Inject 5 µl of solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is full scale of the chart. Dissolve a quantity of the substance being examined, accurately weighed, in methanol to produce solutions of 8 mg per ml as solution (1) and 0.02 mg per ml as solution (2), inject separately 10 µl each of solution (1) and (2) into the column and record the chromatogram for 1.5 times of the retention time of the principal peak. Not more than one secondary peak in the chromatogram obtained with solution (1), secondary peak area are not greater than 3/4 of area of the principal peak in the chromatogram obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (65 : 35) as the mobile phase. Detection wavelength is 254 nm and the number of the theoretical plates of the column is not less than 1000, calculated with reference to the peak of progesterone. The resolution factor between the peaks of progesterone and internal standard complies with related requirements.

Internal standard solution Dissolve about 25 mg of

diethylstilbestrol CRS, accurately weighed, in methanol in a 25 ml volumetric flask and dilute to volume, mix well.

Procedure Dissolve about 25 mg of progesterone CRS, accurately weighed, in methanol and dilute to 25 ml, mix well as the reference solution. Transfer 5 ml each of the reference solution and the internal standard solution, both measured accurately, in a 25 ml volumetric flask, dilute with methanol to volume, mix well. Inject 5 μ l of the resulting solution into the column and record the chromatogram. Repeat the operation, using the substance

g f pr g CRS, h
content of $C_{21}H_{30}O_2$.

Category Progestin.

Storage Preserve in tightly closed containers, protected from light.

Preparation Progesterone Injection

Progesterone Injection

Progesterone Injection is a sterile oily solution of progesterone. It contains not less than 93.0% and not more than 107.0% of the labelled amount of progesterone ($C_{21}H_{30}O_2$).

Description A colourless to pale yellow clear oily liquid.

Identification The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the method as described under Assay in progesterone. Dissolve about 25 mg of progesterone CRS, accurately weighed, in methanol and dilute to 25 ml, mix well as the reference solution. Transfer accurately 5 ml each of the reference solution and the internal standard solution, in a 25 ml volumetric flask, dilute with methanol to volume, mix well. Inject 5-10 μ l of the resulting solution into the column and record the chromatogram. Transfer accurately the injection being examined equivalent to about 50 mg of progesterone with a pipet to contain to a 50 ml volumetric flask, wash the inner wall of the pipet with several portions of ether, add the washings to the same volumetric flask, dilute with ether to volume and mix well. Transfer accurately 5 ml of the ether solution, to a centrifuge tube with stopper, expel the ether in a water bath, then shake with 5 ml of methanol for 10 minutes and centrifuge for 15 minutes and repeat the extraction with 5 ml, 5 ml, 3 ml of methanol successively. Transfer the methanol layers to a 25 ml volumetric flask, add accurately 5 ml of the internal standard solution, dilute with methanol to volume and mix well. inject 5-10 μ l into the column. Calculate the content of $C_{21}H_{30}O_2$.

Category As described under Progesterone.

Strength (1) 1 ml : 5 mg (2) 1 ml : 10 mg
(3) 1 ml : 20 mg

Storage Preserve in well closed containers, protected from light.

Proglumide

$C_{18}H_{26}N_2O_4$ 334.42

[6620-60-6]

Proglumide is 4-(benzoylamino)-5-(dipropylamino)-5-oxo-pentanoic acid. It contains not less than 99.0% of $C_{18}H_{26}N_2O_4$, calculated on the dried basis.

Description A white crystalline powder; odourless; taste, slightly bitter. Freely soluble in ethanol or chloroform; very slightly soluble in water; soluble in sodium hydroxide TS.

Melting point 148.5-152°C (Appendix VI C).

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of proglumide (Appendix XVI).

Chloride To 2.0 g add 1 ml of nitric acid, dilute with water to 50 ml, shake thoroughly and filter. Carry out the limit test for chlorides (Appendix VIII A), using 25 ml of filtrate. Any opalescence produced is not more intense than that of a reference solution using 5 ml of sodium chloride standard solution (0.005%).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N); use 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Weigh accurately about 0.3 g, add 30 ml of neutral ethanol (neutral to phenolphthalein IS) and 2 drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 33.44 mg of $C_{18}H_{26}N_2O_4$.

Category Antacid.

Storage Preserve in tightly closed containers.

Preparation (1) Proglumide Capsules
(2) Proglumide Tablets

Proglumide Capsules

Proglumide Capsules contain not less than 95.0% and not more than 105.0% of the labelled amount of proglumide ($C_{18}H_{26}N_2O_4$).

Identification Weigh a quantity of powdered tablets equivalent to about 0.2 g of proglumide, add 20 ml of ethanol, shake thoroughly and filter, evaporate the filtrate to expel ethanol, dry the crystals at 105°C, the melting range of the crystals is 148-152°C (Appendix VI C).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Carry out the Assay as described under Proglumide, using an accurately weighed quantity (equivalent to about 0.4 g of proglumide) of the mixed contents obtained in the test for weight variation of content, add 30 ml of neutral ethanol (neutral to phenolphthalein IS), shake thoroughly to dissolve proglumide, add 2 drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 33.44 mg of $C_{18}H_{26}N_2O_4$.

Category As described under Proglumide.

Strength 0.2 g

Storage Preserve in tightly closed containers.

Proglumide Tablets

Proglumide Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of proglumide ($C_{18}H_{26}N_2O_4$).

Description White tablets.

Identification Weigh a quantity of powdered tablets equivalent to about 0.2 g of proglumide, add 20 ml of ethanol, shake thoroughly and filter, evaporate the filtrate to expel ethanol, dry the crystals at 105°C, the melting range of the crystals is 147–152°C (Appendix VI C).

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of phosphate BS (pH 7.2) as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. Dilute 3 ml of the successive filtrate, accurately measured, with phosphate BS (pH 7.2) to 50 ml. Dissolve proglumide CRS in phosphate BS (pH 7.2) to produce a solution of about 13.3 µg per ml. Measure the absorbance of the resulting solutions at 223 nm (Appendix IV A). Calculate the dissolution of $C_{18}H_{26}N_2O_4$ from each tablet. Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Weigh accurately a quantity of the powder equivalent to about 0.4 g of proglumide, add 30 ml of neutral ethanol (neutral to phenolphthalein IS), shake thoroughly to dissolve proglumide, add 2 drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 33.44 mg of $C_{18}H_{26}N_2O_4$.

Category As described under Proglumide.

Strength 0.2 g

Storage Preserve in tightly closed containers, protected from light.

Proline

$C_5H_9NO_2$ 115.13

Proline is (S)-pyrrolidine-2-carboxylic acid. It

contains not less than 98.5% of $C_5H_9NO_2$, calculated on the dried basis.

Description White crystals or a crystalline powder; slightly odour; taste, slightly sweet. Freely soluble in water, soluble in ethanol, insoluble in ether or *n*-butanol.

Specific optical rotation -84.5° to -86.0° , in a solution of about 40 mg per ml in water (Appendix VI E).

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Proline (Appendix XVI).

Acidity Dissolve 2.0 g in 20 ml of water, pH 5.9–6.9 (Appendix XVI H).

Transmittance of solution Dissolve 1.0 g in 10 ml of water, the transmittance at 430 nm is not less than 98.0% (Appendix IV A).

Chloride Carry out the limit test for chloride (Appendix VIII A), using 0.25 g. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.02%).

Sulfate Carry out the limit test for sulfate (Appendix VIII B), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of potassium sulfate standard solution (0.02%).

Ammonium Carry out the limit test for ammonium (Appendix VIII K), using 0.10 g. Any colour produced is not more intense than that of a reference solution using 2.0 ml of ammonium chloride standard solution (0.02%).

Other amino acids Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and *n*-butanol-anhydrous ethanol-concentrated ammonia solution-water (8 : 8 : 1 : 3) as the mobile phase. Apply separately to the plate 2 µl each of two solutions of substance being examined in water containing (1) 50 mg per ml, (2) 0.25 mg per ml. After developing and removal of the plate, dry it in air, spray with ninhydrin acetone solution (1→50), heat at 80°C until the colour is produced and examine immediately. Any spot, other than the principal spot in the chromatogram, obtained with solution (1) is not more intense than the principal spot obtained with solution (2) (0.5%).

Loss on drying When dried at 105°C for 3 hours, loses not more than 0.3% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Iron Carry out the limit test for iron (Appendix VIII G), using 1.0 g. Any colour produced is not more intense than that of a reference solution using 1.0 ml of iron standard solution (0.001%).

Heavy metals Dissolve 1.0 g in 23 ml of water, add 2 ml of acetate BS (pH 3.5). Carry out the limit test for heavy metals (Appendix VIII H, method 1): not more than 0.001%.

Arsenic Dissolve 2.0 g in 23 ml of water, add 5 ml of hydrochloric acid, carry out the limit test for arsenic (Appendix VIII J, method 1): not more than 0.001%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E): less than 0.01 EU per mg of proline (for parenteral administration).

Assay Dissolve about 0.1 g, accurately weighed, in 50 ml of glacial acetic acid. Carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank

determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 11.51 mg of $C_9H_9NO_2$.

Category Amino acid.

Storage Preserve in tightly closed containers, protected from light.

Prolonium Iodide

$C_9H_{24}I_2N_2O$ 430.11

[123-47-7]

Prolonium Iodide is (2-hydroxy-1,3-propylenyl)-bis (trimethylammonium) diiodide. It contains not less than 99.0% of $C_9H_{24}I_2N_2O$, calculated on the dried basis.

Description A white or almost white powder; odourless; gradually changes to yellow on exposure to air. Very soluble in water; practically insoluble in ethanol or chloroform.

Identification (1) To about 20 mg add 1 ml of water, 1 ml of chloroform and 1 drop of a solution of 1% potassium dichromate in dilute sulfuric acid and shake, a rose red colour is produced in chloroform layer; a blue colour is produced in the aqueous layer on adding 2 drops of starch IS. (2) To about 0.1 g in a small beaker add 2 ml of 10% sodium hydroxide solution, a fishy odour is perceptible by heating; cover the beaker with a watch glass suspended with 1 drop of alkaline mercuric potassium iodide TS, a light brownish yellow precipitate is produced gradually. (3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of prolonium iodide (Appendix XVI).

Acidity or alkalinity A 1% aqueous solution, pH 5.5-7.5 (Appendix VI H).

Colour of solution The colour of a 2.0% aqueous solution is not more intense than that of reference solution Y_4 (Appendix IX A, method 1).

Free iodine Shake 0.50 g with 10 ml of water and 2 ml of starch IS in a test tube, no blue colour is observed.

Chloride To 0.1 g add 5 ml of water, 5 ml of concentrated ammonia solution and 10 ml of silver nitrate TS, shake well and filter. Wash the precipitate with 10 ml of water and combine the washings with the filtrate. To half of the solution add 10 ml of nitric acid (1→4), dilute with water to 50 ml. Carry out the limit test for chlorides (Appendix VIII A). Any opalescence produced is not more pronounced than that of a reference using 4.0 ml of sodium chloride standard solution (0.08%).

Loss on drying When dried at 105°C to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Heavy metals Dissolve 1.0 g in a quantity of water, add 2 ml of acetate BS (pH 3.5) and water to make 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Assay Dissolve about 0.4 g, accurately weighed, in 20 ml of water, add 1.0 ml of potassium chromate IS and titrate with silver nitrate (0.1 mol/L) VS until an orange red precipitate is produced. Each ml of silver nitrate (0.1 mol/

L) VS is equivalent to 21.51 mg of $C_9H_{24}I_2N_2O$.

Category Used for ophthalmic disorder.

Storage Preserve in tightly closed containers, protected from light.

Preparation Prolonium Iodide Injection

Prolonium Iodide Injection

Prolonium Iodide Injection is a sterile solution of Prolonium Iodide in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of prolonium iodide ($C_9H_{24}I_2N_2O$).

Description A colourless, clear liquid.

Identification Complies with tests (1) and (2) for identification described under prolonium iodide.

pH value 5.0-8.0 (Appendix VI H).

Free iodine To 2.0 ml add 0.5 ml of starch IS, no blue or violet colour is observed.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Prolonium Iodide, using 2 ml, accurately measured, equivalent to about 0.4 g of prolonium iodide. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 21.51 mg of $C_9H_{24}I_2N_2O$.

Category As described under Prolonium Iodide.

Strength 2 ml : 0.4 g

Storage Preserve in well closed containers, protected from light.

Promethazine Hydrochloride

$C_{17}H_{20}N_2S \cdot HCl$ 320.89

Promethazine Hydrochloride is *N, N, α*-trimethyl-10*H*-phenothiazine-10-ethanamine monohydrochloride. It contains not less than 99.0% of $C_{17}H_{20}N_2S \cdot HCl$, calculated on the dried basis.

Description A white or almost white powder or granules; almost odourless; taste, bitter. Slowly changes to blue colour on long exposure to air. Very soluble in water; soluble in ethanol or chloroform; practically insoluble in acetone or ether.

Melting range 217-223°C, with decomposition (Appendix VI C).

Specific absorbance Measure the absorbance of a solution of 6 µg per ml in 0.01 mol/L hydrochloric acid solution at 249 nm (Appendix IV A), the value of *A* (1%, 1 cm) is 883-937.

Identification (1) Dissolve 5 mg in 5 ml of sulfuric acid, a cherry red colour is produced and deepens gradually on standing.

(2) Dissolve 0.1 g in 3 ml of water, add 1 ml of nitric acid, a red precipitate is produced, which dissolves on warming and the red solution changes to orange-yellow.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of promethazine hydrochloride (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.50 g in 10 ml of water, pH 4.0-5.0 (Appendix VI H).

Clarity and Colour of Solution A solution of 1.0 g in 10 ml of water is clear and colourless; any opalescence produced is not more pronounced than reference suspension 1 (Appendix IX B), and its colour is not more intense than reference solution Y₂ (Appendix IX A, method 1).

Related substances Protect from light throughout the procedure. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of hexane-acetone-diethylamine (8.5 : 1 : 0.5) as the mobile phase. Apply separately to the plate 10 µl each of three solutions of the substance being examined in dichloromethane containing (1) 10 mg per ml, (2) 0.15 mg per ml, (3) 0.05 mg per ml. After developing and removal of the plate, dry it in air and examine under ultraviolet light 254 nm, not more than 3 secondary spots are observed in the chromatogram obtained with solution (1). The colour of any secondary spot is not more intense than the principal spot obtained with solution (3); not more than 1 secondary spot obtained in the chromatogram is more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve by warming about 0.3 g, accurately weighed, in 10 ml of glacial acetic acid and 4 ml of mercuric acetate TS, cool to room temperature, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 32.09 mg of C₁₇H₂₀N₂S · HCl.

Category Antihistaminic agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Promethazine Hydrochloride Injection
(2) Promethazine Hydrochloride Tablets

Promethazine Hydrochloride Injection

Promethazine Hydrochloride Injection is a sterile solution of Promethazine Hydrochloride in Water for Injection. It contains not less than 93.0% and not more than 107.0% of the labelled amount of promethazine hydrochloride (C₁₇H₂₀N₂S · HCl). It may also contain a quantity of Vitamin C.

Description A clear, colourless liquid.

Identification (1) Evaporate 0.2 ml to dryness, add 5 ml

of sulfuric acid, a cherry red solution is produced, which deepens gradually on standing.

(2) Complies with tests (2) and (4) Identification for described under Promethazine Hydrochloride.

(3) Use the test solution under related substance as the test solution. Dissolve a quantity of promethazine hydrochloride CRS in methanol-diethylamine (95 : 5) to produce a solution of 10 mg per ml as the reference solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of hexane-acetone-diethylamine (8.5 : 1 : 0.5) as the mobile phase. Apply separately to the plate 10 µl each of the test and reference solution. After developing and removal of the plate, dry it in air and examine under ultraviolet light 254 nm, the colour and position of the principal spot in the chromatography obtained with the test solution correspond to the principal spot obtained with the reference solution.

pH value 4.0-5.5 (Appendix VI H).

Related substances Protect from light throughout the procedure. Measure accurately 10 ml of the injection in 25 ml volumetric flask, dilute with methanol-diethylamine (95 : 5) to the volume and mix well as the test solution. Measure accurately a quantity of the successive filtrate, dilute separately with methanol-diethylamine (95 : 5) to produce the reference solutions (1) 0.05 mg per ml (2) 0.10 mg per ml (3) 0.20 mg per ml (4) 0.25 mg per ml. Comply with the test described under promethazine hydrochloride, beginning at the words "carry out the method for thin-layer chromatography...". The sum of impurities is not greater than 2.5%.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately 2 ml to a 100 ml volumetric flask, dilute with hydrochloric acid (9 → 1000) to volume and mix well. Measure accurately 10 ml of the solution to another 100 ml volumetric flask, dilute with water to volume and mix well. Measure the absorbance at 299 nm (Appendix IV A), calculate the content of C₁₇H₂₀N₂S · HCl, taking 108 as the value of A (1%, 1 cm).

Category As described under Promethazine Hydrochloride.

Strength 2 ml : 50 mg

Storage Preserve in well closed containers, protected from light.

Promethazine Hydrochloride Tablets

Promethazine Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of promethazine hydrochloride (C₁₇H₂₀N₂S · HCl).

Description Sugar coated tablets with white to pale yellow core.

Identification (1) To a quantity of powdered tablets with the coating removed equivalent to about 0.2 g of promethazine hydrochloride, add 10 ml of water, shake to dissolve the promethazine hydrochloride and filter. Evaporate the filtrate to dryness on a water bath, the residue complies with the tests (1), (2) and (4) for Identification described under Promethazine Hydrochloride.

(2) Use the test solution under related substance as the test solution. Dissolve a quantity of promethazine hydrochloride CRS in methanol-diethylamine (95 : 5) to produce a solution of 10 mg per ml as the reference solution. Carry out

the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of hexane-acetone-diethylamine (8.5 : 1 : 0.5) as the mobile phase. Apply separately to the plate 10 µl each of the test and reference solution. After developing and removal of the plate, dry it in air and examine under ultraviolet light 254 nm, the colour and position of the principal spot in the chromatography obtained with the test solution correspond to the principal spot obtained with the reference solution.

Related substances Protect from light throughout the procedure. Weigh and powder 10 tablets (for strength 25 mg) or 20 tablets (for strength 12.5 mg), with sugar coating removed, and dissolve the powder in methanol-diethylamine (95 : 5) in 25 ml volumetric flask. Dilute with methanol-diethylamine (95 : 5) to the volume, mix well and filter. Take the successive filtrate as the test solution. Measure accurately a quantity of the successive filtrate, dilute separately with methanol-diethylamine (95 : 5) to produce the reference solutions (1) 0.05 mg per ml (2) 0.10 mg per ml (3) 0.20 mg per ml (4) 0.25 mg per ml. Comply with the test described under promethazine hydrochloride, beginning at the words "carry out the method for thin-layer chromatography...". The sum of impurities is not greater than 2.5%.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid (9→1000) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 45 minutes and filter. Measure accurately 2.5 ml of the successive filtrate to a 10 ml volumetric flask, add water to volume and mix well. Measure the absorbance of the resulting solution at 249 nm (Appendix IV A). Calculate the dissolution of C₁₇H₂₀N₂S · HCl from each tablet, taking 910 as the value of A (1%, 1 cm), not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets with the coating removed. To a quantity of the powder equivalent to about 12.5 mg of promethazine hydrochloride, accurately weighed, in a 200 ml volumetric flask add a quantity of hydrochloric acid (9→1000). Shake for 15 minutes, dilute with hydrochloric acid (9→1000) to volume and mix well. Filter through a dry filter. Measure accurately 10 ml of the successive filtrate to a 100 ml volumetric flask, dilute with water to volume and mix well. Measure the absorbance of the solution at 249 nm (Appendix IV A), calculate the content of C₁₇H₂₀N₂S · HCl, taking 910 as the value of A (1%, 1 cm).

Category As described under Promethazine Hydrochloride.

Strength (1) 12.5 mg (2) 25 mg

Storage Preserve in tightly closed containers, protected from light.

Propafenone Hydrochloride

C₂₁H₂₇NO₃ · HCl 377.91

[34183-22-7]

Propafenone Hydrochloride is 3-phenyl-1-[2-[3-(propylamine)-2-hydroxy-propoxy] phenyl]-1-propanone hydrochloride. It contains not less than 99.0% of C₂₁H₂₇NO₃ · HCl, calculated on the dried basis.

Description A white crystalline powder; odourless; taste, bitter.

Slightly soluble in ethanol, chloroform or glacial acetic acid; very slightly soluble in water.

Melting point 171-174°C (Appendix VI C).

Identification (1) Dissolve about 20 mg in 4 ml of ethanol, add a few drops of dinitrophenyl hydrazine TS and shake, a golden yellow precipitate is immediately produced.

(2) The light absorption of a solution of 20 µg per ml in ethanol exhibits maxima at 210 nm, 248 nm and 304 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of propafenone hydrochloride (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Clarity in methano solution Dissolve 0.10 g in 20 ml of methanol by warming in a water bath at about 60°C, cool to room temperature, the solution is clear. Any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B).

Loss on drying When dried at 105°C to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N); use 2.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Dissolve about 0.3 g, accurately weighed, in 20 ml of glacial acetic acid by warming, add 5 ml of mercuric acetate TS and 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the solution becomes blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 37.79 mg of C₂₁H₂₇NO₃ · HCl.

Category Antiarrhythmic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Propafenone Hydrochloride Capsules
(2) Propafenone Hydrochloride Injection
(3) Propafenone Hydrochloride Tablets

Propafenone Hydrochloride Capsules

Propafenone Hydrochloride Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of propafenone hydrochloride (C₂₁H₂₇NO₃ · HCl).

Identification (1) Dissolve a quantity of the contents equivalent to about 20 mg of propafenone hydrochloride, in 4 ml of ethanol, filter, add a few drops of 2,4-dinitrophenylhydrazine TS to the filtrate, shake, a golden yellow precipitate is produced.

(2) The light absorption of the solution obtained in the Assay exhibits three maxima at 210 nm, 248 nm and 304 nm (Appendix IV A).

(3) Dissolve a quantity of the contents in water, filter, the filtrate yields the reactions characteristic of chlorides (Appendix III).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay To a quantity of the mixed contents obtained in the test for weight variation of contents equivalent to about 20 mg of propafenone hydrochloride in a 100 ml volumetric flask add a quantity of ethanol, shake thoroughly (if necessary, heat in a warm water bath to dissolve propafenone hydrochloride and cool), dilute with ethanol to volume and mix well. Filter, measure accurately 5 ml of the successive filtrate to a 50 ml volumetric flask, dilute with ethanol to volume and mix well. Measure the absorbance of the resulting solution at 248 nm (Appendix IV A). Calculate the content of $C_{21}H_{27}NO_3 \cdot HCl$, taking 220 as the value of A (1%, 1 cm).

Category As described under Propafenone Hydrochloride.

Strength (1) 100 mg (2) 150 mg

Storage Preserve in well closed containers, protected from light.

Propafenone Hydrochloride Injection

Propafenone Hydrochloride Injection is a sterile solution of Propafenone Hydrochloride in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$).

Description A colourless, clear liquid.

Identification (1) Evaporate 5 ml on a water bath to dryness, dissolve the residue in 4 ml of ethanol, add a few drops of dinitrophenylhydrazine TS and shake, a golden yellow precipitate is immediately produced.

(2) The light absorption of the solution obtained in the Assay exhibits maxima at 210 nm, 248 nm and 304 nm (Appendix IV A).

pH value 3.5-5.0 (Appendix VI H).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 1.5 EU per mg of Propafenone hydrochloride.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dilute an accurately measured quantity with ethanol to produce a solution of about 20 µg per ml. Measure the absorbance at 248 nm (Appendix IV A) and calculate the content of $C_{21}H_{27}NO_3 \cdot HCl$, taking 220 as the value of A (1%, 1 cm).

Category As described under Propafenone Hydrochloride.

Strength (1) 5 ml : 17.5 mg (2) 5 ml : 35 mg
(3) 10 ml : 35 mg (4) 20 ml : 70 mg

Storage Preserve in well closed containers, protected from light.

Propafenone Hydrochloride Tablets

Propafenone Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of

the labelled amount of propafenone hydrochloride ($C_{21}H_{27}NO_3 \cdot HCl$).

Description White or almost white tablets.

Identification (1) To a quantity of the powdered tablets equivalent to about 20 mg of propafenone hydrochloride add 4 ml of ethanol and allow to stand. Decant the supernate liquid, add a few drops of dinitrophenyl hydrazine TS and shake; a golden yellow precipitate is immediately produced.

(2) Dissolve a quantity of the powdered tablets in ethanol to produce a solution of 20 µg per ml of propafenone hydrochloride and filter. The light absorption of the filtrate exhibits maxima at 210 nm, 248 nm and 304 nm (Appendix IV A).

(3) To a quantity of the powdered tablets add water to dissolve propafenone hydrochloride and filter. The filtrate yields the reactions characteristic of chlorides (Appendix III).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately 20 tablets and powder finely. To a quantity of the powdered tablets, equivalent to about 50 mg of propafenone hydrochloride accurately weighed, in a 100 ml volumetric flask add a quantity of ethanol, shake thoroughly, dilute with ethanol to volume, mix well and filter. Measure accurately 5 ml of the successive filtrate to another 100 ml volumetric flask, dilute with ethanol to volume, mix well. Measure the absorbance of the resulting solution at 248 nm (Appendix IV A). Calculate the content of $C_{21}H_{27}NO_3 \cdot HCl$, taking 220 as the value of A (1%, 1 cm).

Category As described under Propafenone Hydrochloride.

Strength (1) 50 mg (2) 100 mg (3) 150 mg

Storage Preserve in tightly closed containers, protected from light.

Propantheline Bromide

$C_{23}H_{30}BrNO_3$ 448.40

[50-34-0]

Propantheline Bromide is *N*-methyl-*N*-(1-methylethyl)-*N*-[2-[(9*H*-xanthen-9-ylcarbonyl) oxy] ethyl]-2-propanaminium bromide. It contains not less than 98.5% and not more than 102.0% of $C_{23}H_{30}BrNO_3$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; taste, extremely bitter. Slightly hygroscopic. Very soluble in water, ethanol or chloroform; insoluble in ether.

Melting range 157-164°C, with decomposition (Appendix VI C).

Identification (1) Dissolve 0.2 g in 5 ml of water, add 10 ml of sodium hydroxide TS, boil for 2 minutes, cool, add 5 ml of dilute hydrochloric acid and filter. Wash the residue with water, recrystallize from dilute ethanol. To about 10 mg of the crystals add 5 ml of sulfuric acid; a

bright yellow or orange yellow solution is produced with slightly green fluorescence.

(2) The light absorption of a solution of 50 µg per ml in ethanol exhibits maxima at 247 nm and 282 nm; the absorbance at 247 nm is about 0.61 (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Propantheline Bromide (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of bromides (Appendix III).

Related substances Carry out the method for thin layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of dichloroethane-methanol-water-anhydrous formic acid (56 : 24 : 1 : 1) as the mobile phase. Apply separately to the plate 10 µl each of two solutions in chloroform containing (1) 40 mg per ml, (2) 0.20 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air, examine under ultraviolet light at 254 nm. Any spot, other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VII L).

Residue on ignition Not more than 0.1% (Appendix VII N).

Assay Dissolve about 0.3 g, accurately weighed, in 10 ml of glacial acetic acid TS, add 5 drops of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 44.84 mg of C₂₃H₃₀BrNO₃.

Category Anticholinergic.

Storage Preserve in tightly closed containers.

Preparation Propantheline Bromide Tablets

Propantheline Bromide Tablets

Propantheline Bromide Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of propantheline bromide (C₂₃H₃₀BrNO₃).

Description Sugar-coated tablets with white core.

Identification Triturate a quantity of the powdered uncoated tablets equivalent to about 0.15 g of propantheline bromide with 5 ml of water and filter, use the filtrate for the following tests:

(1) Complies with tests (1) for Identification described under Propantheline Bromide, beginning at words "add 10 ml of sodium hydroxide TS...".

(2) Yields the reactions characteristic of bromides (Appendix III).

Xanthanoic acid Shake the combined ether extracts obtained in the Assay with two 30 ml quantities of 1.5% of sodium chloride in 0.4% sodium hydroxide solution. Filter the combined aqueous extracts into a beaker and heat on a water bath until the odour of ether is no longer perceptible. Cool, transfer to a 100 ml volumetric flask, dilute with 0.4% sodium hydroxide to volume, and mix well. Measure the absorbance of the resulting solution at 250 nm (Appendix IV A); the absorbance is not more than 0.37.

Other requirements Comply with the general requirements

for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets with the coating removed. Transfer a quantity of the powdered tablets, accurately weighed, equivalent to about 75 mg of propantheline bromide to a sintered glass funnel, extract with four 10 ml quantities of ether and filter. Combine the ether extracts for the test for Xanthanoic acid. Extract the residue with successive quantities of 15 ml each of warm ethanol, transfer to a 100 ml volumetric flask, cool, dilute with ethanol to volume, mix. Measure accurately 5 ml to another 100 ml volumetric flask, dilute with ethanol to volume and mix well. Measure the absorbance of the resulting solution at 247 nm (Appendix IV A), calculate the content of C₂₃H₃₀BrNO₃, taking 121 as the value of A (1%, 1 cm).

Category As described under Propantheline Bromide.

Strength 15 mg

Storage Preserve in tightly closed containers.

Propranolol Hydrochloride

C₁₆H₂₁NO₂ · HCl 295.81

[318-98-9]

Propranolol Hydrochloride is 1-[(1-methylethyl)amino]-3-(1-naphthalenyloxy)-2-propanol hydrochloride. It contains not less than 99.0% of C₁₆H₂₁NO₂ · HCl, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; taste, slightly sweet then bitter. Soluble in water or ethanol; slightly soluble in chloroform.

Melting point 162-165°C (Appendix VI C).

Identification (1) The light absorption of a solution of 20 µg per ml in methanol exhibits maxima at 290 nm and 319 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of propranolol hydrochloride (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.10 g in 10 ml of water, pH 5.0-6.5 (Appendix VI H).

Free naphthol Dissolve 20 mg in 2 ml of ethanol and 2 ml of 10% sodium hydroxide solution, add 1 ml of diazotized sulfanilic acid TS, mix, allow to stand for 3 minutes. Any colour produced is not more intense than that of a reference solution containing 0.30 ml of ethanolic α-naphthol solution (20 µg per ml) (0.03%).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VII L).

Residue on ignition Not more than 0.1% (Appendix VII N).

Assay Dissolve about 0.2 g, accurately weighed, in 20 ml of glacial acetic acid, add 5 ml of mercuric acetate TS and 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary

correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 29.58 mg of $C_{16}H_{21}NO_2 \cdot HCl$.

Category β -Adrenergic blocker.

Storage Preserve in tightly closed containers.

Preparation (1) Propranolol Hydrochloride Injection
(2) Propranolol Hydrochloride Tablets

Propranolol Hydrochloride Injection

Propranolol Hydrochloride Injection is a sterile solution of Propranolol Hydrochloride in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of propranolol hydrochloride ($C_{16}H_{21}NO_2 \cdot HCl$).

Description A clear, colourless liquid.

Identification (1) To a quantity, add a few drops of silicowolframic acid TS; a slightly pink precipitate is produced.

(2) The light absorption of the solution obtained in the Assay exhibits a maximum at 290 nm (Appendix IV A).

(3) Yields the reactions characteristic of chlorides (Appendix III).

pH value pH 3.0-4.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dilute a quantity, accurately measured, with methanol to produce a solution containing about 20 μ g per ml and x well. Measure the absorbance of the resulting solution at 290 nm (Appendix IV A). Calculate the content of $C_{16}H_{21}NO_2 \cdot HCl$, taking 207 as the value of A (1%, 1 cm).

Category As described under Propranolol Hydrochloride.

Strength 5 ml : 5 mg

Storage Preserve in well closed containers, Protected from light.

Propranolol Hydrochloride Tablets

Propranolol Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of propranolol hydrochloride ($C_{16}H_{21}NO_2 \cdot HCl$).

Description White tablets.

Identification (1) Shake a quantity of the powdered tablets equivalent to 0.1 g of propranolol hydrochloride with 20 ml of ethanol, filter, evaporate the filtrate to dryness. The residue complies with test (3) for Identification described under Propranolol Hydrochloride.

(2) The light absorption of the solution obtained in the Assay exhibits maxima at 290 nm, 306 nm and 319 nm (Appendix IV A).

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Shake to disintegrate 1 tablet with 1 ml of water in a 50 ml volumetric flask, add 30 ml of methanol, carry out the procedure described under Assay, beginning at the words "shake for 5 minutes". Calculate the content of $C_{16}H_{21}NO_2 \cdot HCl$.

Dissolution Comply with the requirements for dissolution test (Appendix X C, method 1), using 1000 ml hydrochloric acid solution (1 \rightarrow 100) as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm, withdraw a quantity of the solution after exactly 30 minutes and filter, use the successive filtrate as test solution. Measure the absorbance at 290 nm (Appendix IV A). Dissolve a quantity of Propranolol Hydrochloride CRS with the dissolution medium to produce a solution of 10 μ g per ml, repeat the test. Calculate the content of $C_{16}H_{21}NO_2 \cdot HCl$ from each tablet, Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To a quantity of the powder equivalent to about 20 mg of propranolol hydrochloride, accurately weighed, in a 100 ml volumetric flask add 2 ml of water, shake for 5 minutes, dilute with methanol to volume, mix well, Filter, measure accurately 5 ml of the successive filtrate to a 50 ml volumetric flask, dilute with methanol to volume and mix well. Measure the absorbance at 290 nm (Appendix IV A). Calculate the content of $C_{16}H_{21}NO_2 \cdot HCl$, taking 207 as the value of A (1%, 1 cm).

Category As described under Propranolol Hydrochloride.

Strength 10 mg

Storage Preserve in tightly closed containers.

Propylthiouracil

$C_7H_{10}N_2OS$ 170.24

[51-52-5]

Propylthiouracil is 2,3-dihydro-6-propyl-2-thioxo-4 (1H)-pyrimidinone. It contains not less than 98.0% of $C_7H_{10}N_2OS$, calculated on the dried basis.

Description White crystals or a white crystalline powder; odourless; taste, bitter.

Sparingly soluble in ethanol; very slightly soluble in water; soluble in sodium hydroxide TS or ammonia TS.

Melting point 218-221°C (Appendix VI C).

Identification (1) Heat a quantity of the saturated aqueous solution to boil, add an equal quantity of a freshly prepared solution containing 0.4% of sodium nitroprusside, 0.4% of hydroxylamine hydrochloride and 0.8% of sodium carbonate; a greenish-blue colour is produced.

(2) Dissolve about 25 mg by adding bromine TS dropwise, heat until the colour disappears, cool and add barium hydroxide TS dropwise; a white precipitate is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of propylthiouracil (Appendix XVI).

Thiourea Dissolve 0.50 g in 50 ml of water by heating under reflux, cool and filter. Dilute 5.0 ml of the filtrate to 50 ml with water and mix well. Transfer 10 ml to Nessler cylinder (1) and add 1.0 ml of 0.010% thiourea solution. Transfer 10 ml of the filtrate and 1.0 ml of water to Nessler cylinder (2). Add 0.50 g of sodium acetate and 5.0 ml of silver

nitrate TS to each cylinder, heat in a water bath for 5 minutes. The colour produced in cylinder (2) is not more intense than that produced in cylinder (1).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1%; use 1.0 g (Appendix VIII N).

Heavy metals Carry out the limit test for heavy metals, using the residue obtained in the test for Residue on ignition; not more than 0.002% (Appendix VIII H, method 2).

Assay To about 0.3 g, accurately weighed, add 5 ml of sodium hydroxide TS and 50 ml of water, heat to dissolve and cool. Add 2 drops of phenolphthalein IS, and add dropwise acetic acid until the red colour disappears. Add 1 ml of diphenylcarbazide IS, titrate with mercuric nitrate (0.05 mol/L) VS until the solution becomes purplish. Each ml of mercuric nitrate (0.05 mol/L) VS is equivalent to 17.02 mg of $C_7H_{10}N_2OS$.

Category Antithyroid agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation Propylthiouracil Tablets

Propylthiouracil Tablets

Propylthiouracil Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of propylthiouracil ($C_7H_{10}N_2OS$).

Description White tablets; taste, bitter.

Identification To a quantity of the powdered tablets equivalent to about 0.2 g of propylthiouracil add 10 ml of ethanol, heat under reflux for 20 minutes, filter while hot and evaporate the filtrate on a water bath to dryness. The residue complies with tests (1) and (2) for Identification described under Propylthiouracil.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. Measure accurately a quantity of the successive filtrate and dilute with water to produce a solution of about 5 µg of propylthiouracil per ml as the test solution. Measure the absorbance of the test solution at 274 nm (Appendix IV A). Dissolve about 25 mg of propylthiouracil CRS, weighed accurately, in 20 ml of ethanol in a 100 ml volumetric flask and dissolve propylthiouracil by ultrasonical treatment, cool to room temperature, dilute to volume with water and mix well. Measure accurately a quantity of the solution and dilute with water to produce a solution of about 5 µg of propylthiouracil per ml as the reference solution. Repeat the operations using the reference solution instead of the test solution, calculate the dissolution of $C_7H_{10}N_2OS$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To a quantity equivalent to about 0.3 g of propylthiouracil, accurately weighed, add 5 ml of sodium hydroxide TS and 50 ml of water, heat gently and cool to room temperature. Carry out the Assay described under Propylthiouracil, beginning at the words "Add 2 drops of phenolphthalein

IS...". Each ml of mercuric nitrate (0.05 mol/L) VS is equivalent to 17.02 mg of $C_7H_{10}N_2OS$.

Category As described under propylthiouracil.

Strength (1) 50 mg (2) 100 mg

Storage Preserve in tightly closed containers, protected from light.

Protamine Sulfate

Protamine Sulfate is the sulfate of an alkaline protein obtained from fresh, mature sperm of suitable species of fish. Each mg of Protamine Sulfate, calculated on the dried basis, neutralizes not less than 100 Units of anticoagulant activity of Heparin Sodium (mucous).

Description A white or almost white powder; the aqueous solution exhibits an acid reaction to litmus paper. Freely soluble in water; insoluble in ethanol or ether.

Identification (1) Dissolve about 5 mg in 1 ml of water by warming, add 1 drop of 10% sodium hydroxide solution and 2 drops of cupric sulfate TS; the supernatant liquid exhibits violet-red colour.

(2) Dissolve about 1 mg in 2 ml of water, add 5 drops of a 0.1% α -naphthol solution in 70% ethanol and 5 drops of sodium hypochlorite TS, then make alkaline with sodium hydroxide TS; a pink colour is produced.

(3) Yields the reactions characteristic of sulfates (Appendix III).

Nitrogen content Carry out the method for determination of nitrogen (Appendix XIII D, method 2); not less than 21.0% and not more than 25.0% of N, calculated on the dried basis.

Loss on drying When dried to constant weight at 105°C, loses not more than 7.0% of its weight (Appendix VIII L).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 6.0 EU per mg of protamine sulfate.

Assay Carry out the biological assay of protamine sulfate (Appendix XIII J), the estimated potency is not less than 90% and not more than 110% of the labelled potency.

Category Heparin antagonist.

Storage Preserve in tightly closed containers, stored in a cool place.

Preparation Protamine Sulfate Injection

Protamine Sulfate Injection

Protamine Sulfate Injection is a sterile solution of Protamine Sulfate made isotonic by the addition of sodium chloride. It has a potency of not less than 90% and not more than 115% of the labelled potency, calculated on the basis that each mg of protamine sulfate neutralizes 100 Units of heparin sodium (mucous).

Description A clear, colourless liquid.

Identification Complies with the tests for Identification as described under Protamin Sulfate.

Bacterial endotoxin Complies with the test as described under Protamine Sulfate.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the biological assay of protamine sulfate (Appendix XII J), it complies with the requirements for potency.

Category As described under Protamine Sulfate.

Strength (1) 5 ml : 50 mg (2) 10 ml : 100 mg

Storage Preserve in well closed containers, stored in a cool place.

Protamine Zinc Insulin Injection

Protamine Zinc Insulin Injection is a sterile suspension of Insulin (pig or cattle) with Protamine and Zinc Chloride in Water for Injection. It has a potency of not less than 86% and not more than 120% of the labelled potency. It contains 1.0-1.5 mg of Protamine and 0.2-0.25 mg of Zinc per 100 Units; and it may contain 1.4-1.8 g of Glycerol, 0.22-0.28 g of Phenol and 0.15-0.25 g of disodium hydrogen phosphate per 100 ml.

Description A white or almost white suspension; dispersed uniformly on shaking.

Identification (1) Adjust the pH of the injection with acid to 2.5-3.5, a clear, colourless liquid is formed. (2) To the injection per ml add 0.2 ml of 0.1 mol/L hydrochloric acid solution, allow to stand for a minute, complies with test (2), (3) for Identification described under Insulin.

pH value 6.9-7.3 (Appendix VI H).

Nitrogen content Measure accurately a volume equivalent to about 200 Units, carry out the method for determination of nitrogen (Appendix VII D, method 2); not more than 1.2 mg of N per 100 Units.

Zinc Measure accurately a volume equivalent to about 16 µg of Zinc, carry out the determination of Zinc as described under Insulin, add 2 ml of boric acid-potassium chloride BS (pH 9.0) and 0.4 ml of 0.01 mol/L hydrochloric acid solution (contain 250 Units per ml), allow to stand for 10 minutes, and then add 1 ml of Zincon solution, not less than 0.2 mg and not more than 0.25 mg of Zn per 100 Units.

Prolongation of insulin effect Complies with the test for prolongation of insulin effect (Appendix XII H).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.8 EU per unit.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay To an accurately measured volume, add 0.2 ml of 0.1 mol/L hydrochloric acid solution per ml and allow to stand for a minute, carry out the biological assay of insulin (Appendix XII G), it complies with the requirement for potency.

Category As described under Insulin.

Strength (1) 10 ml : 400 Units (2) 10 ml : 800 Units

Storage Preserve in well closed containers, stored in a cold place, avoid freezing.

Protionamide

$C_9H_{12}N_2S$ 180.28

[14222-60-7]

Protionamide is 2-propylthioisonicotinamide. It contains not less than 99.0% of $C_9H_{12}N_2S$, calculated on the dried basis.

Description Yellow crystals or a crystalline powder; odour, slightly characteristic.

Soluble in methanol, ethanol or acetone; slightly soluble in ether; practically insoluble in water.

Melting range 139-143°C (Appendix VI C).

Identification (1) Heat gently about 50 mg with 3 ml of hydrochloric acid solution (9 → 100), fumes are evolved which stain moistened lead acetate TP black.

(2) The light absorption of a solution of about 20 µg per ml in ethanol exhibits a maximum at 291 nm; the absorbance is about 0.78 (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of protionamide (Appendix XVI).

Acidity Dissolve 2.0 g in 20 ml of ethanol by warming, add 20 ml of water and cool; shake to precipitate protionamide. Add 2 drops of cresol red IS, titrate with sodium hydroxide (0.1 mol/L) VS; the volume of sodium hydroxide (0.1 mol/L) VS required is not more than 0.20 ml.

Related substances Protect from light in the procedure. Carry out the method for thin layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance, a mixture of chloroform-methanol (90 : 10) as the mobile phase. Apply separately to the plate 10 µl each of two solutions in methanol containing (1) 50 mg, (2) 0.50 mg of the substance being examined per ml. After developing and removal of the plate, dry in air and examine under ultra-violet light at 254 nm. Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VII L).

Residue on ignition Not more than 0.1% (Appendix VIII N); use 1.0 g.

Heavy metals Carry out the limit test for heavy metals, using the residue obtained in the test for Residue on ignition (Appendix VIII H, method 2); not more than 0.002%.

Assay Dissolve about 0.15 g, accurately weighed, in 25 ml of glacial acetic acid, add 0.4 ml of naphtholbenzein IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 18.03 mg of $C_9H_{12}N_2S$.

Category Antituberculosis drug.

Storage Preserve in tightly closed containers.

Preparation Protionamide Enteric-coated Tablets

Protionamide Enteric-coated Tablets

Protionamide Enteric-coated Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of protionamide ($C_9H_{12}N_2S$).

Description Enteric coated tablets with yellow core.

Identification (1) To a quantity of powdered tablets equivalent to 20 mg of protionamide in a test tube, add 2 ml of hydrochloric acid solution (9→100), heat gently. Fumes are evolved which stain moistened lead acetate TP black.

(2) Dissolve a quantity of powdered tablets in ethanol to produce a solution of 20 μ g of protionamide per ml, filter. The light absorption of the filtrate exhibits a maximum at 291 nm (Appendix IV A).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets with coating removed. Dissolve an accurately weighed quantity, equivalent to 0.3 g of protionamide, in 20 ml of acetone in an iodine flask. Add 50 ml of silver nitrate (0.1 mol/L) VS, accurately measured, mix well and allow to stand for 15 minutes. Add 50 ml of water, 3 ml of nitric acid, 5 ml of nitrobenzene and 2 ml of ferric ammonium sulfate IS; titrate with ammonium thiocyanate (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 9.014 mg of $C_9H_{12}N_2S$.

Category As described under Protionamide.

Strength 0.1 g

Storage Preserve in tightly closed containers, protected from light.

Puerarin

$C_{21}H_{20}O_9$ 416.38

Puerarin is 8- β -D-Glucopyranol-4',7-dihydroxyisoflavone, extracted from dry roots of *Pueraria Lobata* (Willd.) Ohwi, a leguminous plant. It contains not less than 97.0% of $C_{21}H_{20}O_9$, calculated on the dried basis.

Description A white to slightly yellow crystalline powder. Soluble in methanol; sparingly soluble in ethanol; slightly soluble in water; insoluble in trichloromethane or ether.

Identification (1) Dissolve 10 mg in 10 ml of water, add 2-3 drops of 0.5% ferric chloride solution and mix well; add 2-3 drops of 0.5% potassium ferricyanide solution, a blue-

green colour is produced.

(2) The light absorption of a solution of 10 μ g per ml in ethanol exhibits a maximum at 250 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Puerarin (Appendix XVI).

Acidity Dissolve 20 mg in 20 ml of water, pH 3.5-5.5 (Appendix VI H).

Clarity and colour of solution Dissolve 10 mg in 10 ml of water, the solution is clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution Y_1 (Appendix IX A, Method 1).

Related substances Dissolve a quantity in mobile phase to produce a solution of 0.40 mg per ml as test solution. Dilute a quantity of the test solution, accurately measured, with mobile phase to produce a solution of 10 μ g per ml as reference solution. Carry out the method as described under the Assay. Inject 10 μ l of the reference solution into the column, adjust the attenuation so that the principle peak height in the chromatogram is above 20% full scale of the chart. Inject 10 μ l each of the test solution and the reference solution into the column separately, and record the chromatograms for four times the retention time of the principle peak. The sum of the areas of all peaks other than the principal peak obtained with the test solution is not greater than the area of the principle peak in the chromatogram obtained with the reference solution.

Loss on drying When dried to constant weight at 105°C, loses not more than 5.0% of its weight (Appendix VIII L).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-0.1% citric acid solution (25 : 75) as mobile phase. Detection wavelength is 250 nm and the number of theoretical plates of the column is not less than 2500, calculated with reference to the peak of puerarin. Resolution factors between the peaks of puerarin and other peaks comply with the related requirements.

Procedure Dissolve a quantity, accurately weighed, in mobile phase to produce a solution of 0.05 mg per ml. Inject 20 μ l of the solution into the column. Repeat the operation, using puerarin CRS instead of the substance being examined, calculate the content of $C_{21}H_{20}O_9$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Vasodilators.

Storage Preserve in a tightly closed containers, protect from light.

Preparation (1) Puerarin Injection
(2) Puerarin and Glucose Injection
(3) Puerarin and Sodium Chloride Injection

Puerarin and Glucose Injection

Puerarin and Glucose Injection is a sterile solution of Puerarin and Glucose in Water for Injection. It contains not less than 93.0% and not more than 107.0% of the labelled amount of puerarin ($C_{21}H_{20}O_9$); not less than 95.0% and not more than 105.0% of the labelled amount of glucose ($C_6H_{12}O_6 \cdot H_2O$).

Description A clear, colourless or almost colourless liquid.

Identification (1) To 1 ml, add 2-3 drops of 0.5% ferric chloride solution and mix well, add 2-3 drops of 0.5% potassium ferricyanide solution and mix well; a bluish-green colour is produced.

(2) Drop slowly 5 ml of the injection to the warmly heated alkaline cupric tartrate TS, a red precipitate of cuprous oxide is produced.

(3) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of principal peak of puerarin CRS.

pH value 3.5-5.5 (Appendix VI H).

Colour of solution Any colour produced is not more intense than that of the reference solution Y_1 (Appendix IX A).

5-Hydroxymethylfurfural Take the injection as test solution. Weigh accurately a quantity of 5-hydroxymethylfurfural CRS and dissolve in mobile phase to produce a solution of 10 μ g per ml as reference solution. Carry out the method as described under the Assay for puerarin, the detection wavelength is 284 nm. Inject 20 μ l of the reference solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 10%-20% full scale of the chart. Inject separately 20 μ l of the test solution and the reference solution into the column, and record the chromatograms. The peak area of 5-hydroxymethylfurfural in the chromatogram obtained with the test solution is not greater than the area of the principle peak in the chromatogram obtained with the reference solution.

Related substances Dilute a quantity of the injection with mobile phase to produce a solution of 0.4 mg per ml as test solution. Measure accurately a quantity of the test solution, add mobile phase to produce a solution of 12 μ g per ml as reference solution. Carry out the method as described under the Assay for puerarin. Inject 20 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is above 20% full scale of the chart. Inject 20 μ l each of the test solution and the reference solution into the column separately, and record the chromatograms for 4 times the retention time of the principle peak. The sum of the areas of all peaks other than the principal peak obtained with the test solution is not greater than the area of the principle peak in the chromatogram obtained with the reference solution.

Heavy metals Measure a quantity of the injection, equivalent to about 3 g of glucose, evaporate to about 20 ml and cool. Add 2 ml of acetate BS (pH 3.5) and sufficient water to 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.0005%, calculated with reference to the content of glucose.

Bacterial endotoxin Complies with the test for Bacterial Endotoxin (Appendix XI E); less than 0.5 EU per ml.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay

Puerarin Measure accurately a quantity of the injection, add mobile phase to produce a solution of 0.05 mg per ml. Carry out the method as described under Puerarin for the Assay. Calculate the content of $C_{21}H_{20}O_9$ with respect to the peak area obtained in the chromatogram by the external standard method.

Glucose Carry out the determination of Specific optical rotation (Appendix VI E). Calculate the content of $C_6H_{12}O_6 \cdot H_2O$ (g), taking the resulting of optical rotation multiplied by 2.0852.

Category As described under Puerarin.

Strength (1) 100 ml : puerarin 0.2 g and glucose 5.0 g
(2) 150 ml : puerarin 0.3 g and glucose 7.5 g
(3) 250 ml : puerarin 0.3 g and glucose 12.5 g
(4) 250 ml : puerarin 0.5 g and glucose 12.5 g

Storage Preserve in well closed containers, protect from light.

Puerarin and Sodium Chloride Injection

Puerarin and Sodium Chloride Injection is a sterile solution of Puerarin and Sodium Chloride in Water for Injection. It contains not less than 93.0% and not more than 107.0% of the labelled amount of puerarin ($C_{21}H_{20}O_9$); not less than 95.0% and not more than 105.0% of the labelled amount of Sodium Chloride (NaCl).

Description A clear, colourless or almost colourless liquid.

Identification (1) To 1 ml add 2-3 drops of 0.5% ferric chloride solution and mix well, add 2-3 drops of 0.5% potassium ferricyanide solution and mix well, a blue-green colour is produced.

(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of principal peak of puerarin CRS.

(3) Yields the reactions characteristics of sodium salts and chlorides (Appendix III).

pH value 3.5-5.5 (Appendix VI H).

Colour of solution Any colour produced is not more intense than that of the reference solution Y_1 (Appendix IX A).

Related substances Carry out the method as described under the Assay for puerarin. Dilute a quantity of the injection with mobile phase to produce a solution of 0.4 mg per ml as the test solution. Measure accurately a quantity of the test solution, add mobile phase to produce a solution of 12 μ g per ml as the reference solution. Carry out the method as described under the Assay for puerarin. Inject 20 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is above 20% full scale of the chart. Inject 20 μ l each of the test solution and the reference solution into the column separately, and record the chromatograms for 4 times the retention time of the principle peak. The sum of the areas of all peaks other than the principal peak obtained with the test solution is not greater than the area of the principle peak in the chromatogram obtained with the reference solution.

Heavy metals Measure 20 ml, add 2 ml of acetate BS (pH 3.5) and sufficient water to 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.0001%.

Bacterial endotoxin Carry out the test for Bacterial Endotoxin (Appendix XI E); less than 0.5 EU per ml.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay

Puerarin Measure accurately a quantity of the injection, add mobile phase to produce a solution of 0.05 mg per ml. Carry out the method as described under Puerarin for the assay. Calculate the content of $C_{21}H_{20}O_9$ with respect to the peak area obtained in the chromatogram by the external standard method.

Sodium Chloride Measure accurately 10 ml, add 40 ml of

water and 5 ml of 2% dextrin solution, add 5-8 drops of fluorescein IS, titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 5.844 mg of NaCl.

Category As described under Puerarin.

Strength (1) 100 ml : puerarin 0.2 g and Sodium Chloride 0.9 g
(2) 250 ml : puerarin 0.4 g and Sodium Chloride 2.25 g
(3) 1 : puerarin 0.6 g and Sodium Chloride 2.25 g

Storage Preserve in well closed containers, protect from light.

Puerarin Injection

Puerarin Injection is a sterile solution of Puerarin in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of puerarin ($C_{21}H_{20}O_9$).

Description A clear, colourless to slightly yellow liquid.

Identification Complies with the tests (1) and (2) for Identification described under Puerarin.

Colour of solution Not more intense than that of the reference solution Y₂ (Appendix IV A, method 1).

pH value 3.5-5.5 (Appendix VI H).

Related substance Dilute a quantity of the injection with mobile phase to produce a solution of 0.40 mg per ml as test solution. Measure accurately a quantity of the test solution, add mobile phase to produce a solution of 12 µg per ml as reference solution. Carry out the method as described under the Assay. Inject 10 µl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is above 20% full scale of the chart. Inject 10 µl each of the test solution and the reference solution into the column separately, and record the chromatograms for 4 times the retention time of the principle peak. The sum of the areas of all peaks other than the principal peak obtained with the test solution is not greater than the area of the principle peak in the chromatogram obtained with the reference solution.

Pyrogens Dilute 5 ml with Sodium Chloride Injection to 25 ml as test solution. Complies with the test for pyrogens (Appendix XI D), using 5 ml of the test solution per kg of rabbit's weight. Inject slowly while administration.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity of the injection, add mobile phase to produce a solution of 0.05 mg per ml. Carry out the method as described under Puerarin for the Assay. Calculate the content of $C_{21}H_{20}O_9$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Puerarin.

Strength (1) 2 ml : 50 mg (2) 2 ml : 100 mg

Storage Preserve in well closed containers, protected from light.

Pyrantel Pamoate

$C_{11}H_{14}N_2S \cdot C_{23}H_{16}O_6$ 594.68

[22204-24-6]

Pyrantel Pamoate is (*E*)-1,4,5,6-tetrahydro-1-methyl-2-[2-(2-thienyl)ethenyl]pyrimidine-4,4'-methylene-bis[3-hydroxy-2-naphthalenecarboxylic acid (1:1)]. It contains not less than 97.0% and not more than 103.0% of $C_{11}H_{14}N_2S \cdot C_{23}H_{16}O_6$, calculated on the dried basis.

Description A pale yellow powder; odourless; tasteless. Sparingly soluble in dimethylformamide; very slightly soluble in ethanol; practically insoluble in water.

Specific absorbance Protect from light throughout the procedure.

Dissolve about 20 mg, accurately weighed, in 8 ml of a mixture of dioxane and 0.1% ammonia solution (1:1). Dilute with hydrochloric acid solution (9→1000) to 100 ml, and mix well, filter. Accurately measure 5 ml of the successive filtrate, dilute with a hydrochloric acid solution (9→1000) to 50 ml. Measure the absorbance of the resulting solution at 311 nm (Appendix IV A), the value of *A* (1%, 1 cm) is 302-324.

Identification (1) Dissolve about 10 mg in 5 ml of a mixture of dioxane-0.1% concentrated ammonia solution (1:1), add 2 ml of dilute hydrochloric acid; a yellow precipitate is produced.

(2) To about 20 mg add 1 ml of sulfuric acid and shake; a red colour is produced.

(3) The retention times of principal peaks of the substance being examined in the chromatogram obtained in the Assay are identical with those of principal peaks of pyrantel pamoate CRS.

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of pyrantel pamoate (Appendix XVI).

Chlorinated compounds Carry out the method for oxygen flask combustion (Appendix VII C), using 25 mg, with 10 ml of 0.4% sodium hydroxide solution as the absorbing liquid until absorption is complete. Carry out the limit test for chlorides (Appendix VIII A), using the resulting solution. Any opalescence produced is not more pronounced than that of a reference using 3.5 ml of sodium chloride standard solution (0.14%).

Pyrantel Accurately weigh a quantity of pyrantel, dried in vacuum for 3 hours at 60°C, dissolve in the mobile phase and dilute to produce a solution of 52 µg per ml. Carry out the method described under Assay. Inject 20 µl of the resulting solution into the column and record the chromatogram. Calculate the content of $C_{11}H_{14}N_2S$ by the external standard method. Not less than 63.4% and not more than 67.3%, calculated on the dried basis.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N); use 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with silica and a mixture of acetonitrile-water-acetic acid-diethylamine (94 : 2.5 : 2.5 : 1) as the mobile phase. Detection wavelength is 288 nm and the number of theoretical plates of the column is generally not less than 8000, calculated with reference to the peak of pyrantel. The resolution factor between peaks of pyrantel and pamoate is more than 10.

Procedure Dissolve a quantity of the substance being examined, accurately weighed, in the mobile phase to produce solutions of 80 µg per ml. Inject 20 µl of the resulting solution into the column. Repeat the operation, using the pyrantel pamoate CRS instead of the substance being examined. Calculate the content of $C_{11}H_{14}N_2S \cdot C_{23}H_{16}O_6$.

Category Anthelmintics.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Pyrantel Pamoate Granules
(2) Pyrantel Pamoate Tablets

Pyrantel Pamoate Granules

Pyrantel Pamoate Granules contain not less than 93.0% and not more than 107.0% of the labelled amount of pyrantel pamoate ($C_{11}H_{14}N_2S \cdot C_{23}H_{16}O_6$).

Description A pale yellow powder or granules; taste sweet.

Identification (1) Comply with the tests (1) and (2) for Identification described under Pyrantel Pamoate, using a quantity of the powdered granules.

(2) The light absorption of the solution obtained in the assay exhibits a maximum at 311 nm (Appendix IV A).

Other requirements Comply with the general requirements for granules (Appendix I N).

Assay Protect from light throughout the procedure. Weigh accurately a quantity of mixed contents obtained in the test for weight variation of contents equivalent to about 20 mg of pyrantel pamoate, carry out the Assay described under Pyrantel Pamoate Tablets, calculate the content of $C_{11}H_{14}N_2S \cdot C_{23}H_{16}O_6$, taking 313 as the value of A (1%, 1cm).

Category As described under Pyrantel Pamoate.

Strength 1 g : 0.15 g

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Pyrantel Pamoate Tablets

Pyrantel Pamoate Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of pyrantel pamoate ($C_{11}H_{14}N_2S \cdot C_{23}H_{16}O_6$).

Description Pale yellow tablets.

Identification To a quantity of the powdered tablets equivalent to about 40 mg of pyrantel pamoate add 20 ml of a

mixture of dioxane-0.1% concentrated ammonia solution (1 : 1) to dissolve pyrantel pamoate and filter. To 5 ml of the filtrate add 2 ml of dilute hydrochloric acid; a yellow precipitate is produced. Evaporate 10 ml of the filtrate to dryness, to the residue add 1 ml of sulfuric acid and shake; a red colour is produced.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Protect from light throughout the procedure. Weigh accurately and powder 10 tablets. Weigh accurately a quantity equivalent to about 20 mg of pyrantel pamoate to a 100 ml volumetric flask, add 8 ml of a mixture of dioxane-0.1% concentrated ammonia solution (1 : 1), shake to dissolve pyrantel pamoate, dilute to volume with hydrochloric acid solution (9→1000), mix well. Filter, measure accurately 5 ml of the successive filtrate to a 50 ml amber volumetric flask, dilute to volume with hydrochloric acid solution (9→1000), mix. Measure the absorbance of the resulting solution at 311 nm (Appendix IV A). Calculate the content of $C_{11}H_{14}N_2S \cdot C_{23}H_{16}O_6$, taking 313 as the value of A (1%, 1 cm).

Category As described under Pyrantel Pamoate.

Strength 0.3 g

Storage Preserve in tightly closed containers, protected from light.

Pyrazinamide

$C_5H_5N_3O$ 123.12

[98-96-4]

Pyrazinamide is pyrazine carboxylamide. It contains not less than 99.0% of $C_5H_5N_3O$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless or almost odourless; taste, slightly bitter. Sparingly soluble in water; slightly soluble in ethanol; very slightly soluble in ether.

Melting range 188-192°C (Appendix VI C).

Identification (1) Heat a quantity with 5 ml of sodium hydroxide TS, the characteristic odour of ammonia is perceived, the vapour turns moistened red litmus paper to blue.

(2) Dissolve 0.1 g in 10 ml of water, add 1 ml of ferrous sulfate TS, an orange-red colour is produced; make the solution alkaline with sodium hydroxide TS, the solution turns to blue.

(3) The light absorption of a solution of 10 µg per ml in water exhibits a maximum at 268 nm (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of pyrazinamide (Appendix XVI).

Related substances Carry out the method for thin layer Chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of *n*-butanol-acetic acid glacial-water (60 : 20 : 20) as mobile phase. Apply separately to the plate 20 µl each of two solution in a mixture solution of chloroform-methanol (9 : 1) containing (1) 20 mg (2) 0.04 mg of the substance being examined per ml. After

developing and removal of the plate, dry it in air and examine under ultraviolet light at 254 nm. Any spot in the chromatogram other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Sulfate Carry out the limit test for sulfates (Appendix VIII B), using 0.30 g. Any opalescence produced is not more pronounced than that of a reference using 1.0 ml of potassium sulfate standard solution (0.033%).

Carboxylic acid Dissolve 0.10 g in 10 ml of water with heating, add 0.5 ml of 0.05 mol/L potassium bromate and 0.5 g of potassium iodide, extract this solution with 1 ml of chloroform. The colour in chloroform layer is not more intense than that of a blank reagent prepared in the same manner.

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Dissolve 0.50 g in 2 ml of acetate BS (pH 3.5) and 23 ml of water with heating. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.002%.

Assay Weigh accurately 0.25 g to a distillation flask, add 200 ml of water and 50 ml of 40% solution of sodium hydroxide along the inner wall of the flask to form a layer, connect the distillation apparatus. To 40 ml of 4% boric acid solution contained in a suitable receiver add 10 drops of a mixture of methyl-red and bromocresol-green indicator solution, rotate gently the distillation flask to mix the content. Boil vigorously to complete the distillation of ammonia. Titrate the absorbing solution with hydrochloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of hydrochloric acid (0.1 mol/L) VS is equivalent to 12.31 mg of $C_5H_5N_3O$.

Category Tuberculostatic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Pyrazinamide Capsules
(2) Pyrazinamide Tablets

Pyrazinamide Capsules

Pyrazinamide Capsules contain not less than 93.0% and not more than 107.0% of the labelled amount of Pyrazinamide ($C_5H_5N_3O$).

Description Capsules containing white powder.

Identification (1) Dissolve a quantity of the mixed contents obtained in the test for weight variation of contents equivalent to about 0.2 g of pyrazinamide in 20 ml of ethanol with gentle heating and shaking, filter, evaporate the filtrate to dryness. The residue complies with the tests (1) and (2) for Identification described under Pyrazinamide. (2) The light absorption of the solution under Assay exhibits a maximum at 268 nm (Appendix IV A).

Dissolution Comply with the dissolution test (Appendix XI C, method 1), using 900 ml of water as the dissolution medium, adjust the rotation speed of the paddle to 100 rpm. Withdraw 5 ml of the solution after exactly 30 minutes and filter. Dilute a quantity of the successive filtrate, measured accurately, with water to produce a solution of 10 μ g per

ml. Dissolve pyrazinamide CRS in water to produce a solution of about 10 μ g per ml. Measure the absorbances of the resulting solutions at 268 nm (Appendix IV A). Calculate the dissolution of $C_5H_5N_3O$ from each capsule. Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Take an accurately weighed quantity of the mixed contents obtained in test for Weight variation of content equivalent to about 0.1 g of pyrazinamide to a 200 ml volumetric flask, add a quantity of water, shake to dissolve pyrazinamide, then dilute to volume with water, mix well, stand and filter. Measure accurately 5 ml of the successive filtrate to a 250 ml volumetric flask and dilute to volume with water, mix well, measure the absorbance of the solution at 268 nm (Appendix IV A). Calculate the content of $C_5H_5N_3O$, taking 650 as the value of A (1%, 1 cm).

Category As described under pyrazinamide.

Strength 0.25 g

Storage Preserve in tightly closed containers, protected from light.

Pyrazinamide Tablets

Pyrazinamide Tablets contain Pyrazinamide not less than 95.0% and not more than 105.0% of the labelled amount of Pyrazinamide ($C_5H_5N_3O$).

Description White tablets.

Identification (1) Dissolve a quantity of the powdered tablets equivalent to about 0.2 g of pyrazinamide in 20 ml of ethanol with gentle heating and shaking, filter, evaporate the filtrate to dryness. The residue complies with the tests (1) and (2) for Identification described under Pyrazinamide. (2) The light absorption of the solution under Assay exhibits a maximum at 268 nm (Appendix IV A).

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of water as the dissolution medium, adjust the rotational speed of paddle to 50 rpm. Withdraw 5 ml of solution after 45 minutes and filter. Dilute a quantity of successive filtrate, accurately measured, with water to the solution containing 10 μ g per ml. Dissolve a quantity of pyrazinamide CRS in water to produce a solution of 10 μ g per ml. Measure the absorbances of two solutions at 268 nm (Appendix IV A). Calculate the dissolution of $C_5H_5N_3O$ from each tablet not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh a quantity, weighed accurately, equivalent to about 0.1 g of pyrazinamide, to a 200 ml volumetric flask, add a quantity of water, shake to dissolve pyrazinamide, then dilute to volume with water, mix well, stand and filter. Measure accurately 5 ml of the successive filtrate to a 250 ml volumetric flask and dilute to volume with water, mix well, measure the absorbance of the solution at 268 nm (Appendix IV A). Calculate the content of $C_5H_5N_3O$, taking 650 as the value of A (1%, 1 cm).

Category As described under Pyrazinamide.

Strength (1) 0.25 g (2) 0.5 g

Storage Preserve in tightly closed containers, protected

from light.

Pyridostigmine Bromide

$C_9H_{13}BrN_2O_2$ 261.2

[155-97-5]

Pyridostigmine Bromide is 3-hydroxy-1-methylpyridinium bromide dimethylcarbamate. It contains not less than 98.5% of $C_9H_{13}BrN_2O_2$, calculated on the dried basis.

Description A white or almost white crystalline powder; taste, bitter; deliquescent. Very soluble in water, ethanol and chloroform; Very slightly soluble in ether of petroleum ether.

Melting range 153-157°C (Appendix VI C).

Specific absorbance Dissolve an accurately weighed quantity, in water to produce a solution of 25 µg per ml. Measure the absorbance at 269 nm (Appendix IV A). The value of A (1%, 1 cm) is 180-190.

Identification (1) Add 1-2 drops of sodium hydroxide TS to about 0.1 g, an orange colour is produced gradually, the colour changes to yellow on heating and fumes are evolved which turn moistened red litmus TP to blue.

(2) The infrared spectrum (Appendix IV C) is concordant with the reference spectrum of pyridostigmine bromide (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of bromides (Appendix III).

Loss on drying When dried to constant weight at 105°C, loses not more than 2.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.25 g, accurately weighed, in 20 ml of glacial acetic acid. Add 5 ml of mercuric acetate TS, and 3 drops of quinaldine red IS, titrate with perchloric acid (0.1 mol/L) VS until the solution is colourless. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 26.11 mg of $C_9H_{13}BrN_2O_2$.

Category Anticholinesterase drug.

Storage Preserve in tightly closed containers, protected from light.

Preparation Pyridostigmine Bromide Tablets

Pyridostigmine Bromide Tablets

Pyridostigmine Bromide Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of pyridostigmine bromide ($C_9H_{13}BrN_2O_2$).

Description Sugar coated tablets with white core.

Identification (1) Weigh a quantity of the powdered tablets

with sugar coating removed equivalent to about 0.15 g of pyridostigmine bromide, add 20 ml of chloroform, shake thoroughly, separate the chloroform layer. Filter and evaporate the filtrate to dryness. The residue complies with tests (1) and (3) for identification described under pyridostigmine bromide.

(2) The light absorption of the solution obtained in the Assay exhibits a maximum at 269 nm (Appendix IV A).

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of water as the dissolution medium, adjust the rotational speed of paddle to 100 rpm. Withdraw a quantity of solution after 60 minutes and filter. Dilute a quantity of successive filtrate, accurately measured, with water to produce a solution containing 26.7 µg per ml. Measure the absorbance of the resulting solution at 269 nm (Appendix IV A). Calculate the dissolution of $C_9H_{13}BrN_2O_2$ from each tablet, not less than 80% of the labelled amount is dissolved, taking 186 as the value of A (1%, 1 cm).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh and powder 20 tablets with coating removed. To an accurately weighed quantity of the powdered tablets, equivalent to 0.15 g of pyridostigmine bromide in a 250 ml volumetric flask add about 150 ml of water, shake thoroughly, dilute with water to volume, mix well, filter. Transfer 5 ml of the successive filtrate, accurately measured, to a 100 ml volumetric flask, dilute with water to volume, mix well. Measure the absorbance at 269 nm (Appendix IV A). Calculate the content of $C_9H_{13}BrN_2O_2$, taking 186 as the value of A (1%, 1 cm).

Category As described under Pyridostigmine Bromide.

Strength 60 mg

Storage Preserve in tightly closed containers, protected from light.

Pyrimethamine

$C_{12}H_{13}ClN_4$ 248.71

[58-14-0]

Pyrimethamine is 5-(4-chlorophenyl)-6-ethyl-2,4-pyrimidine diamino. It contains not less than 99.0% of $C_{12}H_{13}ClN_4$.

Description A white, crystalline powder; odourless; tasteless. Slightly soluble in ethanol or chloroform; practically insoluble in water.

Specific absorbance Measure the absorbance of a solution of 13 µg per ml in 0.1 mol/L hydrochloric acid solution at 272 nm (Appendix IV A), the value of A (1%, 1 cm) is 309-329.

Identification (1) The light absorption of the solution obtained in the test for Specific absorbance, exhibits a maximum at 272 nm and a minimum at 261 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of pyrimethamine (Appendix XVI).

(3) Ignite 0.1 g with 0.5 g of anhydrous sodium carbonate and cool. Extract the residue with water, filter, add nitric acid dropwise to the filtrate until it turns litmus paper red; the solution yields that reactions characteristic of chlorides (Appendix III).

Acidity or alkalinity Boil 0.30 g with 15 ml of water, cool and filter, to the filtrate add 2 drops of methyl red IS, no red colour is produced; add 0.10 ml of hydrochloric acid (0.05 mol/L) VS; a red colour is produced.

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and mixture of toluene-glacial acetic acid-*n*-propanol-chloroform (25 : 10 : 10 : 2) as the mobile phase. Apply separately to the plate 10 µl of each of two solutions in the mixture of chloroform-methanol (9 : 1) containing (1) 20 mg (2) 50 µg of the substance being examined per ml. After developing and removal of the plate, dry it in air and examine under ultraviolet light (254 nm). Any spot in the chromatogram other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.15 g, accurately weighed, in 20 ml of glacial acetic acid by heat and allow to cool. Add 2 drops of quinaldine red IS, titrate with perchloric acid (0.1 mol/L) VS until the solution becomes almost colourless. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 24.87 mg of C₁₂H₁₃ClN₄.

Category Antimalarial agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation Pyrimethamine Tablets

Pyrimethamine Tablets

Pyrimethamine Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of pyrimethamine (C₁₂H₁₃ClN₄).

Description White tablets.

Identification (1) To a quantity of the powdered tablets equivalent to about 5 mg of pyrimethamine, add 2 ml of dilute sulfuric acid and heat, cool and filter. Add 2 drops of mercuric potassium iodide TS to the filtrate, a creamy-white precipitate is produced.

(2) The light absorption of the solution obtained in the Assay exhibits a maximum at 272 nm and a minimum at 261 nm (Appendix IV A).

(3) Comply with the test (3) for Identification described under Pyrimethamine, using a quantity of the powdered tablets equivalent to about 0.1 g of pyrimethamine.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Dissolve 1 tablet in a 100 ml volumetric flask with a quantity of 0.1 mol/L hydrochloric acid solution by ultrasonic treatment, cool. Dilute to volume with 0.1 mol/L hydrochloric acid solution, mix well and filter. Transfer 5 ml of the successive filtrate, accurately measured in 25 ml volumetric flask, dilute to volume with 0.1 mol/L hydrochloric acid solution, mix well. Measure the absorbance at 272 nm (Appendix IV A), calculate the content of C₁₂H₁₃ClN₄, taking 319 as the value of A (1%, 1 cm).

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 500 ml of 0.1 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw the solution after exactly 45 minutes and filter. Measure the absorbance at 272 nm (Appendix IV A), using the successive filtrate. Calculate the dissolution of C₁₂H₁₃ClN₄ from each tablet, taking 319 as the value of A (1%, 1 cm). Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To a quantity of the powder equivalent to about 25 mg of pyrimethamine, accurately weighed, in a 100 ml volumetric flask add 70 ml of 0.1 mol/L hydrochloric acid solution, warm and shake thoroughly. Cool, add 0.1 mol/L hydrochloric acid solution to volume, mix well and filter. Measure accurately 5 ml of the successive filtrate to a 100 ml volumetric flask, add 0.1 mol/L hydrochloric acid solution to volume and mix well. Measure the absorbance at 272 nm (Appendix IV A). Calculate the content of C₁₂H₁₃ClN₄, taking 319 as the value of A (1%, 1 cm).

Category As described under Pyrimethamine.

Strength 6.25 mg

Storage Preserve in tightly closed containers, protected from light.

Pyritinol Hydrochloride

C₁₆H₂₀N₂O₄S · 2HCl · H₂O 459.40 [1098-97-1]

Pyritinol Hydrochloride is 3,3-(Dithiobismethylene) bis [5-hydroxy-6-methyl-4-pyridine methanol] dihydrochloride monohydrate. It contains not less than 97.0% and not more than 103.0% of C₁₆H₂₀N₂O₄S · 2HCl, calculated on the anhydrous basis.

Description A white or almost white crystalline powder; odourless; taste bitter and astringent.

Freely soluble in water; sparingly soluble in ethanol; insoluble in acetone, chloroform or ether.

Identification (1) Heat carefully on a straight fire to melt about 50 mg in a test tube, an odour of hydrogen sulfide is perceptible.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with reference spectrum of Pyritinol Hydrochloride (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.1 g in 10 ml of water, pH 2.0-3.5 (Appendix VI H) (used for injection).

Clarity and colour of solution Dissolve 1.0 g in 10 ml of water, the solution is clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution Y₇, OY₇ or YG₅ (for oral use), or Y₂ or YG₂ (used for injection) (Appendix

IX A, method 1).

Water Not more than 4.5% of its weight (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.1% (Appendix VIII N) use 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for residue on ignition, not more than 0.001%.

Sterility Comply with the test for sterility (Appendix XI H) (used for injection).

Assay Dissolve a quantity, accurately weighed, with 0.01 mol/L hydrochloric acid solution to produce a solution of 10 µg per ml. Measure the absorbance of the resulting solution at 295 nm (Appendix IV A), calculate the content of $C_{16}H_{20}N_2O_4S_2 \cdot 2HCl$, taking 403 as the value of A (1%, 1 cm).

Category Nootropic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Pyritinol Hydrochloride Capsules
(2) Pyritinol Hydrochloride for Injection
(3) Pyritinol Hydrochloride Tablets

Pyritinol Hydrochloride Capsules

Pyritinol Hydrochloride Capsules contain not less than 93.0% and not more than 107.0% of the labelled amount of pyritinol hydrochloride ($C_{16}H_{20}N_2O_4S_2 \cdot 2HCl \cdot H_2O$).

Description Capsules containing white or almost white powder.

Identification The contents of capsules comply with tests for Identification (1) described under Pyritinol Hydrochloride. (2) Shake a quantity of the contents of capsules with water and filter. The filtrate yields the reactions characteristic of chloride (Appendix III).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Dissolve a quantity of the mixed contents obtained in the test for weight variation of contents, equivalent to about 0.1 g of Pyritinol Hydrochloride, in 0.01 mol/L hydrochloric acid solution and dilute to 100 ml, mix well and filter. Measure accurately 2 ml of the successive filtrate to a 200 ml volumetric flask, dilute to volume with 0.01 mol/L hydrochloric acid solution, mix well. Measure the absorbance of the resulting solution at 295 nm (Appendix IV A). Calculate the content of $C_{16}H_{20}N_2O_4S_2 \cdot 2HCl \cdot H_2O$, taking 388 as the value of A (1%, 1 cm).

Category As described under pyritinol hydrochloride.

Strength 0.1 g

Storage preserve in tightly closed containers, protected from light.

Pyritinol Hydrochloride for Injection

Pyritinol Hydrochloride for Injection is a sterile powder of Pyritinol Hydrochloride. It contains

not less than 93.0% and not more than 107.0% of the labelled amount of anhydrous Pyritinol Hydrochloride ($C_{16}H_{20}N_2O_4S_2 \cdot 2HCl$), calculated with reference to the average weight of contents.

Description A white or almost white crystalline powder; odourless; taste, bitter and astringent.

Identification Complies with the tests for Identification (1) and (3) described under Pyritinol Hydrochloride.

Clarity and colour of solution Add 2 ml of water to each of 5 containers (calculated with reference to the labelled amount as 0.2 g), the solution is clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution Y₂ or YG₂ (Appendix IX A, method 1).

Acidity A 1% aqueous solution, pH 2.0-3.5 (Appendix VI H).

Water Not more than 5.0% of its weight. (Appendix VIII M, method 1 A).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Weigh accurately a quantity of the mixed contents obtained in the test for weight variation of contents, carry out the Assay described under Pyritinol Hydrochloride.

Category As described under Pyritinol Hydrochloride.

Strength (1) 0.1 g (2) 0.2 g

Storage Preserve in well closed containers, protected from light.

Pyritinol Hydrochloride Tablets

Pyritinol Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of Pyritinol hydrochloride ($C_{16}H_{20}N_2O_4S_2 \cdot 2HCl \cdot H_2O$).

Description White or almost white tablets or sugar coated tablets with white or almost white core.

Identification A quantity of the powdered tablets complies with tests for Identification (1) and (3) described under Pyritinol Hydrochloride.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Powder 20 tablets, with sugar coat removed. Dissolve a quantity, accurately weighed, equivalent to about 0.1 g of Pyritinol hydrochloride in a 100 ml volumetric flask in 0.01 mol/L hydrochloric acid, dilute to volume, mix well and filter. Measure accurately 2 ml of the successive filtrate to a 200 ml volumetric flask, dilute with 0.01 mol/L hydrochloric acid to volume, mix well. Measure the absorbance of the resulting solution at 295 nm (Appendix IV A). Calculate the content of $C_{16}H_{20}N_2O_4S_2 \cdot 2HCl \cdot H_2O$, taking 388 as the value of A (1% 1 cm).

Category As described under Pyritinol hydrochloride.

Strength 0.1 g

Storage Preserve in tightly closed containers, protect from light.

Quinestrol

$C_{25}H_{32}O_2$ 364.50

[152-43-2]

Quinestrol is 3-(cyclopentyloxy)-17 α -pregna-1,3,5 [10]-trien-20-yn-17-ol. It contains not less than 97.5% and not more than 102.5% of $C_{25}H_{32}O_2$, calculated on the dried basis.

Description White or almost white crystals or a crystalline powder.

Soluble in ethanol, acetone, ethyl acetate or chloroform; practically insoluble in water.

Melting range 106-112°C (Appendix VI C).

Specific optical rotation 0° to +5°, in a solution of about 10 mg per ml in dioxane (Appendix VI E).

Identification (1) Dissolve 2 mg in 2 ml of sulfuric acid, an orange red colour is produced, and a yellowish-green fluorescence is exhibited under ultraviolet light. Add 2 ml of water, a red precipitation is produced.

(2) The light absorption of a solution obtained in the Assay exhibits a maximum at 280 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of quinestrol (Appendix XVI).

Loss on drying When dried to constant weight at 80°C, loses not more than 5.5% of its weight (Appendix VIII L).

Assay To 50 mg, accurately weighed, in a 50 ml volumetric flask add absolute ethanol and dilute to volume and mix well. Transfer 5 ml, accurately measured, to another 50 ml volumetric flask, dilute with absolute ethanol to volume and mix well. Measure the absorbance at 280 nm (Appendix IV A). Weigh a quantity of quinestrol CRS to produce a solution of 100 μ g per ml of absolute ethanol instead of the substance being examined. Calculate the content of $C_{25}H_{32}O_2$.

Category Progestogen.

Storage Preserve in tightly closed containers.

Quinidine Sulfate

$(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O$ 782.96 [6591-63-5]

Quinidine Sulfate is (9S)-6'-methoxydeoxycinchonane-9-ol sulfate (2 : 1) (salt), dihydrate. It contains not less than 99.0% of $(C_{20}H_{24}N_2O_2)_2 \cdot$

H_2SO_4 , calculated on the dried basis.

Description White, fine needle crystals; odourless; taste, very bitter; discoloured gradually on exposure to light. Freely soluble in boiling water; soluble in chloroform or ethanol; sparingly soluble in water; practically insoluble in ether.

Specific optical rotation +275° to +290°, in a solution of 20 mg per ml in 0.1 mol/L hydrochloric acid solution (Appendix VI E).

Identification (1) Dissolve 20 mg in 20 ml of water, acidify 10 ml of the solution with dilute sulfuric acid; a blue fluorescence is produced. Add a few drops of hydrochloric acid solution, a fluorescence is disappeared.

(2) Add 1-2 drops of bromine TS and 1 ml of ammonia TS to 5 ml of the solution obtained under (1); an emerald-green colour is produced.

(3) The aqueous solution yields the reactions characteristic of sulfates (Appendix III).

Acidity An aqueous solution of 10 mg per ml, pH 6.0-7.0 (Appendix VI H).

Chloroform-Ethanol-insoluble matter Dissolve 2.0 g in 15 ml of a mixture of chloroform-dehydrated ethanol (2 : 1), heat at 50°C for 10 minutes, cool, filter with a sintered glass filter and wash the filter with five 10 ml portions of a mixture of chloroform-dehydrated ethanol (2 : 1), dried at 105°C for 1 hour, the residue is not more than 0.1% of its weight.

Related substances Carry out the method for thin layer chromatography (Appendix V B), using silica gel H as the coating substance and chloroform-acetone-diethylamine (5 : 4 : 1) as the mobile phase. Apply separately to the plate 10 μ l of each of two solutions in dilute ethanol containing (1) 6 mg; (2) 0.06 mg of the substance being examined per ml. After developing 15 cm and removal of the plate, dry it and spray with glacial acetic acid, and examine under ultraviolet light at 365 nm, spray with potassium iodoplatinate TS. Any spot, other than the quinidine and dihydroquinidine principal spot in the chromatogram obtained with the solution (1) is not more intense than the principal spot obtained with the solution (2).

Loss on drying When dried to constant weight at 120°C, loses not more than 5.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve 0.2 g, accurately weighed, in 5 ml of glacial acetic acid, add 20 ml of acetic anhydride and a drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to green. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 24.90 mg of $(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4$.

Category Antiarrhythmic agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation Quinidine Sulfate Tablets

Quinidine Sulfate Tablets

Quinidine Sulfate Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of Quinidine Sulfate $(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O$.

Description Sugar-coated with white core.

Identification Powder the tablets with the sugar coating removed. Weigh accurately a quantity of the powder equivalent to about 20 mg of Quinidine Sulfate, add 20 ml of water, mix well and filter. The filtrate complies with the tests for Identification described under Quinidine Sulfate.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of 0.1 mol/L hydrochloric acid as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 45 minutes and filter. Measure 2 ml of the successive filtrate and dilute with the dissolution medium to 10 ml. Measure the absorbance of the resulting solution at 347 nm (Appendix IV A). Calculate the dissolution of $(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4$ from each tablet, taking 149 as the value of A (1%, 1 cm) and multiply by 0.9540; not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets with the sugar coating removed. To an accurately weighed quantity of the powdered tablets equivalent to about 0.2 g of quinidine sulfate add 20 ml of acetic anhydride, warm to dissolve quinidine sulfate. Add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the solution changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 26.10 mg $(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O$.

Category As described under Quinidine Sulfate.

Strength 0.2 g

Storage Preserve in tightly closed containers, protected from light.

Quinine Dihydrochloride

$C_{20}H_{24}N_2O_2 \cdot 2HCl$ 397.34

[60-93-5]

Quinine Dihydrochloride is 6'-methoxy-(8 α -9R)-chinchonan-9-ol dihydrochloride. It contains not less than 99.0% of $C_{20}H_{24}N_2O_2 \cdot 2HCl$, calculated on dried basis.

Description A white powder; odourless; taste, very bitter; discoloured slowly on exposure to light; the aqueous solution exhibits an acid reaction. Very soluble in water, soluble in ethanol, slightly soluble in chloroform, very slightly soluble in ether.

Specific optical rotation -223° to -229° in a solution of 30 mg per ml in 0.1 mol/L hydrochloric acid solution (Appendix VI E).

Identification (1) Dissolve about 20 mg in 20 ml of water, add dilute sulfuric acid dropwise to 10 ml of the solution, a blue fluorescence is produced. (2) Add 3 drops of bromine TS and 1 ml of ammonia TS to 5 ml of above solution, a emerald green colour is produced. (3) The infrared absorption spectrum (Appendix IV C) is

concordant with the reference spectrum of quinine dihydrochloride (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.30 g in 10 ml of water, pH 2.0-3.0 (Appendix VI H).

Sulfates Carry out the limit test for sulfates (Appendix VIII B), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of potassium sulfate standard solution (0.05%).

Other cinchona alkaloids Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of toluene-ether-diethylamine (20 : 12 : 5) as the mobile phase. Apply separately to the plate 5 μ l of each of two solutions in methanol containing (1) 10 mg of the substance being examined per ml and (2) 0.25 mg of anchonidine CRS per ml. After developing and removal of the plate, allow it to dry in air and repeat twice the developing. Dry the plate at $105^\circ C$ for 30 minutes, allow it to cool and spray with potassium iodoplatinate TS. Any spot, other than the principal spot, obtained with solution (1) is not more intense than the principal spot obtained with solution (2) (2.5%).

Loss on drying When dried to constant weight at $105^\circ C$, loses not more than 3.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.15% (Appendix VIII N).

Bariums Dissolve 0.20 g in 10 ml of water, add 1 ml of dilute sulfuric acid. The solution remains clear for at least 15 minutes.

Assay Dissolve about 0.15 g, accurately weighed, in 5 ml of acetic anhydride and 3 ml of mercuric acetate TS, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS, until the colour changes to bluish green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 19.87 mg of $C_{20}H_{24}N_2O_2 \cdot 2HCl$.

Category Antimalarial.

Storage Preserve in tightly closed containers, protected from light.

Preparation Quinine Dihydrochloride Injection

Quinine Dihydrochloride Injection

Quinine Dihydrochloride Injection is a sterile solution of Quinine Dihydrochloride in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of quinine dihydrochloride ($C_{20}H_{24}N_2O_2 \cdot 2HCl$).

Description A clear, colourless or pale yellow liquid.

Identification Complies with the tests (1), (2) and (4) for Identification described under Quinine Dihydrochloride.

pH value Not lower than 2.5 (Appendix VI H).

Colour Not more intense than the colour of the reference solution (using 10 ml of Potassium Dichromate Standard Solution, add water to 20 ml) in equal volume.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity of the injection equivalent to about 15 mg of quinine dihydrochloride per ml

in water, and transfer 10 ml, accurately measured, to a separator, add water to produce 20 ml, alkaliify with ammonia TS and extract with chloroform in portions, first time use 25 ml, then use 10 ml each time until the extraction of quinine is completed. Wash each portion of chloroform extract twice with 5 ml of water, then extract the washings with 10 ml of chloroform. Combine the chloroform extracts, evaporate to expel the chloroform on a water bath, add 2 ml of dehydrated ethanol, evaporate to dryness, dry for an hour at 105°C and cool. Dissolve the residue in a mixture of 5 ml of acetic anhydride and 10 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 19.87 mg of $C_{20}H_{24}N_2O_2 \cdot 2HCl$.

Category As described under Quinine Dihydrochloride.

Strength (1) 1 ml : 0.25 g (2) 1 ml : 0.5 g
(3) 2 ml : 0.25 g (4) 2 ml : 0.5 g
(5) 10 ml : 0.25 g

Storage Preserve in tightly closed containers, protected from light.

Quinine Sulfate

$(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O$ 782.96 [6119-70-6]

Quinine Sulfate is (8α, 9R)-6'-methoxy-cinchonan-9-ol sulfate (2 : 1) (salt) dihydrate. It contains not less than 99.0% of $(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4$, calculated on the dried basis.

Description White, fine needle crystals; light and soft; readily compressible; odourless; taste, very bitter; the colour changes gradually on exposure to light; the aqueous solution exhibits neutral reaction.

Freely soluble in a mixture of chloroform-dehydrated ethanol (2 : 1); slightly soluble in water, ethanol, chloroform or ether.

Specific optical rotation -237° to -244° , in a solution of 20 mg per ml in 0.1 mol/L hydrochloric acid solution (Appendix VI E).

Identification (1) Dissolve 20 mg in 20 ml of water, acidify 10 ml of the solution with dilute sulfuric acid, a blue fluorescence is produced.

(2) Add 3 drops of bromine TS and 1 ml of ammonia TS to 5 ml of the solution obtained under (1), an emerald green colour is produced.

(3) Add hydrochloric acid to acidify 5 ml of the solution obtained under (1), then add 1 ml of barium chloride TS, a white precipitate is produced.

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of quinine sulfate (Appendix XVI).

Acidity Dissolve 0.20 g in 20 ml of water, pH 5.7-6.6 (Appendix VI H).

Chloroform-ethanol-insoluble substances Dissolve 2.0 g in 15 ml of a mixture of chloroform-dehydrated ethanol (2 : 1), heat at 50°C for 10 minutes, filter with a previously weighed sintered glass crucible and wash the residue with 10 ml each of the same solvent for 5 times and dried to constant weight at 105°C, the residue is not more than 2 mg.

Other cinchona alkaloids Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-acetone-diethylamine (5 : 4 : 1.25) as the mobile phase. Apply separately to the plate 5 μl of each of two solutions in dilute ethanol containing (1) 10 mg, (2) 50 μg of the substance being examined per ml. After developing and removal of the plate, dry it in warm air and spray with potassium iodoplatinate TS. Any spots, other than the principal spot, obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 5.0% of its weight (Appendix VII L).

Residue on ignition Not more than 0.1% (Appendix VII N).

Assay Dissolve 0.2 g, accurately weighed, in 10 ml of glacial acetic acid, add 5 ml of acetic anhydride and 1-2 drops of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 24.90 mg of $(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4$.

Category Antimalarial.

Storage Preserve in tightly closed containers, protected from light.

Preparation Quinine Sulfate Tablets

Quinine Sulfate Tablets

Quinine Sulfate Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of quinine sulfate $[(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O]$.

Description Sugar coated tablets with white core.

Identification (1) To a quantity of powdered tablets with sugar coating removed equivalent to about 50 mg of quinine sulfate add 5 ml of water, shake and filter. The filtrate complies with tests (1) (2) (3) for Identification described under quinine sulfate.

(2) To a quantity of powdered tablets obtained under (1) add 0.1 mol/L hydrochloric acid solution to produce a solution of 10 mg per ml and filter. The optical rotation of the filtrate (Appendix VI E) exhibits levorotation (distinguish from quinidine tablets).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets after removing sugar coating. Weigh accurately a quantity equivalent to about 0.3 g of quinine sulfate to a separator, add 0.5 g of sodium chloride and 10 ml of 0.1 mol/L sodium hydroxide solution and mix well. Add 50 ml of chloroform, accurately measured, shake for 10 minutes, allow to separate into two layers. Filter the chloroform layer, measure accurately 25 ml of the successive filtrate, add 5 ml of acetic anhydride and 2 drops of dimethyl yellow IS, titrate with perchloric acid (0.1 mol/L) VS until the colour

containing (1) 10 mg per ml, (2) 0.25 mg per ml (3) 0.15 mg per ml, (4) 0.10 mg per ml, (5) 0.05 mg per ml. After developing and removal of the plate, dry it in air, visualize in iodine vapour and observe immediately. The intensity of any secondary spot, in the chromatogram obtained with solution (1) is compared with that of the principal spots obtained with solution (2), (3), (4), (5), the total amount of impurities is not more than 2.5%.

Loss on drying When dried at 60 °C for 4 hours in vacuum over phosphorus pentoxide, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N); use 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in Residue on ignition; not more than 0.002%.

Assay Carry out the method for high-performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-0.77% ammonium acetate solution (285 : 115) as the mobile phase. Detection wavelength is 320 nm and the number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of ranitidine hydrochloride. The resolution factor between peaks of ranitidine hydrochloride and internal standard complies with the related requirements.

Internal standard solution Dissolve a quantity of indomethacin in methanol to produce a solution of about 0.30 mg per ml.

Procedure Dissolve a quantity of ranitidine hydrochloride, accurately weighed, in 50% methanol solution to produce a solution of 0.15 mg per ml. Transfer 2 ml each of the test solution and the internal standard solution, both measured accurately, in a 50 ml volumetric flask, dilute with 50% methanol solution to volume, mix well. Inject 10-15 µl of the resulting solution into the column. Repeat the operation, using the substance being examined instead of ranitidine hydrochloride CRS, calculate the content of $C_{13}H_{22}N_4O_3S$.

Category Histamine H_2 receptor antagonist.

Storage Preserve in tightly closed containers, protected from light, stored in cool, dark and dry place.

Preparation (1) Ranitidine Hydrochloride Capsules
(2) Ranitidine Hydrochloride Injection
(3) Ranitidine Hydrochloride Tablets

Ranitidine Hydrochloride Capsules

Ranitidine Hydrochloride Capsules contain not less than 93.0% and not more than 107.0% of the labelled amount of ranitidine ($C_{13}H_{22}N_4O_3S$).

Identification (1) A quantity of the contents equivalent to about 0.2 g of ranitidine complies with test (1) for Identification described under ranitidine hydrochloride.

(2) The solution obtained in Assay exhibits absorption maxima at 228 nm and 314 nm (Appendix IV A).

(3) Shake the contents with water and filter. The filtrate yields reactions characteristic of chlorides (Appendix III).

Related substances Carry out the related substances described under Ranitidine Hydrochloride Tablets, using the contents of capsules, the total amount of impurities is not more than 4.0%.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Mix well the mixed contents obtained in the test for weights variation of contents and dissolve a quantity of the contents, accurately weighed, equivalent to about 25 mg of ranitidine in a 100 ml volumetric flask with water, dilute to volume with water, mix well and filter, carry out the Assay described under Ranitidine Hydrochloride Tablets, using 5 ml, accurately measured, of the successive filtrate, beginning at the words "To 5 ml, accurately measured, of the dilute solution...". Calculate the content of $C_{13}H_{22}N_4O_3S$.

Category As described under Ranitidine Hydrochloride.

Strength (1) 75 mg (2) 100 mg (3) 150 mg
(calculated on $C_{13}H_{22}N_4O_3S$)

Storage Preserve in tightly closed containers, protected from light, stored in dry place.

Ranitidine Hydrochloride Injection

Ranitidine Hydrochloride Injection is a sterile solution of Ranitidine Hydrochloride in Water for Injection. It contains not less than 93.0% and not more than 107.0% of the labelled amount of ranitidine hydrochloride ($C_{13}H_{22}N_4O_3S$).

Description A clear, slightly yellow or pale yellow liquid.

Identification (1) Transfer 2 ml of the injection to a test tube, evaporate to dryness on a water bath, heat gently, the evolved vapour turns the moistened lead acetate test paper to black.

(2) Complies with the tests (2) and (4) for Identification described under ranitidine hydrochloride.

Related substances Prepare the test solution containing 10 mg per ml of methanol. Dilute a quantity of the test solution, accurately measured with methanol to produce solutions containing 0.05 mg, 0.10 mg, 0.15 mg and 0.20 mg per ml respectively as the reference solution (1), (2), (3) and (4). Carry out the method for thin layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethyl acetate-isopropanol-concentrated ammonia solution-water (25 : 15 : 5 : 1) as the mobile phase. Apply separately to the plate 10 µl each of the 5 solutions. After developing and removal of the plate, dry in air, visualize in iodine vapour and observe immediately. The total amount of impurities is not more than 6.0% in comparison with the colour intensity of the principal spot in the chromatogram obtained with the reference solutions (1), (2), (3) and (4).

pH value 6.5-7.5 (Appendix VI H).

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 1 ml per kg of rabbit's weight.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity equivalent to 25 mg of ranitidine into a 100 ml volumetric flask, dilute with water to volume and mix well. Carry out the assay described under Ranitidine Hydrochloride Tablets, using 5 ml, accurately measured, beginning at the words "To 5 ml, accurately measured, of the dilute solution...". Calculate the content of $C_{13}H_{22}N_4O_3S$.

Category As described under Ranitidine Hydrochloride.

Strength (1) 2 ml : 50 mg (2) 5 ml : 50 mg
(calculated on $C_{13}H_{22}N_4O_3S$)

Storage Preserve in well closed containers, protected from light.

Ranitidine Hydrochloride Tablets

Ranitidine Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of ranitidine ($C_{13}H_{22}N_4O_3S$).

Description Sugar coated or film coated tablets with almost white or slightly yellow core.

Identification (1) Weigh and powder a quantity of tablets with coating removed equivalent to about 0.2 g of ranitidine. It complies with test (1) for Identification described under Ranitidine Hydrochloride.

(2) The solution obtained in Assay exhibits absorption maxima at 228 nm and 314 nm (Appendix IV A).

(3) Shake the powder obtained in test (1) for Identification with water and filter. The filtrate yields the reactions characteristic of chlorides (Appendix III).

Related substances Prepare the test solution containing 10 mg per ml of methanol. Dilute a quantity of the test solution, accurately measured with methanol to produce solutions containing 0.05 mg, 0.10 mg, 0.15 mg and 0.20 mg per ml respectively as the reference solution (1), (2), (3) and (4). Carry out the method for thin layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethyl acetate-isopropanol-concentrated ammonia solution-water (25 : 15 : 5 : 1) as the mobile phase. Apply separately to the plate 10 μ l each of the 5 solutions. After developing and removal of the plate, dry it in air, visualize in iodine vapour and observe immediately. The total amount of impurities is not more than 4.0% in comparison with the colour intensity of the principal spot in the chromatogram obtained with the reference solutions (1), (2), (3) and (4).

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw the solution after exactly 45 minutes and filter, dilute 2 ml of the successive filtrate with water to 20 ml, mix well. Measure the absorption of the resulting solution at 314 nm (Appendix IV A). Calculate the dissolution of $C_{13}H_{22}N_4O_3S$ from each tablet, taking 495 as the value of A (1%, 1 cm). Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Triturate a quantity of powder, accurately weighed, equivalent to about 25 mg of ranitidine with water in a mortar, allow it to disintegrate completely. Transfer the mixture to a 100 ml volumetric flask, wash the mortar with a small amount of water in portions. Combine the washings with the mixture in the volumetric flask, dilute with water to volume, mix well and filter, transfer 5 ml of the successive filtrate, accurately measured, to a 250 ml volumetric flask, dilute with water to volume and shake well. Measure accurately 5 ml of the dilute solution in a 100 ml volumetric flask, dilute with water to volume and mix well. Measure the absorbance of the resulting solution at 314 nm (Appendix IV A), calculate the content of $C_{13}H_{22}N_4O_3S$, taking 495 as the value of A (1%, 1 cm).

Category As described under Ranitidine Hydrochloride.

Strength (1) 75 mg (2) 150 mg

(calculated on $C_{15}H_{22}N_4O_3S$)

Storage Preserve in tightly closed containers, protected from light and stored in dry place.

Raubasine

$C_{21}H_{24}N_2O_3$ 352.43

Raubasine is (19a)-16,17-didehydro-19-methyl-Oxayhimban-16-carboxylic acid methyl ester. It contains not less than 98.5% of $C_{21}H_{24}N_2O_3$, calculated on the dried basis.

Description A white to slightly yellow powder; colourless; odourless.

Soluble in chloroform; slightly soluble in methanol, ethanol or acetone; practically insoluble in water.

Specific optical rotation -57° to -67° , in a solution of 2.5 mg per ml in chloroform (Appendix VI E).

Identification (1) Dissolve about 5 mg in 2 ml of dilute sulfuric acid TS, add 1 drop of bismuth potassium iodide TS, an orange red precipitate is produced immediately.

(2) The light absorption of a solution of 4 μ g per ml in ethanol exhibits a maxima at 227 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Raubasine (Appendix X XIII).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of chloroform-methanol (40 : 0.1) as mobile phase. Apply separately to the plate 10 μ l each of four solution in chloroform containing (1) 10 mg per ml, (2) 0.05 mg per ml, (3) 0.10 mg per ml, (4) 0.15 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air and expose it to saturated iodine vapour until the spots appear, then examine immediately. The number of spots in the chromatogram other than the principal spot obtained with solution (1) is not more than 3. Any spot is compared with that of the principal spots obtained with solution (2), (3), (4), the total impurity is not more than 1.5%.

Chloroform Dissolve a quantity, accurately weighed, in dimethylformamide to produce a solution of 20 mg per ml. Carry out the test for the residual solvents (Appendix VIII P), complying with the requirements.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for residue on ignition; not more than 0.002%.

Assay Dissolve about 0.3 g, accurately weighed, in 20 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid VS (0.1 mol/L) until the colour

changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid VS (0.1 mol/L) is equivalent to 35.24 mg of $C_{21}H_{24}N_2O_3$.

Category Nootropic

Storage Preserve in tightly closed containers and cold place, protected from light.

Recombinant Human Growth Hormone is a protein having 191 amino acid residues or 192 amino acid residues with a methionine on N-terminal, mixed with suitable excipients or stabilizing agent. It contains not less than 90.0% and not more than 110.0% of the labelled amount of recombinant human Growth Hormone. Recombinant Human Growth Hormone is produced by a method based on recombinant DNA technology. It must be demonstrated that the manufacturing process produces a product having a biological activity of at least 2.5 Units per mg, using a suitable, validated vivo bioassay.

Host-cell and vector-derived DNA and host-cell derived proteins are potential specific impurities related to the manufacturing process and must be controlled strictly during the manufacturing process, the host cell derived proteins content of recombinant human somatotropin, determined by an appropriate and validated method, is not more than 10 ppm, the host cell or vector derived DNA content and limit of human insulin derived from a recombinant DNA process that utilizes prokaryotic or eukaryotic host cell are determined by a validated method.

Description A white lyophilized powder.

Identification (1) Dissolve a quantity in water to produce a solution of 2 mg per ml, to a quantity volume of the solution add the equal volume of sample buffer (measure 2.5 ml of concentrated gel buffer, 2.5 ml of 20% sodium dodecyl sulfate (SDS), 1.0 ml of 0.1% bromophenol blue solution and 3.5 ml of 87% glycerol solution, add water to 10 ml), add β -mercaptoethanol to make the final concentration of 5%, heat in a water bath for 3 minutes, cool as a test solution. Repeat the operation, using recombinant human somatotropin RS or formylate recombinant human somatotropin RS instead of the substance being examined as a reference

solution. Apply separately 10 μ l each of the reference solution and the test solution to the gel. Carry out the method for electrophoresis (Appendix V F, method 5, Coomassie staining method). the mobility of the principal component of the test solution is identical with that of the principal component of the reference solution.

(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the test for Related proteins is identical with that of the principal peak of recombinant human somatotropin RS or formylate recombinant human somatotropin RS in the chromatogram of the reference solution.

(3) Dissolve a quantity in water to produce a solution of 2 mg per ml, to 150 μ l of the solution add 150 μ l of trimetamol-acetic acid BS (dissolve 0.294 g calcium chloride and 12.11 g trimetamol in 400 ml of water, adjust pH value to 8.5 with 5 mol/L acetic acid solution, add water to 500 ml) and 10 μ l of trypsin solution (dissolve a quantity of trypsin previously treated with TPCK in 1 mol/L acetic acid-sodium acetate BS (pH 5.0) to produce a solution of 1 mg per ml), mix well, warm in a 37°C water bath for 4 hours, add 60 μ l of glacial acetic acid to stop the reaction, as a test solution. Repeat the operation using recombinant human somatotropin RS or formylate recombinant human somatotropin RS instead of the substance being examined, as a reference solution. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octasilane bonded silica gel (5~10 μ m), a 0.1% solution of trifluoroacetic acid in water as mobile phase A and a 0.1% solution of trifluoroacetic acid in 90% acetonitrile as mobile phase B and performing the gradient elution program. Flow rate is 1.0 ml per minutes, column temperature is 35°C and detection wavelength is 214 nm.

Time (minute)	mobile phase A	mobile phase B
0	100%	0%
20	80%	20%
45	75%	25%
70	50%	50%
75	20%	80%

Inject separately 100 μ l each of the reference solution and the test solution into the column, and record the chromatogram. The peptide map of the test solution is identical with that of the reference solution.

Related proteins Dissolve a quantity in 0.05 mol/L trimetamol-hydrochloric acid BS (pH 7.5) to produce a solution of 2 mg per ml as a test solution. Repeat the operation using recombinant human somatotropin RS or formylate recombinant human somatotropin RS as a reference solution. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with butylsilyl silica gel (5~10 μ m) and a mixture of 0.05 mol/L trimetamol-hydrochloric acid BS (pH 7.5)-*n*-propanol (about 71:29) as the mobile phase, adjust the proportions of the *n*-propanol such that the retention time of the principal peak of human somatotropin is approximately 30-36 minutes. Flow rate is 0.5 ml per minute, column temperature is 45°C and detection wavelength is 220 nm. Inject 20 μ l of the system suitability test solution (Dissolve a quantity of recombinant human somatotropin RS or formylate recombinant human somatotropin RS in 0.05 mol/L trimetamol-hydrochloric acid BS (pH 7.5) to produce a solution of 2 mg per ml. The final processes are sterile filtration, and allow to stand at room temperature for 5 hours. into the column. The resolution factor between the peaks of recombinant human somatotropin and oxidation recombinant human somatotropin is not less than 1.0, the tailing factor is 0.9~1.8. Inject 20 μ l of the test solution into the column.

Calculate the content of total related proteins with respect to the peak areas obtained in the chromatograms by the area normalization method; not more than 10.0%.

High molecular weight proteins Carry out the method described under Assay, calculate the content of high molecular weight proteins with respect to the peak areas obtained in the chromatogram by the area normalization method; not more than 4.0%.

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method).

Water Not more than 10.0% (Appendix VIII M, method 1 A).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 5 Eu per mg of recombinant human somatotropin.

Assay Carry out the method for size exclusion chromatography (Appendix V H), using a column packed with hydrophilic silica gel for chromatography suitable for separation of globular protein with 5000-60000 daltons and 2-propanol-0.06 mol/L phosphate buffer solution (Dissolve 5.18 g of anhydrous phosphate hydrate sodium and 3.65 g of phosphate dihydrate sodium in 950 ml of water, adjust the pH to 7.0 with 85% phosphoric acid, dilute to 1000 ml with water) (3 : 97) as the mobile phase. Flow rate is 0.6 ml per minute and detection wavelength is 214 nm. Inject 20 µl of solution for system suitability test (dissolve monomer-dimer human somatotropin CRS in 0.025 mol/L phosphate buffer solution pH (7.0) (0.063 mol/L phosphate buffer solution 1→2.5) to produce a solution of 1.0 mg per ml) into the column. The resolution between the peak of monomer of human somatotropin and dimer should comply with the requirement.

Procedure Dissolve a quantity in 0.025 mol/L phosphate buffer solution (pH 7.0) to produce a solution of 1.0 mg per ml, inject 20 µl into the column. Repeat the operation, using recombinant human somatotropin CRS instead of the substance being examined. Calculate the content of recombinant human somatotropin with respect to the peak area obtained in the chromatogram by the external standard method.

Category Growth hormone.

Storage Preserve in tightly closed containers, stored at a temperature of 2°C to 8°C.

Preparation Recombinant Human Growth Hormone for Injection.

Recombinant Human Growth Hormone for Injection

Recombinant Human Growth Hormone for Injection is a lyophilized preparation of recombinant human somatotropin. It contains not less than 90.0% and not more than 110.0% of the labelled amount of recombinant human growth hormone.

Description A white lyophilized powder.

Identification Complies with tests (1) and (2) for Identification described under recombinant human somatotropin.

Acidity or alkalinity To each container add 1 ml of water for Injection, pH 6.5-8.5 (Appendix VI H).

Clarity and colour of solution A solution of 1.6 mg per ml in

water is clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 2 (Appendix IX B).

Water Not more than 3.0% (Appendix VIII M, method 1 A).

Related proteins Carry out the method for Related proteins described under Recombinant Human Somatotropin; not more than 13.0%.

High molecular weight protein Carry out the method for High molecular weight proteins described under Recombinant Human Somatotropin; not more than 6.0%.

Bacterial endotoxin and Sterility Complies with the test for Bacterial endotoxin and Sterility described under Recombinant Human Somatotropin.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Recombinant Human Somatotropin.

Category As described under Recombinant Human Growth Hormone.

Strength (1) 1.6 mg (4IU) (2) 4.0 mg (10IU)
(3) 1.0 mg (2.5IU) (4) 1.2 mg (3IU)

Storage Preserve in well closed containers, stored at a temperature of 2°C to 8°C and protected from light.

Recombinant Human Growth Hormone Bulk Solution

Recombinant Human Growth Hormone Bulk Solution is a solution containing a protein having 191 amino acid residues or 192 amino acid residues with a methionine on N-terminal and suitable excipients or stabilizing agent. It contains not less than 90.0% and not more than 110.0% of the labelled amount of recombinant human growth hormone bulk.

Recombinant Human Growth Hormone Bulk solution is produced by a method based on recombinant DNA technology. It must be demonstrated that the manufacturing process produces a product having a biological activity of at least 2.5 Units per mg, using a suitable, validated vivo bioassay.

Host-cell and vector-derived DNA and host-cell derived proteins are potential specific impurities related to the manufacturing process and must be controlled strictly during the manufacturing process, the limit must meet the related requirements described under Recombinant Human Growth Hormone Bulk.

Description A colourless, clear or slightly opalescent liquid.

Identification Complies with test for Identification described under recombinant human growth hormone.

Related proteins, High molecular weight Protein, Bacterial endotoxin and sterility Complies with the tests described under Recombinant Human Growth Hormone.

Assay Dilute a quantity with 0.025 mol/L phosphate BS

which becomes brownish-yellow on the addition of a few drops of ammonia TS.

(2) Dissolve 0.1 g in 2 ml of sodium hydroxide TS, add 1 drop of chloroform, a deep red colour is produced on heating; add a slight excess of hydrochloric acid, the colour changes to pale yellow.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of resorcinol (Appendix XVI).

Phenol Dissolve 0.25 g in 5 ml of water, heat gently, no odour of phenol is perceptible.

Catechol Dissolve 0.50 g in 10 ml of water, add 2 drops of dilute acetic acid and 0.5 ml of lead acetate TS, no turbidity is produced.

Loss on drying When dried over sulfuric acid to constant weight, loses not more than 1.0% of its weight (Appendix VII L).

Residue on ignition Not more than 0.05% (Appendix VIII N).

Assay Dissolve about 0.15 g, accurately weighed, in water in a 100 ml volumetric flask, dilute with water to volume and mix well. Transfer 25 ml of the resulting solution to an iodine flask, add 30 ml of bromine (0.05 mol/L) VS, 50 ml of water and 5 ml of hydrochloric acid. Stopper the flask immediately, shake and allow to stand in the dark for 15 minutes. Add 5 ml of potassium iodide TS, immediately stopper the flask, shake thoroughly, allow to stand in the dark for 15 minutes. Titrate with sodium thiosulfate (0.1 mol/L) VS, add 1 ml of starch IS towards the end point, and continue the titration until the blue colour disappears. Perform a blank determination and make any necessary correction. Each ml of bromine (0.1 mol/L) VS is equivalent to 1.835 mg of $C_8H_{12}N_4O_5$.

Category Antiseptic Disinfectant.

Storage Preserve in tightly closed containers, protected from light.

Ribavirin

$C_8H_{12}N_4O_5$ 244.21

[36791-04-5]

Ribavirin is 1- β -D-ribofuranosyl-1*H*-1,2,4-triazole-3-carboxamide. It contains not less than 98.5% and not more than 101.5% of $C_8H_{12}N_4O_5$, calculated on the dried basis.

Description A white crystalline powder; odourless; tasteless. Freely soluble in water; slightly soluble in ethanol; insoluble in ether or chloroform.

Specific optical rotation -35.0° to -37.0° , in a solution of 40 mg per ml in water (Appendix VI E).

Identification (1) Dissolve about 0.1 g in 10 ml of water, add 5 ml of sodium hydroxide TS, heat to boiling, an odour characteristic of ammonia is perceptible, and the vapor produced turns the moistened red litmus paper to blue.

(2) The retention time of principal peak in the substance being examined in the chromatogram obtained in the Assay is identical with that of principal peak of ribavirin CRS in the chromatogram of the reference solution.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of ribavirin (Appendix XVI).

Acidity Dissolve 0.5 g in 25 ml of water, pH 4.0-6.5 (Appendix VI H).

Light absorption The absorbance of a solution of 1.0 g in 25 ml of water at 430 nm (Appendix IV A) is not more than 0.02.

Related substances Carry out the method as described under Assay. Dissolve a quantity of the substance being examined in water to produce a test solution of 0.4 mg per ml. Accurately measure 1 ml into 100 ml of volumetric flask, dilute with the mobile phase to volume, mix well, as the reference solution. Inject 20 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% of the full scale of the chart. Inject 20 μ l of the test solution into the column, and record the chromatogram for twice the retention time of the principal peak. The sum of the areas of all secondary peaks obtained with the test solution is not greater than the area of the principle peak in the chromatogram obtained with the reference solution (1.0%).

Loss on drying When dried to constant weight at 105°C , loses not more than 0.5% of its weight (Appendix VII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with hydrogen cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form and water adjusted pH to 2.5 ± 0.1 , using dilute sulfate acid as the mobile phase. Detection wavelength is 207 nm and the number of the theoretical plates of the column is not less than 3000, calculated with reference to the peak of ribavirin.

Procedure Dissolve an accurately weighed quantity in water to produce a solution of 50 μ g per ml. Inject 20 μ l into the column. Repeat the operation, using ribavirin CRS instead of the substance being examined. Calculate the content of $C_8H_{12}N_4O_5$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Antiviral.

Storage Preserved in tightly closed containers, protected from light.

Preparation

- (1) Ribavirin and Glucose Injection
- (2) Ribavirin and Sodium Chloride Injection
- (3) Ribavirin Bawal Tablets
- (4) Ribavirin Capsules
- (5) Ribavirin Eye Drops
- (6) Ribavirin for Injection
- (7) Ribavirin Granules
- (8) Ribavirin Injection
- (9) Ribavirin Nasal Drops
- (10) Ribavirin Oral Solution
- (11) Ribavirin Tablets

Ribavirin Buccal Tablets

Ribavirin Buccal Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of ribavirin ($C_8H_{12}N_4O_5$).

Description Pale yellow buccal tablets; odour, flavor; taste, sweet.

Identification To a quantity of the powdered tablets equivalent to about 0.1 g of ribavirin, add 20 ml of water, triturate and filter. The successive filtrate complies with tests (1) and (2) for Identification described under Ribavirin.

Other requirements Comply with the general requirements for tablets (Appendix I A), other than Disintegration.

Assay Weigh accurately and powder 20 tablets. Dissolve an accurately weighed quantity of the powder in mobile phase to produce a solution of 50 µg of ribavirin per ml, shake thoroughly and filter. Carry the Assay as described under Ribavirin, using the successive filtrate.

Category As described under Ribavirin.

Strength (1) 20 mg (2) 50 mg (3) 100 mg

Storage Preserve in tightly closed containers.

Ribavirin Capsules

Ribavirin capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of ribavirin ($C_8H_{12}N_4O_5$).

Description Capsules containing white or almost white granule or powder.

Identification A quantity of the contents of the capsules, equivalent to about 0.1 g of ribavirin, comply with the tests (1) and (2) for Identification described under Ribavirin.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately a quantity of the mixed contents obtained in the test for Weight variation, dissolve and dilute it with mobile phase to produce a solution of 50 µg of ribavirin per ml and filter. Carry out the Assay as described under Ribavirin, using the successive filtrate.

Category As described under Ribavirin.

Strength 0.15 g

Storage Preserve in tightly closed containers.

Ribavirin Eye Drops

Ribavirin Eye Drops contain not less than 90.0% and not more than 110.0% of the labelled amount of ribavirin ($C_8H_{12}N_4O_5$). It contains benzalkonium bromide as preservative.

Description A clear, colourless solution.

Identification Comply with tests (1) and (2) for Identification described under Ribavirin.

Acidity 5.0-7.0 (Appendix VI H).

Other requirements Comply with the general requirements for eye preparations (Appendix I G).

Assay Carry out the Assay as described under Ribavirin, using an accurately measured quantity. The resolution factor between the peaks of ribavirin and the preservative complies with the related requirements.

Category As described under Ribavirin.

Strength (1) 8 ml : 8 mg (2) 10 ml : 10 mg
(3) 10 ml : 50 mg

Storage Preserve in tightly closed containers, stored in a cool place.

Ribavirin for Injection

Ribavirin for Injection is a sterile Lyophilized powder of ribavirin and suitable excipient. It contains not less than 90.0% and not more than 110.0% of the labelled amount of ribavirin ($C_8H_{12}N_4O_5$).

Description A white or almost white lyophilized powder.

Identification Complies with tests (1) and (2) for identification described under Ribavirin.

Acidity An aqueous solution of 25 mg of ribavirin per ml, pH 4.0-7.0 (Appendix VI H).

Clarity and colour of solution An aqueous solution of 50 mg of ribavirin per ml is clear and colourless; any colour produced is not more intense than that of reference solution Y₁ or YG₁ (Appendix IX A).

Related substances Carry out the test for Related substances as described under Ribavirin; not more than 1.0%.

Loss on drying When dried to constant weight at 105°C, loses not more than 5.0% of its weight (Appendix VII L).

Bacterial endotoxin Carry out the test for Bacterial endotoxin (Appendix XI E); less than 0.15 EU per mg of ribavirin.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Weigh accurately a quantity of the mixed contents obtained in the test for Weight variation, Dissolve and dilute to produce a solution of 50 µg of ribavirin per ml and filter. Carry out the Assay as described under Ribavirin, using the successive filtrate.

Category As described under ribavirin.

Strength 0.25g

Storage Preserve in well closed containers, stored in a cool place.

Ribavirin Granules

Ribavirin granules contain not less than 90.0% and not more than 110.0% of the labelled amount of Ribavirin ($C_8H_{12}N_4O_5$).

Description White or almost white soluble granules.

Identification To a quantity of granules, equivalent to about 0.1 g of ribavirin, add 20 ml of water, triturate and filter. The successive filtrate complies with tests (1) and (2) for Identification described under Ribavirin.

Loss on drying When dried to constant weight at 105°C, loses not more than 2.0% of its weight (Appendix VIII L).

Other requirements Comply with the general requirements for granules (Appendix I N).

Assay Weigh accurately a quantity of the mixed contents obtained in the test for Weight variation, triturate it with mobile phase to dissolve ribavirin, and dilute it with mobile phase to produce a solution of 50 µg per ml and filter. Carry out the Assay as described under Ribavirin, using the successive filtrate.

Category As described under Ribavirin.

Strength 50 mg

Storage Preserve in tightly closed containers, stored in a dry place.

Ribavirin Injection

Ribavirin Injection is a sterile solution of Ribavirin in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of ribavirin ($C_8H_{12}N_4O_5$).

Description A clear, colourless liquid.

Identification Complies with tests (1) and (2) for Identification described under Ribavirin.

pH value 4.0-6.0 (Appendix VI H).

Related substances Carry out the test for Related Substances described under Ribavirin; not more than 1.0%.

Bacterial endotoxin Comply with the test for bacterial endotoxin (Appendix XI E): Less than 0.15 EU per mg.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay as described under Ribavirin, using an accurately measured quantity.

Category As described under Ribavirin.

Strength (1) 1 ml : 100 mg (2) 2 ml : 250 mg
(3) 2 ml : 100 mg (4) 2 ml : 200 mg
(5) 5 ml : 250 mg

Storage Preserve in well closed containers.

Ribavirin Nasal Drops

Ribavirin Nasal Drops contain not less than 90.0% and not more than 110.0% of the labelled amount of ribavirin ($C_8H_{12}N_4O_5$). It may contain suitable preservative.

Description A clear, colourless liquid.

Identification Comply with tests (1) and (2) for Identification described under Ribavirin.

pH value 4.5-6.5 (Appendix VI H).

Other requirements Comply with the general requirements for nasal preparations (Appendix I R).

Assay Carry out the Assay described under Ribavirin, using an accurately measured quantity. The resolution factor

between the peaks of ribavirin and the preservative complies with the related requirements.

Category As described under Ribavirin.

Strength 10 ml : 50 mg

Storage Preserved in tightly closed containers, stored in a cool place.

Ribavirin Oral Solution

Ribavirin Oral Solution contains not less than 90.0% and not more than 110.0% of the labelled amount of Ribavirin ($C_8H_{12}N_4O_5$).

Description A colourless or pale yellow liquid; taste, sweet.

Identification Complies with tests (1) and (2) for Identification described under ribavirin.

Colour Not more intense than the colour of reference solution Y₄ (Appendix IX A, method 1).

pH value 4.0-6.0 (Appendix VI H).

Other requirements Complies with the general requirements for oral solution (Appendix I O).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and water as the mobile phase. Detection wavelength is 207 nm and the number of the theoretical plates of the column is not less than 2500, calculated with reference to the peak of ribavirin.

Procedure Measure accurately a quantity of the oral solution being examined, equivalent to about 150 mg of ribavirin, dilute with water to produce a solution of 30 µg per ml. Inject 20 µl into the column. Repeat the operation, using ribavirin CRS instead of the substance being examined. Calculate the content of $C_8H_{12}N_4O_5$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Ribavirin.

Strength (1) 10 ml : 0.3 g (2) 5 ml : 0.15 g

Storage Preserve in tightly closed containers.

Ribavirin Tablets

Ribavirin Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of ribavirin ($C_8H_{12}N_4O_5$).

Description White tablets.

Identification To a quantity of the powdered tablets equivalent to about 0.1 g of ribavirin add 20 ml of water, triturate and filter. The filtrate complies with tests (1) and (2) for Identification described under Ribavirin.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder finely 20 tablets. Dissolve an accurately weighed quantity of the powder in water to produce a solution containing 50 µg ribavirin per ml. Filter, and carry out the Assay described under Ribavirin, using the successive filtrate.

Category As described under Ribavirin.

Strength (1) 20 mg (2) 50 mg (3) 100 mg
(4) 200 mg

Storage Preserve in tightly closed containers.

Ribavirin and Glucose Injection

Ribavirin and Glucose Injection is a sterile solution of Ribavirin and Glucose in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of ribavirin ($C_8H_{12}N_4O_5$); not less than 95.0% and not more than 105.0% of the labelled amount of glucose ($C_6H_{12}O_6 \cdot H_2O$).

Description A clear, colourless liquid.

Identification (1) Complies with tests (1) and (2) for Identification described under Ribavirin.

(2) Add dropwise slowly warm alkaline cupric tartrate TS, a red precipitate of cuprous oxide is produced.

pH Value 4.0-6.0 (Appendix VI H).

5-hydroxymethylfurfural Transfer an accurately measured quantity of the injection, equivalent to about 0.1 g of glucose, in a 50 ml volumetric flask, dilute with water to volume and mix well. Measure the absorbance of the resulting solution at 284 nm (Appendix IV A), the absorbance is not greater than 0.25.

Related substances Carry out the test for Related substances described under Ribavirin; not more than 1.0%.

Heavy metals Evaporate a quantity of injection, equivalent to about 3 g of glucose, to about 20 ml if necessary, cool, add 2 ml of acetate BS (pH 3.5) and sufficient water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.0005%.

Bacterial endotoxin Carry out the test for Bacterial endotoxin (Appendix XI E); less than 0.5 EU per ml.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Ribavirin Carry out the Assay as described under Ribavirin. Measure accurately a quantity of the injection, add mobile phase to produce a solution of 50 µg of ribavirin per ml as test solution.

Glucose Measure accurately 2 ml of the injection, equivalent to about 0.1 g of glucose, to a conical flask with stopper, add accurately 25 ml of iodine (0.05 mol/L) VS, add 40 ml of sodium hydroxide (0.1 mol/L) VS dropwise with shaking, allow to stand 30 minutes in dark place, add 4 ml of dilute sulfuric acid. Titrate with sodium thiosulfate (0.1 mol/L) VS, add 2 ml of starch IS when the end point is nearly approached, continue the titration until blue colour disappears. Perform a blank determination and necessary correction. Each ml of iodine (0.05 mol/L) VS is equivalent to 9.909 mg of glucose ($C_6H_{12}O_6 \cdot H_2O$).

Category As described under ribavirin.

Strength (1) 100 ml : ribavirin 0.1 g and glucose 5 g
(2) 100 ml : ribavirin 0.2 g and glucose 5 g
(3) 250 ml : ribavirin 0.25 g and glucose 12.5 g
(4) 250 ml : ribavirin 0.5 g and glucose 12.5 g
(5) 500 ml : ribavirin 0.5 g and glucose 25 g

Storage Preserve in well closed containers, stored in cool place and protected from light.

Ribavirin and Sodium Chloride Injection

Ribavirin and Sodium Chloride Injection is a sterile solution of Ribavirin and Sodium Chloride in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of ribavirin ($C_8H_{12}N_4O_5$); not less than 95.0% and not more than 105.0% of the labelled amount of sodium chloride (NaCl).

Description A clear, colourless liquid.

Identification (1) To 5 ml of the injection add 5 ml of sodium hydroxide TS, boil gently, the vapour produced turns moistened red litmus paper to blue.

(2) The retention time of the principal peak in the chromatogram obtained with the test solution in the Assay is identical with that of the principal peak in the chromatogram of the reference solution.

(3) Yields the reaction characteristic of sodium salts and the reactions characteristic of chlorides (Appendix III).

pH Value 4.0-6.0 (Appendix VI H).

Related substances Carry out the test for Related substances as described under ribavirin; not more than 1.0%.

Heavy metals Evaporate 50 ml of the injection to about 20 ml, cool, add 2 ml of acetate BS (pH 3.5) and sufficient water to 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.00003%.

Bacterial endotoxin Carry out the test for Bacterial endotoxin (Appendix XI E); less than 0.5 EU per ml.

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Ribavirin Measure accurately a quantity of the injection, dilute with mobile phase to produce a solution of 50 µg of ribavirin per ml as test solution. Carry out the test for the Assay as described under Ribavirin.

Sodium Chloride Measure accurately 10 ml of the injection, add 40 ml of water, 5 ml of dextrin solution (1→50), 0.1 g of calcium carbonate and 8 drops of fluorescein IS. Titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 5.844 mg of NaCl.

Category As described under Ribavirin.

Strength (1) 100 ml : ribavirin 0.2 g and sodium chloride 0.9 g
(2) 250 ml : ribavirin 0.5 g and sodium chloride 2.25 g
(3) 250 ml : ribavirin 0.5 g and sodium chloride 2.125 g
(4) 100 ml : ribavirin 0.5 g and sodium chloride 0.9 g
(5) 250 ml : ribavirin 0.5 g and sodium chloride 1.95 g

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Riboflavin Sodium Phosphate

$C_{17}H_{20}N_4NaO_6P \cdot 2H_2O$ 514.36

Riboflavin Sodium Phosphate is riboflavin 5'-(sodium hydrogen phosphate) dihydrate. It contains not less than 74.0% and not more than 79.0% of $C_{17}H_{20}N_4O_6$, calculated on the dried basis.

Description An orange yellow crystalline powder; almost odourless; taste, slightly bitter; hygroscopic. Soluble in water; practically insoluble in ethanol, chloroform or ether.

Specific optical rotation Protect from light throughout the procedure, $+38.0^\circ$ to $+42.0^\circ$, in a solution of about 15 mg per ml in hydrochloric acid solution (45→100) (Appendix VI E).

Identification (1) Dissolve about 1 mg in 100 ml of water. The solution is pale yellow by transmitted light, and has an intense yellowish green fluorescence which disappears on the addition of mineral acids or alkalis.

(2) The light absorption of a solution of 10 μ g per ml in phosphate BS (pH 7.0) exhibits three maxima at 267 nm, 372 nm and 444 nm, and a minimum at 240 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of riboflavin sodium phosphate (Appendix XVI).

(4) To 0.5 g add 10 ml of nitric acid, evaporate the mixture to dryness on a water bath, ignite the residue until the carbon is removed. Dissolve the residue in 5 ml of water, filter if necessary. The filtrate yields the reactions characteristic of sodium salts (Appendix III).

Clarity of the solution A solution of 0.20 g in 10 ml of water is clear (Appendix IX B).

Acidity Dissolve 0.4 g in 20 ml of water, pH 4.0-6.5 (Appendix VI H).

Lumiflavin Shake 35 mg with 10 ml of ethanol-free chloroform for 5 minutes and filter, the light absorbance of the filtrate at 440 nm is not greater than 0.025 (Appendix IV A).

Loss on drying When dried to constant weight at 130°C , loses not more than 10% of its weight (Appendix VIII L), using 0.3 g.

Free phosphoric acid Place 0.2 g, accurately weighed and calculated on the dried basis, in a 100 ml volumetric flask. Add 10 ml of a standard phosphate solution [place 0.42 g of potassium dihydrogen phosphate, previously dried at 105°C for 2 hours and accurately weighed, in a 1000 ml volumetric flask, dissolve it in water, add 10 ml of sulfuric acid solution (3→10) and dilute with water to volume, mix well, dilute with water to produce a solution of 1/10 of its original concentration immediately before use] in another 25 ml volumetric flask. To each flask add 5 ml of water, 2.5 ml of ammonium molybdate in sulfuric acid TS and 1 ml of 1-

amino-2-naphthol-4-sulfuric acid solution (mix 5 g of anhydrous sodium sulfite, 94.3 g of sodium bisulfite with 0.7 g of 1-amino-2-naphthol-4-sulfuric acid, dissolve 1.5 g of above the mixture in 10 ml of water before use, filter if necessary), dilute with water to volume, mix well and allow to stand at 20°C for 30 minutes. The absorbance of the solution containing the substance being examined, measured at 740 nm (Appendix IV A), is not greater than that of the standard solution under same condition.

Assay Protect from light throughout the procedure. Dissolve about 0.1 g, accurately weighed, in 1 ml of glacial acetic acid and 75 ml of water in a 500 ml volumetric flask, dilute with water to volume and mix well. Transfer 10 ml of the solution, accurately measured, to a 100 ml volumetric flask, add 7 ml of 1.4% sodium acetate solution, dilute with water to volume and mix well, measure the absorbance of the resulting solution at 444 nm (Appendix IV A). Calculate the content of $C_{17}H_{20}N_4O_6$, taking 323 as the value of A (1%, 1 cm).

Category Vitamin.

Storage Preserve in tightly closed containers, protected from light.

Preparation Riboflavin Sodium Phosphate Injection

Riboflavin Sodium Phosphate Injection

Riboflavin Sodium Phosphate Injection is a sterile solution of Riboflavin Sodium Phosphate in Water for Injection. It contains not less than 90.0% and not more than 115.0% of the labelled amount of riboflavin ($C_{17}H_{20}N_4O_6$).

Description A clear, yellow to orange yellow liquid, deteriorates easily on exposure to light.

Identification (1) Dilute a quantity of the injection equivalent to about 1 mg of riboflavin with water to 100 ml, the solution is pale yellow by transmitted light and has an intense yellowish green fluorescence which disappears upon the addition of mineral acids or alkalis.

(2) Evaporate a quantity of the injection equivalent to about 0.1 g of riboflavin sodium phosphate to dryness on a water bath. Add 10 ml of nitric acid and evaporate it to dryness on a water bath. Ignite the residue until the carbon is removed, dissolve the residue in 5 ml of water, filter if necessary. The filtrate yields the reactions characteristic of sodium salts and phosphates (Appendix III).

pH value 5.6-6.5 (Appendix VI H).

Other requirements Complies with the general requirements of injections (Appendix I B).

Assay Protect from light throughout the procedure. Transfer a quantity of the injection equivalent to about 10 mg of riboflavin, accurately measured, to a 1000 ml volumetric flask, add 2 ml of 10% acetic acid solution and 7 ml of 14% sodium acetate solution, dilute with water to volume and mix well. Measure the absorbance of the resulting solution at 444 nm (Appendix IV A). Calculate the content of $C_{17}H_{20}N_4O_6$, taking 323 as the value of A (1%, 1 cm).

Category As described under Riboflavin Sodium Phosphate.

Strength (1) 2 ml : 5 mg (2) 2 ml : 10 mg
(calculated on $C_{17}H_{20}N_4O_6$)

Storage Preserve in well closed containers, protected from light.

Ribostamycin Sulfate

$C_{17}H_{34}N_4O_{10} \cdot nH_2SO_4$ ($n < 2$)

[25546-65-0]

Ribostamycin Sulfate is *O*-3-*D*-ribofuranosyl-(1→5)-*O*-[α-2,6,diamino-2,6-dideoxy-*D*-glucopyranosyl (1→4)]-α-deoxy-streptamine, sulfuric acid salt. It has a potency of not less than 680 Ribostamycin Units per mg calculated on the dried basis.

Description A white or almost white powder; odourless or almost odourless; taste slightly bitter; hygroscopic. Freely soluble in water; practically insoluble in methanol, ethanol, acetone, chloroform or ether.

Identification (1) Dissolve 10 mg in 2 ml of water, add 3 ml of a 0.1% solution of anthrone in sulfuric acid; a blue to bluish-green colour is produced.

(2) Dissolve 20 mg in 2 ml of water, add 1 ml of a 0.1% solution of ninhydrine in *n*-butanol saturated with water, heat in a water bath, a violet colour is produced.

(3) The aqueous solution yields the reactions characteristic of sulfates (Appendix III).

Acidity or alkalinity An aqueous solution of 50 mg per ml, pH 6.0-8.0 (Appendix VI H).

Clarity and colour of solution Dissolve separately each 1.5 g of the 5 portions in 5 ml of water, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution Y₄ or YG₄ (Appendix IX A, method 1).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight at 60°C, loses not more than 4.7% of its weight (Appendix VII L).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E), less than 2.5 EU per 1000 Ribostamycin Units.

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method), dissolving each portion and transfer to at least 500 ml of 0.9% sterile sodium chloride solution respectively.

Assay Dissolve an accurately weighed quantity in sterile water to produce a solution of about 1000 Units per ml. Carry out the Microbiological Assay of Antibiotics (Appendix XI A). 1000 Ribostamycin Units are equivalent to 1 mg of $C_{17}H_{34}N_4O_{10}$.

Category Aminoglycoside Antibiotic.

Storage Preserve in hermetically sealed containers, stored

in a dry place.

Preparation Ribostamycin Sulfate for Injection

Ribostamycin Sulfate for Injection

Ribostamycin Sulfate for Injection is a sterile powder of Ribostamycin Sulfate. It has a potency of not less than 680 Ribostamycin Units per mg, calculated on the dried basis; it contains not less than 93.0% and not more than 107.0% of the labelled amount of ribostamycin ($C_{17}H_{34}N_4O_{10}$), calculated on the basis of the average weight of contents.

Description A white or almost white powder.

Identification Complies with the tests for Identification described under Ribostamycin Sulfate.

Clarity and colour of solution To each of 5 containers add water to produce solutions containing 200000 Units per ml. The solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution Y₄ or YG₄ (Appendix IX A, method 1).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight at 60°C, loses not more than 5.0% of its weight (Appendix VII L).

Acidity or alkalinity, Bacterial endotoxin, sterility Complies with the corresponding requirements described under Ribostamycin Sulfate.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Ribostamycin Sulfate, using the mixed contents obtained in the test for weight variation of contents.

Category As described under Ribostamycin Sulfate.

Strength 1 g (1000000 Units)

Storage Preserve in well closed containers, stored in a dry place.

Rifampicin

$C_{43}H_{58}N_4O_{12}$ 822.95

[13292-46-1]

Rifampicin is 3-[(4-methyl-1-piperazinyl)-iminomethyl]-rifamycin. It contains not less than 93.0% of $C_{43}H_{58}N_4O_{12}$, calculated on the dried

basis.

Description A bright red or dark red crystalline powder; odourless; tasteless.

Freely soluble in chloroform; soluble in methanol; practically insoluble in water.

Identification (1) Dissolve about 5 mg in 2 ml of 0.1 mol/L hydrochloric acid solution. add 2 drops of 0.1 mol/L sodium nitrite solution; the colour changes from orange to dark red. (2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay are identical with that of the reference solution. (3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of rifampicin (Appendix XVI).

Crystallinity complies with the test for crystallinity (Appendix IX D).

Acidity A suspension of 10 mg per ml in water, pH 4.0-6.5 (Appendix VI H).

Relate substances Dissolve a quantity of the substance being examined, accurately weighed, in acetonitrile to produce the test solution of 1 mg per ml; Dissolve an accurately weighed amount of rifampicin CRS in acetonitrile to produce the reference solution of 10 µg per ml. Carry out the method as described under Assay. Inject 10 µl of the reference solution into the column and adjust the attenuation so that principal peak height in the chromatogram is 25% of the full scale of the chart. Inject accurately 10 µl of the test solution and the reference solution into the column, separately, and record the chromatogram for four times the retention time of principal peak. Calculate separately the contents of secondary peaks on the chromatogram obtained with the test solution according to the corrected peak area of the principal peak obtained with reference solution (the corrected factor to Rifampicin, Rifampicinquinone, N-oxid Rifampicin, 3-Formylrifamycin SV are 1.0, 1.4, 1.67 and 1.08 respectively). The contents of Rifampicinquinone, N-oxid Rifampicin, 3-Formylrifamycin SV are not more than 1.5% (1.5 times), 0.5% (0.5 times) and 0.5% (0.5 times) of the area of the principal peak obtained with reference solution; the total contents of other secondary peaks (the corrected factor is 1.0) are not more than 3.0% (3 times).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N); use 1 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octylsilicane bonded silica gel and a mixture of methanol-acetonitrile-0.075 mol/L potassium dihydrogen phosphate-1.0 mol/L citric acid (30 : 30 : 26 : 4) as the mobile phase. Detection wavelength is 254 nm. Dissolve Rifampicin CRS, Rifampicinquinone CRS N-oxid Rifampicin CRS, 3-Formylrifamycin SV CRS and Rifamycin SV CRS in acetonitrile to produce a solution of 0.04 mg per ml respectively. Inject 10 µl into column. The retention time of the substance in mixture solution are Rifampicinquinone, Rifampicin, Rifamycin SV, N-oxid Rifampicin and 3-Formylrifamycin in turn; the resolution factor among these peaks complies with related requirements. The number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of rifampicin.

Produce Dissolve a quantity in acetonitrile to produce a

solution of 0.08 mg per ml. Inject 10 µl into volume, Repeat the operations, using Rifampicin CRS instead of the substance being examined. Calculate the content of $C_{43}H_{58}N_4O_{12}$.

Category Tuberculostatics.

Storage Preserve in tightly closed containers, protected from light, stored in a cool and dry place.

Preparation (1) Rifampicin Capsules
(2) Rifampicin for Eye Use
(3) Rifampicin Tablets

Rifampicin Capsules

Rifampicin Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of rifampicin ($C_{43}H_{58}N_4O_{12}$).

Identification Complies with the tests (1) and (2) for Identification described under Rifampicin, using the contents of capsules.

Relate substances Dissolve a accurately weighed quantity (equivalent to 125 mg Rifampicin) of mixed contents obtained in the test for weight variation of contents add acetonitrile to produce a solution of 5 mg per ml. Filter this solution with 0.45 µm membrane, measure accurately a quantity of the successive filtrate in acetonitrile to produce the test solution of 1 mg per ml. Carry out the method as described under Rifampicin. Calculate separately the contents of secondary peaks on the chromatogram obtained with the test solution according to the corrected peak area of the principal peak obtained with reference solution (the corrected factor to Rifampicin, Rifampicinquinone, N-oxid Rifampicin, 3-Formylrifamycin SV are 1.0, 1.4, 1.67 and 1.08 respectively). The contents of Rifampicinquinone, N-oxid Rifampicin, 3-Formylrifamycin SV are not more than 2.0% (2.0 times), 1.0% (1 times) and 0.5% (0.5 times) of the area of the principal peak obtained with reference solution; the total contents of other secondary peaks (the corrected factor is 1.0) are not more than 3.5% (3.5 times).

Dissolution Carry out the dissolution test (Appendix X C method 1), using 900 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the basket to 50 rpm. Withdraw the solution after exactly 45 minute and filter, measure accurately a quantity of the successive filtrate and dilute with phosphate buffer solution (dissolve 3.02 g of potassium dihydrogen phosphate and 6.2 g of dipotassium hydrogen phosphate in 1000 ml of water, adjust pH to 7.0) to produce a solution of 20 µg per ml. Measure the absorbance of the resulting solution at 474 nm (Appendix IV A). Calculate the dissolution of $C_{43}H_{58}N_4O_{12}$ from each capsule, taking 187 as the value of A (1%, 1 cm). Not less than 75% of the labelled amount is dissolved.

Loss on drying When dried to constant weight at 105°C, loses not more than 2.0% of its weight (Appendix VIII L), using the mixed contents of the capsules.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay To accurately weighed quantity of mixed contents obtained in the test for weight variation of contents equivalent to 80 mg rifampicin add acetonitrile to produce a solution of 0.8 mg per ml. Filter this solution with 0.45 µm membrane, measure accurately a quantity of the successive

filtrate in acetonitrile to produce a solution of 0.08 mg per ml. Carry out the Assay described under Rifampicin.

Category As described under Rifampicin.

Strength (1) 0.15 g (2) 0.3 g

Storage Preserve in tightly closed containers, protected from light, stored in a cool and dry place.

Rifampicin for Eye Use

Rifampicin for eye use is a mixed preparation of rifampin tablets/pills/granules and buffer solution, dissolving rifampin with the buffer solution before using. It contains not less than 90.0% and not more than 110.0% of the labeled content of rifampicin ($C_{43}H_{58}N_4O_{12}$).

Description A orange or dark red tablets/pills/granules, and a clear, colourless buffer solution.

Identification Complies with the tests (1) and (2) for Identification described under Rifampicin, using a quantity of powdered tablets/pills/granules.

Acidity or Alkalinity Dissolve 1 tablet/pill/granule in buffer solution, pH 6.0~8.0 (Appendix VI H).

Weight variation Complies with the requirements for weight variation test (Appendix I G).

Volume of buffer solution Complies with the requirements for the volume test of buffer solution (Appendix I G).

Dispersion limit Complies with the requirements for pills (Appendix I H).

Visible impurities Complies with the requirements for the buffer solution (Appendix XI H).

Microbial limit Dissolve 2 tablets/pills/granules in the buffer solution. Use 10 ml of the solution above as liquid sample to prepare the test solution. Complies with the requirements for microbial limit test (Appendix XI J membrane filtration method).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octylsilicane bonded silica gel and a mixture of methanol-acetonitrile-0.0075 mol/L potassium dihydrogen phosphate-1.0 mol/L citric acid (30 : 30 : 36 : 4) as the mobile phase. Detection wavelength is 254 nm. Dissolve rifampicin CRS and rifampicinquinone CRS in acetonitrile to produce a mixture solution of 0.08 mg per ml. Inject 10 μ l in to column. The resolution factor between the peaks of rifampicinquinone and rifampicin is not less than 4.0.

Procedure Transfer 5 tablets/pills/granules in a 50 ml volumetric flask, dilute with the buffer solution to volume, mix well and filter. Measure an accurately quantity of the successive filtrate in acetonitrile to produce test solution of 0.08 mg per ml. Inject 10 μ l in to column and record the chromatogram. Repeat the operations, using Rifampin CRS instead of the substance being examined. Calculate the contents of $C_{43}H_{58}N_4O_{12}$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Rifampicin.

Strength (1) Tablets (10 mg of $C_{43}H_{58}N_4O_{12}$ and 10 ml of the buffer solution; 5 mg of $C_{43}H_{58}N_4O_{12}$ and 10 ml of the buffer solution) (2) Pills (10 mg of $C_{43}H_{58}N_4O_{12}$ and 10 ml of the buffer solution) (3) Granules (10 mg of

$C_{43}H_{58}N_4O_{12}$ and 10 ml of the buffer solution; 5 mg of $C_{43}H_{58}N_4O_{12}$ and 10 ml of the buffer solution)

Storage Preserve in tightly closed containers, protected from light and stored in a dry place.

Rifampicin Tablets

Rifampicin Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of rifampicin ($C_{43}H_{58}N_4O_{12}$).

Description Sugar coated tablets with orange or dark red core.

Identification Comply with the tests (1) and (2) for Identification described under Rifampicin, using a quantity of powdered tablets.

Related substances Dissolve a accurately weighed quantity (equivalent to 125 mg Rifampicin) of powdered tablets obtained in the test for Assay add acetonitrile to produce a solution of 5 mg per ml. Filter this solution with 0.45 μ m membrane, measure accurately a quantity of the successive filtrate in acetonitrile to produce the test solution of 1 mg per ml. Carry out the method as described under Rifampicin. Calculate separately the contents of secondary peaks on the chromatogram obtained with the test solution according to the corrected peak area of the principal peak obtained with reference solution (the corrected factor to Rifampicin, Rifampicinquinone, N-oxid Rifampicin, 3-Formylrifamycin SV are 1.0, 1.4, 1.67 and 1.08 respectively). The contents of Rifampicinquinone, N-oxid Rifampicin, 3-Formylrifamycin SV are not more than 3.0% (3.0 times), 1.0% (1 times) and 0.5% (0.5 times) of the area of the principal peak obtained with reference solution; the total contents of other secondary peaks (the corrected factor is 1.0) are not more than 3.5% (3.5 times).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the basket to 50 rpm. Withdraw the solution after exactly 45 minutes and filter, measure accurately a quantity of the successive filtrate and dilute with phosphate buffer solution, prepared by dissolving 3.02 g of potassium dihydrogen phosphate and 6.2 g of dipotassium hydrogen phosphate in 1000 ml of water, adjusted to pH 7.0 to produce a solution of 20 μ g per ml. Measure the absorbance of the resulting solution at 474 nm (Appendix IV A). Calculate the dissolution of $C_{43}H_{58}N_4O_{12}$ from each tablet, taking 187 as the value of A (1%, 1 cm). Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Triturate an accurately weighed quantity of the powder equivalent to 80 mg of rifampicin in acetonitrile to produce a solution of 0.8 mg per ml. Withdraw the solution and filter with 0.45 μ m membrane, measure accurately a quantity of the successive filtrate in acetonitrile to produce a solution of 0.08 mg per ml. Carry out the Assay described under rifampicin.

Category As described under Rifampicin.

Strength 0.15 g

Storage Preserve in tightly closed containers, protected from light and stored in a cool and dry place.

Rifampin and Isoniazid Capsules

Rifampin and Isoniazid capsule is a mixed preparation of rifampin and isoniazid. It contains not less than 90.0% and not more than 110.0% of the labeled content of rifampin ($C_{43}H_{58}N_4O_{12}$) and isoniazid ($C_6H_7N_3O$).

Description The contents of capsules is orange red or dark red powder.

Identification (1) Dissolve about weighed quantity of the content of capsules, equivalent to 5 mg of Rifampin, in 2 ml of 0.1 mol/L hydrochloric acid solution, add 2 drops of 0.1 mol/L sodium nitrite solution; the colour changes from orange red to dark red.

(2) Dissolve about weighed quantity of the content of capsules (equivalent to 0.1 g of Isoniazid) in 10 ml of water in a test tube, shake and filter. Use the filtrate, add 1 ml of ammoniated silver nitrate TS, bubbles and a black turbidity are produced immediately, and a silver mirror is formed on the wall of the tube.

(3) The retention time of principal peaks of rifampin and isoniazid in the chromatogram obtained in the Assay are identical with that of principal peaks of Rifampin CRS and Isoniazid CRS in the chromatogram of the reference solution correspondingly.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw the solution after exactly 30 minutes and filter, measure accurately a quantity of the successive filtrate and dilute with phosphate buffer solution (dissolve 3.02 g of potassium dihydrogen phosphate and 6.2 g of dipotassium hydrogen phosphate in 1000 ml of water, adjusted to pH 7.0), to produce a solution of 30 µg of rifampicin per ml. Dissolve an accurately weighed quantity of Rifampicin CRS in phosphate buffer solution to produce a solution of 30 µg of rifampicin per ml. Measure the absorbance of the resulting solution at 474 nm (Appendix IV A). Calculate the dissolution of $C_{43}H_{58}N_4O_{12}$ from each capsule. Not less than 75% of the labeled amount is dissolved.

Loss on drying When dried in a vacuum over phosphorous pentoxide to constant weight at 60°C, loses not more than 3.0% of its weight (Appendix VIII L).

Other requirements Comply the general requirements for capsules (Appendix I E).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with nitrile groups chemically bonded to porous silica particles and a mixture of 0.01 mol/L sodium heptanesulfonate solution (adjust to pH 2.2 with dilute phosphoric acid)-acetonitrile (44 : 56) as the mobile phase. Detection wavelength is 254 nm. Dissolve Rifampicin CRS, Rifampicinquinone CRS and Isoniazid CRS in mobile phase to produce a mixture solution, contains 60 µg of Rifampicin, 60 µg of Rifampicinquinone and 30 µg of Isoniazid per ml. Inject 20 µl in to column and record the chromatogram. The retention time of the substance in mixture solution are Isoniazid, Rifampicinquinone and Rifampicin in turn; and the resolution factor among these peaks complies with related requirements.

Procedure Triturate the mixed contents obtained in the test for weight variation of contents. Weigh accurately a quantity (equivalent to 60 mg of Rifampicin) in a 100 ml volumetric flask, dilute with mobile phase to volume, mix well and

filter. Measure accurately 5 ml of the successive filtrate in 50 ml volumetric flask, dilute with mobile phase to volume, and mix well. Inject 20 µl in to column and record the chromatogram. Repeat the operations, using Rifampicin CRS and Isoniazid CRS instead of the substance being examined. Calculate the contents of $C_{43}H_{58}N_4O_{12}$ and $C_6H_7N_3O$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Antibiotics for tuberculosis.

Strength (1) 0.25 g (0.15 g of $C_{43}H_{58}N_4O_{12}$ and 0.1 g of $C_6H_7N_3O$)
(2) 0.225 g (0.15 g of $C_{43}H_{58}N_4O_{12}$ and 0.075 g of $C_6H_7N_3O$)

Storage Preserve in tightly closed containers, protected from light and stored in a dry place.

Rifampin and Isoniazid Tablets

Rifampin and Isoniazid tablet is a mixed preparation of rifampin and isoniazid. It contains not less than 90.0% and not more than 110.0% of the labeled content of rifampin ($C_{43}H_{58}N_4O_{12}$) and isoniazid ($C_6H_7N_3O$).

Description Film coated tablets with orange red or dark red core.

Identification

(1) Dissolve about weighted quantity of the powdered tablets, equivalent to 5 mg of Rifampin, in 2 ml of 0.1 mol/L hydrochloric acid solution, add 2 drops of 0.1 mol/L sodium nitrite solution; the colour changes from orange red to dark red.

(2) Dissolve about weighed quantity of the content of capsules (equivalent to 0.1 g of Isoniazid) in 10 ml of water in a test tube, shake and filter. Use the filtrate, add 1 ml of ammoniated silver nitrate TS, bubbles and a black turbidity are produced immediately, and a silver mirror is formed on the wall of the tube.

(3) The retention time of principal peaks of rifampin and isoniazid in the chromatogram obtained in the Assay are identical with that of principal peaks of Rifampin CRS and Isoniazid CRS in the chromatogram of the reference solution correspondingly.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw the solution after exactly 30 minutes and filter, measure accurately a quantity of the successive filtrate and dilute with phosphate buffer solution, prepared by dissolving 3.02 g of potassium dihydrogen phosphate and 6.2 g of dipotassium hydrogen phosphate in 1000 ml of water, adjusted to pH 7.0, to produce a solution of 30 µg of rifampicin per ml. Dissolve an accurately weighed quantity of Rifampicin CRS in Measure the absorbance of the resulting solution at 474 nm (Appendix IV A). Calculate the dissolution of $C_{43}H_{58}N_4O_{12}$ from each tablet. Not less than 75% of the labeled amount is dissolved.

Other requirements Comply the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with nitrile groups chemically bonded to porous silica particles and a mixture of 0.01 mol/L sodium heptanesulfonate solution (adjust to pH 2.2 with dilute phosphoric acid)-acetonitrile (44 : 56) as the mobile phase.

Detection wavelength is 254 nm. Dissolve Rifampicin CRS, Rifampicinquinone CRS and Isoniazid CRS in mobile phase to produce a mixture solution, contains 60 µg of Rifampicin, 60 µg of Rifampicinquinone and 30 µg of Isoniazid per ml. Inject 20 µl in to column and record the chromatogram. The retention time of the substance in mixture solution are Isoniazid, Rifampicinquinone and Rifampicin in turn; and the resolution factor among these peaks complies with related requirements.

Procedure Triturate 10 tablets with the coating removed. Weigh accurately a quantity (equivalent to 60 mg of Rifampicin) in a 100 ml volumetric flask, dilute with mobile phase to volume, mix well and filter. Measure accurately 5 ml of the successive filtrate in 50 ml volumetric flask, dilute with mobile phase to volume, and mix well. Inject 20 µl in to column and record the chromatogram. Repeat the operations, using Rifampin CRS and Isoniazid CRS instead of the substance being examined. Calculate the contents of $C_{43}H_{58}N_4O_{12}$ and $C_6H_7N_3O$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Antibiotics for tuberculosis.

Strength 0.45 g ($C_{43}H_{58}N_4O_{12}$ 0.3 g and $C_6H_7N_3O$ 0.15 g)

Storage Preserve in tightly closed containers, protected from light and stored in a dry place.

Rifampin Isoniazid and Pyrazinamide Capsules

Rifampin Isoniazid and Pyrazinamide tablet is a mixed preparation of rifampin, isoniazid and pyrazinamide. It contains not less than 90.0% and not more than 110.0% of the labeled content of rifampin ($C_{43}H_{58}N_4O_{12}$), isoniazid ($C_6H_7N_3O$) and pyrazinamide ($C_5H_5N_3O$).

Description The contents of capsules orange or red powder.

Identification

(1) Dissolve about weighed quantity of the content of capsules, equivalent to 5 mg of rifampin, in 2 ml of 0.1 mol/L hydrochloric acid solution, add 2 drops of 0.1 mol/L sodium nitrite solution; the colour changes from orange red to dark red.

(2) Dissolve about weighed quantity of the content of capsules (equivalent to 0.1 g of Isoniazid) in 10 ml of water in a test tube, shake and filter. Use the filtrate, add 1 ml of ammoniated silver nitrate TS, bubbles and a black turbidity are produced immediately, and a silver mirror is formed on the wall of the tube.

(3) Heat a quantity of the content of capsules (equivalent to 0.2 g of Pyrazinamide) with 5 ml of sodium hydroxide TS, the characteristic odour of ammonia is perceived, the vapour turns moistened red litmus paper to blue.

(4) The retention time of principal peaks of rifampin, isoniazid and pyrazinamide in the chromatogram obtained in the Assay are identical with that of principal peaks of Rifampin CRS, Isoniazid CRS and Pyrazinamide CRS in the chromatogram of the reference solution correspondingly.

Loss on drying When dried in a vacuum over phosphorous pentoxide to constant weight at 60°C for 3 hours, loses not more than 3.0% of its weight (Appendix VIII L).

Dissolution Carry out the dissolution test (Appendix X C,

method 2), using 900 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw a quantity of the solution after exactly 30 minutes and filter, measure accurately a quantity of the successive filtrate and dilute with phosphate buffer solution (dissolve 3.02 g of potassium dihydrogen phosphate and 6.2 g of dipotassium hydrogen phosphate in 1000 ml of water, adjusted to pH 7.0), to produce a solution of 30 µg of rifampicin per ml. Dissolve an accurately weighed quantity of rifampicin CRS in phosphate buffer solution to produce a solution of 30 µg of rifampicin per ml. Measure the absorbance of the resulting solution at 474 nm (Appendix IV A). Calculate the dissolution of $C_{43}H_{58}N_4O_{12}$ from each capsule. Not less than 75% of the labeled amount is dissolved.

Other requirements Comply the general requirements for capsules (Appendix I E).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with nitrile groups chemically bonded to porous silica particles and a mixture of 0.01 mol/L sodium heptanesulfonate solution (adjust to pH 2.2 with diluted phosphoric acid solution)-acetonitrile (44 : 56) as the mobile phase. Detection wavelength is 254 nm. Dissolve Rifampicin CRS, Rifampicinquinone CRS, Isoniazid CRS, and Pyrazinamide CRS in mobile phase to produce a mixture solution, contains 60 µg of Rifampicin, 60 µg of Rifampicinquinone 30 µg of Isoniazid and 125 µg of pyrazinamide per ml. Inject 20 µl in to column and record the chromatogram. The retention time of the substance in mixture solution are Pyrazinamide, Isoniazid, Rifampicinquinone and Rifampicin in turn; and the resolution factor among these peaks complies with related requirements. The number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of Pyrazinamide.

Procedure Triturate the mixed contents obtained in the test for weight variation of contents. Weigh accurately a quantity (equivalent to 60 mg of rifampicin) in a 100 ml volumetric flask, dilute with mobile phase to volume, mix well and filter. Measure accurately 5 ml of the successive filtrate in 50 ml volumetric flask, dilute with mobile phase to volume, and mix well. Inject 20 µl in to column and record the chromatogram. Repeat the operations, using Rifampin CRS, Isoniazid CRS and Pyrazinamide CRS instead of the substance being examined. Calculate the contents of $C_{43}H_{58}N_4O_{12}$, $C_6H_7N_3O$ and $C_5H_5N_3O$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Antibiotics for tuberculosis.

Strength (1) 0.225 g (0.06 g of $C_{43}H_{58}N_4O_{12}$, 0.04 g of $C_6H_7N_3O$ and 0.125 g of $C_5H_5N_3O$)
(2) 0.45 g (0.12 g of $C_{43}H_{58}N_4O_{12}$, 0.08 g of $C_6H_7N_3O$ and 0.25 g of $C_5H_5N_3O$)

Storage Preserve in tightly closed containers, protected from light and stored in a dry place.

Rifampin Isoniazid and Pyrazinamide Tablets

Rifampin Isoniazid and Pyrazinamide tablet is a mixed preparation of rifampin, isoniazid and pyrazinamide. It contains not less than 90.0% and not more than 110.0% of the labeled content of rifampin ($C_{43}H_{58}N_4O_{12}$), isoniazid ($C_6H_7N_3O$)

and pyrazinamide ($C_5H_5N_3O$).

Description Film coated tablets with orange red or dark red core.

Identification

(1) Dissolve about weighed quantity of the powdered tablets, equivalent to 5 mg of rifampin, in 2 ml of 0.1 mol/L hydrochloric acid solution, add 2 drops of 0.1 mol/L sodium nitrite solution; the colour changes from orange red to dark red.

(2) Dissolve about weighed quantity of the powdered tablets (equivalent to 0.1 g of Isoniazid) in 10 ml of water in a test tube, shake and filter. Use the filtrate, add 1 ml of ammoniated silver nitrate TS, bubbles and a black turbidity are produced immediately, and a silver mirror is formed on the wall of the tube.

(3) Heat a quantity of the powdered tablets (equivalent to . g P. z d with 5 ml of sodium hydroxide TS, the characteristic odour of ammonia is perceived, the vapour turns moistened red litmus paper to blue.

(4) The retention time of principal peaks of rifampin, isoniazid and pyrazinamide in the chromatogram obtained in the Assay are identical with that of principal peaks of Rifampin CRS, Isoniazid CRS and Pyrazinamide CRS in the chromatogram of the reference solution correspondingly.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw a quantity of the solution at 30 minutes and filter, measure accurately a quantity of the successive filtrate and dilute with phosphate buffer solution (dissolve 3.02 g of potassium dihydrogen phosphate and 6.2 g of dipotassium hydrogen phosphate in 1000 ml of water, adjusted to pH 7.0), to produce a solution of 30 µg of rifampicin per ml. Dissolve an accurately weighed quantity of rifampicin CRS in phosphate buffer solution to produce a solution of 30 µg of rifampicin per ml. Measure the absorbance of the resulting solution at 474 nm (Appendix IV A). Calculate the dissolution of $C_{43}H_{58}N_4O_{12}$ from each tablet. Not less than 75% of the labeled amount is dissolved.

Other requirements Comply the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with nitrile groups chemically bonded to porous silica particles and a mixture of 0.01 mol/L sodium heptanesulfonate solution (adjust to pH 2.2 with dilute phosphoric acid)-acetonitrile (44 : 56) as the mobile phase. Detection wavelength is 254 nm. Dissolve Rifampicin CRS, Rifampicinquinone CRS, Isoniazid CRS, and Pyrazinamide CRS in mobile phase to produce a mixture solution, contains 60 µg of Rifampicin, 60 µg of Rifampicinquinone 20 µg of Isoniazid and 62.5 µg of pyrazinamide per ml. Inject 20 µl in to column and record the chromatogram. The retention time of the substance in mixture solution are Pyrazinamide, Isoniazid, Rifampicinquinone and Rifampicin in turn; and the resolution factor among these peaks complies with related requirements. The number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of Pyrazinamide.

Procedure Weigh accurately and powder 10 tablets with coating removed. Triturate an accurately weighed quantity of the powder (equivalent to 60 mg of Rifampicin) in a 100 ml volumetric flask, dilute with mobile phase to volume, mix well and filter. Measure accurately 5 ml of the successive filtrate in 50 ml volumetric flask, dilute with mobile phase to volume, mix well and filter. Inject 20 µl in to column

and record the chromatogram. Repeat the operations, using Rifampin CRS, Isoniazid CRS and Pyrazinamide CRS instead of the substance being examined. Calculate the contents of $C_{43}H_{58}N_4O_{12}$, $C_6H_7N_3O$ and $C_5H_5N_3O$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Antibiotics for tuberculosis.

Strength 0.45 g (0.12 g of $C_{43}H_{58}N_4O_{12}$, 0.08 g of $C_6H_7N_3O$ and 0.25 g of $C_5H_5N_3O$)

Storage Preserve in tightly closed containers, protected from light and stored in a dry place.

Rotundine

$C_{21}H_{25}NO_4$ 355.43

Rotundine is 5,8,13,13α-tetrahydro-2,3,9,10-tetramethoxy-6H-dibenzo [a, g] quinolizine. It contains not less than 98.0% of $C_{21}H_{25}NO_4$, calculated on the dried basis.

Description White to slightly yellow crystals; odourless; tasteless. It turns to yellow on exposure to light or heat. Soluble in chloroform; sparingly soluble in ethanol or ether; insoluble in water; freely soluble in dilute sulfuric acid.

Melting point 141-144°C (Appendix VI C).

Specific optical rotation -290° to -300°, measured at 25°C in a solution of 8 mg per ml in ethanol (Appendix VI E).

Specific absorbance Measure the absorbance of a 30 µg per ml solution in 0.5% sulfuric acid solution at 281 nm (Appendix IV A), the value of A (1%, 1 cm) is 150-160.

Identification (1) Carry out the following tests using a solution of 0.1 g in a mixture of 10 ml of water and 1 ml of dilute sulfuric acid.

To 2 ml of the solution add 1 drop of potassium dichromate TS, a yellow precipitate is produced; To 2 ml of the solution add 1 drop of saturated sodium chloride solution, a white precipitate is produced; To 2 ml of the solution add dilute potassium ferricyanide TS; A yellow precipitate is produced, which gradually turns to green and finally changes to blue on gentle heating.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of rotundine (Appendix XVI).

Clarity and colour of acidity solution Dissolve 0.15 g in 5 ml of 5% sulfuric acid solution, the solution is clear; any colour produced is not more intense than reference solution YG₄ (Appendix IX A, method 1).

Other alkaloids Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-dehydrated ethanol-concentrated ammonia solution (98 : 2 : 0.5) as the mobile phase. Apply separately to the plate 20 µl of each of

two solutions in dehydrated ethanol containing (1) 10 mg, (2) 50 μg of the substance being examined per ml. After developing and removal of the plate, allow it to dry in air and visualize with iodine vapour. Any spot, other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 5.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VII N).

Assay Dissolve about 0.3 g, accurately weighed, in 2 ml of acetic acid and 15 ml of water in a 50 ml volumetric flask with heating, mix well. Add 25 ml of 1.7% potassium iodide solution, accurately measured dilute with water to volume and mix well. Filter through dry filter. Measure accurately 25 ml of the successive filtrate, add 3-5 drops of eosin sodium IS, titrate with silver nitrate (0.05 mol/L) VS until the pink precipitate coagulates. Perform a blank determination and make any necessary corrections. Each ml of silver nitrate (0.05 mol/L) VS is equivalent to 17.77 mg of $\text{C}_{21}\text{H}_{25}\text{NO}_4$.

Category Analgesic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Rotundine Sulfate Injection
(2) Rotundine Tablets

Rotundine Tablets

Rotundine Tablets contain not less than 93.0% and not more than 107% of the labelled amount of rotundine ($\text{C}_{21}\text{H}_{25}\text{NO}_4$).

Description White to slightly yellow tablets.

Identification (1) To a quantity of the powdered tablets equivalent to about 0.1 g of rotundine add 10 ml of water and 1 ml of dilute sulfuric acid, shake to dissolve rotundine and filter. The filtrate complies with test (1) for Identification described under Rotundine.

(2) To a quantity of powdered tablets add ethanol to produce a suspension containing 8 mg of rotundine per ml and filter. The specific optical rotation of the filtrate (Appendix VI E) is not less than -270° , calculated on the basis of the labelled amount (distinction from tetrahydropalmatine sulfate).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid solution (9 \rightarrow 1000) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw the solution after exactly 45 minutes and filter. Transfer 5 ml (for strength 60 mg) of successive filtrate in a 10 ml volumetric flask and dilute with dissolution medium to the volume. Measure the absorbance at 281 nm (Appendix IV A), calculate the dissolution of $\text{C}_{21}\text{H}_{25}\text{NO}_4$ of each tablet, taking 155 as the value of A (1%, 1 cm), not less than 70% of the labelled amounts dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder finely 20 tablets. Weigh accurately a quantity equivalent to about 60 mg of rotundine to a 100 ml volumetric flask, add 0.5% sulfuric

acid solution, shake to dissolve rotundine, dilute with the same solvent to volume, mix well and filter. Measure accurately 5 ml of the successive filtrate to a 100 ml volumetric flask, dilute with 0.5% sulfuric acid solution to volume and mix well. Measure the absorbance of the resulting solution at 281 nm (Appendix IV A), calculate the content of $\text{C}_{21}\text{H}_{25}\text{NO}_4$, taking 155 as the value of A (1%, 1 cm).

Category As described under Rotundine.

Strength (1) 30 mg (2) 60 mg

Storage Preserve in tightly closed containers, protected from light.

Rotundine Hydrochloride

$\text{C}_{21}\text{H}_{25}\text{NO}_4 \cdot \text{HCl}$ 391.89

Rotundine Hydrochloride is 2,3,9,10-tetramethoxy-5,8,13,13 α -tetrahydro-6H-dibenzo (a, g) quinolizine. It contains not less than 98.5% of $\text{C}_{21}\text{H}_{25}\text{NO}_4 \cdot \text{HCl}$, calculated on the dried basis.

Description White to slightly yellow crystals; odourless; taste bitter; readily turns to yellow on exposure to light on heating.

Soluble in chloroform, methanol or boiled water; sparingly soluble in water; slightly soluble in dehydrated ethanol; practically insoluble in ether or acetone.

Specific optical rotation Above -232°C , measured at 25°C in a solution of 10 mg per ml in water (Appendix VI E).

Specific absorbance Measure the absorbance of a solution of about 30 μg per ml in 0.01 mol/L hydrochloric acid solution at 281 nm (Appendix IV A), the value of A (1%, 1 cm) is 135 to 146.

Identification (1) Dissolve 10 mg in 2 ml of water, add 1 drop of potassium dichromate TS, a yellow precipitate is produced.

(2) Dissolve 10 mg in 2 ml of water, add 1 drop of potassium dichromate TS, a yellow precipitate is produced, which gradually turns to green, and then to blue on heating slowly.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the spectrum of rotundine hydrochloride (Appendix XIV).

Acidity Dissolve a quantity in water to produce a solution of 2 mg per ml, pH 4.0-4.7 (Appendix VI H).

Other alkaloids Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-dehydrated ethanol (98 : 2) as the mobile phase. Apply separately to the plate 10 μl of each of two solutions in a mixture of dehydrated ethanol-concentrate ammonia solution (9 : 1) containing (1) 10 mg per ml, (2) 0.1 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air and expose to iodine vapour. Any spot in the chromatogram other than the principal spot obtained with solution (1) is not more intense than the principal spot

obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 6.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Weigh accurately 0.35 g, add 25 ml of glacial acetic acid, 2 ml of acetic anhydride and 5 ml of mercuric acetate TS, shake to dissolve, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the solution turns to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 39.19 mg of $C_{21}H_{25}NO_4 \cdot HCl$.

Category Analgesic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Rotundine Hydrochloride Tablets

Rotundine Hydrochloride Tablets

Rotundine Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of rotundine hydrochloride ($C_{21}H_{25}NO_4 \cdot HCl$).

Description White to pale yellow tablets.

Identification To a quantity of powdered tablets equivalent to about 0.1 g of rotundine hydrochloride add 20 ml of water, shake to dissolve rotundine hydrochloride, filter, the filtrate complies with tests (1) and (2) for Identification described under Rotundine Hydrochloride.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and triturate 20 tablets, dissolve an accurately weighed quantity equivalent to about 30 mg of rotundine hydrochloride in 0.01 mol/L hydrochloric acid in a 100 ml volumetric flask and dilute to volume, mix well, filter. Measure accurately 5 ml of the successive filtrate to a 50 ml volumetric flask, dilute with 0.01 mol/L hydrochloric acid solution to volume, mix well. Measure the absorbance at 281 nm (Appendix IV A), calculate the content of $C_{21}H_{25}NO_4 \cdot HCl$, taking 140.4 as the value of A (1%, 1 cm).

Category As described under Rotundine Hydrochloride.

Strength 30 mg

Storage Preserve in tightly closed containers, protected from light.

Rotundine Sulfate Injection

Rotundine Sulfate Injection is a sterile solution of Rotundine in Water for Injection containing a quantity of dilute sulfuric acid. It contains not less than 93.0% and not more than 107.0% of the labelled amount of rotundine sulfate [$(C_{21}H_{25}NO_4)_2 \cdot H_2SO_4$].

Description A clear, pale yellow to yellow liquid; the colour deepens on exposure to light or heat.

Identification (1) Complies with test (1) for Identification described under Rotundine.

(2) Mix 5 ml, measured accurately, with 10 ml of water, the specific optical rotation of the resulting solution (Appendix VI E) is not less than -237° (distinction from tetrahydropalmatine sulfate).

pH value 2.5-4.0 (Appendix VI H).

Colour Not more intense than that of reference solution YG₉ (Appendix IX A, method 1); use 5 ml.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity of rotundine sulfate, dilute with 0.5% sulfuric acid solution to produce a solution of 30 µg per ml. Measure the absorbance of the resulting solution at 281 nm (Appendix IV A), calculate the content of $(C_{21}H_{25}NO_4)_2 \cdot H_2SO_4$, taking 136 as the value of A (1%, 1 cm).

Category As described under Rotundine.

Strength 2 ml : 60 mg

Storage Preserve in well closed containers, protected from light.

Roxithromycin

$C_{41}H_{76}N_2O_{15}$ 837.03

[80214-83-1]

Roxithromycin is (3R,4S,5S,6R,7R,9R,11S,12R,13S,14R)-4-[(2,6-dideoxy-3-C,3-O-dimethyl-α-L-ribo-hexopyranosyl)oxy]-14-ethyl-7,12,13-trihydroxy-10-[(E)-[(2-methoxyethoxy)-methoxy]imino]-3,5,7,9,11,13-hexamethyl-6-[3,4,6-trideoxy-3-dimethylamino-β-D-xylo-hexopyranosyl]oxy oxacyclotetradecan-2-one. It contains not less than 94.0% of $C_{41}H_{76}N_2O_{15}$, calculated on the anhydrous basis.

Description A white or almost white crystalline powder; odourless; taste, bitter; slightly hygroscopic.

Freely soluble in ethanol or acetone; soluble in methanol or ether; sparingly soluble in acetonitrile, practically insoluble in water.

Specific optical rotation -82° to -87° , in a solution of 20 mg per ml in dehydrated ethanol (Appendix VI E).

Identification (1) The retention time of principal peak of the solution being examined in the chromatogram obtained in the Assay is identical with that the principal peak of the reference solution correspondingly.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of roxithromycin (Appendix XIV). If any disagreement is found, dissolve a quantity in acetone, dry it in air first in vacuum at 60°C and then perform the determination.

Alkalinity To 0.1 g add 150 ml of water, shake thoroughly, pH 8.0-10.0 (Appendix VI H).

Related substances Dissolve a quantity in mobile phase to produce a solution of 2 mg per ml, using it as test solution. Measure accurately 1 ml to a 100 ml volumetric flask, dilute with mobile phase to volume, mix well as reference solution. Carry out the method as described under Assay. Inject 20 μ l of reference solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is about 20% of full scale of the chart. Inject accurately 20 μ l of the two solutions respectively into the column and record the chromatograms for four times the retention time of the principal peak. The area of each impurity peak in the chromatogram obtained with test solution is not greater than 1.5 times of the area of the principal peak in the chromatogram obtained with reference solution (1.5%); the sum of the area of all impurity peak in the chromatogram obtained with test solution is not greater than 4.5 times of the area of the principal peak in the chromatogram obtained with reference solution (4.5%).

Water Dissolve a quantity in pyridine, carry out the method for determination of water (Appendix VIII M, method 1 A); not more than 3.0%.

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of ammonium dihydrogen phosphate (adjust to pH 6.5 with triethylamine)-acetonitrile (65 : 35) as mobile phase. The detection wavelength is 210 nm; The retention time of roxithromycin is not less than 9 minutes. The resolution factor between peaks of roxithromycin and the front impurity peak is not less than 1.0, the resolution factor between peaks of roxithromycin and the back impurity peak is not less than 2.0; The number of theoretical plates of the column is not less than 2500, calculated with reference to the peak of roxithromycin.

Procedure Dissolve a quantity, accurately weighed, in mobile phase to produce a solution of 1 mg per 1 ml, inject 20 μ l into the column and record the chromatogram. Repeat the operation, using the roxithromycin CRS instead of the substance being examined, calculate the content of $C_{41}H_{76}N_2O_{15}$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Macrolide antibiotic.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation (1) Roxithromycin Capsules
(2) Roxithromycin Dispersible Tablets
(3) Roxithromycin for Suspension
(4) Roxithromycin Granules
(5) Roxithromycin Tablets

Roxithromycin Capsules

Roxithromycin Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of roxithromycin ($C_{41}H_{76}N_2O_{15}$).

Description White or almost white crystalline powder and granules.

Identification The retention time of the principal peak of the solution being examined in the chromatogram obtained in the Assay is identical with that the principal peak of the reference solution correspondingly.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using hydrochloric acid solution (1 \rightarrow 1000) 900 ml as the dissolution medium (600 ml for 50 mg), adjust the rotational speed of the basket to 100 rpm. Withdraw the solution after exactly 45 minutes and filter, dilute an accurately measured quantity of the successive filtrate with the dissolution medium to produce a solution of 80 μ g of roxithromycin per ml. Dissolve an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents equivalent to about the average weight of one capsule in ethanol (using 1 ml ethanol for 5 mg of roxithromycin), and dilute with the dissolution medium and filter, dilute an accurately measured quantity of the successive filtrate with the dissolution medium to produce a solution of 80 μ g of roxithromycin per ml according to the labelled amount. Measure accurately 5 ml each of the two solutions separately, add 5 ml of sulfuric acid solution (75 \rightarrow 100) respectively, mix well, allow to stand for 30 minutes, cool. Measure the absorbances of the resulting solutions at 482 nm (Appendix IV A), calculate the dissolution of $C_{41}H_{76}N_2O_{15}$ from each capsule. Not less than 75% of the labeled amount is dissolved. The disintegration of shell by swelling reduce not to be complied, using hydrochloric acid solution (1 \rightarrow 1000) containing 1% pepsin (1 : 1200-1 : 3000) as the solvent, repeat the test.

Related substances Dissolve an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents in mobile phase to produce a solution of 2 mg per ml, filter and use the successive filtrate as the test solution. Measure accurately 1 ml to a 100 ml volumetric flask, dilute with mobile phase to volume, mix well as the reference solution. Carry out the test for Related substances described under Roxithromycin. The area of each impurity peak in the chromatogram obtained with test solution is not greater than 2.5 times of the area of the principal peak in the chromatogram obtained with reference solution (2.5%).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately and powder a quantity of the mixed contents in the test for weight variation of contents, equivalent to about 50 mg of roxithromycin, add quantity mobile phase, sonicate for 20 minutes, dilute with mobile phase to produce a solution of 1 mg of roxithromycin per ml, filter, take the successive filtrate as the test solution and carry out the test of the Assay as described under Roxithromycin.

Category As described under Roxithromycin.

Strength (1) 50 mg (2) 75 mg (3) 150 mg

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Roxithromycin Dispersible Tablets

Roxithromycin Dispersible Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of roxithromycin ($C_{41}H_{76}N_2O_{15}$).

Description White or almost white tablets.

Identification The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that the principal peak of the reference solution.

Related substances Dissolve a quantity of the powdered tablets in mobile phase to produce a solution of 2 mg per ml, filter and use the successive filtrate as the test solution. Measure accurately 1 ml to a 100 ml volumetric flask, dilute with mobile phase to volume, mix well as reference solution. Carry out the test for Related substances described under Roxithromycin. The area of each impurity peak in the chromatogram obtained with test solution is not greater than 2.5 times of the area of the principal peak in the chromatogram obtained with reference solution (2.5%).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using hydrochloric acid solution (1→1000) 900 ml as the dissolution medium (600 ml for strength 50 mg), adjust the rotational speed of the basket to 100 rpm. Withdraw the solution after exactly 45 minutes and filter, dilute an accurately measured quantity of the successive filtrate with the dissolution medium to produce a solution of 80 µg of roxithromycin per ml. Dissolve a quantity of 10 powdered tablets, equivalent to about the average weight of one tablet, in ethanol (1 ml of ethanol per 5 mg of roxithromycin), dilute with the dissolution medium and filter, dilute an accurately measured quantity of the successive filtrate with the dissolution medium to produce a solution of 80 µg of roxithromycin per ml according to the labelled amount. Measure accurately 5 ml each of the two solutions separately, add 5 ml of sulfuric acid solution (75→100), mix well, allow it to stand for 30 minutes, cool to room temperature. Measure the absorbances of the resulting solutions at 482 nm (Appendix VI A), calculate the dissolution of $C_{41}H_{76}N_2O_{15}$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for dispersible tablets (Appendix I A).

Assay Weigh accurately and powder finely 10 tablets, triturate an accurately weighed quantity, equivalent to about 50 mg of roxithromycin, add quantity mobile phase, ultrasonic for 20 minutes, dilute with mobile phase to produce a solution of 1 mg of roxithromycin per ml, filter, take the successive filtrate as the test solution and carry out the test for the Assay as described under Roxithromycin.

Category As described under Roxithromycin.

Strength (1) 50 mg (2) 75 mg (3) 150 mg

Storage Preserve in tightly closed containers, stored in a dry place.

Roxithromycin for Suspension

Roxithromycin for suspension contains not less than 90.0% and not more than 110.0% of the labelled amount of roxithromycin ($C_{41}H_{76}N_2O_{15}$).

Description Powder; odour fragrant, taste, sweet.

Identification The retention time of principal peak of the solution being examined in the chromatogram obtained in the Assay is identical with that the principal peak of the reference solution correspondingly.

Alkalinity Weigh a quantity of the substance being examined, equivalent to about 15 mg of roxithromycin, add 10 ml of water, shake thoroughly, pH 7.0-9.0. (Appendix VI H).

Loss on drying When dried in vacuum to constant weight at 80°C, loses not more than 2.0% of its weight (Appendix VII L).

Other requirements Complies with the general requirements for oral suspensions (Appendix I O) except of ratio of sedimental volume.

Assay Weigh accurately and powder finely the mixed contents obtained in the test for weight variation of contents, dissolve accurately a quantity of powdered mixed contents in mobile phase, ultrasonic for 20 minutes, dilute with mobile phase to produce a solution of 0.5 mg per ml. Filter and use the successive filtrate as the test solution. Carry out the Assay described under Roxithromycin.

Category As described under Roxithromycin.

Strength (1) 25 mg (2) 50 mg (3) 75 mg

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Roxithromycin Granules

Roxithromycin Granules contain not less than 90.0% and not more than 110.0% of the labelled amount of roxithromycin ($C_{41}H_{76}N_2O_{15}$).

Description Suspension granules; taste, slightly sweet. or tasteless coated granules with white or almost white core.

Identification The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peaks of the reference solution.

Dissolution Carry out the dissolution test (Appendix XC method 1), using hydrochloric acid solution (1→1000) 900 ml as the dissolution medium (600 ml for strength 50 mg, 500 ml for strength 25 mg), adjust the rotational speed of the basket to 100 rpm. Withdraw the solution after exactly 45 minutes and filter, dilute an accurately measured quantity of the successive filtrate with the dissolution medium to produce a solution of 80 µl of roxithromycin per ml (50 µg for strength 25 mg) as the test solution. Dissolve an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents, equivalent to about 50 mg of roxithromycin (using 1 ml of ethanol for 5 mg of roxithromycin), and dilute with the dissolution medium to produce a solution of 80 µg or 50 µg per ml and filter, using the successive filtrate as the reference solution. Measure accurately 5 ml of each of the test solution and reference solution separately, add 5 ml of sulfuric acid solution (75→100) respectively, accurately measured mix well, allow to stand for 30 minutes, cool to room temperature. Measure the absorbances of the resulting solutions at 482 nm (Appendix IV A), calculate the dissolution of $C_{41}H_{76}N_2O_{15}$ from each container. Not less than 70% of the labelled amount is dissolved (for coated granules).

Loss on drying When dried to constant weight at 105°C,

loses not more than 2.0% of its weight (Appendix VIII L).

Other requirements Comply with the general requirements for granules (Appendix I N).

Assay Dissolve an accurately weighed quantity of the powdered and mixed contents in the test for weight variation of contents in ethanol (using 1 ml of ethanol for 5 mg of roxithromycin), dilute with phosphate BS (pH 7.8) to produce a solution of 1000 Units per ml, mix well and allow to stand. Measure accurately a quantity of the supernatant liquid and carry out the Assay described under Roxithromycin.

Category As described under Roxithromycin.

Strength (1) 25 mg (2) 50 mg
(3) 75 mg (4) 150 mg

Storage Preserve in tightly closed containers, stored in a dry place.

triturate an accurately weighed quantity, equivalent to about 50 mg of roxithromycin, add quantity mobile phase, in an ultrasonic bath for 20 minutes, dilute with mobile phase to produce a solution of 1 mg roxithromycin per ml, filter, take the successive filtrate as test solution and carry out the Assay as described under Roxithromycin.

Category As described under Roxithromycin.

Strength (1) 50 mg (50000 units)
(2) 75 mg (75000 units)
(3) 150 mg (150000 units)

Storage Preserve in tightly closed containers, stored in a dry place.

Roxithromycin Tablets

Roxithromycin Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of Roxithromycin ($C_{41}H_{76}N_2O_{15}$).

Description White or almost white tablets or film coated tablets with white or almost white core.

Identification The retention time of principal peak of the solution being examined in the chromatogram obtained in the Assay is identical with that the principal peak of the reference solution correspondingly.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using hydrochloric acid solution (1→1000) 900 ml as the dissolution medium (600 ml for strength 50 mg), adjust the rotational speed of the basket to 100 rpm. Withdraw the solution after exactly 45 minutes and filter, dilute an accurately measured quantity of the successive filtrate with the dissolution medium to produce a solution of 80 µg of roxithromycin per ml. Dissolve a quantity of 10 powdered tablets, equivalent to about the average weight of one tablet, in ethanol (1 ml of ethanol per 5 mg roxithromycin), dilute with the dissolution medium and filter, dilute an accurately measured quantity of the successive filtrate with the dissolution medium to produce a solution of 80 µg of roxithromycin per ml according to the labelled amount. Measure accurately 5 ml each of the two solutions separately, add 5 ml of sulfuric acid solution (75→100), measured accurately, mix well, allow it to stand for 30 minutes, cool to room temperature. Measure the absorbances of the resulting solutions at 482 nm (Appendix IV A), calculate the dissolution of $C_{41}H_{76}N_2O_{15}$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Related substances Dissolve a quantity of powdered tablets in mobile phase to produce a solution of 2 mg per 1 ml, filter and use the successive filtrate as the test solution. Measure accurately 1 ml to a 100 ml volumetric flask, dilute with mobile phase to volume, mix well as reference solution. Carry out the Related substances as described under Roxithromycin. The area of each impurity peak in the chromatogram obtained with test solution is not greater than 2.5 times of the area of the principal peak in the chromatogram obtained with reference solution (2.5%).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder finely 10 tablets,

Saccharin Sodium

$C_7H_4NNaO_3S \cdot 2H_2O$ 241.19

[6155-57-3]

Saccharin Sodium is the sodium salt of 1,2-benzisothiazolin-3 (2H)-one-1,1-dioxide dihydrate. It contains not less than 99.0% of $C_7H_4NNaO_3S$, calculated on the dried basis.

Description Colourless crystals or a white crystalline powder; odourless or with a faintly aromatic odour; taste, intensely sweet with bitter. Efflorescent. Freely soluble in water; sparingly soluble in ethanol.

Identification (1) Dissolve about 0.3 g in 5 ml of water, add 1 ml of dilute hydrochloric acid; a crystalline precipitate is produced. Filter, wash the precipitate with water and dry at 105°C for 2 hours, it melts at 226-230°C (Appendix VI C). (2) Mix 20 mg with 40 mg of resorcinol, add 0.5 ml of sulfuric acid, heat over a small flame until it assumes a dark green colour. Allow it to cool, add 10 ml of water and an excess of sodium hydroxide TS; a fluorescent green liquid is produced.

(3) The residue left on ignition yields the reactions characteristic of sodium salts (Appendix III).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of saccharin sodium (Appendix XVI).

Acidity or alkalinity A solution of 1.0 g in 10 ml of water is neutral or alkaline to litmus paper, but exhibits no red colour to phenolphthalein IS.

Ammonium salt Dissolve 0.40 g in 20 ml of ammonia-free water, add 1 ml of alkaline potassium mercuric-iodide TS, mix well and allow to stand for 5 minutes. Any colour produced is not more intense than that of a reference solution prepared in the same manner with 0.10 ml of ammonium chloride solution. 0.966 g ammonium chloride, previously dried to constant weight at 105°C, is dissolved in ammonia-free water to make 1000 ml (0.0025%).

Benzoate and salicylate Dissolve 0.50 g in 10 ml of water, acidify with 5 drops of acetic acid, add 3 drops of ferric chloride TS; no precipitate or violet colour is produced.

Toluenesulfonamide Carry out the method for gas chromatography (Appendix V E), using a column packed with 1.5% polyethylene glycol adipate containing silicone (OV-17) as the stationary phase, and maintain the column temperature at 180°C.

Dissolve a quantity of *o*- and *p*-Toluenesulfonamide CRS, accurately weighed, in dichloromethane to produce a solution containing 50 µg each of *o*-Toluenesulfonamide and 50 µg of *p*-Toluenesulfonamide per ml as reference standard solution. Dissolve about 2.0 g of saccharin sodium, accurately weighed, in 8.0 ml of 5% solution of sodium carbonate, then add 10 g of kieselguhr [weigh 100 g of kieselguhr (pass through No. 9 sieve), add 800 ml of hydrochloric acid, stir occasionally, allow to immerse for 12 hours, discard the acid solution. Repeat the operation for 3 times using hydrochloric acid, allow to immerse for 1 hour each time. Wash with water till the solution yields neutral reaction. Transfer the kieselguhr to 300 ml of methanol and filter,

dried at 80°C], mix well, pack into a 25 mm × 250 mm chromatography tube. Carry out the method for column chromatography (Appendix V C, method 2), using dichloromethane to elute about 30 minutes. Collect 50 ml of eluent, evaporate to almost dryness, add dichloromethane to produce 1.0 ml as the test solution. Inject the two solutions to operate the column respectively and calculate the content of toluenesulfonamide, the sum is not more than 0.0025%.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight upon drying.

Heavy metals Dissolve 2.0 g in 48 ml of water in a beaker, add 2 ml of hydrochloric acid solution (9→100), stir and scratch the inside of the beaker with a glass rod until crystallization begins. Allow to stand for 1 hour, filter. Carry out the limit test for heavy metals (Appendix VIII H, method 1) using 25 ml of the filtrate; not more than 0.001%.

Arsenic Transfer 1 g to a crucible containing about 1 g of anhydrous sodium carbonate on the bottom and around the inner walls. Moisten with a small quantity of water. Evaporate to dryness on a water bath, gently ignite to carbonize it and continue to ignite at 500-600°C until all black particles have disappeared. Cool, dissolve the residue in 5 ml of hydrochloric acid and 23 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Assay Dissolve about 0.2 g, accurately weighed, in 20 ml of glacial acetic acid, add 1 drop of crystal violet IS and titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 20.52 mg of $C_7H_4NNaO_3S$.

Category Diagnostic and sweetener.

Storage Preserve in tightly closed containers.

Salbutamol

$C_{13}H_{21}NO_3$ 239.31

[18559-94-9]

Salbutamol is 1-(4-hydroxy-3-hydroxymethylphenyl)-2-(tert-butylamino) ethanol. It contains not less than 98.5% of $C_{13}H_{21}NO_3$, calculated on the dried basis.

Description White crystalline powder; odourless; almost tasteless. Soluble in ethanol; sparingly soluble in water; insoluble in ether.

Melting range 154-158°C, with decomposition (Appendix VI C).

Identification (1) Dissolve about 20 mg in 2 ml of water, add 2 drops of ferric trichloride TS and shake; a violet colour is produced which turns to orange-red on addition of sodium bicarbonate TS.

(2) Dissolve about 10 mg in 20 ml of 0.4% borax solution, add 1 ml of 3% 4-aminoantipyrine solution and 1 ml of 2% potassium ferricyanide solution. Add 10 ml of chloroform, shake and allow to stand; an orange-red colour is produced in the chloroform layer.

(3) The light absorption of a solution of 0.08 mg per ml in

0.1 mol/L hydrochloric acid solution, exhibits a maximum at 276 nm (Appendix IV A).

Colour of ethanol solution A solution of 0.40 g in 10 ml of dehydrated ethanol is made by warming in a water bath. Any colour produced is not more intense than that of reference solution (to 0.5 ml of yellow stock Reference Solution add 10 ml of dehydrated ethanol) (Appendix IX A, method 1).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethyl acetate-isopropanol-water-concentrated ammonia (50 : 30 : 16 : 4) as the mobile phase. Apply separately to the plate 10 µl each of two solutions in methanol containing (1) 10 mg; (2) 0.10 mg of the substance being examined per ml. After developing and removal of the plate, dry it in air. Place the plate in an atmosphere saturated with diethylamine for 5 minutes and spray with diazotized sulfanilic acid solution. Any spot other than the principal spot in the chromatogram obtained with solution (1), is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.2 g, accurately weighed, in 25 ml of glacial acetic acid, add a drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 23.93 mg of $C_{13}H_{21}NO_3$.

Category β_2 -Adrenergic receptor activating agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation Salbutamol Aerosol

Salbutamol Aerosol

Salbutamol Aerosol of solution type or suspension type is packed in a tightly closed containers fitted with meter-dose valve system. It contains not less than 90.0% and not more than 120.0% of the labelled amount of salbutamol, ($C_{13}H_{21}NO_3$). The concentration of salbutamol in the liquid is not less than 80% (g/g) and not more than 130% (g/g) of the labelled concentration.

Description Solution type: a clear, colourless to pale yellow liquid; suspension type: a white suspension.

Identification Punch a small hole on the aluminium cover of one container, with a syringe needle, remove the aluminium cover after complete evaporation of the propellant, weigh a quantity equivalent to about 5 mg of salbutamol, add 10 ml of 2% borax solution, 1 ml of 3% 4-aminoantipyrine solution and 2 ml of 2% potassium ferricyanide solution; the solution becomes orange-red, then shake with 5 ml of chloroform, and allow to stand; an orange-red colour is produced in the chloroform layer.

Other requirements Complies with the general requirements for aerosols (Appendix I L).

Assay Remove the cover of one container, weigh accurately, punch a small hole on the aluminium cover and insert a syringe needle connecting to a dry rubber tubing, keep the needle without contact the liquid surface. Dip the other end of the

tubing to 5 ml of ethanol contained in a 50 ml volumetric flask, allow the propellant to evaporate slowly. Remove the aluminium cover, and valve, transfer the content to above 50 ml volumetric flask. Wash the aluminium cover, valve and container with ethanol for several times, combine the washings to a small beaker, evaporate to dryness on a water bath, wash the residue with 0.1 mol/L hydrochloric acid solution and transfer to above volumetric flask, dilute with 0.1 mol/L hydrochloric acid to volume, mix well, filter. Measure accurately 5 ml of successive filtrate to a 50 ml volumetric flask, dilute with 0.1 mol/L hydrochloric acid solution to volume, mix well, as the test solution. Weigh accurately about 28 mg of salbutamol CRS (suspension type using 20 mg), in a 50 ml volumetric flask, add 0.1 mol/L hydrochloric acid solution to dissolve salbutamol and dilute to volume, mix well. Measure accurately 5 ml to a 50 ml volumetric flask, dilute with 0.1 mol/L hydrochloric acid solution to volume, mix well, as the reference solution. Measure the absorbance of the two solutions at 276 nm (Appendix IV A). Calculate the content of salbutamol. Weigh accurately the weight of container, aluminium cover and valve after washing clean and dried, subtracted from the original weight of the container being the weight of salbutamol; the concentration may be obtained from the ratio of content of salbutamol in each container. Repeat the Assay with another two containers, if only one of the two results of the content and the concentration result meets the requirement, all results should comply with the requirements.

Category β_2 -Adrenergic receptor activating agent.

Strength Solution type: 14 g per container, containing 28 mg of salbutamol, liquid concentration: 0.2% (g/g), spraying dose: 0.14 mg
Suspension type: 14 g per container, containing 20 mg of salbutamol, liquid concentration: 0.14% (g/g), spraying dose: 0.10 mg
Suspension type: 20.4 g per container, containing 24.0 mg of salbutamol, liquid concentration: 0.1176% (g/g), spraying dose: 0.10 mg

Storage Preserve in well closed containers, stored in cool place, protected from light.

Salbutamol Sulfate

($C_{13}H_{21}NO_3$)₂ · H₂SO₄ 576.71

[51027-70-9]

Salbutamol Sulfate is 1-(4-hydroxy-3-hydroxy-methylphenyl)-2-(tert-butyl-amino) ethanol sulfate (2 : 1) (salt). It contains not less than 98.0% of ($C_{13}H_{21}NO_3$)₂ · H₂SO₄, calculated on the dried basis.

Description A white or almost white powder; odourless; taste, slightly bitter. Freely soluble in water; very slightly soluble in ethanol; practically insoluble in chloroform or ether.

Identification (1) Dissolve 20 mg in 2 ml of water, add 1 drop of ferric chloride TS and shake; a violet colour is produced which turns to cloudy orange yellow on addition of sodium bicarbonate TS.

(2) Dissolve about 10 mg in 20 ml of 0.4% borax solution, add 1 ml of 3% 4-aminoantipyrine solution and 1 ml of 2% potassium ferricyanide solution. Add 10 ml of chloroform, shake and allow it to stand; an orange-red colour is produced in the chloroform layer.

(3) The light absorption of a solution of 0.08 mg per ml in water exhibits a maximum at 276 nm (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Salbutamol sulfate (Appendix XVI).

(5) The aqueous solution yields the reactions characteristic of sulfates (Appendix III).

Clarity and colour of solution A solution of 0.5 g in 10 ml of water is clear and colourless. Any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B) and any colour produced is not more intense than that of reference solution Y₂ (Appendix IX A, method 1).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of concentrated ammonia solution-water-isopropanol-ethyl acetate (4 : 16 : 30 : 50) as the mobile phase. Apply separately to the plate 4 µl each of two solutions of the substance being examined in water containing (1) 50 mg per ml, (2) 0.50 mg per ml. After developing and removal of the plate, allow it to dry in air. Place the plate in an atmosphere saturated with diethylamine for 5 minutes and spray with diazotised sulfanilic acid solution. Any spot in the chromatogram obtained with solution (1), other than the principal spot, is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried in vacuum to constant weight at 60°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.4 g, accurately weighed, in 10 ml of glacial acetic acid on gentle heating and cool. Add 15 ml of acetic anhydride and a drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 57.67 mg of (C₁₃H₂₁NO₃)₂ · H₂SO₄.

Category β-Adrenergic receptor activating agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Salbutamol Sulfate Capsules
(2) Salbutamol Sulfate Injection
(3) Salbutamol Sulfate Sustained-release Tablets
(4) Salbutamol Sulfate Sustained-release Capsules
(5) Salbutamol Sulfate Tablets

Salbutamol Sulfate Capsules

Salbutamol Sulfate Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of salbutamol sulfate [(C₁₃H₂₁NO₃)₂ · H₂SO₄].

Identification To the powdered contents of 20 capsules, add 20 ml of water, shake to dissolve and filter. The filtrate complies with tests for Identification (1), (2), (3), (5) described under Salbutamol Sulfate.

Loss on drying When dried in vacuum at 60°C over

phosphorus pentoxide to constant weight, loses not more than 7.0% of its weight. (Appendix VIII L).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately the mixed powered contents obtained in the test for weight variation of contents, equivalent to about 8 mg of salbutamol sulfate, to a 100 ml volumetric flask, add about 50 ml of water, shake to dissolve salbutamol sulfate. Dilute to volume with water, mix well and filter (repeat filter with the same filter paper if the filtrate is not clear). Measure the absorbance of the successive filtrate at 276 nm (Appendix IV A), calculate the content of (C₁₃H₂₁NO₃)₂ · H₂SO₄, taking 59 as the value of A (1%, 1 cm).

Category As described under salbutamol sulfate.

Strength 2.4 mg (equivalent to 2 mg of salbutamol)

Storage Preserve in tightly closed containers, protected from light.

Salbutamol Sulfate Injection

Salbutamol Sulfate Injection is a sterile solution of salbutamol sulfate in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of salbutamol sulfate [(C₁₃H₂₁NO₃)₂ · H₂SO₄].

Description A clear, colourless liquid.

Identification (1) Evaporate a quantity, equivalent to about 2.4 mg of salbutamol sulfate, to 1 ml on a water bath, add 2 drops of ferric chloride TS and mix well, a violet colour is produced, which turns to turbid orange-yellow on addition of sodium bicarbonate TS.

(2) Evaporate a quantity, equivalent to about 2.4 mg of salbutamol sulfate, to 3 ml on a water bath, add 15 ml of 0.4% borax solution, 1 ml of 3% 4-aminoantipyrine solution, 1 ml of 2% potassium ferricyanide solution and 5 ml of chloroform, shake, allow to stand. An orange-red colour is produced in the chloroform layer.

(3) The light absorption of a solution obtained in the Assay exhibits a maximum at 276 nm (Appendix IV A).

(4) Yields the reactions characteristic of sulfates (Appendix III).

pH value 3.0-4.5 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity equivalent to about 2.4 mg of salbutamol sulfate into a 25 ml volumetric flask, dilute with water to volume and mix well. Measure the absorbance of the solution at 276 nm (Appendix IV A), calculate the content of (C₁₃H₂₁NO₃)₂ · H₂SO₄, taking 59 as the value of A (1%, 1 cm).

Category As described under salbutamol sulfate.

Strength 2 ml : 0.48 mg (equivalent to 0.4 mg of salbutamol)

Storage Preserve in well closed containers, protected from light.

Salbutamol Sulfate Sustained-release Capsules

Salbutamol Sulfate Sustained-release Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of salbutamol ($C_{13}H_{21}NO_3$).

Description Capsules containing white or almost white pills.

Identification (1) The retention time of the principle peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principle peak of salbutamol sulfate CRS in the chromatogram of the reference solution.

(2) Weigh a quantity of powdered contents, equivalent to about 20 mg of salbutamol, add 10 ml of water and shake to dissolve salbutamol sulfate. The filtrate yields the reactions characteristic of sulfates (Appendix III B).

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Triturate the content of 1 capsule in a mortar. Add a quantity amount of 0.1 mol/L hydrochloric acid, triturate and transfer into a 50 ml (for strength 4 mg) or a 100 ml volumetric flask (for strength 8 mg), in an ultrasonic bath for 15 minutes, cool, dilute with 0.1 mol/L hydrochloric acid to the volume, mix well and filter. Carry out the procedure as described under the Assay, calculate the content of $C_{13}H_{21}NO_3$.

Drug Release Carry out the method for drug release test (Appendix X D, method 1) and use the apparatus for dissolution test (Appendix X C, method 2), using 500 ml of phosphate BS [Dissolve 6.8 g of potassium dihydrogen phosphate in 900 ml water, adjust to pH 3 ± 0.5 with phosphoric acid, dilute with water to 1000 ml] as the release medium, adjust the rotation speed of the paddle to 100 rpm. Withdraw a sample of 5 ml of the solution at exact 1, 4 and 8 hours respectively, filter and supply 5 ml of release medium accordingly in the vessel immediately. Carry out the chromatographic conditions as described under the Assay. Accurately inject 20 μ l of the successive filtrate into the column and record the chromatogram. Dissolve an accurately weighed quantity of salbutamol sulfate CRS in release medium to produce a solution of 8 μ g per ml (for strength 4 mg) or 16 μ g per ml (for strength 8 mg), measure in the same manner. Calculate the content of $C_{13}H_{21}NO_3$ dissolved from each capsule at 1, 4 and 8 hours separately by multiplying the percentage content of $C_{13}H_{21}NO_3 \cdot H_2SO_4$ by 0.8299. The dissolution complies with the following requirements; the quantity dissolved of each capsule is less than 40%, 45%-80% and over 75% of the labelled amount at 1, 4 and 8 hours respectively.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.005 mol/L ammonium biphosphate solution (pH 3.0)-methanol (75 : 25) as the mobile phase. Detection wavelength is 224 nm and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of salbutamol sulfate.

Procedure Weigh accurately the contents of 10 capsules, triturate and mix well. Weigh accurately a quantity of powder, equivalent to about 8 mg of salbutamol, in a 100 ml volumetric flask, add a quantity of 0.1 mol/L hydrochloric

acid, in an ultrasonic bath for 15 minute to dissolve salbutamol sulfate and dilute with 0.1 mol/L hydrochloric acid to volume, mix well and filter. Accurately inject 20 μ l of the successive filtrate into the column and record the chromatogram. Dissolve an accurately weighed quantity of salbutamol sulfate CRS in 0.1 mol/L hydrochloric acid to produce a solution of 80 μ g per ml, measure in the same manner. Calculate the content of $C_{13}H_{21}NO_3$ by multiplying the percentage content of $C_{13}H_{21}NO_3 \cdot H_2SO_4$ by 0.8299.

Category As described under Salbutamol Sulfate.

Strength (1) 4 mg (2) 8 mg ($C_{13}H_{21}NO_3$)

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Salbutamol Sulfate Sustained-release Tablets

Salbutamol Sulfate Sustained-release Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of salbutamol ($C_{13}H_{21}NO_3$).

Description White or almost white tablets.

Identification (1) Weigh a quantity of powdered tablets, equivalent to about 50 mg of salbutamol, add 2 ml of water and shake to dissolve salbutamol sulfate. Filter and add 1 drop of ferric chloride to a proper amount of filtrate, shake, a violet colour is produced. Add drops of sodium bicarbonate TS, an orange-yellow turbidity is produced.

(2) Weigh a quantity of powdered tablets, equivalent to about 10 mg of salbutamol, add 20 ml of 0.4% sodium borate solution and shake to dissolve salbutamol sulfate. Add 1 ml of 3% 4-aminodimethyloxycinchin solution and 1 ml of 2% potassium ferricyanide solution. Add 10 ml of chloroform, shake and allow to stand for stratification. An orange-red colour is produced in the chloroform layer.

(3) The retention time of the principle peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principle peak of salbutamol sulfate CRS in the chromatogram of the reference solution.

(4) The filtrate obtained in the test (1) for Identification yields the reactions characteristic of sulfates (Appendix III).

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Triturate 1 tablet in a mortar and transfer with water in portions to a 100 ml volumetric flask. Shake to dissolve salbutamol sulfate and dilute with water to volume, mix well and filter. Carry out the procedure as described under the Assay beginning at the words "Accurately inject 20 μ l of the successive filtrate into the column...", calculate the content of $C_{13}H_{21}NO_3$.

Drug Release Carry out the method for drug release test (Appendix X D) and use the apparatus for dissolution test (Appendix X C, method 3), using 250 ml of hydrochloric acid (9 \rightarrow 1000) as the release medium in the first 2 hours, then changed by 250 ml of phosphate BS (pH 6.8), adjust the rotation speed of the paddle to 100 rpm. Withdraw a sample of 5 ml of the solution at exact 2, 4 and 8 hours respectively, filter and supply 5 ml of phosphate BS (pH 6.8) accordingly in the vessel immediately. Carry out the chromatographic conditions as described under the Assay. Accurately inject 20 μ l of the successive filtrate into the column and record the chromatogram. Respectively dissolve an accurately weighed quantity of salbutamol sulfate CRS in hydrochloric acid (9 \rightarrow 1000) and phosphate BS (pH 6.8) to produce a solution of 32 μ g per ml, measure in the same manner. Calculate the content of $C_{13}H_{21}NO_3$ dissolved from

each capsule at 2, 4 and 8 hours separately by multiplying the percentage content of $C_{13}H_{21}NO_3 \cdot H_2SO_4$ by 0.8299. The dissolution complies with the following requirements; the quantity dissolved of each tablet is 35%-55%, 55%-75% and over 75% of the labelled amount at 2, 4 and 8 hours respectively.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of phosphate BS [Dissolve 9.77 g of sodium dihydrogen phosphate in 1000 ml of water, adjust to pH 3.10 ± 0.05 with phosphoric acid] -methanol (85 : 15) as the mobile phase. Detection wavelength is 276 nm and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of salbutamol sulfate.

Procedure Weigh accurately 20 tablets and powder. Weigh accurately a quantity, equivalent to about 8 mg of salbutamol, in a 100 ml volumetric flask, add a quantity of water, shake to dissolve salbutamol sulfate and dilute with water to volume, mix well and filter. Accurately inject 20 μ l of the successive filtrate into the column and record the chromatogram. Dissolve an accurately weighed quantity of salbutamol sulfate CRS in water to produce a solution of 80 μ g per ml, measure in the same manner. Calculate the content of $C_{13}H_{21}NO_3$ by multiplying the percentage content of $C_{13}H_{21}NO_3 \cdot H_2SO_4$ by 0.8299.

Category As described under Salbutamol Sulfate.

Strength 8 mg ($C_{13}H_{21}NO_3$)

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Salbutamol Sulfate Tablets

Salbutamol Sulfate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of salbutamol sulfate [$(C_{13}H_{21}NO_3)_2 \cdot H_2SO_4$].

Description White tablets.

Identification Powder 20 tablets, extract with 20 ml of water and filter. The filtrate complies with the tests (1), (2), (3) and (5) for Identification described under Salbutamol Sulfate.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Shake 1 tablet in a 25 ml volumetric flask with a quantity of mobile phase to dissolve salbutamol sulfate. Dilute to volume with mobile phase, mix well and filter. Carry out the method as described under Assay beginning at the words "Inject 20 μ l of the successive filtrate into the column...", calculate the content of $(C_{13}H_{21}NO_3)_2 \cdot H_2SO_4$.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of sodium dihydrogen phosphate solution (Dissolve 11.04 g of sodium dihydrogen phosphate ($NaH_2PO_4 \cdot 2H_2O$) in water in a 1000 ml volumetric flask and dilute to volume and adjusting to pH 3.10 ± 0.05 with phosphoric acid) -methanol (85 : 15) as the mobile phase. Detection wavelength is 276 nm

and the number of the theoretical plates of the column is not less than 3000, calculated with reference to the peak of salbutamol sulfate.

Procedure Weigh accurately and powder 10 tablets. Add a sufficient quantity of mobile phase to an accurately weighed quantity, equivalent to about 4.8 mg of salbutamol sulfate, in a 50 ml volumetric flask, shake to dissolve salbutamol sulfate. Dilute to volume with mobile phase, mix well and filter. Inject 20 μ l of the successive filtrate into the column, record the chromatogram. Dissolve a quantity of salbutamol sulfate CRS in mobile phase to produce a solution of 96 μ g per ml, repeat the operation. Calculate the content of $(C_{13}H_{21}NO_3)_2 \cdot H_2SO_4$ by external method.

Category As described under Salbutamol Sulfate.

Strength (1) 0.6 mg (equivalent to 0.5 mg of salbutamol)
(2) 2.4 mg (equivalent to 2 mg of salbutamol)

Storage Preserve in tightly closed containers, protected from light.

Salicylic Acid

$C_7H_6O_3$ 138.12

[69-72-7]

Salicylic Acid is 2-hydroxy-benzoic acid. It contains not less than 99.5% of $C_7H_6O_3$.

Description White needle crystals or a white crystalline powder; odourless or almost odourless; taste, slightly sweet then uncomfortable. The aqueous solution exhibits acid reaction.

Freely soluble in ethanol or ether; soluble in boiling water; sparingly soluble in chloroform; slightly soluble in water.

Melting range 158-161°C (Appendix VI C).

Identification (1) To the aqueous solution add 1 drop of ferric chloride TS, a violet colour is produced.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of salicylic acid (Appendix XVI).

Phenol Dissolve 0.10 g in 2 ml of ethanol, add 0.7 ml of sodium hydroxide TS and 2 ml of ammonia-ammonium chloride BS (pH 10.0), then add 0.5 ml of 2% 4-amino-antipyrine solution, mix well. Add 0.25 ml of potassium ferricyanide TS, mix well. Extract with 10, 5 and 5 ml of chloroform and combine the chloroform solution. Any colour produced is not more intense than that of a reference solution using 1.0 ml (0.10 g/ml) of phenol standard solution (0.10%).

Residue on ignition Not more than 0.1% (Appendix VII N).

Heavy metals Dissolve 1.0 g in 23 ml of ethanol, add 2 ml of acetate BS (pH 3.5). Carry out the limit test for heavy metals (Appendix VII H, method 1): Not more than 0.001%.

Assay Dissolve about 0.3 g, accurately weighed, in 25 ml of neutral dilute ethanol (neutral to phenolphthalein IS), add 3 drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 13.81 mg of $C_7H_6O_3$.

Category Antiseptic, Disinfectant.

Storage Preserve in tightly closed containers.

Salsalate

$C_{14}H_{10}O_5$ 258.22

[552-94-3]

Salsalate is 2-hydroxybenzoic acid-2-carboxyl-phenyl ester. It contains not less than 99.0% of $C_{14}H_{10}O_5$, calculated on the dried basis.

Description White crystalline powder; odourless; taste, slightly bitter.

Freely soluble in ethanol or ether, practically insoluble in water.

Melting range 140-146°C (Appendix VI C).

Identification To about 0.5 g add 5 ml of sodium hydroxide TS, boil, the solution yields the reactions characteristic of salicylates (Appendix III).

Chloride To 1.0 g add 20 ml of water, shake and filter, measure 4 ml of the successive filtrate, carry out the limit test for chloride (Appendix VIII A). Any opalescence produced is not more pronounced than that of a reference using 1 ml of sodium chloride standard solution (0.005%).

Sulfate To 5 ml of the filtrate obtained in the test for chloride add 1 ml of dilute hydrochloric acid and 3 ml of barium chloride TS; no opalescence is produced.

Salicylic acid Dissolve 1.0 g of the substance being examined in 20 ml of chloroform as test solution. Transfer 25 mg of salicylic acid, accurately weighed, to a 100 ml volumetric flask, and dissolve in chloroform, dilute to volume and mix well, accurately measure 20 ml of the resulting as the reference solution. Transfer the above two solutions in the separators respectively, and extract with four 20 ml portions of ferric nitrate solution [dissolve 1 g of ferric nitrate with nitric acid solution (0.1→100) and dilute to 1000 ml]. Filter the ferric nitrate solution to a 100 ml volumetric flask and dilute to volume with ferric nitrate solution, mix well. Measure the absorbance at 530 nm (Appendix IV A). The absorbance of test solution is not more than that of reference solution.

Loss on drying When dried in vacuum over phosphorus pentoxide to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals To 5 ml filtrate obtained in the test for chloride add a few drops of sodium sulfide TS; no colour is produced.

Assay Dissolve about 0.5 g, accurately weighed, in 40 ml of ethanol, add 0.2 ml of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 25.82 mg of $C_{14}H_{10}O_5$.

Category Anti-inflammatory, analgesic, non-steroids anti-inflammatory agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation Salsalate Tablets

Salsalate Tablets

Salsalate Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of salsalate ($C_{14}H_{10}O_5$).

Description White tablets.

Identification To a quantity of the powdered tablets equivalent to about 0.3 g of salsalate add 5 ml of sodium hydroxide TS, shake to dissolve salsalate, filter, boil the filtrate. The filtrate complies with the test for Identification described under Salsalate.

Salicylic acid Transfer a quantity of the powdered tablets equivalent to about 0.3 g of salsalate, accurately weighed, to a separator, dissolve with 50 ml of chloroform, add 2.5 ml of 1 mol/L hydrochloric acid and 7.5 ml of water, shake. Filter the chloroform, and wash with 10 ml chloroform. Combine the chloroform as the test solution. Transfer 45 mg of salicylic acid, accurately weighed, to a 50 ml volumetric flask. Dissolve with chloroform and dilute to volume, and mix well. Accurately measure 5 ml of the solution, add 50 ml of chloroform, take the resulting solution as the reference solution. Transfer the above two solution in the separators respectively, and extract with four 20 ml portions of ferric nitrate solution [dissolve 1 g of ferric nitrate with nitric acid solution (0.1→100) and dilute to 1000 ml]. Filter the ferric nitrate solution to a 100 ml volumetric flask, and dilute to volume with ferric nitrate solution, mix well. Measure the absorbance at 530 nm (Appendix IV A). The absorbance of test solution is not more than that of reference solution.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Dissolve a quantity, accurately weight, equivalent to about 0.3 g of salsalate, in 40 ml of ethanol with shaking, add 0.2 ml of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 25.82 mg of $C_{14}H_{10}O_5$.

Category As described under Salsalate.

Strength 0.3 g

Storage Preserve in tightly closed containers, protected from light.

Saponated Cresol Solution

Saponated Cresol Solution contains not less than 85.0% and not more than 110.0% of the labelled amount of Cresol (C_7H_8O).

Formula	Cresol	500 ml
	Vegetable oil	173 g
	Sodium hydroxide	sufficient (about 27 g)
	Water	sufficient quantity

To make 1000 ml

Processing Dissolve sodium hydroxide in 100 ml of water,

cool and add the solution to vegetable oil with constant stirring to form a uniform emulsion. Allow it to cool for 30 minutes, warm gently by indirect steam or water bath. Continue to stir when the saponified matter becomes darker and transparent. The saponification process is complete if a sample complies with the test for unsaponified matter. Add cresol while hot with constant stirring, cool, add water to produce 1000 ml. Fatty acids of low or medium molecular weight may be used instead of vegetable oils.

Description A yellowish-brown to reddish-brown viscous liquid with odour of cresol.

Miscible with ethanol to form clear liquid.

Alkalinity Dilute 1.0 ml with 20 ml of neutral ethanol (neutral to phenolphthalein IS), add 1 ml of phenolphthalein IS, any red colour produced requires not more than 1.0 ml of 0.5% /L. V g.

Unsaponified matter A solution of 5 ml in 95 ml of water is clear. Any opalescence produced is not more pronounced than that of a reference solution (prepared by mixing of 6 ml of potassium sulfate standard solution with 80 ml of water and 1 ml of dilute hydrochloric acid, match the colour of the solution with cobaltic chloride solution CS and concentrate caramel solution, then add 3 ml of 25% barium chloride solution and water to produce 100 ml, mix well, compared after 10 minutes).

Minimum fill Complies with the requirements for minimum fill (Appendix X F).

Assay Carry out the method for gas chromatography (Appendix V E), using a column packed with 4%-10% polyethylene glycol adipate containing 2% phosphoric acid as the stationary phase, and maintain the column temperature at 145°C. The number of theoretical plates of the column is not less than 400, calculate with reference to the peak of *o*-cresol, and the resolution factor between the peaks of *o*-cresol and the internal standard substance complies with the related requirements.

Dissolve about 1.3 g of salicylaldehyde, accurately weighed, in ether in a 50 ml volumetric flask and dilute to volume, mix well as internal standard solution.

Dissolve about 0.65 g of *o*-cresol CRS, accurately weighed, in ether in a 25 ml volumetric flask and dilute to volume, mix well, as reference solution. Measure accurately 5 ml each of the reference solution and internal standard solution into a test tube with stopper, mix well. Inject 1 µl of the resulting solution into the column, calculate the correction factor for *o*-cresol, multiply by 1.042, that represents the correction factor for *p*-cresol and *m*-cresol.

Procedure Measure accurately 2 ml with a "to contain" pipet into a separator, add 0.1 ml of hydrochloric acid, mix well, add 3 ml of water, mix well again. Add accurately 20 ml of ether, shake gently, allow to stand, discard the aqueous layer, add 5 ml of water, and shaking gently, allow to stand and discard the aqueous layer again. Mix well 5 ml each of the ether extract and 5 ml of internal standard solution, both accurately measured, in a test tube with stopper. Inject 1 µl of the resulting solution into the column. Calculate the content of cresol as follows.

$$\% \text{ of the labelled amount} = \frac{(A_1 f_1 + A_2 f_2) \cdot W}{A \times 5 \times 0.52} \times 100\%$$

Where A is peak area of the internal standard substance;

A₁ is peak area of *o*-cresol;

A₂ is peak area of *m*-cresol and *p*-cresol;

f₁ is correction factor of *o*-cresol;

f₂ is correction factor of *m*-cresol and *p*-cresol;

W is weight of the internal standard (g);

0.52 is the content of cresol (g/ml) in the formula.

Category As described under Cresol.

Storage Preserve in tightly closed containers, protected from light.

Scopolamine Butylbromide

C₂₁H₃₀BrNO₄ 440.38

[149-64-4]

Scopolamine Butylbromide is (1*S*,3*S*,5*R*,6*R*,7*S*,8*S*)-6,7-epoxy-8-butyl-3-[(*S*)-tropoyloxy] tropanium bromide. It contains not less than 99.0% of C₂₁H₃₀BrNO₄, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless or almost odourless.

Freely soluble in water or chloroform, sparingly soluble in ethanol.

Specific optical rotation -18° to -20°, in a solution of about 0.1 g per ml in water.

Identification (1) The light absorption of a solution of 1 mg per ml in hydrochloric acid solution (0.01 mol/L) exhibits maxima at 252 nm, 257 nm, and 264 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference of scopolamine butylbromide (Appendix XVI).

(3) Yields the reactions characteristic of tropane alkaloids (Appendix III).

(4) The aqueous solution yields the reactions characteristic of bromides (Appendix III).

Acidity A solution of 0.1 g per ml in water, pH 5.5-6.5 (Appendix VI H).

Clarity of solution A solution of 0.5 g in 15 ml of water is clear.

Scopolamine and related substances Dissolve a quantity in the mobile phase to produce a solution of 2.5 mg per ml as the test solution; dissolve a quantity of scopolamine hydrobromide CRS in the mobile phase to produce a solution of 0.01 mg per ml as the reference solution. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and 0.008 mol/L sodium laurylsulfate in a mixture of 0.004% phosphoric acid-acetonitrile (50 : 50) as the mobile phase. Detection wavelength is 210 nm and the number of the theoretical plates of the column is not less than 3000, calculated with reference to the peak of scopolamine butylbromide, the resolution factor between the peaks of scopolamine butylbromide and scopolamine hydrobromide complies with the related requirements. Inject 10 µl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 20% of the full scale of the chat. Inject separately 10 µl of the reference solution and the test solution into the column, and record the chromatogram for twice the retention time of the principal peak. The peak area of scopolamine hydrobromide is not greater than that of the principal peak in

the chromatogram obtained with the reference solution (0.4%); The sum of the areas of all impurity peaks other than the bromine peak near the solvent is not greater than twice the area of the principal peak in the chromatogram obtained with the reference solution.

Loss on drying When dried to constant weight at 105°C, loses not more than 2.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.3 g, previously dried to constant weight at 105°C and accurately weighed, in 20 ml of glacial acetic acid, heat gently if necessary, add 5 ml of mercuric acetate TS and 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to pure blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 44.04 mg of $C_{21}H_{30}BrNO_4$.

Category Anticholinergic.

Storage Preserve in tightly closed containers, protected from light.

Preparations (1) Scopolamine Butylbromide Capsules
(2) Scopolamine Butylbromide Injection

Scopolamine Butylbromide Capsules

Scopolamine Butylbromide Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of scopolamine butylbromide ($C_{21}H_{30}BrNO_4$).

Identification (1) To a quantity of the contents of the capsules equivalent to about 50 mg of scopolamine butylbromide add 20 ml of chloroform, shake to dissolve scopolamine butylbromide. Filter and evaporate the filtrate to dryness on a water bath, dissolve the residue in 50 ml of hydrochloric acid solution (0.01 mol/L), the light absorption of the resulting solution exhibits maxima at 252 nm, 257 nm and 264 nm (Appendix IV A).

(2) Dissolve a quantity of the contents of the capsules equivalent to about 10 mg of scopolamine butylbromide in 5 ml of chloroform with shaking, filter it rapidly, evaporate the filtrate to dryness on a water bath, the residue yields the reaction characteristic of tropane alkaloids (Appendix III).

(3) The aqueous solution yields the reactions characteristic of bromides (Appendix III).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of acetone-concentrated ammonia solution (95 : 3) as the mobile phase. Apply separately to the plate 20 µl of each of two solutions containing (1) 0.10 g of the substance being examined per ml in chloroform (dissolve a quantity of the contents of the capsules equivalent to about 0.10 g of scopolamine butylbromide in 10 ml of chloroform with shaking, filter and wash the residue with 5 ml of chloroform, combine the washing and filtrate, evaporate to dryness on a water bath, dissolve the residue in 1 ml of chloroform.). (2) 0.5 mg of scopolamine butylbromide CRS per ml in ethanol. After developing and removal of the plate, dry it in air and spray with dilute potassium iodobismuthate TS. Not more than 1 spot, other than the principal spot, obtained with solution (1) is observed, and it is not more intense than the principal spot obtained with solution (2).

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Transfer the content

of 1 capsule to a 25 ml volumetric flask, wash the shell with water in divided portions, transfer the washings to the same volumetric flask, add 15 ml of water, shake thoroughly to dissolve scopolamine butylbromide, dilute with water to volume, mix well and allow to stand, use the supernatant liquid as the test solution. Carry out the procedure as described under the Assay. Calculate the content of $C_{21}H_{30}BrNO_4$.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and 0.008 mol/L sodium laurylsulfate in a mixture of 0.004% phosphoric acid-acetonitrile (50 : 50) as the mobile phase. Detection wavelength is 210 nm and the number of the theoretical plates of the column is not less than 3000, calculated with reference to the peak of scopolamine butylbromide, the resolution factor between the peaks of scopolamine butylbromide and scopolamine hydrobromide complies with the related requirements.

Procedure Weigh and mix the contents of 20 capsules, dissolve a quantity, weighed accurately, equivalent to about 20 mg of scopolamine butylbromide in the mobile phase to produce a solution of 0.4 mg per ml, filter. Inject 20 µl of the successive filtrate into the column, record the chromatogram; Dissolve a quantity of scopolamine butylbromide CRS, weighed accurately, in the mobile phase to produce a solution of 0.4 mg per ml, repeat the test, calculate the content of $C_{21}H_{30}BrNO_4$ with respect to the peak area by external standard method.

Category As described under Scopolamine Butylbromide.

Strength 10 mg

Storage Preserve in tightly closed containers, protected from light.

Scopolamine Butylbromide Injection

Scopolamine Butylbromide Injection is a sterile solution of Scopolamine Butylbromide in Water for Injection. It contains not less than 93.0% and not more than 107.0% of the labelled amount of scopolamine butylbromide ($C_{21}H_{30}BrNO_4$).

Description A clear, colourless liquid.

Identification (1) Complies with the test (1) and (4) for Identification described under Scopolamine Butylbromide.

(2) Evaporate 0.5 ml of the injection to dryness on a water bath, the residue yields the reactions characteristic of tropane alkaloids (Appendix III).

pH value 3.7-5.5 (Appendix VI H).

Scopolamine and related substance Dilute a quantity with the mobile phase to produce two solutions containing scopolamine hydrobromide 2 mg per ml (1) and 40 µg per ml (2) respectively; dissolve a quantity of scopolamine hydrobromide CRS in the mobile phase to produce a solution of 20 µg per ml (3). Carry out the method as described under the Assay. Inject 10 µl of solution (3) into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 20% of the full scale of the chat. Inject separately 10 µl of the three solutions into the column, and record the chromatogram for twice the retention time of the principal peak. The peak area of the

scopolamine hydrobromide is not greater than that of the principal peak in the chromatogram obtained with the solution (3) (1.0%); The sum of the areas of all impurity peaks other than the bromine peak near the solvent is not greater than twice the area of the principal peak in the chromatogram obtained with the solution (2).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and 0.008 mol/L sodium laurylsulfate in a mixture of 0.004% phosphoric acid-acetonitrile (50 : 50) as the mobile phase. Detection wavelength is 210 nm and the number of the theoretical plates of the column is not less than 3000, calculated with reference to the peak of scopolamine butylbromide, the resolution factor between the peaks of scopolamine butylbromide and scopolamine hydrobromide complies with the related requirements.

Procedure Measure accurately a quantity, dilute with the mobile phase to produce a solution of 0.4 mg per ml. Inject 20 μ l into the column, record the chromatogram. Dissolve a quantity of scopolamine butylbromide CRS, weighed accurately, in the mobile phase to produce a solution of 0.4 mg per ml, repeat the test, calculate the content of $C_{17}H_{21}NO_4 \cdot HBr$ with respect to the peak area by external standard method.

Category As described under Scopolamine Butylbromide.

Strength 1 ml : 20 mg

Storage Preserve in tightly closed containers, protected from light.

Scopolamine Hydrobromide

$C_{17}H_{21}NO_4 \cdot HBr \cdot 3H_2O$ 438.32 [114-49-8]

Scopolamine Hydrobromide is 6 β , 7 β -epoxy-1 α H, 5 α H-tropane-3 α -ol (-) trobate (ester) hydrobromide trihydrate. It contains not less than 99.0% of $C_{17}H_{21}NO_4 \cdot HBr$, calculated on the dried basis.

Description Colourless crystals or a white, crystalline powder; odourless; slightly efflorescent. Freely soluble in water; sparingly soluble in ethanol; very slightly soluble in chloroform; insoluble in ether.

Melting range 195-199°C, with decomposition (Appendix VI C).

Specific optical rotation -24° to -27° , in a solution of 50 mg per ml in water (Appendix VI E).

Identification (1) Dissolve 10 mg in 1 ml of water in a separator, add ammonia TS to make the solution alkaline, extract with 5 ml of chloroform. Evaporate the chloroform extract to dryness on a water bath. To the residue add 1.5 ml of the ethanolic solution of mercuric chloride (to 2 g of

mercuric chloride add 60% ethanol to produce 100 ml), a white precipitate is produced (distinction from atropine and homatropine).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of scopolamine hydrobromide (Appendix XVI).

(3) Yields the reactions characteristic of tropane alkaloids (Appendix III).

(4) The aqueous solution yields the reactions characteristic of bromides (Appendix III).

Clarity of solution A solution of 0.50 g in 15 ml of water is clear.

Acidity Dissolve 0.50 g in 10 ml of water, pH 4.0-5.5 (Appendix VI H).

Other alkaloids Divide a solution of 0.10 g in 2 ml of water into two equal parts. To one part add 2-3 drops of ammonia TS, no turbidity is produced. To the other part add a few drops of potassium hydroxide TS, an almost white turbidity is produced which disappears immediately.

Readily oxidizable substances Dissolve 0.15 g in 5 ml of water, at 15-20°C, add 0.05 ml of potassium permanganate (0.02 mol/L) VS, the red colour is not completely discharged in 10 minutes.

Loss on drying When dried at 60°C for 1 hour and then at 105°C to constant weight, loses not more than 13.0% of its weight (Appendix VIII L).

Assay Dissolve about 0.3 g, previously dried to constant weight at 105°C and accurately weighed, in 20 ml of glacial acetic acid, heat gently if necessary, add 5 ml of mercuric acetate TS and 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the solution becomes pure blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 38.43 mg of $C_{17}H_{21}NO_4 \cdot HBr$.

Category Anticholinergic agent.

Storage Preserve in tightly closed containers, protected from light.

Preparations (1) Scopolamine Hydrobromide Injection
(2) Scopolamine Hydrobromide Tablets

Scopolamine Hydrobromide Injection

Scopolamine Hydrobromide Injection is a sterile solution of Scopolamine Hydrobromide in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of scopolamine hydrobromide ($C_{17}H_{21}NO_4 \cdot HBr \cdot 3H_2O$).

Description A clear, colourless liquid.

Identification (1) Evaporate a quantity equivalent to about 2.5 mg of scopolamine hydrobromide to dryness on a water bath. Triturate the residue with 0.5 ml of ethanol to dissolve scopolamine hydrobromide (Solution 1). Dissolve scopolamine hydrobromide CRS in ethanol to prepare a solution of 5 mg per ml (Solution 2). Carry out the method for ascending paper chromatography (Appendix V A), using a piece of chromatographic paper impregnated with a buffer solution (dissolve 0.76 g of anhydrous disodium hydrogen phosphate and 0.18 g of anhydrous potassium dihydrogen phosphate in water to produce 100 ml) and dried in air. Using water saturated *n*-butanol as the mobile phase. Apply to the paper 10 μ l each of the above two solutions;

after developing and removal of the paper, dry it at 105°C for 20 minutes, cool, spray with dilute potassium iodobismuthate TS. The principal spot in the chromatogram obtained with solution (1) is similar in position and colour to that in the chromatogram obtained with solution (2).

(2) Evaporate the ethanol solution obtained in Identification test (1) to dryness on a water bath. The residue yields the reactions characteristic of tropane alkaloids (Appendix III).

(3) Yields the reactions characteristic of bromides (Appendix III).

pH value 3.0-5.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity equivalent to about 3 mg of scopolamine hydrobromide to a 50 ml volumetric flask, dilute with water to volume and mix well. Carry out the Assay described under Scopolamine Hydrobromide Tablets.

Category As described under Scopolamine Hydrobromide.

Strength (1) 1 ml : 0.3 mg (2) 1 ml : 0.5 mg

Storage Preserve in well closed containers, protected from light.

Scopolamine Hydrobromide Tablets

Scopolamine Hydrobromide Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of scopolamine hydrobromide ($C_{17}H_{21}NO_4 \cdot HBr \cdot 3H_2O$).

Description White tablets.

Identification (1) Extract a quantity of the finely powdered tablets equivalent to about 3 mg of scopolamine hydrobromide with 2 ml of ethanol and centrifuge, using the supernatant liquid as the test solution; Dissolve scopolamine hydrobromide CRS in ethanol to prepare a solution of 4.5 mg per ml as the reference solution. Carry out the method for ascending paper chromatography (Appendix V A), using a piece of chromatographic paper impregnated with a buffer solution (dissolve 0.76 g of anhydrous disodium hydrogen phosphate and 0.18 g of anhydrous potassium dihydrogen phosphate in water to produce 100 ml) and dried in air. Using water saturated *n*-butanol as the mobile phase. Apply to the paper 30 μ l of the test solution and 10 μ l of the reference solution; after developing and removal of the paper, dry it at 105°C for 20 minutes, cool, spray with dilute potassium iodobismuthate TS. The principal spot in the chromatogram obtained with the test solution is similar in position and colour to that in the chromatogram obtained with the reference solution.

(2) Evaporate the ethanolic solution obtained in Identification test (1) to dryness on a water bath. The residue yields the reactions characteristic of tropane alkaloids (Appendix III).

(3) Shake a quantity of the fine powder with water and filter, the filtrate yields the reactions characteristic of bromides (Appendix III).

Content uniformity Comply with the requirements for content uniformity (Appendix X E).

Triturate 1 tablet with 5 ml, measured accurately, of water to dissolve scopolamine hydrobromide and centrifuge. Carry out the procedure described under Assay, using the supernatant liquid as the test preparation.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh

accurately a quantity of the powder equivalent to about 3 mg of scopolamine hydrobromide to a 50 ml volumetric flask, add water to dissolve scopolamine hydrobromide and dilute to volume, mix well and filter, use the successive filtrate as the test solution. Dissolve a quantity of scopolamine Hydrobromide CRS, accurately weighed, and dilute with water to produce a solution of 60 μ g per ml as the reference solution. Measure accurately 2 ml each of the reference solution and test solution to two separators each containing 10 ml of chloroform, accurately measured, add 4.0 ml of bromocresol green solution [dissolve 50 mg of bromocresol green and 1.021 g of potassium hydrogen phthalate in 1.6 ml of hydrochloric acid (0.2 mol/L) VS and add water to produce 100 ml, filter if necessary]. Extract with shaking, allow to stand to separate the chloroform layers. Measure the absorbances of the chloroform solutions at 420 nm (Appendix IV A), calculate the content of $C_{17}H_{21}NO_4 \cdot HBr \cdot 3H_2O$ by multiplying the result with 1.141.

Category As described under Scopolamine Hydrobromide.

Strength 0.3 mg

Storage Preserve in tightly closed containers, protected from light.

Secobarbital Sodium

$C_{12}H_{17}N_2NaO_3$ 260.27

[309-43-3]

Secobarbital Sodium is 5-(1-methylbutyl)-5-(2-propenyl)-2,4,6-(1*H*,3*H*,5*H*)-pyrimidinetrione monosodium salt. It contains not less than 98.5% of $C_{12}H_{17}N_2NaO_3$, calculated on the dried basis.

Description A white powder; odourless; taste, bitter; hygroscopic

Very soluble in water; soluble in ethanol; insoluble in ether.

Identification (1) Dissolve 1 g in 100 ml of water, add 5 ml of dilute acetic acid, stir vigorously, add 200 ml of water, boil to dissolve (no oily substance remaining on the surface of the solution). Cool, allow to stand until crystallizes and filter. The crystals, dried at 70°C, melt at about 97°C (Appendix VI C).

(2) Dissolve 0.1 g in 10 ml of water, add 2 ml of iodine TS, a yellowish-brown colour is produced which disappears within 5 minutes.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of secobarbital sodium (Appendix XVI).

(4) Yields the reactions characteristic of malonylureas (Appendix III).

Clarity of solution A solution of 1.0 g in 10 ml of freshly boiled and cooled water is clear.

Neutral and basic substances Complies with the test for neutral and basic substances described under Phenobarbital, using 1.0 g.

Loss on drying When dried to constant weight at 105°C, loses not more than 3.0% of its weight (Appendix VIII L).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 3); use 1.0 g; not more than

0.002%.

Assay Dissolve 0.1 g, accurately weighed, in a 250 ml iodine flask with 10 ml of water on shaking. Add accurately 25 ml of bromine (0.05 mol/L) VS and 5 ml of hydrochloric acid, stopper the flask immediately and shake for 1 minute, allow to stand in dark for 15 minutes. Add 10 ml of potassium iodide TS, stopper the flask immediately and mix well. Titrate with sodium thiosulfate (0.1 mol/L) VS and add starch IS toward the end of titration and continue the titration until the blue colour disappears. Perform a blank determination and make any necessary correction. Each ml of bromine (0.05 mol/L) VS is equivalent to 13.01 mg of $C_{12}H_{17}N_2NaO_3$.

Category Hypnotic agent.

Storage Preserve in tightly closed containers.

Preparation Secobarbital Sodium Capsules

Secobarbital Sodium Capsules

Secobarbital Sodium Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of secobarbital sodium ($C_{12}H_{17}N_2NaO_3$).

Identification (1) The contents of the capsules yields the reactions characteristic of malonylureas (Appendix III). (2) The residue obtained by incineration of the contents yields the reactions characteristic of sodium (Appendix III).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately a quantity obtained in the test for weight variation of contents equivalent to about 0.1 g of secobarbital sodium. Carry out the Assay described under Secobarbital Sodium. Each ml of bromine (0.05 mol/L) VS is equivalent to 13.01 mg of $C_{12}H_{17}N_2NaO_3$.

Category As described under Secobarbital Sodium.

Strength 0.1 g

Storage Preserve in tightly closed containers, stored in dry place.

Selenium Sulfide

SeS_2 143.09 [7488-56-4]

Selenium Sulfide contains not less than 52.0% and not more than 55.5% of selenium (Se).

Description An orange-yellow to orange-red powder with a slight odour of hydrogen sulfide. Practically insoluble in water or organic solvents.

Identification (1) To 10 ml of the nitrified solution obtained in the Assay, add 5 ml of water and 5 g of urea, heat to boiling, cool and add 2 ml of potassium iodide TS. A slightly yellow to orange colour is produced which darkens rapidly on standing.

(2) Allow the coloured solution obtained under the Identification (1) to stand for 10 minutes and filter. To the filtrate add 10 ml of barium chloride TS; a precipitate is produced.

Soluble selenium compounds *Reference preparation* Dissolve sodium selenite CRS, accurately weighed, in nitric acid solution (1→30) to produce a solution containing about

1 mg per ml of selenium. Transfer 5 ml of the solution, accurately measured, to a 250 ml volumetric flask, dilute with water to volume and mix well; measure accurately 5 ml of the solution into a 200 ml volumetric flask, dilute with water to volume and mix well (each ml is equivalent to 0.5 µg of Se).

Test preparation To 5.0 g, in a 150 ml flask, add 50.0 ml of water, allow to stand for 1 hour with frequent shaking and filter. Use the filtrate as a test solution.

Procedure To each of 10 ml of the reference solution and the test solution, add 2 ml of 2.5 mol/L formic acid solution, dilute to 50 ml with water, adjust, if necessary, to pH 2.0 to 3.0 with the 2.5 mol/L formic acid solution and mix well. Add 2 ml of a freshly prepared 0.5% solution of diaminobenzidine hydrochloride and mix well, allow to stand for 45 minutes and then adjust to pH 6.0 to 7.0 with ammonia TS. Transfer the solution to a separator, add 10 ml of toluene, accurately measured, and shake vigorously for 1 minute, allow the layers to separate and discard the aqueous phase. Measure the absorbances of the toluene layers at 420 nm (Appendix IV A). The absorbance of the test solution is not greater than that of the reference solution (0.0005%).

Assay To about 0.1 g, accurately weighed, add 25 ml of fuming nitric acid and heat on a water bath for about 1 hour until it is thoroughly nitrified. Cool and transfer the solution to a 100 ml volumetric flask, dilute with water to volume and mix well. To 20 ml, accurately measured, add 10 g of urea and 25 ml of water and heat to boiling. Cool, add 10 ml of potassium iodide TS and 3 ml of starch IS and titrate immediately with sodium thiosulfate (0.05 mol/L) VS until the colour changes from reddish-brown to orange-red. Each ml of sodium thiosulfate (0.05 mol/L) VS is equivalent to 0.987 mg of Se.

Category Antiseborrheic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Selenium Sulfide Lotion

Selenium Sulfide Lotion

Selenium Sulfide Lotion is a suspension of Selenium Sulfide. It contains not less than 90.0% and not more than 110.0% of the labelled amount of Selenium Sulfide (SeS_2).

Description A viscous, orange-yellow suspension with a sweet odour.

Identification Complies with the tests for the Identification described under Selenium Sulfide, using 10 ml of the filtrate obtained in the Assay.

pH value To 25 g, add 50 ml of water and mix well, pH 3.0-5.0 (Appendix VI H).

Other requirements Complies with the general requirements for lotion (Appendix I S).

Assay To a well-mixed and accurately weighed quantity, equivalent to about 100 mg of Selenium Sulfide, add 25 ml of fuming nitric acid, heat on a water bath for 2 hours, cool and transfer the solution to a 100 ml volumetric flask, dilute with water to volume and mix well. Filter and to 20 ml of the successive filtrate, accurately measured, carry out the Assay described under Selenium Sulfide beginning at the words "add 10 g of urea...". Each ml of sodium thiosulfate

(0.05 mol/L) VS is equivalent to 1.789 mg of SeS_2 .

Category As described under Selenium Sulfide.

Strength (1) 50 g : 1.25 g (2) 100 g : 2.5 g

Storage Preserve in tightly closed containers, stored in a cool and dark place.

Semustine

$\text{C}_{10}\text{H}_{18}\text{ClN}_3\text{O}_2$ 247.72

[13909-09-6]

Semustine is 1-(2-chloroethyl)-3-(4-methylcyclohexyl)-1-nitrosourea. It contains not less than 97.0% and not more than 103.0% of $\text{C}_{10}\text{H}_{18}\text{ClN}_3\text{O}_2$, calculated on the dried basis.

Description A pale yellow with slightly reddish crystalline powder; sensitive to light.

Very soluble in chloroform; soluble in ethanol or cyclohexane; practically insoluble in water.

Melting range 71-75°C (Appendix VI C).

Identification (1) Dissolve 10 mg in 5 ml of ethanol with shaking, add 2 ml of 1% sulfanilamide in dilute hydrochloric acid solution, heat in a water bath for 10 minutes, allow to cool. Add 2 ml of alkaline β -naphthol TS, an orange yellow colour is produced.

(2) The light absorption of the solution obtained in the Assay exhibits a maximum at 232 nm (Appendix IV A).

(3) To about 10 mg add 5 ml of sodium hydroxide TS, heat in a water bath for 5 minutes, the solution yields the reactions characteristic of chlorides (Appendix III).

Chloride To 0.25 g add 20 ml of water, shake thoroughly and filter. Wash the residue with 10 ml of water, combine the filtrate and washings, carry out the limit test for chlorides (Appendix III A). Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.02 %).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica HF_{254} as the coating substance and a mixture of cyclohexane-chloroform (1 : 3) as the mobile phase. Apply separately to the plate 10 μl each of two solutions in ethanol containing (1) 10 mg, (2) 0.1 mg of the substance being examined per ml. After developing and removal of the plate, dry it in air and examine under ultraviolet light (254 nm). Any spot, other than the principal spot in the chromatogram obtained with solution (1), is not more intense than the principal spot obtained with solution (2). Visualize in iodine vapour, no yellow colour exhibits at the original spot.

Loss on drying When dried in vacuum over phosphorous pentoxide for 4 hours, loses not more than 0.5 % of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Protect from light throughout the operation. Dissolve an accurately weighed quantity in cyclohexane to produce a solution of about 20 μg per ml. Measure the absorbance at 232 nm (Appendix IV A), calculate the content of $\text{C}_{10}\text{H}_{18}\text{ClN}_3\text{O}_2$, taking 254 as the value of A

(1%, 1 cm).

Category Antineoplastic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Semustine Capsules

Semustine Capsules

Semustine Capsules contain not less than 97.0% and not more than 110.0% of the labelled amount of semustine ($\text{C}_{10}\text{H}_{18}\text{ClN}_3\text{O}_2$).

Identification (1) Weigh a quantity of the contents equivalent to about 10 mg of semustine, comply with the test (1) for Identification described under Semustine.

(2) The light absorption of the solution obtained in the Assay exhibits a maximum at 232 nm (Appendix IV A).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Protect from light throughout the procedure. Weigh accurately a quantity of the mixed contents obtained in the test for Weight variation of contents, equivalent to about 25 mg of semustine, into a 50 ml volumetric flask, add a quantity of cyclohexane to dissolve semustine and shake well, dilute to volume, shake and filtrate. Transfer 2 ml of successive filtrate, accurately measured, into a 50 ml volumetric flask, dilute to volume with cyclohexane, mix well, and carry out the Assay as described under Semustine.

Category As described under Semustine.

Strength (1) 10 mg (2) 50 mg

Storage Preserve in tightly closed containers, protected from light and stored in a cool place.

Serine

$\text{C}_3\text{H}_7\text{NO}_3$ 105.09

[56-45-1]

Serine is (L)-2-amino-3-hydroxypropanoic acid. It contains not less than 98.5% of $\text{C}_3\text{H}_7\text{NO}_3$, calculated on the dried basis.

Description White crystals or a white, crystalline powder; odourless; taste, sweet.

Freely soluble in water; practically insoluble in ethanol, acetone or ether.

Specific optical rotation +14.0° to +16.0°, in a solution of 0.1 g per ml in hydrochloric acid solution (2 mol/L) (Appendix VI E).

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of serine (Appendix XVI).

Acidity Dissolve 0.30 g in 30 ml of water, pH 5.5-6.5 (Appendix VI H).

Transmittance of solution Dissolve 1.0 g in 20 ml of water, the transmittance at 430 nm is not less than 98.0%

(Appendix IV A).

Chloride Carry out the limit test for chloride (Appendix VIII A), using 0.25 g. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.02%).

Sulfate Carry out the limit test for sulfate (Appendix VIII B), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of potassium sulfate standard solution (0.02%).

Ammonium Carry out the limit test for ammonium (Appendix VIII K), using 0.10 g. Any colour produced is not more intense than that of a reference solution using 2.0 ml of ammonium chloride standard solution (0.2%).

Other amino acids Carry out the method for thin-layer chromatography (Appendix V), using silica gel G as the coating substance and a mixture of *n*-butanol-water-glacial acetic acid (3 : 1 : 1) as the mobile phase. Apply separately to the plate 5 μ l of each of two solutions of the substance being examined in water containing (1) 6 mg per ml, (2) 30 μ g per ml. After developing and removal of the plate, dry in air and spray with ninhydrin solution (dissolve 1 g ninhydrin in 50 ml of acetone) and heat at 80°C until the colour is produced and examine immediately. Any spot, other than the principal spot in the chromatogram, obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried at 105°C for 3 hours, loses not more than 0.2% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Iron Carry out the limit test for iron (Appendix VIII G), using 1.0 g. Any colour produced is not more intense than that of a reference solution using 1.0 ml of iron standard solution (0.001%).

Heavy metals Dissolve 2.0 g in 23 ml of water, add 2 ml of acetate BS (pH 3.5). Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Arsenic Dissolve 2.0 g in 23 ml of water, add 5 ml of hydrochloric acid. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0001%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 12.5 EU per g of serine (for parenteral administration).

Assay Dissolve about 0.1 g, accurately weighed, in 1 ml of dehydrated formic acid, add 25 ml of glacial acetic acid. Carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS and perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 10.51 mg of $C_{19}H_{37}N_5O_7$.

Category Amino acid.

Storage Preserve in tightly closed containers, protected from light.

Sisomicin Sulfate

$(C_{19}H_{37}N_5O_7)_2 \cdot 5H_2SO_4$ 1385.43 [53179-09-2]

Sisomicin Sulfate is O-3-deoxy-4-C-methyl-3-(methylamino)- β -L-arabinopyranosyl-(1 \rightarrow 4)-O-[2,6-diamino-2,3,4,6-tetrahydro-2H-pyran-4-enopyranosyl-(1 \rightarrow 6)]-2-deoxy-L-streptamine sulfate (2 : 5) (salt). It has a potency of not less than 580 Sisomicin Units per mg, calculated on the anhydrous basis.

Description A white or almost white powder; odourless; hygroscopic.

Freely soluble in water; insoluble in ethanol, acetone, chloroform or ether.

Specific optical rotation +100° to +110°, in a solution of 10 mg per ml in water (Appendix VI E).

Identification (1) Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-methanol-ammonia solution (5 : 12 : 6) as the mobile phase. Apply separately to the plate 5 μ l each of three solutions in water containing (1) 10 mg per ml of the substance being examined, (2) 10 mg per ml of sisomicin RS, and (3) 5 mg per ml of each of the substance being examined and sisomicin RS. After developing and removal of the plate, allow it to dry in air, and heat at 110°C for 15 minutes, cool, spray with a 1% solution of ninhydrin in *n*-butanol saturated with water (dissolve 1 g of ninhydrin in 100 ml of *n*-butanol containing 1 ml of pyridine). The colour and position of the principal spot in the chromatogram obtained with solution (1) correspond to that in the chromatogram obtained with solution (2), and the solution (3) shows only one principal spot.

(2) The aqueous solution yields the reactions characteristic of sulfates (Appendix III).

Acidity Dissolve a quantity in water to produce a solution of 40 mg per ml, pH 3.5-5.5 (Appendix VI H).

Clarity and colour of solution Dissolve 700 mg each of 5 portions in 5 ml water respectively, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₂ or YG₂ (Appendix IX A, method 1).

Water Not more than 15.0% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 1.0% (Appendix VIII N).

Bacterial endotoxin Carry out the test for bacterial endotoxin

(Appendix XI E): less than 0.5 EU per 1000 Sisomicin Units.

Assay Carry out the Microbiological assay of antibiotics (Appendix XI A), using a solution of about 1000 Units per ml in phosphate BS (pH 7.8). The fiducial limit is not more than 7%. 1000 Sisomicin Units is equivalent to 1 mg of $C_{19}H_{37}N_5O_7$.

Category Aminoglycosides antibiotic.

Storage Preserve in tightly closed containers, stored in a place below -6°C .

Preparation Sisomicin Sulfate Injection

Sisomicin Sulfate Injection

Sisomicin Sulfate Injection is a sterile solution of sisomicin sulfate in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of sisomicin ($C_{19}H_{37}N_5O_7$).

Description A clear, colourless or almost colourless liquid.

Identification Complies with the tests for Identification described under Sisomicin Sulfate.

pH value 3.0-5.5 (Appendix VI H).

Colour The solution is colourless; any colour produced is not more intense than that of reference solution Y_2 or YG_2 (Appendix IX A, method 1).

Sterility Dilute each vial with not less than 500 ml of 0.9% sterile Sodium Chloride Solution, the solution complies with the test for sterility (Appendix XI H, membrane filtration method).

Bacterial endotoxin Complies with the corresponding requirements described under Sisomicin Sulfate.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity and carry out the Assay described under Sisomicin Sulfate.

Category As described under Sisomicin Sulfate.

Strength (1) 1 ml : 50000 Units (2) 2 ml : 100000 Units

Storage Preserve in well closed containers, stored in a cool and dark place.

Sodium Aminosalicylate

$C_7H_6NNaO_3 \cdot 2H_2O$ 211.14 [65-49-6]

Sodium Aminosalicylate is sodium 4-amino-2-hydroxybenzoate dihydrate. It contains not less than 99.0% of $C_7H_6NNaO_3$, calculated on the dried basis.

Description White or almost white crystals, or a crystalline powder; odourless; taste, sweetish and saline. Very soluble in water; sparingly soluble in ethanol; insoluble in

ether.

Identification (1) Dissolve about 10 mg in 10 ml of water, acidify with 2 drops of dilute hydrochloric acid and add 1 drop of ferric chloride TS; a violet colour is produced; allow to stand for 3 hours, no precipitate is produced (distinction from 5-aminosalicylate).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of sodium para-aminosalicylate (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of sodium salts (Appendix III).

Acidity or alkalinity A solution of 0.40 g in 20 ml of water, pH 6.5-8.5 (Appendix VI H).

Clarity and colour of solution Dissolve 1.0 g (for oral administration) or 2.0 g (for injection) in 10 ml of water, the solution is clear and colourless. Any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of the reference solution Y_6 (Appendix IX A, method 1).

Chloride Dissolve 1.0 g in 25 ml of water, add 2 ml of nitric acid, filter if necessary. Carry out the limit test for chlorides (Appendix VIII A), any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.005%).

Sulfate Dissolve 1.0 g in 25 ml of water, add 2 ml of dilute hydrochloric acid, filter. Carry out the limit test for sulfates (Appendix VIII B), any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of potassium sulfate standard solution (0.05%).

3-Aminophenol To 3.0 g, finely powdered, in a 50 ml beaker add 25 ml of dehydrated ether, stir with a glass rod for 1 minute. Filter the ether extract with caution into a separator. Extract the residue with two portions of 25 ml dehydrated ether. Filter the extracts into the same separator, add 10 ml of water, 1 drop of methylorange IS and mix well. Titrate with hydrochloric acid (0.02 mol/L) VS. Perform a blank determination and make any necessary correction. The hydrochloric acid (0.02 mol/L) VS consumed is not more than 0.30 ml.

Sulfide Dissolve 0.50 g in 5 ml of water, add 5 ml of potassium iodide TS, 2 g of zinc granules and 5 ml of 1.6% stannous chloride solution in hydrochloric acid. Carry out the limit test for sulfides (Appendix VIII C); not more than 0.001%.

Loss on drying When dried to constant weight at 105°C , loses not more than 16.0%-17.5% of its weight (Appendix VIII L).

Iron Mix 1.0 g with 2 g of anhydrous sodium carbonate in a platinum crucible, ignite at about 740°C . Cool and dissolve the residue in 15 ml of dilute hydrochloric acid. Carry out the limit test for iron (Appendix VIII G), the solution is not more intense than a reference solution using 1.5 ml of iron standard solution (0.0015%).

Heavy metals Transfer 1.0 g to a platinum crucible, carry out the limit test for heavy metals (Appendix VIII H, method 2); not more than 0.001%.

Arsenic Transfer 1 g of anhydrous sodium carbonate to a platinum crucible, add 1.0 g of the substance being examined. Moisten with a few drops of water, dry, ignite gently to carbonize, then at $500-600^{\circ}\text{C}$ until free from carbon. Allow to cool, dissolve the residue in a mixture of 5 ml of hydrochloric acid and 23 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 20 mg per ml (for injection) per kg of the rabbit's weight dissolved in 10 ml of sterile water for injections.

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method) using 5 ml of a solution of 0.5 g (for injection) per ml in sterile water.

Assay Dissolve about 0.4 g, accurately weighed, in 180 ml of water and 15 ml of hydrochloric acid solution (1→2), carry out the method for dead-stop titration (Appendix VII A), titrate with sodium nitrite (0.1 mol/L) VS. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 17.51 mg of $C_7H_5NNaO_3$.

Category Tuberculostatic agent.

Storage Preserve in hermetically sealed containers, protected from light.

Preparation (1) Sodium Aminosalicilate Enteric-coated Tablets
(2) Sodium Aminosalicilate for Injection

Sodium Aminosalicilate Enteric-coated Tablets

Sodium Aminosalicilate Enteric-coated Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of Sodium Aminosalicilate ($C_7H_5NNaO_3 \cdot 2H_2O$).

Description Enteric-coated tablets, with white or almost white core.

Identification To a quantity of the powdered tablets, with enteric coating removed, equivalent to about 1 g of sodium aminosalicilate, add 25 ml of water, filter and evaporate the filtrate to dryness, complies with the tests (1) and (3) for Identification described under sodium Aminosalicilate.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh and powder 10 tablets. Transfer to a 500 ml volumetric flask with water, dilute to volume, shake thoroughly and filter. Measure accurately 50 ml of the successive filtrate, add 150 ml of water, 20 ml of dilute hydrochloric acid and 3 g of potassium bromide, carry out the method for dead-stop titration (Appendix VII A), titrate with sodium nitrate (0.1 mol/L) VS. Each ml of sodium nitrate (0.1 mol/L) VS is equivalent to 21.11 mg of $C_7H_5NNaO_3 \cdot 2H_2O$.

Category As described under Sodium Aminosalicilate.

Strength 0.5 g

Storage Preserve in tightly closed containers, protected from light.

Sodium Aminosalicilate for Injection

Sodium Aminosalicilate for Injection is a sterile crystalline powder of Sodium Aminosalicilate. It contains not less than 95.0% and not more than 105.0% of the labelled amount of sodium aminosalicilate ($C_7H_5NNaO_3 \cdot 2H_2O$), calculated

on the basis of the average weight of contents.

Description White or almost white crystals, or a crystalline powder.

Identification Complies with the tests (1) and (3) for Identification described under Sodium Aminosalicilate.

Colour of solution Dissolve the content of one container in water to produce a solution of 0.2 g per ml. The solution is not more intense than the reference solution Y_6 (Appendix IX A, method 1).

Loss on drying, Pyrogens, Sterility Complies with the related requirements described under Sodium Aminosalicilate.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Weigh accurately about 0.4 g of the mixed contents obtained in the test for weight variation of content, dissolve in 180 ml of water and 1.5 ml of hydrochloric acid solution (1→2). Carry out the method for dead-stop titration (Appendix VII A), titrate with sodium nitrite (0.1 mol/L) VS. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 21.11 mg of $C_7H_5NNaO_3 \cdot 2H_2O$.

Category As described under Sodium Aminosalicilate.

Strength (1) 2 g (2) 4 g (3) 6 g

Storage Preserve in well closed containers, protected from light.

Sodium Ascorbate

$C_6H_7NaO_6$ 198.11

Sodium Ascorbate is the sodium salt of L-ascorbic acid. It contains not less than 99.0% of $C_6H_7NaO_6$, calculated on the dried basis.

Description White to very slightly yellow crystals or a crystalline powder; odourless; stable in atmosphere, darkens gradually on exposure to light. Freely soluble in water, very slightly soluble in ethanol, insoluble in chloroform or ether.

Specific optical rotation $+103^\circ$ to $+108^\circ$, in a solution of about 0.10 g per ml in water at $25^\circ C$ (Appendix VI E).

Identification (1) To 4 ml of the aqueous solution (1→50), add 1 ml of 0.1 mol/L hydrochloric acid solution and several drops of alkaline cupric tartrate TS, heat, a red precipitate is produced.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the spectrum of Sodium Ascorbate (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of sodium salts (Appendix III).

Acidity or alkalinity Dissolve 1.0 g in 10 ml of water, pH 7.0-8.0 (Appendix VI H).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight at $60^\circ C$, loses not more than 0.25% of its weight (Appendix VIII L).

Heavy metals Carry out the limit test for heavy metals

(Appendix VIII H, method 2), using 1.0 g: not more than 0.002%.

Assay Dissolve about 0.2 g, accurately weighed, in a mixture of 100 ml of cooled water boiled freshly and 15 ml of 1 mol/L sulfuric acid solution, add 2 ml of starch IS, titrate with iodine (0.05 mol/L) VS until a blue colour persists for at least 30 seconds. Each ml of iodine (0.05 mol/L) VS is equivalent to 9.905 mg of $C_6H_7NaO_5$.

Category Vitamin.

Storage Preserve in tightly closed containers, protected from light.

Sodium Bicarbonate

$NaHCO_3$ 84.01

[144-55-8]

Sodium Bicarbonate contains not less than 99.5% and not more than 100.5% of $NaHCO_3$ (for injection), or not less than 99.0% of $NaHCO_3$ (for oral administration).

Description A white crystalline powder; odourless; taste, salty; decomposes slowly on exposure to moist air. The alkalinity of aqueous solution increases on standing, shaking or warming.

Soluble in water; insoluble in ethanol.

Identification Yields the reactions characteristic of sodium salts and bicarbonates (Appendix III).

Alkalinity Dissolve 0.20 g in 20 ml of water, the pH value is not greater than 8.6 (Appendix VI H).

Clarity of solution A solution of 1.0 g in 20 ml of water is clear (for injection); any opalescence produced is not more pronounced than that of reference suspension 2 (Appendix IX B), (for oral administration).

Chloride Dissolve 1.5 g (for injection) or 0.15 g (for oral administration) in 25 ml of water, acidify with nitric acid dropwise, heat in a water bath to expel carbon dioxide and allow to cool. Carry out the limit test for chlorides (Appendix VIII A). Any opalescence produced is not more pronounced than that of a reference solution using 3.0 ml of sodium chloride standard solution (0.002% for injection or 0.02% for oral administration).

Sulfate Dissolve 3.0 g (for injection) or 0.50 g (for oral administration) in 40 ml of water, acidify with hydrochloric acid dropwise, heat in a water bath to expel carbon dioxide and allow to cool. Carry out the limit test for sulfates (Appendix VIII B). Any opalescence produced is not more pronounced than that of a reference solution using 1.5 ml of potassium sulfate standard solution (0.005% for injection or 0.03% for oral administration).

Ammonium Heat 1.0 g in 10 ml of sodium hydroxide TS, the vapour evolved does not turn a moistened red litmus paper to blue.

Calcium Dissolve 1.0 g in 50 ml of freshly boiled and cooled water, add 1 ml of ammonia TS and 2 ml of ammonium oxalate TS, mix well and allow to stand for 1 hour. Any opalescence produced is not more pronounced than that of a reference solution using 1.0 ml of standard calcium solution (weigh 0.125 g of calcium carbonate to a 500 ml volumetric flask, add a mixture of 5 ml of water and 0.5 ml of hydrochloric acid, dilute with water to volume and mix well. Each ml is equivalent to 0.1 mg of Ca) (0.01% for injection).

Iron Dissolve 3.0 g (for injection) or 1.0 g (for oral

administration) in a quantity of water, acidify with dilute nitric acid, boil for 1 minute, cool and dilute with water to produce 25 ml. Carry out the limit test for iron (Appendix VIII G). Any colour produced is not more intense than that of a reference solution using 1.5 ml of iron standard solution (0.0005% for injection or 0.0015% for oral administration).

Heavy metals Dissolve 4.0 g in a mixture of 19 ml of dilute hydrochloric acid and 5 ml of water, boil for 5 minutes and allow to cool. Add 1 drop of phenolphthalein IS, then add ammonia TS dropwise until pink colour is produced. Add 2 ml of acetate BS (pH 3.5) and sufficient water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1): not more than 0.0005%.

Arsenic Dissolve 1.0 g in 23 ml of water, add 5 ml of hydrochloric acid, carry out the limit test for arsenic (Appendix VIII J, method 1): not more than 0.0002%.

Assay Dissolve about 1 g, accurately weighed, in 50 ml of water, add 10 drops of methyl red/bromocresol green IS, titrate with hydrochloric acid (0.5 mol/L) VS until the colour turns from green to purplish-red. Boil for 2 minutes, cool to room temperature and continue the titration until the colour turns from green to dark purple. Each ml of hydrochloric acid (0.5 mol/L) VS is equivalent to 42.00 mg of $NaHCO_3$.

Category Antacid.

Storage Preserve in tightly closed containers. Stored in a dry place.

Preparation (1) Sodium Bicarbonate Injection
(2) Sodium Bicarbonate Tablets

Sodium Bicarbonate Injection

Sodium Bicarbonate Injection is a sterile solution of Sodium Bicarbonate in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of sodium bicarbonate ($NaHCO_3$).

It may contain suitable stabilizers.

Description A colourless, clear liquid.

Identification Yields the reactions characteristic of sodium salts and bicarbonates (Appendix III).

pH value 7.5-8.5 (Appendix VI H).

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 10 ml per kg of the rabbit's weight.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay To a quantity equivalent to about 0.5 g of sodium bicarbonate, accurately measured, add water to produce 50 ml and 10 drops of methyl red/bromocresol green IS, titrate with hydrochloric acid (0.5 mol/L) VS until the colour turns from green to purplish-red. Boil for 2 minutes, cool to room temperature and continue the titration until the colour turns from green to dark purple. Each ml of hydrochloric acid (0.5 mol/L) VS is equivalent to 42.00 mg of $NaHCO_3$.

Category As described under Sodium Bicarbonate.

Strength (1) 10 ml : 0.2 g (2) 10 ml : 0.5 g
(3) 20 ml : 1 g (4) 100 ml : 5 g
(5) 250 ml : 12.5 g (6) 500 ml : 25 g

Storage Preserve in tightly closed containers.

Sodium Bicarbonate Tablets

Sodium Bicarbonate Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of sodium bicarbonate (NaHCO_3).

Description White tablets.

Identification Shake a quantity of the powdered tablets with water and filter. The filtrate yields the reactions characteristic of sodium salts and bicarbonates (Appendix III).

Carbonate To an accurately weighed quantity of the powdered tablets equivalent to 1.00 g of sodium bicarbonate add 100 ml of freshly boiled and ice cooled water, dissolve the sodium bicarbonate by swirling gently. Add 4-5 drops of phenolphthalein IS, no red colour is produced or becomes colourless on the addition of 1.30 ml of hydrochloric acid (0.5 mol/L) VS.

Other requirements Comply with the general requirements for tablets (Appendix I A), except the tablets disintegrate.

Assay Weigh accurately and powder 10 tablets. To a quantity of the powder equivalent to about 1 g of sodium bicarbonate, accurately weighed, add 50 ml of water and shake to dissolve. Add 10 drops of methyl red/bromocresol green IS, titrate with hydrochloric acid (0.5 mol/L) VS until the colour turns from green to purplish-red. Boil for 2 minutes, cool and continue the titration until the colour turns from green to dark purple. Each ml of hydrochloric acid (0.5 mol/L) VS is equivalent to 42.00 mg of NaHCO_3 .

Category As described under Sodium Bicarbonate.

Strength (1) 0.3 g (2) 0.5 g

Storage Preserve in tightly closed containers, stored in a dry place.

Sodium Chloride

NaCl 58.44 [7647-14-5]

Sodium Chloride contains not less than 99.5% of NaCl, calculated on the dried basis.

Description Colourless, transparent cubic crystals or a white crystalline powder; odourless; taste, salty. Freely soluble in water; practically insoluble in ethanol.

Identification The aqueous solution yields the reactions characteristic of sodium salts and chlorides (Appendix III).

Acidity or alkalinity Dissolve 5.0 g in 50 ml of water, add 2 drops of bromothymol blue IS; not more than 0.10 ml of sodium hydroxide (0.02 mol/L) VS or 0.20 ml of hydrochloric acid (0.02 mol/L) VS is required to change the colour of solution from yellow to blue or from blue or green to yellow.

Clarity of solution A solution of 5.0 g in 25 ml of water is clear.

Iodide Moisten 5.0 g in a porcelain evaporating dish by the dropwise addition of a freshly prepared starch mixture (mix 0.25 g of soluble starch with 2 ml of water, add boiling water to produce 25 ml with stirring, cool and add 2 ml of 0.025 mol/L sulfuric acid solution, 3 drops of sodium nitrite

TS and 25 ml of water and mix well). Examine the mixture in daylight; no particle shows any trace of blue colour within 5 minutes.

Bromide Dissolve 2.0 g in 10 ml of water, add 3 drops of hydrochloric acid and 1 ml of chloroform, and add 3 drops of freshly prepared 2% chloramine T solution with shaking. Any colour produced in the chloroform layer is not more intense than that of a reference solution using 1.0 ml of potassium bromide standard solution (weigh accurately 0.1485 g of potassium bromide, previously dried to constant weight at 105°C, add water to produce 100 ml of solution, mix well).

Sulfate Carry out the limit test for sulfates (Appendix VIII B), using 5.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 1.0 ml of potassium sulfate standard solution (0.002%).

Barium Dissolve 4.0 g in 20 ml of water, filter and divide the filtrate into two equal portions. To one portion add 2 ml of dilute sulfuric acid and to the other portion add 2 ml of water, allow to stand for 15 minutes; both portions are equally clear.

Calcium Dissolve 2.0 g in 10 ml of water, add 1 ml of ammonia TS, mix well, add 1 ml of ammonium oxalate TS; no opalescence is produced within 5 minutes.

Magnesium Dissolve 1.0 g in 20 ml of water, add 2.5 ml of sodium hydroxide TS and 0.5 ml of 0.05% titan yellow solution and mix well. Any colour produced is not more intense than that of a reference solution using 1.0 ml of standard magnesium solution (dissolve 16.58 mg, accurately weighed, of magnesium oxide, previously ignited to constant weight at 800°C, in 2.5 ml of hydrochloric acid and dilute with water to produce 1000 ml, mix well) (0.001%).

Potassium Dissolve 5.0 g in 20 ml of water, add 2 drops of dilute acetic acid, add 2 ml of sodium tetraphenylboron solution (triturate 1.5 g of sodium tetraphenylboron with 10 ml of water, then add 40 ml of water triturate again and filter), add water to produce 50 ml. Any opalescence produced is not more pronounced than that of a reference solution using 12.3 ml of standard potassium sulfate solution (0.02%).

Loss on drying When dried to constant weight at 130°C, loses not more than 0.5% of its weight (Appendix VIII L).

Iron Carry out the limit test for iron (Appendix VIII G) using 5.0 g. Any colour produced is not more intense than that of a reference solution using 1.5 ml of iron standard solution (0.0003%).

Heavy metals Dissolve 5.0 g in 20 ml of water, add 2 ml of acetate BS (pH 3.5) and a quantity of water to produce 25 ml, carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.0002%.

Arsenic Dissolve 5.0 g in 23 ml of water, add 5 ml of hydrochloric acid, carry out the limit test for arsenic (Appendix VIII J, method 1), complies with the test (0.00004%).

Assay Dissolve about 0.12 g, accurately weighed, in 50 ml of water, add 5 ml of dextrin solution (1→50) and 5-8 drops of fluorescein IS, titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 5.844 mg of NaCl.

Category Electrolyte supplement.

Storage Preserve in tightly closed containers.

Preparation (1) Sodium Chloride Injection
(2) Sodium Chloride Physiological Injection

(3) Concentrated Sodium Chloride Injection

Sodium Chloride Injection

Sodium Chloride Injection is a sterile and isotonic solution of Sodium Chloride in Water for Injection. It contains not less than 0.850% and not more than 0.950% (g/ml) of NaCl.

Description A clear, colourless liquid; taste, slightly salty.

Identification Yields the reactions characteristic of sodium salts and chlorides (Appendix III).

pH value 4.5-7.0 (Appendix VI H).

Heavy metals Evaporate 50 ml to about 20 ml and cool, add 2 ml of acetate BS (pH 3.5) and a quantity of water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.00003%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.5 EU per ml.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay To 10 ml, accurately measured, add 40 ml of water, 5 ml of dextrin solution (1 → 50) and 5-8 drops of fluorescein IS and titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 5.844 mg of NaCl.

Category As described under Sodium Chloride.

Strength

(1) 2 ml : 18 mg	(2) 5 ml : 45 mg
(3) 10 ml : 90 mg	(4) 20 ml : 180 mg
(5) 50 ml : 0.45 g	(6) 100 ml : 0.9 g

(9) 300 ml : 2.7 g	(10) 500 ml : 4.5 g
(11) 1000 ml : 9 g	

Storage Preserve in well closed containers.

Concentrated Sodium Chloride Injection

Concentrated Sodium Chloride Injection is a sterile and hypertonic solution of Sodium Chloride in Water for Injection. It contains not less than 9.50% and not more than 10.50% of NaCl (g/ml).

Description A clear, colourless liquid; taste, saline.

Identification Yields the reactions characteristic of sodium salts and chlorides (Appendix III).

pH value 4.5-7.0 (Appendix VI H).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.05 EU per ml.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Transfer 10 ml, accurately measured, into a 100 ml volumetric flask, dilute with water to volume and mix well. Measure accurately 10 ml, add 40 ml of water, 5 ml of dextrin solution (1 → 50) and 5-8 drops of fluorescein IS, then titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 5.844 mg of NaCl.

Category As described under Sodium Chloride.

Strength 10 ml : 1 g

Storage Preserve in well closed containers.

Sodium Chloride Physiological Solution

Sodium Chloride Physiological Solution is a sterile solution of Sodium Chloride in Water. It contains not less than 0.85% and not more than 0.95% (g/ml) of sodium chloride (NaCl).

Description A clear, colourless liquid; taste, slightly salty.

Identification Yields the reactions characteristic of sodium salts and chlorides (Appendix III).

pH value 4.5-7.0 (Appendix VI H).

Other requirements Complies with the general requirements for lotions (Appendix I S).

Assay To 10 ml, accurately measured, add 40 ml of water, 5 ml of dextrin solution (1 → 50) and 5-8 drops of fluorescein IS and titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 5.844 mg of NaCl.

Category Irrigation.

Storage Preserve in tightly closed containers.

Compound Sodium Chloride Injection

Compound Sodium Chloride Injection is a sterile mixture of Sodium Chloride, Potassium Chloride and Calcium Chloride in Water for Injection. It contains 0.52%-0.58% (g/ml) of total chlorides (Cl); 0.028%-0.032% (g/ml) of potassium chloride (KCl) and 0.031%-0.035% (g/ml) of calcium chloride ($\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$).

Formula	Sodium Chloride	8.5 g
	Potassium Chloride	0.30 g
	Calcium Chloride	0.33 g
	Water for Injection	a sufficient quantity
	To make	1000 ml

Description A clear, colourless liquid; taste, saline.

Identification Yields the reactions characteristic of sodium, potassium, calcium salts and chlorides (Appendix III).

pH value 4.5-7.5 (Appendix VI H).

Heavy metals Evaporate 50 ml of the injection to about 20 ml, cool, add 2 ml of acetate BS (pH 3.5) and a sufficient quantity of water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.00003%.

Arsenic To 20 ml of the injection add 3 ml of water and 5 ml of hydrochloric acid, carry out the limit test for arsenic (Appendix VIII J); not more than 0.00001%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.5 EU per ml.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Total chlorides To 10 ml of the injection, accurately measured, add 40 ml of water, 5 ml of 2% dextrin solution and 5-8 drops of fluorescein IS, titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 3.545 mg of Cl.

Potassium Chloride To 60 ml of sodium tetraphenylborate solution (0.02 mol/L) VS in a beaker add 1 ml of glacial acetic acid and 25 ml of water. Add accurately 100 ml of the injection, heat in a water bath at 50-55°C for 30 minutes, cool and allow to stand in an ice bath for 30 minutes. Filter with a tared No. 4 sintered glass crucible previously dried to constant weight at 105°C, wash the precipitate with 20 ml of clear saturated potassium tetraphenylborate solution in 4 portions, finally wash it with a small amount of water. dry at 105°C to constant weight and weigh accurately. Multiply the weight of precipitate by 0.2081, the product represents the weight of KCl in the sample being examined.

Calcium chloride To a 200 ml conical flask add 100 ml of the injection, accurately measured. To 15 ml of ammonia-ammonium chloride BS (pH 10.0) add a few drops of magnesium sulfate TS and a small amount of eriochrome black T indicator mixture, titrate with disodium edetate (0.05 mol/L) VS until a blue colour is produced. Pour the titrated solution into the conical flask mentioned above, titrate again with disodium edetate (0.05 mol/L) VS until the blue colour is restored. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 7.351 mg of $\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$.

Category Electrolyte replenisher.

Strength (1) 100 ml (2) 500 ml (3) 1000 ml

Storage Preserve in well closed containers, protected from light

Sodium Chromate [^{51}Cr] Injection

Sodium Chromate [^{51}Cr] Injection is a sterile solution of Sodium Chromate [^{51}Cr] made isotonic by the addition of sodium chloride. It contains not less than 90.0% and not more than 110.0% of the labelled amount of radioactive concentration of chromium-51 at the date and hour stated on the label.

Description A clear, pale yellow liquid.

Identification (1) Carry out the γ -ray spectrum method (Appendix XIII), using suitable amount of sample, the prominent photon has an energy of 0.320 MeV. (2) The principal spot obtained in the determination of Radiochemical purity has a prominent radioactive peak with R_f value of about 0.8.

pH value 7.0-8.0 (Appendix VI H).

Chromium Dilute 0.2 ml of the injection, accurately measured, with 0.05 mol/L sodium hydroxide solution to 4.0 ml, mix well and measure the absorbance at 370 nm (Appendix IV A), taking 299 as the value of A (1%, 1 cm) for sodium chromate [^{51}Cr]. Calculate the content of Cr, not more than 50 μg per ml.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E), using 1 vial, it contains less than 40 EU per ml.

Sterility Complies with the test for sterility (Appendix XI H).

Radiochemical purity Carry out the determination of radiochemical purity (Appendix XIII, method 1), using a mixture of water-ethanol-concentrate ammonia solution (5:2:1) as the mobile phase. Not less than 95% of the total radioactivity is found in the spot corresponding to sodium chromate [^{51}Cr].

Radioactive concentration Not less than 37 MBq per ml (Appendix XIII).

Category Diagnostic.

Strength (1) 37 MBq (2) 185 MBq

Storage Preserve in well closed lead containers, the intensity of radiation on the surface of the container complies with relevant regulation.

Sodium Citrate

$\text{C}_6\text{H}_5\text{Na}_3\text{O}_7 \cdot 2\text{H}_2\text{O}$ 294.10

[6132-04-3]

Sodium Citrate is 2-hydroxypropane-1,2,3-tricarboxylic acid trisodium salt dihydrate. It contains not less than 99.0% of $\text{C}_6\text{H}_5\text{Na}_3\text{O}_7$, calculated on the dried basis.

Description Colourless crystals or a white crystalline powder; odourless; taste, saline and cool; slightly deliquescent in moist air, and efflorescent in hot air. Freely soluble in water, practically insoluble in ethanol.

Identification Yields the reactions characteristic of sodium salts and citrates (Appendix III).

Alkalinity Dissolve 1.0 g in 20 ml of water, add 1 drop of phenolphthalein IS. Not more than 0.10 ml of sulfuric acid (0.05 mol/L) VS is required to change the colour of the solution.

Clarity of solution A solution of 2.5 g in 10 ml of water is clear.

Chloride Carry out the limit test for chlorides (Appendix VII A), using 0.60 g. Any opalescence produced is not more pronounced than that of a reference solution using 6.0 ml of sodium chloride standard solution (0.01%).

Sulfate Carry out the limit test for sulfates (Appendix VII B), using 0.50 g. Any opalescence produced is not more pronounced than that of a reference solution using 2.5 ml of potassium sulfate standard solution (0.05%).

Tartrate Dissolve 1 g in 2 ml of water in a test tube, add 1 ml each of potassium acetate TS and acetic acid. Rub the inner wall of the test tube with a glass rod, no crystalline precipitate is formed.

Readily carbonizable substances Heat 0.40 g with 5 ml of sulfuric acid (94.5%-95.5%) for 1 hour at $90^\circ\text{C} \pm 1^\circ\text{C}$, cool immediately. Carry out the limit test for readily carbonizable substances (Appendix VII O). Any colour produced is not more intense than reference solution YG_8 or Y_8 (for parenteral administration), and YG_{10} or Y_{10} (for oral administration).

Loss on drying When dried to constant weight at 180°C , loses 10.0%-13.0% of its weight (Appendix VII L).

Calcium salts or oxalate Dissolve 2.0 g in 20 ml of freshly boiled and cooled water, add 0.4 ml of ammonia TS and 2 ml of ammonium oxalate TS, mix well, allow to stand for 1 hour. Any opalescence produced is not more pronounced than that of a reference solution using 1.0 ml of calcium standard solution (dissolve 0.125 g of calcium carbonate, accurately weighed, in a 500 ml volumetric flask with a mixture of 5 ml of water and 0.5 ml of hydrochloric acid, dilute to volume with water and mix well. Each ml is equivalent to 0.10 mg of Ca) (0.005%).

If no opalescence is produced in above test, dissolve 1.0 g in a mixture of 1 ml of water and 3 ml of dilute hydrochloric acid, add 4 ml of 90% ethanol and 4 drops of calcium chloride TS, allow to stand for 1 hour. No opalescence is produced.

Iron Carry out the limit test for iron (Appendix VIII G) by extract 1.0 g with *n*-butanol. Any opalescence produced is not more pronounced than that of a reference solution prepared in the same manner, using 1.0 ml of iron standard solution (0.001%).

Heavy metals Dissolve 2.0 g in 10 ml of water, add 10 ml of dilute acetic acid and a sufficient quantity of water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.0005%.

Arsenic Dissolve 2.0 g in 23 ml of water, add 5 ml of hydrochloric acid. Complies with the limit test for arsenic (Appendix VIII J, method 1) (0.0001%).

Assay Heat and dissolve about 80 mg, accurately weighed, in 5 ml of glacial acetic acid, allow to cool, add 10 ml of acetic anhydride and 1 drop of crystal violet IS and titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 8.602 mg of $C_{23}H_{14}Na_2O_{11}$.

Category Anticoagulant.

Storage Preserve in tightly closed containers.

Preparation Sodium Citrate Injection for Transfusion

Sodium Citrate Injection for Transfusion

Sodium Citrate Injection for Transfusion is a sterile solution of Sodium Citrate in Water for Injection. It contains not less than 2.35% and not more than 2.65% of $C_6H_5Na_3O_7 \cdot 2H_2O$.

Description A clear, colourless liquid.

Identification Yields the reactions characteristic of sodium salts and citrates (Appendix III).

pH value 6.5-8.5 (Appendix VI H).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.25 EU per mg of sodium citrate.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Evaporate 3 ml, accurately measured, on a water bath to dryness, dry at 105°C for 30 minutes and cool. Carry out the Assay described under Sodium Citrate, beginning at the words "in 5 ml of glacial acetic acid...". Calculate the content of $C_6H_5Na_3O_7 \cdot 2H_2O$. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 9.803 mg of $C_6H_5Na_3O_7 \cdot 2H_2O$.

Category As described under Sodium Citrate.

Storage Preserve in well closed containers.

Sodium Cromoglicate

$C_{23}H_{14}Na_2O_{11}$ 512.34

[15826-37-6]

Sodium Cromoglicate is 5,5'-[(2-hydroxy-1,3-propanediyl) bis (oxy)] bis [4-oxo-4H-1-benzopyran-2-carboxylic acid] disodium salt. It contains not less than 98.0% of $C_{23}H_{14}Na_2O_{11}$, calculated on the dried basis.

Description A white crystalline powder; odourless; hygroscopic; discoloured on exposure to light. Soluble in water; insoluble in ethanol or chloroform.

Identification (1) To 0.1 g add 2 ml of water and 2 ml of sodium hydroxide TS, boil for 1 minute, a yellow solution is obtained; add a few drops of diazotized sulfanilic acid TS, the colour of the solution changes blood red.

(2) The light absorption of a solution of 10 µg per ml in phosphate BS (pH 7.4) exhibits maxima at 238 nm and 326 nm (Appendix IV A).

(3) The infrared absorption spectrum is (Appendix IV C), concordant with the reference spectrum of sodium cromoglicate (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of sodium salts (Appendix III).

Acidity and alkalinity Dissolve 0.10 g in 10 ml of water, add 1 drop of bromothymol blue IS; if a yellow colour is produced, add 0.15 ml of sodium hydroxide (0.01 mol/L) VS the colour changes to blue; if a blue colour is produced, add 0.15 ml of hydrochloric acid (0.01 mol/L) VS, the colour changes to yellow.

Oxalate To 0.10 g and 1 ml of oxalic acid reference solution (dissolve 25 mg, accurately weighed, of dehydrated oxalic acid in a 100 ml volumetric flask in water and dilute to volume and mix well), in two 50 ml volumetric flasks separately add 20 ml of water and 5.0 ml of ferric salicylate TS, dilute with water to volume and mix well; measure the absorbances of the resulting solutions at 480 nm. The absorbance of the test solution is not greater than that of the oxalate reference solution (0.25%).

Loss on drying When dried to constant weight at 120°C, loses not more than 10.0% of its weight (Appendix VII L).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using 1.0 g; not more than 0.001%.

Assay Dissolve 0.18 g, accurately weighed, in a mixture of 20 ml of propylene-glycol and 5 ml of isopropanol by heating and cool. Add 20 ml of dioxane and a few drops of methyl orange-xylene cyanol blue FF IS, titrate with perchloric acid in dioxane (0.1 mol/L) VS until the solution becomes bluish-grey. Each ml of perchloric acid in dioxane (0.1 mol/L) VS is equivalent to 25.62 mg of $C_{23}H_{14}Na_2O_{11}$.

Category Anti-allergic agent.

Storage Preserve in tightly closed containers, protected

from light.

Preparation (1) Sodium Cromoglicate Aerosol
(2) Sodium Cromoglicate Eye Drops

Sodium Cromoglicate Aerosol

Sodium Cromoglicate Aerosol contains not less than 85.0% and not more than 120.0% of the labelled amount of sodium cromoglicate ($C_{23}H_{14}Na_2O_{11}$). The labelled concentration of sodium cromoglicate aerosol is not less than 80.0% (g/g) and not more than 130.0% (g/g).

Description A colourless to pale yellow suspension in pressurized container, spray out as foggy particles on release of the delivery valve.

Identification (1) Mix each 2 ml of water and sodium hydroxide TS in a test tube, spray the solution for several times with sodium cromoglicate aerosol, mix well, boil for 1 minute, a yellow colour is produced; add a few drops of diazotized sulfanilic acid TS, the colour of the solution changes to red.

(2) The light absorption of the solution obtained in the Assay exhibits a maximum at 326 nm (Appendix IV A).

Other requirements Complies with the general requirements of aerosols and sprays (Appendix I L) except that the dose of principal drug substance in each spray is 80%-120% of the labelled amount.

Assay Allow the content of one container to precipitate on standing, accurately weighed, punch a small hole on the aluminium cover, until the propellant expels. Remove the cover, place the container and the cover in a beaker, add 150 ml of water, heat to dissolve sodium cromoglicate. Transfer the solution to a 250 ml volumetric flask, wash the container and cover with water in divided portions, combine the washings into the volumetric flask, cool, dilute with water to volume and mix well. Measure accurately 10 ml to a 100 ml volumetric flask, dilute with phosphate BS (pH 7.4) to volume and mix well. Measure accurately 10 ml to another 100 ml volumetric flask, dilute with phosphate BS (pH 7.4) to volume and mix well. Measure the absorbance of the resulting solution at 326 nm and make necessary correction using phosphate BS (pH 7.4) as blank (Appendix IV A). Weigh accurately 0.7 g of sodium cromoglicate CRS in a 250 ml volumetric flask, dissolve it in water, dilute to volume and mix well. Measure accurately 10 ml to a 100 ml volumetric flask, dilute with phosphate BS (pH 7.4) to volume, mix well. Measure accurately 10 ml to another 100 ml volumetric flask, dilute with phosphate BS (pH 7.4) to volume. Measure the absorbance in the same manner, calculate the content of sodium cromoglicate in each container. Dry and weigh accurately the empty container, valve and cover, calculate the weight of content and the concentration of sodium cromoglicate in the aerosol.

Category As described under Sodium Cromoglicate.

Strength (1) The total weight of content in each container is 14 g which contains 0.7 g of sodium cromoglicate, and 3.5 mg of sodium cromoglicate in each spray.
(2) The total weight of content in each container is 19.97 g which contains 0.7 g of sodium cromoglicate, and 5 mg of sodium cromoglicate in each spray.

Storage Preserve in tightly closed containers, stored in a

cool place.

Sodium Cromoglicate Eye Drops

Sodium Cromoglicate Eye Drops contain not less than 90.0% and not more than 110.0% of the labelled amount of sodium cromoglicate ($C_{23}H_{14}Na_2O_{11}$).

Description A clear, colourless or almost colourless liquid.

Identification (1) To 5 ml add 2 ml of sodium hydroxide TS, boil for 1 minute, a yellow colour is produced. Add a few drops of diazotized sulfanilic acid TS, the solution becomes blood red.

(2) The light absorption of the solution obtained in the Assay exhibits a maximum at 326 nm (Appendix IV A).

pH value 4.0-7.0 (Appendix VI H).

Other requirements Comply with the general requirements for eye preparations (Appendix I G).

Assay Place 2 ml of the eye drops, accurately measured, in a 100 ml volumetric flask, dilute with phosphate BS (pH 5.8) to volume and mix well. Transfer 5 ml of the solution, accurately measured, into another 100 ml volumetric flask, dilute with phosphate BS (pH 5.8) to volume and mix well. Measure the absorbance of the solution at 326 nm (Appendix IV A). Calculate the content of $C_{23}H_{14}Na_2O_{11}$, taking 164 as the value of A (1%, 1 cm).

Category As described under Sodium Cromoglicate.

Strength 8 ml + 0.16 g

Storage Preserve in tightly closed containers, protected from light.

Sodium Diatrizoate Injection

Sodium Diatrizoate Injection is a sterile solution of Diatrizoic Acid in Water for Injection neutralized with sodium hydroxide. It contains not less than 95.0% and not more than 105.0% of the labelled amount of sodium diatrizoate ($C_{11}H_8I_3N_2NaO_4$).

Description A clear, colourless to pale yellow liquid.

Identification (1) Evaporate about 1 ml to dryness, heat the residue gently; violet iodine vapour is evolved.

(2) Complies with test (2) for Identification described under Diatrizoic Acid.

(3) Yields the reactions characteristic of sodium salts (Appendix III).

pH value 6.5-8.0 (Appendix VI H).

Colour Not more intensely coloured than reference solution Y₃ (Appendix IX A, method 1).

Free iodine To a quantity equivalent to about 1.0 g of sodium diatrizoate add water to produce 10 ml, the resulting solution complies with the test for Free iodine described under Diatrizoic Acid.

Iodide To a quantity equivalent to about 0.8 g of sodium diatrizoate add water to produce 10 ml. Add dropwise 3 ml of dilute nitric acid, stir for a few minutes, a precipitate is produced. Filter, wash the precipitate with 5 ml of water, combine the washings with the filtrate. Add 1 ml of chloroform and 1 ml of concentrated hydrogen peroxide solution, mix well and allow to stand. Any colour produced

in the chloroform layer is not more intense than that of a reference solution prepared in the same manner using 4.0 ml of a 0.0013% solution of potassium iodide.

Pyrogens Complies with the test for pyrogens (Appendix XI D), inject 3 ml per kg of rabbit's weight slowly.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Transfer accurately a quantity equivalent to about 5 g of sodium diatrizoate to a 100 ml volumetric flask, add water to volume, mix well. Measure accurately 10 ml, carry out the Assay described under Diatrizoic Acid, beginning at the words "add 30 ml of sodium hydroxide TS and 1.0 g of powdered zinc...". Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 21.20 mg of $C_{11}H_8I_3N_2NaO_4$.

Category Diagnostic aid.

Strength (1) 1 ml : 0.3 g (2) 20 ml : 10 g

Storage Preserve in well closed containers, protected from light.

Sodium Dihydrogen Phosphate

$NaH_2PO_4 \cdot H_2O$ 137.99 [10049-21-5]

Sodium Dihydrogen Phosphate contains not less 98.0% of NaH_2PO_4 , calculated on the dried basis.

Description Colourless crystals or a white crystalline powder; odourless; taste, salty and sour; slightly hygroscopic. Freely soluble in water; practically insoluble in ethanol.

Identification (1) The aqueous solution effervesces on addition of sodium carbonate.
(2) The aqueous solution yields the reactions characteristic of sodium salts and phosphates (Appendix III).

Acidity Dissolve 2.0 g in 40 ml of water, pH 4.1-4.5 (Appendix VI H).

Chloride Carry out the limit test for chlorides (Appendix VIII A), using 0.50 g. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.01%).

Sulfate Carry out the limit test for sulfates (Appendix VII B), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of potassium sulfate standard solution (0.05%).

Loss on drying When dried at 60°C for 2 hours and then to constant weight at 105°C, loses not more than 15.0% and not less than 10.0% of its weight (Appendix VIII L).

Aluminum Dissolve 0.50 g in a quantity of water, add 5 ml of acetic acid-ammonium acetate BS (pH 4.5) and sufficient water to produce 25 ml, then add 1 ml of 0.1% ammonium aurintricarboxylate solution, mix well. Any red colour produced is not more intense than that of a reference solution using 5.0 ml of aluminium standard solution [weigh accurately 1.76 g of aluminium potassium sulfate ($AlK(SO_4)_2 \cdot 12H_2O$) into a 1000 ml volumetric flask, add water to dissolve it and dilute to volume, mix well. Measure accurately 10 ml of the resulting solution into a 100 ml volumetric flask prior to use, dilute with water to volume, mix well. Each ml of the solution is equivalent to 10 µg of Al] (0.01%).

Calcium Dissolve 0.50 g in a quantity of water, add 1 ml of ammonium oxalate TS, allow to stand for 1 minute. Add 2 ml of dilute acetic acid, 5 ml of ethanol and 25 ml of water, mix well. Any opalescence produced is not more

pronounced than that of a reference solution using 5.0 ml of calcium standard solution (weigh accurately 0.125 g of calcium carbonate, previously dried to constant weight at 105°C, into a 500 ml volumetric flask, dissolve in 5 ml of water and 0.5 ml of hydrochloric acid, dilute with water to volume and mix well. Transfer accurately 10 ml of resulting solution to a 100 ml volumetric flask before use, dilute with water to volume, mix well. Each ml of the solution is equivalent to 10 µg of Ca) (0.01%).

Heavy metals Dissolve 1.0 g in 20 ml of water, add 2 ml of acetate BS (pH 3.5) and sufficient water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1): not more than 0.001%.

Arsenic Dissolve 0.4 g in 23 ml of water, add 5 ml of hydrochloric acid. Carry out the limit test for arsenic (Appendix VIII J, method 1): not more than 0.0005%.

Assay Dissolve about 2.5 g, accurately weighed, in 10 ml of water, add 20 ml of saturated sodium chloride solution and 2-3 drops of phenolphthalein IS. Titrate with sodium hydroxide (1 mol/L) VS. Each ml of sodium hydroxide (1 mol/L) VS is equivalent to 120.0 mg of NaH_2PO_4 .

Category Buffering agent, phosphorus replenisher.

Storage Preserve in tightly closed containers.

Sodium Dimercaptosuccinate

$C_4H_4Na_2O_4S_2 \cdot 3H_2O$ 280.23

Sodium Dimercaptosuccinate is 2,3-dimercaptosuccinic acid, disodium salt, trihydrate. It contains not less than 95.0% of $C_4H_4Na_2O_4S_2$, calculated on the dried basis.

Description A white to pale yellow powder; odour, characteristic, alliaceous. Freely soluble in water; insoluble in ethanol, chloroform or ether.

Identification (1) Dissolve about 0.2 g in 2 ml of water, make alkaline with sodium hydroxide TS and add dropwise sodium nitroprusside TS; a violet-red colour is produced.
(2) Dissolve about 0.2 g in 2 ml of water, add 1 ml of lead acetate TS; a pale yellow precipitate is produced.
(3) The aqueous solution yields the reactions characteristic of sodium salts (Appendix III).

Acidity or alkalinity Dissolve 1.0 g in 10 ml of water, pH 6.0-7.5 (Appendix VI H).

Colour of solution A solution of 1.0 g in 10 ml of water is colourless. Any colour produced is not more intense than that of reference solution BR₄ (Appendix IX A, method 1).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight at 60°C, loses not less than 18.0% and not more than 24.0% of its weight (Appendix VIII L).

Sterility A solution of 1.0 g in 10 ml of sterile water complies with the test for sterility (Appendix XI H).

Assay Dissolve about 0.1 g, dried previously to constant weight and accurately weighed, in 30 ml of water in a 100 ml volumetric flask, add 2 ml of dilute acetic acid and 50 ml of

silver nitrate (0.1 mol/L) VS accurately measured. Shake vigorously, heat in a water bath for 2-3 minutes, cool, dilute with water to volume and mix well. Filter, measure accurately 50 ml of the successive filtrate to a conical flask with stopper. Add 2 ml of nitric acid and 2 ml of ferric ammonium sulfate IS, titrate with ammonium thiocyanate (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 5.656 mg of $C_4H_4Na_2O_4S_2$.

Category Antidote.

Storage Preserve in hermetically sealed containers, stored in a dark and cool place.

Preparation Sodium Dimercaptosuccinate for Injection

Sodium Dimercaptosuccinate for Injection

Sodium Dimercaptosuccinate for Injection is a sterile powder of Sodium Dimercaptosuccinate. It contains not less than 95.0% and not more than 105.0% of the labelled amount of sodium dimercaptosuccinate ($C_4H_4Na_2O_4S_2 \cdot 3H_2O$), calculated on the basis of average content in each container.

Description A white to pale yellow powder; odour, characteristic, alliaceous.

Identification Complies with the tests for Identification as described under Sodium Dimercaptosuccinate.

Colour of solution A solution of the content of container in 5 ml of water (0.5 g) or 10 ml of water (1 g) is colourless; any colour produced is not more intense than that of reference solution RB₁ (Appendix IX A, method 1).

Sterility Add separately a quantity of sterile water to two containers to produce solutions of 0.1 g per ml, the solutions comply with the test for sterility (Appendix XI H).

Acidity or alkalinity, Loss on drying Complies with the respective test as described under Sodium Dimercaptosuccinate.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Weigh accurately 0.1 g of the mixed contents obtained in the test for weight variation of content, carry out the Assay as described under Sodium Dimercaptosuccinate. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 7.006 mg of $C_4H_4Na_2O_4S_2 \cdot 3H_2O$.

Category As described under Sodium Dimercaptosuccinate.

Strength (1) 0.5 g (2) 1 g

Storage Preserve in well closed containers, stored in a dark and cool place.

Sodium Etacrylate

$C_{13}H_{11}Cl_2NaO_4$ 325.12

Sodium Etacrylate is [2,3-dichloro-4-(2-methylene-1-oxobutyl) phenoxy]-acetic acid, sodium salt. It contains not less than 98.0% of $C_{13}H_{11}Cl_2NaO_4$, calculated on the dried basis.

Description A white powder; odourless; taste, bitter and astringent.

Soluble in water; slightly soluble in ethanol.

Identification (1) Complies with tests (1) and (4) for Identification described under Etacrynic Acid.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of sodium etacrylate (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of sodium (Appendix III).

Acidity Dissolve 25 mg in 25 ml of water, pH 5.5-7.0 (Appendix VI H).

Loss on drying When dried in vacuum at 60°C over phosphorus pentoxide to constant weight, loses not more than 4.0% of its weight (Appendix VIII L).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 1), using 1 g; not more than 0.002%.

Sterility Dissolve 0.1 g in 10 ml of sterile water respectively, the solutions comply with the test for sterility (Appendix XI H).

Assay Carry out the Assay described under Etacrynic Acid, using about 0.15 g, accurately weighed. Each ml of bromine (0.05 mol/L) VS is equivalent to 16.26 mg of $C_{13}H_{11}Cl_2NaO_4$.

Category Diuretic.

Storage Preserve in hermetically closed containers, protected from light.

Preparation Sodium Etacrylate for Injection

Sodium Etacrylate for Injection

Sodium Etacrylate for Injection is a sterile powder of Sodium Etacrylate. It contains not less than 90.0% and not more than 110.0% of the labelled amount of sodium etacrylate ($C_{13}H_{11}Cl_2NaO_4$), calculated on the basis of average content.

Description A white powder; odourless; taste, bitter and astringent.

Identification Complies with the tests for Identification described under Sodium Etacrylate.

Acidity Dissolve 25 mg in 25 ml of water, pH 5.5-7.0 (Appendix VI H).

Loss on drying When dried in vacuum at 60°C over phosphorus pentoxide to constant weight, loses not more than 5.0% of its weight (Appendix VIII L).

Sterility Dissolve the contents of containers in sterile water to produce solutions of 10 mg per ml, the resulting solutions comply with the related requirements (Appendix XI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the assay as described under Etacrynic Acid, using about 0.15 g, accurately weighed, of the mixed contents obtained in the test for weight variation of contents. Each ml of bromine (0.05 mol/L) VS is

equivalent to 16.26 mg of $C_{13}H_{11}Cl_2NaO_4$.

Category As described under Sodium Etacrylate.

Strength 25 mg

Storage Preserve in well closed containers, protected from light.

Sodium Ferulate

$C_{10}H_9NaO_4 \cdot 2H_2O$ 252.20

Sodium Ferulate is sodium 3-methoxy-4-hydroxy cinnamate dihydrate. It contains not less than 98.5% (for oral administration) or 99.0% (for injection) of $C_{10}H_9NaO_4$, calculated on anhydrous basis.

Description White or almost white crystals or crystalline powder, odourless. Soluble in water; very slightly soluble in ethanol; insoluble in trichloromethane or ether.

Specific absorbance Protected from light throughout the procedure. Measure the absorbance of a solution of 10 μ g per ml in water at 310 nm (Appendix IV A), the value of A (1%, 1 cm) is 690-732.

Identification (1) The light absorption of a solution of 10 μ g per ml in water exhibits two maxima at 287 nm and 310 nm, and a minima at 254 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of sodium ferulate (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of sodium salts (Appendix III).

Acidity or alkalinity An aqueous solution of 50 mg per ml, pH 6.0-7.5 (Appendix VI H).

Clarity and colour of solution An aqueous solution of 20 mg per ml is clear and colourless; any colour produced is not more intense than that of reference solution Y2 or YG₂ (Appendix IX A, method 1) (for injection).

Related substances Protected from light throughout the procedure. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of water-methanol-acetic acid (69 : 30 : 1.5) as the mobile phase. Detection wavelength is 322 nm and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of sodium ferulate. Dissolve a quantity of the substance being examined in mobile phase to produce a solution of 0.7 mg per ml as test solution, transfer accurately 1 ml of the test solution into a 100 ml volumetric flask, dilute with mobile phase, shake thoroughly as reference solution. Inject 10 μ l of the reference solution into the column and adjust the attenuation so that the principal peak height in the chromatogram is 10% of full scale of the chart. Inject separately 10 μ l each of the test solution and the reference solution into the column, and record the chromatogram for 2.5 times of the retention time of the principal peak. The sum of the areas of all impurity peaks in the chromatogram obtained with the test solution is not greater than that of the principal peak in the chromatogram

obtained with the reference solution.

Water 13.0%-15.5% (Appendix VIII M, method 1, A).

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 1 ml of a solution of 5 mg per ml in Sterile Water for Injection per kg of rabbit's weight (for injection).

Sterility Complies with the test for sterility (Appendix XI H). Using a solution of 20 mg per ml in Sterile Water for Injection (for injection).

Assay Protected from light throughout the procedure. Dissolve about 0.15 g, accurately weighed, in 20 ml of glacial acetic acid, add 3 ml of acetic anhydride and 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the blue color changes to pink. Perform blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 25.62 mg of $C_{10}H_9NaO_4$.

Category Anticoagulant.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Sodium Ferulate for Injection
(2) Sodium Ferulate Tablets

Sodium Ferulate for Injection

Sodium Ferulate for Injection is a sterile powder of Sodium Ferulate. It contains not less than 90.0% and not more than 110.0% of the labelled amount of sodium ferulate ($C_{10}H_9NaO_4 \cdot 2H_2O$), calculated with reference to the average weight of contents.

Description White or almost white crystals or a crystalline powder; odourless.

Identification Complies with the test (1) and (3) for Identification described under Sodium Ferulate.

Acidity or alkalinity An aqueous solution of 50 mg per ml, pH 6.0-7.5 (Appendix VI H).

Clarity and colour of solution An aqueous solution of 20 mg per ml is clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B), any colour produced is not more intense than that of reference solution Y3 or YG3 (Appendix IX A, method 1).

Water 13.0%-16.0% (Appendix VIII M, method 1, A).

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 3 ml of a solution of 5 mg per ml in Sterile Water for Injection per kg of rabbit's weight.

Sterility Complies with the test for sterility (Appendix XI H). Using a solution of 20 mg per ml in Sterile Water for Injection.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Protected from light throughout the procedure. To about 0.15 g of the mixed contents obtained under the test for Weight variation, accurately weighed. Carry out the Assay described under Sodium Ferulate beginning at the words "in 20 ml of glacial acetic acid". Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 25.22 mg of $C_{10}H_9NaO_4 \cdot 2H_2O$.

Category As described under Sodium Ferulate.

Strength 0.1 g

Storage Preserve in tightly closed containers, protected from light.

Sodium Ferulate Tablets

Sodium Ferulate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of sodium ferulate ($C_{10}H_9NaO_4 \cdot 2H_2O$).

Description White or almost white tablets.

Identification (1) The solution obtained in Assay complies with the test (1) for Identification described under Sodium Ferulate.

(2) Comply with the test (3) for Identification described under Sodium Ferulate.

Dissolution Protected from light throughout the procedure. Carry out the dissolution test (Appendix X C, method 1), using 900 ml of water as the dissolution medium, adjust the rotational speed of the basket to 50 rpm. Withdraw the solution at exactly 30 minutes and filter. Dilute a quantity of the successive filtrate, accurately measured, with water to produce a solution of about 10 μ g per ml. Measure the absorbance of the solution at 310 nm (Appendix IV A). Calculate the dissolution of $C_{10}H_9NaO_4 \cdot 2H_2O$ from each tablet, taking 712 as the value of A (1%, 1 cm), and multiply the result by 1.167. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Protected from light throughout the procedure. Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powder, equivalent to about 50 mg of sodium ferulate, into a 250 ml volumetric flask, add a quantity of water to dissolve sodium ferulate, and dilute with water to volume, shake thoroughly and filter, measure accurately 5 ml of the successive filtrate into a 100 ml volumetric flask, dilute to volume with water and shake thoroughly. Measure the absorbance of the resulting solution at 310 nm (Appendix IV A). Calculate the content of $C_{10}H_9NaO_4 \cdot 2H_2O$, taking 712 as the value of A (1%, 1 cm), and multiply the result by 1.167.

Category As described under Sodium Ferulate.

Strength 50 mg

Storage Preserve in tightly closed containers, protected from light.

Sodium Glutamate

$C_5H_8NNaO_4 \cdot H_2O$ 187.13

Sodium Glutamate is *L*-2-aminopentane-1,5-dioic acid monosodium monohydrate. It contains not less than 99.0% and not more than 100.5% of $C_5H_8NNaO_4 \cdot H_2O$, calculated on the dried basis.

Description White crystals or a crystalline powder. Freely soluble in water, slightly soluble in ethanol.

Specific optical rotation $+24.8^\circ$ to $+25.3^\circ$, in a solution of about 0.1 g per ml in 2 mol/L hydrochloric acid solution (Appendix VI E).

Identification (1) Dissolve about 5 mg in 1 ml of water; add several drops of ninhydrin TS and heat, the solution exhibits a blue to violet-blue colour.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of sodium glutamate (Appendix XVI).

(3) Yields the reactions characteristic of sodium salts (Appendix III).

Acidity or alkalinity Dissolve 1.0 g in 10 ml of water, pH 6.7-7.2 (Appendix VI H).

Transmittance of solution Dissolve 1.0 g in 10 ml of water, the transmittance at 430 nm is not less than 98.0% (Appendix IV A).

Chloride Carry out the limit test for chloride (Appendix VII A), using 0.10 g. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.05%).

Sulfate Carry out the limit test for sulfate (Appendix VII B), using 0.5 g. Any opalescence produced is not more pronounced than that of a reference solution using 1.5 ml of potassium sulfate standard solution (0.03%).

Ammonium Carry out the limit test for ammonium (Appendix VIII K), using 0.10 g. Any colour produced is not more intense than that of a reference solution using 2.0 ml of ammonium chloride standard solution (0.02%).

Other amino acids Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and *n*-butanol-water-glacial acetic acid (2 : 1 : 1) as the mobile phase. Apply separately to the plate 5 μ l of each of two solutions in water containing (1) 20 mg per ml, (2) 0.1 mg per ml of the substance being examined. After developing and removal of the plate, dry in air, spray with ninhydrin acetone solution (1 \rightarrow 50), heat at 80°C until the colour is produced and examine immediately. Any spot, other than the principal spot in the chromatogram, obtained with solution (1) is not more intense than the principal spot obtained with solution (2) (0.5%).

Loss on drying When dried at 97°C to 99°C for 5 hours, loses not more than 0.1% of its weight (Appendix VIII L).

Iron Carry out the limit test for iron (Appendix VIII G), using 1.0 g. Any colour produced is not more intense than that of a reference solution using 1.0 ml of iron standard solution (0.001%).

Heavy metals Dissolve 1.0 g in 23 ml of water, add 2 ml of acetate BS (pH 3.5). Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Arsenic Dissolve 2.0 g in 23 ml of water, add 5 ml of hydrochloric acid, carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0001%.

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 10 ml of a solution of 20 mg per ml in Sodium Chloride Injection, per kg of the rabbit's weight.

Assay Dissolve about 80 mg, accurately weighed, in 3 ml of dehydrated formic acid, add 30 ml of glacial acetic acid. Carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 9.357 mg of $C_5H_8NNaO_4 \cdot H_2O$.

Category Amino acid.

Storage Preserve in tightly closed containers, protected from light.

Preparation Sodium Glutamate Injection

Sodium Glutamate Injection

Sodium Glutamate Injection is a sterile aqueous solution of glutamic acid with a quantity of sodium hydroxide. It contains not less than 95.0% and not more than 105.0% of the labelled amount of sodium glutamate ($C_5H_8NNaO_4$).

Description A clear, colourless or almost colourless liquid.

Identification (1) Dilute 1 drop with 2 ml of water, add about 2 mg of ninhydrin and heat, the solution exhibits a blue to violet-blue colour.

(2) Yields the reactions characteristic of sodium salts (Appendix III).

pH value 7.5-8.5 (Appendix VI H).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.025 EU per mg of sodium glutamate.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately 15 ml to a 50 ml volumetric flask, add 10 ml of hydrochloric acid, dilute with water to volume and mix well. Carry out the determination of optical rotation (Appendix VI E) and multiply by 5.986 to obtain the amount (g) of $C_5H_8NNaO_4$ in 100 ml.

Category As described under Glutamic Acid.

Strength 20 ml : 5.75 g

Storage Preserve in well closed containers, protected from light.

Sodium Glycerophosphate

[1334-74-3]

Sodium Glycerophosphate is a mixture of α -Sodium Glycerophosphate and β -Sodium Glycerophosphate. It contains not less than 67.0% and not more than 71.0% of $C_3H_7Na_2O_6P$.

Description Colourless crystals or a white crystalline powder; odourless; taste, salty. Freely soluble in water; insoluble in ethanol or acetone.

Identification (1) Heat a mixture of about 0.1 g and 0.5 g of potassium hydrogen sulfate in a test tube, pungent vapours of acrolein are evolved.

(2) The aqueous solution yields the reactions characteristic of sodium salts (Appendix III).

(3) To about 0.1 g add 5 ml of dilute nitric acid, heat to boil about 1 minute, cool, the solution yields the reactions characteristic of phosphates (Appendix III).

Alkalinity Dissolve 1.0 g in 30 ml of water, add 1.0 ml of hydrochloric acid (0.1 mol/L) VS and 4 drops of phenolphthalein IS, the solution is colourless.

Clarity and colour of solution Dissolve 1.0 g in 10 ml of water, the solution is clear and colourless. Any opalescence produced is not more pronounced than that of reference

suspension 2 (Appendix IX B). Any colour produced is not more intense than that of reference solution Y_1 (Appendix IX A, method 1).

Free glycerol and ethanol-soluble substances To 1.0 g add 25 ml of dehydrated ethanol, stir for 10 minutes and filter. Wash the residue with 5 ml ethanol, evaporate the combined filtrate and washings on a water bath to dryness and dry for 1 hour, the weight of residue is not more than 10 mg.

Chloride Dissolve 0.25 g in 15 ml of water, carry out the limit test for chloride (Appendix VIII A). Any opalescence produced is not more pronounced than that of a reference using 5.0 ml of sodium chloride standard solution (0.02%).

Sulfate Dissolve 0.60 g in 15 ml of water. Carry out the limit test for sulphate (Appendix VIII B). Any opalescence produced is not more pronounced than that of a reference using 3.0 ml of potassium sulfate standard solution (0.5%).

Free Phosphate Dissolve 0.10 g in 10 ml of water. Dilute 1.0 ml with water to 100 ml, add 4 ml of ammonium molybdate solution (to 2.5 g of ammonium molybdate, add 20 ml of water, heat to dissolve; to 28 ml of sulfuric acid dilute with 50 ml of water, cool; combine two solutions and dilute with water to 100 ml), mix well, add 0.1 ml of stannous chloride solution (dissolve 3.3 g of stannous chloride in 1 ml of hydrochloric acid, dilute with water to 10 ml, measure 1 ml, add 9 ml of 2 mol/L hydrochloric acid solution), mix well, allow to stand 10 minutes. Any colour produced is not more intense than that of 2.0 ml of phosphate standard solution (dissolve potassium dihydrogen phosphate 0.716 g in water and dilute with water to 1000 ml, measure 1.00 ml dilute with water to 100 ml), add 98 ml of water, proceed in the same manner (0.1%).

Loss on drying When dried to constant weight at 105°C, loses 29.0%-33.5% of its weight (Appendix VIII L).

Iron Dissolve 0.50 g in 10 ml of water. Carry out the limit test for iron (Appendix VIII G). Any colour produced is not more intense than that of a reference using 2.0 ml of iron standard solution (0.004%).

Heavy metals Dissolve 1.0 g in 23 ml of water, add 2 ml of acetate BS (pH 3.5). Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.002%.

Arsenic Dissolve 0.40 g in 25 ml of water. Carry out the limit test for arsenic (Appendix VIII J); not more than 0.0005%.

Assay Dissolve 0.20 g, accurately weighed, in 30 ml of water, carry out the method for potentiometric titration (Appendix VII A), titrate with sulfuric acid (0.05 mol/L) VS. Each ml of sulfuric acid (0.05 mol/L) VS is equivalent to 21.6 mg of $C_3H_7Na_2O_6P$.

Category Phosphorus replenisher.

Storage Preserve in tightly closed containers.

Sodium Glycerophosphate Injection

Sodium Glycerophosphate Injection is a sterile solution of Sodium Glycerophosphate in Water for Injection. It contains 28.80-33.14 mg of phosphorus (P) per ml and 43.68-48.28 mg of sodium (Na) per ml.

Description A clear, colourless or almost colourless liquid.

Identification (1) Measure 1 ml, add 10 ml of water, 10 ml of diluted nitric acid solution and 5 ml of ammonium molybdate TS, heat for a moment and cool, a yellow precipitate is produced which dissolves in ammonia TS.

(2) Heat a mixture of about 5 ml and a quantity of potassium hydrogen sulfate in a test tube, pungent vapours of acrolein are evolved.

(3) Carry out the method as described under Assay of sodium, the absorption exhibits a maximum at 589 nm.

pH value 7.2-7.6 (Appendix VI H).

Free phosphate *Reference solution* Carry out the method as described under Assay of phosphorus.

Procedure Dilute 1.0 ml to 30 ml with water and mix well as the test solution. Carry out the method as described under Assay of phosphorus, beginning at the words "Measure accurately 5 ml of the reference solution and the test solution". The absorption of the test solution is not greater than that of the reference solution (<0.03 mmol/L).

Bacterial endotoxin Dilute the content of a quantity with water-BET to 40 times of its original volume. Carry out the test for bacterial endotoxin (Appendix XI E): less than 0.4 EU per ml of diluted solution.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay *Sodium* Measure accurately 2 ml in a 200 ml volumetric flask, dilute to volume with water and mix well. Measure accurately 10 ml of the resulting solution in a 50 ml volumetric flask, dilute to volume with water and mix well. Measure accurately 2 ml to a 100 ml volumetric flask, add 4.0 ml of cesium chloride solution (Dissolve 63.34 g of cesium chloride in water and dilute to 1000 ml.), dilute to volume with water and mix well as the test solution. Weigh 1.2711 g of sodium chloride previously dried to constant weight at 130°C in a 500 ml volumetric flask. Dissolve in water, dilute to volume to produce a solution of 1 mg (Na) per ml and mix well. Measure accurately 10 ml to a 50 ml volumetric flask, dilute to volume with water. Transfer 0.00 ml, 0.05 ml, 1.00 ml, 1.50 ml of the resulting solution, add 4.0 ml of cesium chloride solution, to 100 ml volumetric flasks, respectively. Dilute to volume with water and mix well as the reference solution. Carry out the method for atomic absorption spectrophotometry (Appendix IV D, method 1), measure the absorbance of the solutions at 589 nm. Calculate the content of Na.

Phosphorus Measure accurately 5 ml in a 50 ml volumetric flask, dilute to volume with water and mix well. Measure accurately 1 ml of the resulting solution in a crucible and add 1 g of zinc oxide. Heat gently until it is charred, ignite at 600°C for 1 hour and cool to room-temperature. Add 5 ml of water and 5 ml of hydrochloric acid, heat to dissolve the residue. Transfer the resulting solution to a 100 ml volumetric flask, dilute to volume with water and mix well as the test solution. Weigh 136.09 mg of potassium dihydrogen phosphate previously dried to constant weight at 105°C in a 100 ml volumetric flask, dilute to volume with water and mix well. Measure accurately 10 ml to a 100 ml volumetric flask, dilute to volume with water and mix well as the reference solution. Measure accurately 5 ml of the reference solution and the test solution, to 25 ml volumetric flasks, respectively add 1 ml of ammonium molybdate solution [Weigh 5 g of ammonium molybdate, dissolve with 5% (g/ml) sulfuric acid solution and dilute to 100 ml.] and 1 ml of freshly prepared 0.5% hydroquinone solution [Weigh 0.5 g of hydroquinone, dissolve with 0.25% (g/ml) sulfuric acid solution and dilute to 100 ml, freshly prepared before use.] and 3 ml of 50% sodium acetate solution, dilute to volume with water and mix well. Measure the

absorbance at 720 nm (Appendix IV A). Calculate the content of P.

Category Phosphorus replenisher.

Strength 10 ml : 2.16 g

Storage Preserve in tightly closed containers, stored at a temperature below 25°C and not frosted.

Sodium Hydroxybutyrate

$C_4H_7NaO_3$ 126.09

Sodium Hydroxybutyrate is the sodium salt of 4-hydroxybutyric acid. It contains not less than 99.0% of $C_4H_7NaO_3$, calculated on the dried basis.

Description A white crystalline powder; odour, faint; taste, salty; hygroscopic.

Very soluble in water; soluble in ethanol; insoluble in ether or chloroform.

Identification (1) Dissolve 0.1 g in 1 ml of water, add 3-5 drops of ferric chloride TS; a red colour is produced.

(2) Dissolve 0.1 g in 1 ml of water, add 1 ml of ammonium ceric nitrate TS, an orange-red colour is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of sodium hydroxybutyrate (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of sodium salts (Appendix III).

Alkalinity Dissolve 2.0 g in 10 ml of water, pH 7.5-9.0 (Appendix VI H).

Clarity and colour of solution A solution of 2.0 g in 10 ml of water is clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 2 (Appendix IX B); any colour produced is not more intense than that of reference solution Y_2 (Appendix IX A, method 1).

Chloride Carry out the limit test for chlorides (Appendix VIII A), using 0.50 g. Any opalescence produced is not more pronounced than that of a reference solution using 7.0 ml of sodium chloride standard solution (0.014%).

Sulfate Carry out the limit test for sulfates (Appendix VIII B), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of potassium sulfate standard solution (0.020%).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.5% of its weight (Appendix VIII L).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 3), using 0.50 g, not more than 0.002%.

Assay Dissolve about 0.1 g, accurately weighed, in 10 ml of glacial acetic acid, add 2 ml of acetic anhydride and 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS, until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 12.61 mg of $C_4H_7NaO_3$.

Category General anesthetic by intravenous injection.

Storage Preserve in tightly closed containers, protected from

light.

Preparation Sodium Hydroxybutyrate Injection.

Sodium Hydroxybutyrate Injection

Sodium Hydroxybutyrate Injection is a sterile solution of Sodium Hydroxybutyrate in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of sodium hydroxybutyrate ($\text{C}_4\text{H}_7\text{NaO}_3$).

Description A clear, colourless or almost colourless liquid.

Identification Complies with the test (1), (2) and (4) for Identification described under Sodium Hydroxybutyrate.

pH value 7.5-9.0 (Appendix IV H).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); not more than 0.017 EU per mg of sodium hydroxybutyrate.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately 5 ml to a 50 ml volumetric flask, dilute with water to volume and mix well. Evaporate 5 ml, measured accurately, to dryness on a water bath and dry it at 105°C. Carry out the Assay described under Sodium Hydroxybutyrate beginning at the words "in 10 ml of glacial acetic acid..." Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 12.61 mg of $\text{C}_4\text{H}_7\text{NaO}_3$.

Category As described under Sodium Hydroxybutyrate.

Strength 10 ml : 2.5 g

Storage Preserve in well closed containers, protected from light.

Sodium Iodide

NaI 149.89 [7681-82-5]

Sodium Iodide contains not less than 99.0% of NaI, calculated on the dried basis.

Description Colourless crystals, or a white crystalline powder; odourless; taste, saline and slightly bitter; hygroscopic; easily changes to brown colour in damp atmosphere. Very soluble in water; soluble in ethanol.

Identification Yields the reactions characteristic of sodium salts and iodides (Appendix III).

Alkalinity Dissolve 1.0 g in 10 ml of water, add 1 drop of phenolphthalein IS and 0.10 ml of sulfuric acid (0.05 mol/L) VS, no red colour is produced.

Clarity and colour of solution A solution of 1.0 g in 10 ml of water is clear and colourless; any colour produced is not more intense than that of reference solution Y_1 (Appendix IX A, method 1).

Chloride Dissolve 0.25 g in 100 ml of water, add 1 ml of concentrated hydrogen peroxide solution and 1 ml of phosphoric acid, boil until the solution becomes colourless and cool. Add again 0.5 ml of concentrated hydrogen peroxide solution, boil and then cool. Transfer it to a 250 ml volumetric flask, dilute with water to volume and mix well. Carry out the limit test for chlorides, (Appendix VIII A), using 5.0 ml of the solution. Any opalescence produced

is not more pronounced than that of a reference solution using 2.5 ml of sodium chloride standard solution (0.5%).

Sulfate Carry out the limit test for sulfates (Appendix VIII B) using 0.50 g. Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of potassium sulfate standard solution (0.04%).

Iodate Dissolve 0.50 g in 10 ml of freshly boiled and cooled water, add 2 drops of dilute sulfuric acid and 0.2 ml of starch IS, allow to stand in the dark, no blue colour is produced within 2 minutes.

Loss on drying When dried at 105°C for 4 hours, loses not more than 3.0% of its weight (Appendix VIII L).

Potassium Dissolve 1.0 g in a quantity of water in a 100 ml volumetric flask, dilute with water to volume and mix well. Measure accurately 4.0 ml of the solution, add 1.0 ml of dilute acetic acid and mix well. Add 5.0 ml of sodium tetraphenylborate solution (1→30), shake immediately and allow to stand for 10 minutes. Any opalescence produced is not more pronounced than that of a reference solution prepared in a similar manner using 4.0 ml of potassium chloride standard solution (dissolve 9.5 mg of potassium chloride in a quantity of water and dilute with water to 1000 ml) (0.05%).

Barium Dissolve 1.0 g in 20 ml of water, filter, divide the filtrate into two equal portions. Add 1 ml of dilute sulfuric acid to one portion and add 1 ml of water to the other portion. The two portions should be similar in clarity within 15 minutes.

Heavy metals Dissolve 2.0 g in 23 ml of water, add 2 ml of acetate BS (pH 3.5) carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Assay Dissolve about 0.3 g, accurately weighed, in 10 ml of water, add 35 ml of hydrochloric acid. Titrate with potassium iodate (0.05 mol/L) VS until a yellow colour is produced; add 5 ml of chloroform, continue the titration and shake thoroughly until the colour disappears in the chloroform layer. Each ml of potassium iodate (0.05 mol/L) VS is equivalent to 14.99 mg of NaI.

Category Iodine replenisher.

Storage Preserve in tightly closed containers, protected from light.

Sodium Iodide [^{131}I] Capsules

Sodium Iodide [^{131}I] Capsules are capsules containing Sodium Iodide [^{131}I]. Iodine [^{131}I] is prepared by neutron irradiation in the chemical form of sodium iodide which may contain trace amount of natural iodine.

It contains not less than 90.0% and not more than 110.0% of the labelled amount of radioactive concentration of Iodine-131 at the date and hour stated on the label.

Suitable amount of stabilizer may be added to the preparation.

Identification Dissolve the suitable content in water. It is used for the following tests.

(1) Carry out the γ -spectrum method (Appendix XIII) with suitable amount of the solution, the prominent photon has an energy of 0.365 MeV.

(2) The principal spot obtained in the determination of

Radiochemical purity has a prominent peak with R_f value of about 0.8.

Content uniformity Take 20 capsules at random. measure the radioactive count of each capsule with a suitable instrument under the same geometric conditions for the measurement and calculate the average radioactivity. Compare the radioactivity count of each capsule with the average value, not less than the values of 19 capsules are found to within the range of 96.5%-103.5% of the average value.

Disintegration Take 6 capsules at random, carry out the test for disintegration (Appendix X A, for capsules).

Radiochemical purity Carry out the determination of radiochemical purity (Appendix XIII, method 1), using 75% methanol as the mobile phase. Not less than 95% of the total radioactivity is found in the spot corresponding to Sodium Iodide [^{131}I].

Radioactivity Comply with the requirements for radioactivity (Appendix XIII, Measurement of radioactivity concentration).

Category Diagnostic.

Strength 333 kBq

Storage Preserve in tightly closed lead containers. The intensity of radiation on the surface of the container complies with relevant regulation.

Sodium Iodide [^{131}I] Oral Solution

Sodium Iodide [^{131}I] Oral Solution is an aqueous solution of Sodium Iodide [^{131}I]. It contains not less than 90.0% and not more than 110.0% of the labelled amount of radioactive concentration of Iodine-131 at the date and hour stated on the label. Sodium sulfite is added as a stabilizer.

Description A clear, colourless liquid.

Identification (1) Carry out the γ -ray spectrum method (Appendix XIII) using suitable amount of sample, the prominent photon has an energy of 0.365 MeV. (2) The principal spot obtained in the determination of radiochemical purity has a prominent radioactive peak with R_f value of about 0.8.

pH value 7.0-9.0 (Appendix VI H).

Radiochemical purity Carry out the determination of radiochemical purity (Appendix XIII, method 1), using 75% methanol as the mobile phase. Not less than 95% of the total radioactivity is found in the spot corresponding to Sodium Iodide [^{131}I].

Radioactive concentration Not less than 185 MBq per ml (Appendix XIII).

Category Radiopharmaceutical.

Strength (1) 925 MBq (2) 1850 MBq
(3) 3700 MBq (4) 7400 MBq

Storage Preserve in tightly closed lead containers. The intensity of radiation on the surface of the container complies with relevant regulation.

Sodium Iodohippurate [^{131}I] Injection

Sodium Iodohippurate [^{131}I] Injection is a sterile solution of Sodium Iodohippurate [^{131}I]. It

contains not less than 90.0% and not more than 110.0% of the labelled amount of radioactive concentration of Iodine-131 at the date and hour stated on the label.

Description A clear, pale brown liquid.

Identification (1) Carry out the γ -ray spectrum method (Appendix XIII), the prominent photon has an energy of 0.36 MeV.

(2) The principal spot obtained in the determination of Radiochemical purity has a prominent radioactive peak with R_f value of about 0.5.

pH value 5.0-6.0 (method of exchange) or 6.0-8.5 (method of melting) (Appendix VI H).

Bacterial endotoxin Dilute the content of 1 vial with water-BET to 10 times of its original volume. Carry out the test for bacterial endotoxin (Appendix XI E); less than 15 EU per ml.

Sterility Complies with the test for sterility (Appendix XI H).

Radiochemical purity Carry out the determination of radiochemical purity (Appendix XIII, method 1), using a mixture of benzene-glacial acetic acid-water (4 : 4 : 1) as the mobile phase. Not less than 95% of the radiochemical purity is found in the spot corresponding to Sodium Iodohippurate [^{131}I], not more than 2% of the total radioactivity is found in the spot corresponding to Iodohippuric acid [^{131}I] (R_f value 0.9-1.0).

Radioactive concentration Not less than 37 MBq per ml (Appendix XIII).

Category Diagnostic.

Strength (1) 37 MBq (2) 111 MBq
(3) 185 MBq (4) 370 MBq

Storage Preserve in well closed lead containers. The intensity of radiation on the surface of the container complies with relevant regulation.

Sodium Lactate Injection

Sodium Lactate Injection is a sterile solution of Sodium Lactate in Water for Injection. It contains not less than 95.0% and not more than 110.0% of the labelled amount of sodium lactate ($\text{C}_3\text{H}_5\text{NaO}_3$).

Description A clear, colourless liquid.

Identification Yield the reactions characteristic of sodium salts and lactates (Appendix III).

pH value 6.0-7.5 (Appendix VI H).

Pyrogens Dilute with sterile water for injection to produce a solution containing 25 mg of $\text{C}_3\text{H}_5\text{NaO}_3$ per ml. Complies with the test for pyrogens (Appendix XI D), using 10 ml per kg of the rabbit's weight.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately 1 ml to a conical flask, dry at 105°C for 1 hour. Carry out the Assay described under Sodium Lactate Solution, beginning at the words "Add 15 ml of glacial acetic acid and...". Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 11.21 mg of $\text{C}_3\text{H}_5\text{NaO}_3$.

Category As described under Sodium Lactate Solution.

Strength (1) 20 ml : 2.24 g (2) 50 ml : 5.60 g

Storage Preserve in well closed containers, protected from light.

Sodium Lactate Solution

Sodium Lactate Solution contains not less than 40.0% (g/g) of Sodium Lactate ($C_3H_5NaO_3$).

Description A clear, colourless or almost colourless, viscous liquid.

Miscible with water, ethanol or glycerol.

Identification Yields the reactions characteristic of sodium salts and lactates (Appendix III).

Acidity or alkalinity Prepare a solution of 0.112 g per ml in water, heat for 30 minutes in a water bath, allow to cool. pH 6.5-7.5 (Appendix VI H).

Chloride Carry out the limit test for chlorides (Appendix VII A), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.005%).

Sulfate Carry out the limit test for sulfates (Appendix VII B), using 2.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of potassium sulfate standard solution (0.010%).

Citrate, oxalate, phosphate or tartrate To 1.0 g add a quantity of water to produce 5 ml, mix well, add 1 ml calcium chloride TS, heat for 5 minutes in a water bath, no opalescence is produced.

Reducing sugar Mix 0.5 g with 10 ml of water, add 6 ml of alkaline cupric tartrate TS and boil for 2 minutes, no red precipitate is produced.

Heavy metals Transfer 2.0 g to a quartz crucible (or platinum crucible). Carry out the limit test for heavy metals (Appendix VIII H, method 2); not more than 0.001%.

Arsenic To 1.0 g add 5 ml of hydrochloric acid and 23 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Assay To about 0.2 g, accurately weighed, in a conical flask, dried for an hour at 105°C, add 15 ml of glacial acetic acid and 2 ml of acetic anhydride and heat to dissolve it. Allow the solution to cool, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 11.21 mg of $C_3H_5NaO_3$.

Category Alkaline sodium salt.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Sodium Lactate Injection
(2) Sodium Lactate Ringer's Injection

Sodium Lactate Ringer's Injection

Sodium Lactate Ringer's Injection is a sterile mixture of Sodium Lactate, Sodium Chloride, Potassium Chloride and Calcium Chloride in Water for Injection. It contains not less than 93.0% and not more than 107.0% of the labelled amount of

Sodium Lactate ($C_3H_5NaO_3$). It contains not less than 95.0% and not more than 105.0% of the labelled amount of Sodium Chloride (NaCl), Potassium Chloride (KCl) and Calcium Chloride ($CaCl_2 \cdot 2H_2O$) separately.

Formula	Sodium Lactate	3.10 g
	Sodium Chloride	6.00 g
	Potassium Chloride	0.30 g
	Calcium Chloride ($CaCl_2 \cdot 2H_2O$)	0.20 g
	Water for Injection	a sufficient quantity
	To make	1000 ml

Description A clear, colourless liquid.

Identification Yields the reactions characteristic of sodium salt, potassium salt, calcium salt (2), lactate and chloride (Appendix III).

pH value 6.0-7.5 (Appendix VI H).

Heavy metals Evaporate 100 ml of the injection on a water bath to about 20 ml, cool, add 2 ml of acetate BS (pH 3.5) and a quantity of water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.00003%.

Arsenic To 25 ml of the injection add 5 ml of hydrochloric acid, carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.000008%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.5 EU per ml.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Potassium chloride Reference Solution Dissolve a quantity of potassium chloride dried at 130°C for 2 hours, accurately weighed, in water to produce a solution of 15 µg of potassium chloride per ml.

Test solution Measure accurately 10 ml of the injection to a 100 ml volumetric flask, dilute with water to volume, mix well; measure accurately 10 ml of the solution to a 100 ml volumetric flask, dilute with water to volume, mix well.

Procedure Measure accurately 15.0 ml, 20.0 ml and 25.0 ml of the reference solution to three 100 ml volumetric flasks, add respectively to each flask 1.0 ml, accurately measured, of the following solution [dissolve 0.31 g of sodium lactate, 0.60 g of sodium chloride, 0.02 g of calcium chloride ($CaCl_2 \cdot 2H_2O$) in water and dilute to 100 ml], dilute with water to volume, mix well. Carry out the method of atomic absorbance spectrophotometry (Appendix IV D Assay procedure, method 1), measure the absorbance of the resulting solutions and test solution at 767 nm. Calculate the content of KCl.

Sodium chloride Reference solution Dissolve a quantity of sodium chloride dried at 110°C for 2 hours, accurately weighed, in water to produce a solution of 20 µg per ml.

Test solution Measure accurately 2 ml of the injection to a 100 ml volumetric flask, dilute to volume with water, mix well. Measure accurately 2 ml into another 100 ml volumetric flask, dilute to volume with water.

Procedure Measure accurately 10.0 ml, 15.0 ml and 20.0 ml of the reference solution to three 100 ml volumetric flasks, dilute to volume with water, mix well. Carry out the method of atomic absorbance spectrophotometry (Appendix IV D Assay procedure, method 1), measure the absorbance of the resulting solutions and the test solution at 589 nm. Calculate the content of NaCl as follows:

$$NaCl\% = (W - 1.6165 \times \text{the labelled amount of})$$

sodium lactate) $\div 6 \times 100\%$

Where W is the total content of sodium chloride tested in 1 ml of the injection (mg).

Calcium chloride Reference solution Dissolve about 0.3125 g of calcium carbonate dried at 110°C for 2 hours, accurately weighed, in a 500 ml volumetric flask with 25 ml of 1 mol/L of hydrochloric acid, and dilute with water to volume.

Lanthanum solution Dissolve 6.6 g of Lanthanum Oxide in 10 ml of hydrochloric acid, dilute to 100 ml with water.

Test solution Measure accurately 10 ml of the injection to a 50 ml volumetric flask, add 2 ml of lanthanum solution, dilute to volume with water.

Procedure Measure accurately 1 ml, 2 ml and 3 ml of the reference solution to three 50 ml volumetric flasks, add respectively to each flask 10 ml, accurately measured, of the following solution [dissolve 0.31 g of sodium lactate, 0.60 g of sodium chloride, 0.03 g of potassium chloride in water and dilute to 100 ml], and 2 ml of lanthanum solution, dilute to volume with water, mix well. Carry out the method of atomic absorbance spectrophotometry (Appendix IV D Assay procedure, method 1), measure the absorbance of the resulting solutions and the test solution at 422.7 nm. Calculate the content of $\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$.

Sodium lactate Measure accurately 10 ml of the injection to a conical flask with stopper, add accurately measured 25 ml of potassium dichromate (0.01667 mol/L) VS and 15 ml of sulfuric acid solution (1 \rightarrow 2), heat for about 20 minutes on a water bath. Cool, add 2.5 g of potassium iodide, cover the stopper, allow to stand in dark place for 10 minutes. Add 10 ml of water, titrate with sodium thiosulfate (0.1 mol/L) VS towards the end of titration. Add 1 ml of starch IS, continue to titrate until blue colour disappears and a bright green colour is produced. Perform a blank determination and make any necessary correction. Each ml of potassium dichromate (0.01667 mol/L) VS is equivalent to 2.802 mg of $\text{C}_3\text{H}_5\text{NaO}_3$.

Category Body fluid, electrolyte, regulator of acid-base balance.

Strength 500 ml

Storage Preserve in well closed containers.

Compound Sodium Lactate and Glucose Injection

Compound Sodium Lactate and Glucose Injection is a sterile mixture of Sodium Lactate ($\text{C}_3\text{H}_5\text{NaO}_3$), Sodium Chloride (NaCl), Potassium Chloride (KCl), Calcium Chloride ($\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$) and Anhydrous Glucose ($\text{C}_6\text{H}_{12}\text{O}_6$) in Water for Injection. It contains not less than 93.0% and not more than 107.0% of the labelled amount of sodium lactate; not less than 95.0% and not more than 110.0% of the labelled amount of sodium chloride, potassium chloride, calcium chloride and anhydrous glucose respectively.

Formula	Sodium Lactate	3.10 g
	Sodium Chloride	6.00 g
	Potassium Chloride	0.30 g
	Calcium Chloride ($\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$)	0.20 g
	Anhydrous Glucose	50.0 g

Water for Injection

a sufficient quantity

To make

1000 ml

Description A clear, colourless to pale yellow liquid.

Identification (1) Add 5 ml of the injection dropwise to hot alkaline cupric tartrate TS; a red precipitate of cuprous oxide is produced.

(2) Yields the reactions characteristic of sodium salt, potassium salt, calcium salt, lactates and chlorides (Appendix III).

pH value 3.6-6.5 (Appendix VI H).

Heavy metals Evaporate 100 ml of the injection on a water bath to dryness, heat gently until it is thoroughly charred, cool, add 2 ml of nitric acid and 5 drops of sulfuric acid. Heat gently until fumes are no longer evolved, ignite at $500-600^\circ\text{C}$ until the incineration is complete. Allow to cool, add 2 ml of hydrochloric acid, heat on a water bath for 2 minutes, add 1 drop of phenolphthalein IS and a quantity of ammonia TS until the solution becomes pale red, filter. To the filtrate add 2 ml of acetate BS (pH 3.5) and a quantity of water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VII H, method 2): not more than 0.00002%.

Arsenic Evaporate 40 ml of the injection on a water bath to about 5 ml, add 5 ml of diluted sulfuric acid and 1 ml of bromine TS, and then evaporate to about 5 ml, cool, add 5 ml of hydrochloric acid and 18 ml of water, carry out the limit test for arsenic (Appendix VIII J, method 2): not more than 0.000005%.

Pyrogens Complies with the test for pyrogens (Appendix XI D), inject slowly 10 ml per kg of the rabbit's weight.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Potassium chloride Reference solution Weigh accurately a quantity of potassium chloride dried at 130°C for 2 hours, dissolve it in water to produce a solution of 15 μg of potassium chloride per ml.

Test solution Measure accurately 10 ml of the injection to a 100 ml volumetric flask, dilute with water to volume, mix well; measure accurately 10 ml of the solution to a 100 ml volumetric flask, dilute with water to volume, mix well.

Procedure Measure accurately 15.0 ml, 20.0 ml and 25.0 ml of the reference solution to three 100 ml volumetric flasks separately, add to each volumetric flask 1.0 ml, accurately measured, of the following solution [dissolve 0.31 g of sodium lactate, 0.60 g of sodium chloride, 0.02 g of calcium chloride ($\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$) and 5.00 g of anhydrous glucose with water in a 100 ml volumetric flask, and dilute to volume] dilute to volume with water, mix well. Carry out the method of atomic absorption spectrophotometry (Appendix IV D Assay procedure, method 1), measure the absorbance of the resulting solution at 767 nm. Calculate the content of KCl.

Sodium chloride Reference solution Dissolve a quantity of sodium chloride dried at 110°C for 2 hours, accurately weighed, in water to produce a solution of 20 μg per ml.

Test solution Measure accurately 2 ml of the injection to a 100 ml volumetric flask, dilute to volume with water, mix well. Measure accurately 2 ml into a 100 ml volumetric flask, dilute to volume with water.

Procedure Measure accurately 10 ml, 15 ml and 20 ml of the reference solution to three 100 ml volumetric flasks, dilute to volume with water, mix well. Carry out the method of atomic absorbance spectrophotometry (Appendix

IV D Assay procedure, method 1), measure the absorbance of the resulting solutions and the test solution at 589 nm. Calculate the content of NaCl as follows:

$$\text{NaCl}\% = (\text{W} - 1.6165 \times \text{the labelled amount of sodium lactate}) \div 6 \times 100\%$$

Where W is the total content of sodium chloride tested in 1 ml of the injection (mg).

Calcium chloride Reference solution Dissolve a quantity of calcium carbonate dried at 110°C for 2 hours, accurately weighed, in water to produce a solution of 250 µg per ml.

Lanthanum solution Dissolve 6.6 g of Lanthanum Oxide in 10 ml of hydrochloric acid, dilute to 100 ml with water.

Test solution Measure accurately 10 ml of the injection to a 50 ml volumetric flask, add 2 ml of lanthanum solution, dilute to volume with water.

Procedure Measure accurately 1 ml, 2 ml and 3 ml of the reference solution to three 50 ml volumetric flasks, add respectively to each flask 10 ml, accurately measured, of the following solution [dissolve 0.31 g of sodium lactate, 0.60 g of sodium chloride, 0.03 g of potassium chloride in water and dilute to 100 ml], and 2 ml of lanthanum solution, dilute to volume with water, mix well. Carry out the method of atomic absorbance spectrophotometry (Appendix IV D Assay procedure, method 1), measure the absorbance of the resulting solutions and the test solution at 422.7 nm. Calculate the content of $\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$.

Sodium lactate Measure accurately 10 ml of the injection to a conical flask with stopper, add accurately measured 25 ml of potassium dichromate (0.01667 mol/L) VS and 15 ml of sulfuric acid solution (1→2), heat about 20 minutes on a water bath. Cool, add 2.5 g of potassium iodide, cover the stopper, allow to stand in dark place for 10 minutes. Add 10 ml of water, titrate with sodium thiosulfate (0.1 mol/L) VS towards the end of titration. Add 1 ml of starch IS, continue to titrate until blue colour disappears and a bright green colour is produced. Perform a blank determination and make any necessary correction. Each ml of potassium dichromate (0.01667 mol/L) VS is equivalent to 2.802 mg $\text{C}_3\text{H}_5\text{NaO}_3$.

Anhydrous glucose Carry out the determination of optical rotation (Appendix VI E). The observed rotation in degree multiplied by 1.8958 represents the weight (g) of $\text{C}_6\text{H}_{12}\text{O}_6$.

Category Antacid.

Strength 500 ml

Storage Preserve in well closed containers.

Sodium Morrhuate Injection

Sodium Morrhuate Injection is a sterile solution of the sodium salts of the fatty acids of Cod Liver Oil in Water for Injection. It contains not less than 93.0% and not more than 107.0% of the labelled amount of Sodium Morrhuate.

A suitable quantity of benzyl alcohol may be added.

Description A clear, yellow to brownish-yellow liquid; deteriorated on exposure to light.

Identification (1) Evaporate 5 ml of chloroform solution obtained in the test for Iodine value to 1 ml on a water bath, add 1 drop of sulfuric acid, a transient red colour is produced, and changing rapidly to brownish red.
(2) Yields the flame reactions of sodium salts (Appendix III).

Acidity or alkalinity To 5.0 ml add 5 ml of ethanol (neutral to phenolphthalein IS) and 2 drops of phenolphthalein IS. If the solution is colourless, add 0.5 ml of sodium hydroxide (0.1 mol/L) VS, a pale red colour is produced; If the colour of the solution is red, add 0.3 ml of hydrochloric acid (0.1 mol/L) VS, the colour disappears.

Iodine value Evaporate the petroleum ether extract obtained in the Assay to dryness at 60°C, dry the residue in vacuum over phosphorus pentoxide for 12 hours and weigh it accurately. Dissolve the residue in chloroform to produce a solution of 100 ml. Measure accurately 25 ml of the solution and determine the iodine value (Appendix VII H); the iodine value is not less than 130.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity of the injection equivalent to about 0.5 g of Sodium Morrhuate to a separator. Add 25 ml of petroleum ether. And add 25 ml of sulfuric acid (0.05 mol/L) VS, accurately measured, shake gently, and allow to separate. Withdraw the acid layer and wash the petroleum ether layer with two 10 ml portions of water, combine the washings and the acid solution. Add 1 drop of methyl orange TS, and titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sulfuric acid (0.05 mol/L) VS is equivalent to 32.40 mg of Sodium Morrhuate.

Category Sclerosing agent, hemostatic.

Strength (1) 1 ml : 0.05 g (2) 2 ml : 0.1 g
(3) 5 ml : 0.25 g (4) 10 ml : 0.5 g

Storage Preserve in well closed containers, protected from light.

Sodium Nitrite

NaNO_2 69.00

[7632-00-0]

Sodium nitrite contains not less than 99.0% of NaNO_2 , calculated on the dried basis.

Description Colourless or white to pale yellow crystals; odourless; taste, slightly saline; hygroscopic. The aqueous solution exhibits alkaline reaction. Freely soluble in water; slightly soluble in ethanol.

Identification (1) Acidify 1 ml of aqueous solution (0.3→10) with acetic acid, add a few drops of freshly prepared ferrous sulfate TS, a brown colour is produced.
(2) Heat a quantity of the above solution with dilute mineral acid, a reddish-brown fume is evolved.
(3) The aqueous solution yields the reactions characteristic of sodium salts (Appendix III).

Chloride Carry out the limit test for chlorides (Appendix VIII A), using 0.30 g. Any opalescence produced is not more pronounced than that of a reference solution using 6.0 ml of sodium chloride standard solution (0.02%).

Sulfate Carry out the limit test for sulfates (Appendix VIII B), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 3.0 ml of potassium sulfate standard solution (0.03%).

Loss on drying When dried over sulfuric acid to constant weight, loses not more than 1.0% of its weight (Appendix VIII L).

Heavy metals Dissolve 2.0 g in 6 ml of dilute hydrochloric acid, evaporate to dryness on a water bath with constant

stirring to make the residue a coarse powder. Add 5 ml of water, evaporate to dryness, then add 23 ml of water and 2 ml of acetate BS (pH 3.5). Carry out the limit test for heavy metals (Appendix VIII H, method 1): not more than 0.001%.

Arsenic Dissolve 1.0 g in 0.4 ml of sulfuric acid and 1 ml of water, evaporate to dryness, heat until white fumes are evolved, cool, add 5 ml of hydrochloric acid and 23 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1), complies with the requirement (0.0002%).

Assay Dissolve about 1 g, accurately weighed, in water in a 100 ml volumetric flask, dilute to volume and mix well. Add slowly with swirling 10 ml of the solution, accurately measured, to a conical flask containing 50.0 ml of potassium permanganate (0.02 mol/L) VS, 100 ml of water and 5 ml of sulfuric acid, keep the tip of the pipet below the surface during the addition. Stopper the flask tightly, allow to stand for 10 minutes, add 3 g of potassium iodide, stopper the flask tightly again, shake gently and allow to stand for 10 minutes. Titrate with sodium thiosulfate (0.1 mol/L) VS, adding 2 ml of starch IS towards the end of the titration and continue the titration until the blue colour disappears. Perform a blank determination and make any necessary correction. Each ml of potassium permanganate (0.02 mol/L) VS is equivalent to 3.45 mg of NaNO_2 .

Category Antidote.

Storage Preserve in tightly closed containers.

Sodium Nitroprusside

$\text{Na}_2\text{Fe}(\text{CN})_5\text{NO} \cdot 2\text{H}_2\text{O}$ 297.95 [13755-38-9]

Sodium Nitroprusside is disodium pentacyanonitrosyl ferrate (2-) dihydrate. It contains not less than 99.0% of $\text{Na}_2\text{Fe}(\text{CN})_5\text{NO}$, calculated on the dried basis.

Description Reddish-brown crystals or a powder; odourless or almost odourless. Freely soluble in water; slightly soluble in ethanol.

Identification (1) Dissolve about 50 mg in 10 ml of 2% ascorbic acid solution, add 1 ml of dilute hydrochloric acid and mix well. Add dropwise 1 ml of sodium hydroxide TS; a blue colour is produced, which disappears gradually on standing.

(2) The light absorption of a solution of 10 mg per ml in water exhibits a maximum at 394 nm (Appendix IV A).

(3) Yields the reactions characteristic of sodium salts (Appendix III).

Chloride Dissolve 1.0 g in 90 ml of water, add 10 ml of cupric sulfate TS, mix well, allow to stand for 10 minutes and then centrifuge. Carry out the limit test for chlorides (Appendix VIII A), using 25 ml of the supernatant liquid. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution and treated by adding cupric sulfate TS dropwise until the colour matches that of the test solution (0.02%).

Ferricyanide Dissolve 0.5 g in 10 ml of water, add 1 ml of ferrous sulfate TS; a reddish-brown precipitate is produced, showing no greyish-green colour.

Ferrocyanide Dissolve 1.0 g in 20 ml of water, divide the solution into two equal portions A and B. To portion B add 0.05 ml of ferric chloride TS and mix well. Compare it with portion A; no greyish-green colour is produced.

Water-insoluble substances Dissolve 10.0 g in 50 ml of water, heat on a water bath for 30 minutes, filter with a sintered glass crucible previously dried to constant weight at 105°C and wash with water until the filtrate is colourless. The residue, when dried to constant weight at 105°C, weighs not more than 1 mg.

Loss on drying When dried to constant weight at 120°C, loses not less than 11.6% and not more than 12.6% of its weight (Appendix VIII L).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E): less than 8.3 EU per mg of Sodium Nitroprusside.

Assay Dissolve 0.12 g, accurately weighed, in 50 ml of water, carry out the method for potentiometric titration (Appendix VII A), using saturated calomel electrode with potassium nitrate salt bridge as the reference electrode, and silver electrode as the indicator electrode, titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 13.10 mg of $\text{Na}_2\text{Fe}(\text{CN})_5\text{NO}$.

Category Vasodilator.

Storage Preserve in tightly closed containers, protected from light.

Preparation Sodium Nitroprusside for Injection

Sodium Nitroprusside for Injection

Sodium Nitroprusside for Injection is a sterile, freeze dried preparation. It contains not less than 90.0% and not more than 110.0% of the labelled amount of sodium nitroprusside [$\text{Na}_2\text{Fe}(\text{CN})_5\text{NO} \cdot 2\text{H}_2\text{O}$], calculated with reference to the average weight of contents each container.

Description A pink crystalline powder; unstable in aqueous solution; decomposed rapidly on exposure to light.

Identification Complies with the tests for Identification described under Sodium Nitroprusside.

Acidity Dissolve the contents of 2 containers in 10 ml of water, pH 5.0-7.0 (Appendix VI H).

Cyanide Carry out the limit test for cyanides (Appendix VIII F, method 2), using the contents of 5 containers (equivalent to 0.25 g of sodium nitroprusside). The absorbance of the resulting solution is not greater than that of a reference solution prepared in the same manner, using 1.0 ml of potassium cyanide standard solution (0.0008%).

Ferricyanide, Ferrocyanide Complies with the test for Ferricyanide and Ferrocyanide described under Sodium Nitroprusside.

Loss on drying When dried to constant weight at 120°C, loses not more than 12.6% of its weight (Appendix VIII L).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E): less than 8.3 EU per mg of Sodium Nitroprusside.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Weigh accurately 0.12 g of the mixed contents obtained in the test for weight variation of contents. Proceed as directed in the Assay under Sodium Nitroprusside. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 14.90 mg of $\text{Na}_2\text{Fe}(\text{CN})_5\text{NO} \cdot 2\text{H}_2\text{O}$.

Category As described under Sodium Nitroprusside.

Strength 50 mg

Storage Preserve in well closed containers, protected from light.

Sodium Pertechnetate [$^{99\text{m}}\text{Tc}$] Injection

Sodium Pertechnetate [$^{99\text{m}}\text{Tc}$] Injection is a sterile isotonic solution of Sodium Pertechnetate [$^{99\text{m}}\text{Tc}$]. Technetium-99 m is a decay product of Molybdenum-99. ^{99}Mo is a radioactive isotope. [^{99}Mo] obtained by neutron irradiation of molybdenum compound is adsorbed on a column of alumina to form neutron irradiation Technetium [$^{99\text{m}}\text{Tc}$]. Prepare Molybdenum [^{99}Mo] obtained from this generator in colloidal form, then absorbed on a column to form Technetium [$^{99\text{m}}\text{Tc}$] generator, known as Colloided Molybdenum Technetium [$^{99\text{m}}\text{Tc}$] generator, Molybdenum [^{99}Mo] isolated from uranium fission products is absorbed on a column of alumina, known as Fission Technetium [$^{99\text{m}}\text{Tc}$] generator. Sodium Pertechnetate [$^{99\text{m}}\text{Tc}$] Injection is eluted from the generator with Sodium Chloride Injection under aseptic condition. It contains not less than 90.0% and not more than 110.0% of the labelled amount of Technetium-99 m radioactivity at the date and hour stated on the label.

Description A clear, colourless liquid.

Identification (1) Carry out the γ -ray spectrum method (Appendix XIII). The prominent photo has an energy of 0.140 MeV. Or half-life is not less than 5.72 hours and not more than 6.32 hours.

(2) The principal spot of prominent radioactive peak obtained in the determination of Radiochemical purity has a R_f value of 0.9-1.0.

pH value 4.0-7.0 (Appendix VI H).

Aluminium This test is applied to Technetium-99m obtained by neutron irradiation or from fission products.

To each of five 5 ml volumetric flasks containing 0 ml, 1.0 ml, 1.0 ml of aluminium standard solution (1 μg per ml) and 0.10 ml, 1.0 ml of the Injection add 1.0 ml of hydrochloric acid (0.1 mol/L) VS, 1.0 ml of 0.02% chrome azurol S solution and 1.0 ml of 0.1% cetrimonium bromide solution, 1.5 ml acetic acid-sodium acetate BS (pH 6.0) and water to volume, shake well. Allow to stand for 15-20 minutes, measure the absorbance at 620 nm (Appendix IV A), using 1 cm cells. Calculate the content of aluminium; not more than 10 μg per ml (Technetium-99 m obtained from fission products); or 20 μg per ml (Technetium-99 m obtained by neutron irradiation).

Zirconium This test is applied to Technetium-99 m obtained from colloidal Mo-99.

Preparation of reference solution Weigh accurately zirconium oxychloride ($\text{ZrOCl}_2 \cdot 8\text{H}_2\text{O}$) in suitable amount to dissolve in hydrochloric acid (0.05 mol/L) VS and dilute to a solution containing 10 μg per ml.

Procedure Place 1.0 ml, measured accurately, each of the reference solution and the solution being examined into 5 ml volumetric flask, add 0.5 ml of sulfuric acid solution 1 mol/L and 1.0 ml of 0.05% xylene orange solution and make up to volume with water, shake well and allow to stand for 10

minutes. Measure the absorbances at 535 nm (Appendix IV A), calculate the content of Zr; not more than 10 μg per ml.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E), using a suitable amount of sample, diluted with water BET to 15 times of its original volume, less than 7.5 EU per ml.

Sterility Complies with the test for sterility (Appendix XI H).

Radionuclidic purity Carry out the determination of radionuclidic purity (Appendix XIII), with a suitable instrument. The radioactive impurities should comply with the following limit; $^{99}\text{Mo} < 0.1\%$.

Sodium Technetium [$^{99\text{m}}\text{Tc}$] Injection produced from Fission Technetium [$^{99\text{m}}\text{Tc}$] generator also comply to the following limits:

$$\begin{aligned} {}^{131}\text{I} &< 0.005\% \\ {}^{103}\text{Ru} &< 0.005\% \\ {}^{89}\text{Sr} &< 6 \times 10^{-5}\% \\ {}^{90}\text{Sr} &< 6 \times 10^{-6}\% \end{aligned}$$

$$\alpha\text{-radionuclide} < 1 \times 10^{-7}\%$$

$$\text{other } \beta, \gamma \text{ ray emitting impurities} < 0.01\%.$$

Radiochemical purity Carry out the determination of radiochemical purity (Appendix XIII, method 1), using hydrochloric acid solution (2 mol/L)-acetone [1 : 4] as the mobile phase. Not less than 98% of the total radioactivity is found in the spot corresponding to Sodium Pertechnetate [$^{99\text{m}}\text{Tc}$] (R_f value 0.9-1.0).

Radioactive concentration Not less than 51.8 MBq per ml (Appendix XIII).

Radioactivity Complies with the requirements for radioactivity (Appendix XIII, Measurement of radioactivity concentration).

Category Diagnostic.

Strength 3.7 GBq : 7.4 GBq (neutron irradiation generator)
18.5 GBq : 29.6 GBq : 37 GBq (fission and colloidal generator)

Sodium Phosphate [^{32}P] Injection

Sodium Phosphate [^{32}P] Injection is a sterile solution of ^{32}P -labelled Sodium Phosphate (predominantly $\text{Na}_2\text{H}^{32}\text{PO}_4$). It contains not less than 90.0% and not more than 110.0% of the labelled amount of radioactive concentration of phosphorus-32 at the date and hour stated on the label.

Description A clear, colourless liquid.

Identification Complies with the tests for Identification described under Sodium Phosphate [^{32}P] Oral Solution.

pH value 6.0-8.0 (Appendix VI H).

Phosphorus Carry out the corresponding test described under Sodium Phosphate [^{32}P] Oral Solution using 1 ml (no dilution), measured accurately; not more than 10 μg per ml.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E), less than 15 EU per ml.

Sterility Complies with the test for sterility (Appendix XI H).

Radiochemical purity Carry out the determination of Radiochemical purity described under Sodium Phosphate [^{32}P] Oral Solution, using a strip of chromatographic paper

impregnated for 1-2 minutes with 2% ammonium chloride solution and dried at 100°C. Not less than 95% of the total radioactivity is found in the spot corresponding to Sodium Phosphate [^{32}P].

Radioactive concentration Not less than 185 MBq per ml (Appendix XIII).

Category Radiopharmaceutical.

Strength (1) 185 MBq (2) 370 MBq
(3) 925 MBq (4) 1850 MBq

Storage Preserve in well closed lead containers. The intensity of radiation on the surface of the container complies with relevant regulation.

Sodium Phosphate [^{32}P] Oral Solution

Sodium Phosphate [^{32}P] Oral Solution is a solution of ^{32}P -labelled Sodium Phosphate (predominantly $\text{Na}_2\text{H}^{32}\text{PO}_4$) with carrier. It contains not less than 90.0% and not more than 110.0% of the labelled amount of radioactive concentration of phosphorus-32 at the date and hour stated on the label.

Description A clear, colourless liquid.

Identification (1) Carry out the β -ray spectrum method (Appendix XIII) using suitable amount of sample, the β radiation has a maximum energy of 1.71 MeV.

(2) The principal spot obtained in the determination of Radiochemical purity has prominent radioactive peak with a R_f value of about 0.7.

pH value 6.0-8.0 (Appendix VI H).

Phosphorus Reference preparation Weigh accurately 21.95 mg of potassium dihydrogen phosphate to a 500 ml volumetric flask, dissolve it in water and dilute to volume, mix well. Each ml is equivalent to 10 μg of P.

Test preparation Dilute the solution being examined with water to about 10 μg of P per ml.

Procedure Transfer 1 ml each of the reference solution and test solution, both measure accurately, to 5 ml volumetric flasks separately, add successively 0.5 ml ammonium vanadate TS, 0.5 ml of ammonium molybdate TS and 1 ml of 70% perchloric acid solution with shaking, dilute with water to volume and mix well. Allow to stand for 30 minutes and measure the absorbance at 420 nm (Appendix IV A). Calculate the content of phosphorus (P): not more than 10 mg per ml.

Radiochemical purity Carry out the determination of radiochemical (Appendix XIII, method 1), using a mixture of acetone-water-concentrated amount solution-trichloroacetic acid (60 ml : 20 ml : 0.5 ml : 2.5 g) as the mobile phase. Not less than 98% of the total radioactivity is found in the spot corresponding to Sodium Phosphate [^{32}P].

Radioactive concentration Not less than 370 MBq per ml (Appendix XIII).

Category Radiopharmaceutical.

Strength (1) 370 MBq (2) 740 MBq
(3) 1850 MBq (4) 3700 MBq

Storage Preserve in well closed lead containers. The intensity of radiation on the surface of the container complies with relevant regulation.

Sodium Phytate and Stannous Chloride for Injection

Sodium Phytate and Stannous Chloride for Injection is a sterile, lyophilized mixture of Sodium Phytate ($\text{C}_6\text{H}_9\text{Na}_9\text{O}_{24}\text{P}_6$) and Stannous Chloride ($\text{SnCl}_2 \cdot 2\text{H}_2\text{O}$). It contains not less than 80.0% and not more than 115.0% of the labelled amount of Sodium Phytate, calculated as Phytic acid ($\text{C}_6\text{H}_{18}\text{O}_{24}\text{P}_6$).

Description A white lyophilized powder. Freely soluble in water.

Identification (1) Alkalinity the supernatant liquid obtained in the Assay (excess hydrogen sulfide removed) with dilute ammonia solution, add a few drops of calcium chloride TS, a white precipitate is produced.

(2) To the clear, digested solution obtained in the Assay add ammonium molybdate TS, a yellow colour is produced.

(3) Dissolve the content of 1 container in 0.5 ml of Sodium Chloride Injection, apply 1 drop of the solution to a strip of ammonium phosphomolybdate TP, a blue colour is produced.

Clarity and colour of solution Dissolve the content of 1 container in 6 ml of Sodium Chloride Injection, the solution is clear and colourless.

Stannous chloride To 5 containers, add 3 ml of 1 mol/L hydrochloric acid solution saturated by nitrogen to allow to dissolve. Carry out the method for potentiometric titration (Appendix VII A), titrate with potassium iodate (0.001667 mol/L) VS, under a current of nitrogen. The consumption of potassium iodate (0.001667 mol/L) VS of each container is not less than 0.07 ml. If one container fails the requirements, a further 5 containers may be tested and all must comply.

Acidity The pH value of the solution obtained in the test for Clarity and colour of solution is 3.0-6.0 (Appendix VI H).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E), using suitable amount of the solution prepared by dissolving the content in water BET and diluted to 25 times of its volume with water BET; less than 75 EU each container.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dissolve the contents of 3 containers separately in 2 ml of water, accurately measured, combine the solutions and mix well. To 2 ml of the combined solution add 2 ml of 2% hydrochloric acid solution, both accurately measured, mix well and pass hydrogen sulfide into the solution until precipitation is complete. Centrifuge and decant the supernatant liquid, expel the excess hydrogen sulfide with a current of air. To 1 ml of the liquid, accurately measured, add 1 ml of sulfuric acid, digest until it is completely carbonized, cool and add hydrogen peroxide solution until it is clear and colourless. Heat for 15 minutes, allow to cool and transfer it to a 25 ml volumetric flask, dilute with water to volume and mix well. Transfer 2 ml of the solution, accurately measured, to another 25 ml volumetric flask, add 5 ml of molybdo-ascorbic acid solution (mix 9 ml of dilute sulfuric acid with 3 ml each of 2.5% ammonium molybdate solution and 10% ascorbic acid solution), dilute with water to volume and mix well. Warm for 30 minutes on a water bath at 45°C, measure the absorbance of total phosphorus

(E_1) at 660 nm (Appendix VI A). Transfer 1 ml of the liquid with hydrogen sulfide removed accurately measured, to a 25 ml volumetric flask, dilute with water to volume and mix well. Place 2 ml, accurately measured, in a 25 ml volumetric flask, add 5 ml of molybdo-ascorbic acid solution and make up to volume with water. Proceed as described above, beginning at the words "shake well,..." Measure the absorbance of inorganic phosphorus (E_1). Place 2 ml of potassium dihydrogen phosphate standard solution [corresponding to 0.05 mg of phosphorus (P) per ml], accurately measured, pass hydrogen sulfide into the solution, and then expel the excess hydrogen sulfide with a current of air. Transfer 1 ml of the liquid, accurately measured, in a 25 ml volumetric flask and add 5 ml of molybdo-ascorbic acid solution, dilute with water to volume. Proceed as described above, beginning at the words "shake well,..." measure the absorbance (E_2). Calculate the phosphorus content in the sample, multiplied by 3.548, represents the content of phytic acid ($C_6H_{18}O_{24}P_6$).

Category Used for the preparation of Technetium [^{99m}Tc] Phytate Injection.

Strength 9 mg of phytic acid and 0.12 mg of stannous chloride ($\text{SnCl}_2 \cdot 2\text{H}_2\text{O}$).

Storage Preserve in well closed containers, stored at 2–8°C in a dark place.

Sodium Prasterone Sulfate

$\text{C}_{19}\text{H}_{27}\text{NaO}_5\text{S} \cdot 2\text{H}_2\text{O}$ 426.51

Sodium Prasterone Sulfate is 3 β -hydroxy-androst-5-en-17-one sodium sulfate dihydrate. It contains not less than 97.0% and not more than 103.0% of $\text{C}_{19}\text{H}_{27}\text{NaO}_5\text{S}$, calculated on the dried basis.

Description White crystals or a crystalline powder; odourless; taste, bitter.

Soluble in ethanol, sparingly soluble in water, slightly soluble in dehydrated ethanol, practically insoluble in acetone, chloroform or ether.

Specific optical rotation +10°C to +13°C, in a solution of 40 mg per ml in methanol (Appendix VI E).

Identification (1) Dissolve about 10 mg in 1 ml of ethanol, add about 10 mg of 1,3-dinitrobenzene and stir to dissolve, add several drops of sodium hydroxide TS. A violet red colour is produced.

(2) The light absorption of a solution of 5 mg per ml in water exhibits a maximum at 289 nm, the absorbance is about 0.65, and a minimum at 241 nm.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the spectrum of Sodium Prasterone Sulfate (Appendix XVI).

(4) Dissolve about 50 mg in 5 ml of water, add 2 ml of 2 mol/L hydrochloric acid, heat in a water bath for 10 minutes, cool, filter, divide the filtrate into two portions: One portion yields the reactions characteristic of sulfates (Appendix III). To the another portion add concentrated

ammonia solution to neutralize, and add acetic acid to acidify, the solution yields the reactions characteristic of sodium salts (Appendix III).

Acidity Dissolve 0.10 g in 10 ml of water, pH 5.0–7.0 (Appendix VI H).

Clarity and colour of solution Dissolve 0.10 g in 10 ml of water by shaking thoroughly, the solution is clear and colourless.

Sulfate Dissolve 0.50 g in 40 ml of acetone-water (1 : 1) in a 50 ml Nessler cylinders, add 2 ml of diluted hydrochloric acid solution, mix well, add 5 ml of 25% barium chloride solution, dilute with water to volume, mix well, heat in a 30°C to 40°C water bath for 10 minutes. Carry out the limit test for sulfate (Appendix VII B). Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of potassium sulfate standard solution (0.04%).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G mixed with 0.5% carboxymethylcellulose sodium as the coating substance and a mixture of chloroform-methanol-water (75 : 22 : 3) as the mobile phase. Apply separately to the plate 10 μl of each of solutions in methanol containing (1) 10.0 mg per ml and (2) 0.10 mg per ml of the substance being examined. After developing and removal of the plate, dry in air. Spray with a mixture of sulfuric acid-ethanol (1 : 1) and heat at 80°C for 5 minutes. No more than 1 secondary spot is obtained in the chromatogram with solution (1) and the colour is not more intense than that of the principal spot obtained with solution (2).

Loss on drying when dried in vacuum over phosphorus pentoxide to constant weight at 60°C, loses not more than 9.6% of its weight (Appendix VIII L), using 0.50 g.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E): less than 1.5 EU per mg.

Sterility Complies with the tests for sterility (Appendix XI H) (for directly sterility preparation).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water-triethylamine (650 : 350 : 4) with a pH value adjusted to 5.3 ± 0.1 by 4 mol/L sulfuric acid solution as the mobile phase. Detection wavelength is 210 nm and the number of theoretical plates of the column is not less than 800, calculated with reference to the peak of sodium prasterone sulfate.

Procedure Dissolve about 50 mg, accurately weighed, in the mobile phase to produce a solution of about 2 mg per ml. Inject 10 μl into the column, record the chromatogram. Repeat the operation, using a quantity of sodium prasterone sulfate CRS instead of the substance being examined. Calculate the content of $\text{C}_{19}\text{H}_{27}\text{NaO}_5\text{S}$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Androgen.

Storage Preserve in hermetically closed containers, protected from light.

Preparation Sodium Prasterone Sulfate for Injection.

Sodium Prasterone Sulfate for Injection

Sodium Prasterone Sulfate for Injection is a sterile powder or a sterile lyophilized preparation of

Sodium Prasterone Sulfate. It contains not less than 90.0% and not more than 110.0% of the labelled amount of sodium prasterone sulfate ($C_{19}H_{27}NaO_5S$), calculated on the basis of average content weight in containers.

Description White crystals or a crystalline powder (a sterile powder), or a white friable solid or powder (lyophilized preparation).

Identification (1) Complies with the tests (1) and (4) for Identification as described under Sodium Prasterone Sulfate.

(2) The retention time of the principal peak of Sodium Prasterone Sulfate in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of sodium prasterone sulfate CRS in the chromatogram of the reference solution.

Acidity Dissolve the content of 1 container in 10 ml of water, pH 5.0-7.0 (Appendix VI H).

Clarity and colour of solution Dissolve the contents of 1 container in 10 ml of water, the solution is clear and colourless.

Loss on drying When dried in vacuum over phosphorus pentoxide to constant weight at 60°C, loses not more than 9.3% of its weight (Appendix VIII L).

Related substances Carry out the test for Related substances described under Sodium Prasterone Sulfate, using methanol-water (1 : 1) instead of methanol.

Bacterial endotoxin Carry out the test for bacterial endotoxins (Appendix XI E); less than 1.5 EU per mg of sodium prasterone sulfate.

Sterility Complies with the test for Sterility as described under Sodium Prasterone Sulfate.

Other requirements Comply with the general requirements for injections (Appendix I B).

Assay Weigh accurately a quantity of the well-mixed contents in the test for weight variation of contents, equivalent to about 50 mg of sodium prasterone sulfate, and carry out the Assay as described under Sodium Prasterone Sulfate. Calculate the content of $C_{19}H_{27}NaO_5S$.

Category As described under Sodium Prasterone Sulfate.

Strength 0.1 g

Storage Preserve in tightly closed containers, protected from light.

Sodium Pyrophosphate and Stannous Chloride for Injection

Sodium Pyrophosphate and Stannous Chloride for Injection is a sterile, lyophilized mixture of sodium pyrophosphate ($Na_4P_2O_7 \cdot 10H_2O$) and stannous chloride ($SnCl_2 \cdot 2H_2O$). It contains not less than 80.0% and not more than 115.0% of the labelled amount of sodium pyrophosphate.

Description A white lyophilized powder. Freely soluble in water.

Identification (1) Dissolve the contents of 1 container in 1 ml of water, add 1 drop of magnesium ammonium chloride TS, a white precipitate is produced.

(2) Dissolve the contents of 1 container in 0.5 ml of Sodium

Chloride Injection, apply 1 drop of the solution to a strip of ammonium phosphomolybdate TP, a blue colour is produced.

Clarity and colour of solution Dissolve the contents of 1 container in 10 ml of Sodium Chloride Injection, the solution is clear and colourless.

Stannous chloride Dissolve the contents of 5 containers separately in 8 ml of hydrochloric acid solution (1 mol/L), previously saturated with nitrogen. Carry out the method for potentiometric titration (Appendix VII A) under a current of nitrogen, titrate 2 ml, measured accurately, of the solution with potassium iodate (0.001667 mol/L) VS. Not less than 0.31 ml is consumed for each container. Repeat the test with another 5 containers, if one of them fails to meet the requirement. All the containers in the second test must comply with the requirement.

Acidity The pH value of the solution obtained in the test for Clarity and colour of solution is 5.0-7.0 (Appendix VI H).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E), using suitable amount of sample solution prepared by dissolving the contents in water BET and diluted to 10 times of its volume with water BET; less than 75 EU each container.

Other requirements Comply with the general requirements for injections (Appendix I B).

Assay Dissolve the contents of 3 containers separately in 2 ml of water, accurately measured, combine the solutions and mix well. To 2 ml of the combined solution add 2 ml of 2% hydrochloric acid solution, both accurately measured, mix well and pass hydrogen sulfide into the solution until precipitation is complete. Centrifuge and decant the supernatant liquid, expel the excess hydrogen sulfide with current of air. Transfer 1 ml of the liquid, accurately measured, to a 10 ml volumetric flask, dilute with water to volume and mix well. Measure accurately 1 ml of the solution and transfer it to a 25 ml volumetric flask, add 5 ml of molybdo-ascorbic acid solution (mix 9 ml of dilute sulfuric acid with 3 ml each of 2.5% ammonium molybdate solution and 10% ascorbic acid solution), dilute with water to volume and mix well. Warm for 30 minutes on a water bath at 70°C, measure the absorbance of the solution at 660 nm (Appendix IV A). Dissolve 100 mg of sodium pyrophosphate CRS, accurately weighed, in 10 ml of Sodium Chloride Injection. Transfer 1 ml, accurately measured, add 1 ml of water and proceed as described above, beginning at the words "add 2 ml of 2% hydrochloric solution...". Calculate the content of $Na_4P_2O_7 \cdot 10H_2O$ in each container.

Category Used for the preparation of Technetium [^{99m}Tc] Pyrophosphate Injection.

Strength 10 ml of sodium pyrophosphate and 1.0 mg of stannous chloride ($SnCl_2 \cdot 2H_2O$).

Storage Preserve in tightly closed containers, stored at 2-8°C in a dark place.

Sodium Stibogluconate

[16037-91-5]

Sodium Stibogluconate is a pentavalent antimony compound of indefinite composition. It contains not less than 30.0% and not more than 34.0% of antimony (Sb), calculated on the dried basis.

Description A white to faintly yellow amorphous powder;

odourless. The aqueous solution is dextrorotatory. Freely soluble in hot water; soluble in water; insoluble in ethanol or ether.

Identification (1) Acidify the aqueous solution with dilute hydrochloric acid, add potassium iodide TS, a brown colour is produced which turns to blue on the addition of starch IS. (2) When heated, it chars without melting, emitting an odour of burnt sugar. Continue the heating until charring is complete, the residue yields the reactions characteristic of antimony salts and sodium salts (Appendix III).

Chlorides Dissolve 2.5 g in 100 ml of water. To 5.0 ml of the solution add 0.20 g of tartaric acid, shake to dissolve. Carry out the limit test for chlorides (Appendix VII A). Any opalescence produced is not more pronounced than that of a reference solution using 7.0 ml of sodium chloride standard solution (0.056%).

Sulfates Dissolve 0.20 g of tartaric acid in 20 ml of the remaining solution obtained in the test for chlorides. Carry out the limit test for sulfates (Appendix VII B). Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of potassium sulfate standard solution (0.04%).

Loss on drying When dried under vacuum to constant weight at 120°C, loses not more than 15.0% of its weight (Appendix VII L).

Trivalent antimony To 40 ml of the remaining solution obtained in the test for Chlorides add 10 ml of freshly prepared sodium bicarbonate saturated solution and 2 ml of starch IS, mix well, add 0.10 ml of iodine solution (0.05 mol/L), a blue colour is produced and persists for not less than 3 minutes.

Lead Dissolve 1.0 g in 10 ml of water, add 1.0 g of tartaric acid, 10 ml of 10% sodium hydroxide solution, 2 ml of potassium cyanide TS and 5 drops of sodium sulfide TS, mix well and allow to stand for 2 minutes. Any colour produced is not more intense than that of a reference solution using 2.0 ml of lead standard solution (0.002%).

Arsenic To 0.10 g in a Nessler cylinder add 0.3 ml of 0.01% mercuric chloride solution, 9.2 ml of hydrochloric acid and 0.5 ml of stannous chloride solution (dissolve 22.5 g of stannous chloride in 12 ml of hydrochloric acid by warming), mix well, allow to stand for 30 minutes. Any colour produced is not more intense than that of a reference solution (to 0.3 ml of 0.0005% As solution add 0.3 ml of 0.01% mercuric chloride solution, 8.9 ml of hydrochloric acid and 0.5 ml of stannous chloride solution, mix well and allow to stand for 30 minutes) (0.0015%).

Stability of solution Dissolve a quantity equivalent to 2.0 g of antimony in 100 ml of water, the solution is almost colourless. Heat the solution at 115.5°C for 30 minutes in an autoclave, pH 5.0-7.0 (Appendix VI H).

Toxicity Complies with the test for Toxicity of sodium stibogluconate (Appendix VII L).

Assay To about 0.3 g, accurately weighed, in a stoppered conical flask add 100 ml of water, 15 ml of hydrochloric acid and 10 ml of potassium iodide TS, stopper the flask, shake well, allow to stand in the dark for 10 minutes. Titrate with sodium thiosulfate (0.1 mol/L) VS, add starch IS towards the end of the titration, continue the titration until the blue colour disappears. Perform a blank determination and make any necessary correction. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 6.088 mg of Sb.

Category Antileishmanial.

Storage Preserve in tightly closed containers, protected from light.

Preparation Sodium Stibogluconate Injection

Sodium Stibogluconate Injection

Sodium Stibogluconate Injection is a sterile solution of Sodium Stibogluconate in Water for Injection. Each ml contains not less than 0.095 g and not more than 0.105 g of antimony (Sb).

Description A clear, colourless to faintly yellow liquid.

Identification (1) Complies with test (1) for Identification described under Sodium Stibogluconate.

(2) The residue obtained after evaporation to dryness complies with test (2) for Identification described under Sodium Stibogluconate.

pH value 5.0-6.3 (Appendix VI H).

Trivalent antimony To 3.0 ml add 37 ml of water, then add 10 ml of freshly prepared sodium bicarbonate saturated solution and 2 ml of starch IS, mix well, add 0.10 ml of iodine solution (0.05 mol/L) TS, a blue colour is produced and persists for not less than 3 minutes.

Toxicity Complies with the test for Toxicity of sodium stibogluconate (Appendix VII L).

Other requirements Comply with the general requirements for injections (Appendix I B).

Assay Measure accurately 1 ml, carry out the Assay described under Sodium Stibogluconate. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 6.088 mg of Sb.

Category As described under Sodium stibogluconate.

Strength 6 ml (contains 0.6 g of pentavalent antimony, equivalent to about 1.9 g of sodium stibogluconate)

Storage Preserve in tightly closed containers, protected from light.

Sodium Thiosulfate

$\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$ 248.19 [10102-17-7]

Sodium Thiosulfate contains not less 99.0% of $\text{Na}_2\text{S}_2\text{O}_3$, calculated on dried basis.

Description Colourless, transparent crystals or crystalline granules; odourless; taste, saline; efflorescents in dry air and hygroscopic in damp air; aqueous solution exhibits weak alkaline reaction.

Very soluble in water; insoluble in ethanol.

Identification (1) Dissolve about 0.1 g in 1 ml of water, a white precipitate is produced on adding hydrochloric acid which turns rapidly to yellow and the pungent odour of sulfur dioxide is perceived.

(2) Dissolve about 0.1 g in 1 ml of water, a transient dark purple colour is produced on addition of ferric chloride TS.

(3) The aqueous solution yields the reactions characteristic of sodium salts (Appendix III).

Loss on drying When dried at 40-50°C and gradually raising the temperature to 105°C until the weight is constant, loses not more than 37.0% and not less than 32.0% of its weight (Appendix VII L).

Calcium Dissolve 0.50 g in 10 ml of water and add ammonium oxalate TS. No turbidity is produced.

Heavy metals Dissolve 1.0 g in 10 ml of water, add slowly 5 ml of dilute hydrochloric acid and evaporate to dryness on a water bath. To the residue add 15 ml of water, boil gently for 10 minutes, filter. Boil the filtrate, add a quantity of bromine TS while hot to make the solution clear. Add a slight excess of bromine TS, boil to expel the excess bromine and allow it to cool. Add 1 drop of phenol-phthalein IS and a quantity of ammonia TS until the solution becomes pink. A. 2 ml of acetic acid. B. (pH 3.5) ... to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.002%.

Arsenic Dissolve 0.20 g in 5 ml of water, add 3 ml of nitric acid, carefully evaporate to dryness on a water bath. Add several milliliters of water to the residue, stir thoroughly and filter. Wash the residue with water, combine the filtrate and washings and evaporate to dryness. Dissolve the residue in 5 ml of hydrochloric acid and 23 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.001%.

Assay Dissolve about 0.5 g, accurately weighed, in 30 ml of water, add 2 ml of starch IS, titrate with iodine (0.05 mol/L) VS until the blue colour of the solution is persistent. Each ml of iodine (0.05 mol/L) VS is equivalent to 15.81 mg of $\text{Na}_2\text{S}_2\text{O}_3$.

Category Antidote.

Storage Preserve in tightly closed containers.

Preparation Sodium Thiosulfate Injection

Sodium Thiosulfate Injection

Sodium Thiosulfate Injection is a sterile solution of Sodium Thiosulfate in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of sodium thiosulfate ($\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$).

A quantity of stabilizer may be added.

Description A clear, colourless liquid.

Identification Complies with tests for Identification described under Sodium Thiosulfate.

pH value 8.5-10.0 (Appendix VI H).

Pyrogen Complies with the test for pyrogens (Appendix XI D), using 2.0 ml per kg of the rabbit's weight.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity of the injection equivalent to about 0.5 g of sodium thiosulfate, add 20 ml of water and 2 ml of acetone, allow to stand for 5 minutes. Add 2 ml of dilute acetic acid and 2 ml of starch IS, titrate with iodine (0.05 mol/L) VS until the blue colour of the solution is persistent. Each ml of iodine (0.05 mol/L) VS is equivalent to 24.82 mg of $\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$.

Category As described under Sodium Thiosulfate.

Strength (1) 10 ml : 0.5 g (2) 20 ml : 1 g
(3) 20 ml : 10 g

Storage Preserve in well closed containers.

Sodium Valproate

$\text{C}_8\text{H}_{15}\text{NaO}_2$ 166.2

[1069-66-5]

Sodium Valproate is sodium 2-propylpentanoate. It contains not less than 99.0% of $\text{C}_8\text{H}_{15}\text{NaO}_2$, calculated on the dried basis.

Description A white crystalline powder or granules; taste, slightly astringent; strongly hygroscopic. Very soluble in water, freely soluble in methanol or ethanol, practically insoluble in acetone.

Identification (1) Dissolve 0.1 g in 1 ml of water, add 1 ml of benzene and 1-2 drops of 1% uranyl acetate solution and 1-2 drops of saturated solution of rhodamine B in benzene, a pink colour is produced immediately in benzene layer; examine under ultraviolet light, an orange fluorescence is produced.

(2) Dissolve 1 g in 10 ml of water, acidity with about 4 ml of hydrochloric acid solution (9→50), add 15 ml of ether and mix well. Allow to stand, evaporate the ether layer in an evaporating dish. Refractive index of the residue, 1.423-1.426 (Appendix VI F).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of sodium valproate (Appendix XVI).

(4) The aqueous layer described under Identification test (2) yields the reaction characteristic of sodium (Appendix III).

Clarity and colour of solution A solution of 1.0 g in 10 ml of freshly boiled and cooled water is colourless and clear, any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B).

Alkalinity Dissolve 1.0 g in 20 ml of water, pH 7.5-9.0 (Appendix VI H).

Ethanol-insoluble substance To about 1 g add 10 ml of dehydrated ethanol, it dissolves completely.

Loss on drying When dried to constant weight at 105°C, loses not more than 3.0% of its weight (Appendix VIII L).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 3), using 1.0 g; not more than 0.002%.

Assay Dissolve about 0.5 g, accurately weighed, in 30 ml of water, add 30 ml of ether. Carry out the method for potentiometric titration using glass-calomel electrode (Appendix VII A), titrate with hydrochloric acid (0.1 mol/L) VS to pH 4.5. Each ml of hydrochloric acid (0.1 mol/L) VS is equivalent to 16.62 mg of $\text{C}_8\text{H}_{15}\text{NaO}_2$.

Category Antiepileptic.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation Sodium Valproate Tablets

Sodium Valproate Tablets

Sodium Valproate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of sodium valproate ($C_8H_{15}NaO_2$).

Description Sugar coated tablets with white or almost white core.

Identification Shake 5 tablets with sugar coating removed in 10 ml of water. Filter, the filtrate complies with tests (1), (2) and (4) for Identification described under Sodium Valproate.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Add about 50 ml of water to 10 tablets (for strength 0.2 g) or 20 tablets (for strength 0.1 g) in a 100 ml volumetric flask, shake thoroughly. Dilute with water to volume and mix well. Filter, measure accurately 25 ml of the successive filtrate. Complete the Assay described under sodium valproate, beginning at the words "add 30 ml of ether...". Each ml of hydrochloric acid (0.1 mol/L) VS is equivalent to 16.62 mg of $C_8H_{15}NaO_2$.

Category As described under Sodium Valproate.

Strength (1) 0.1 g (2) 0.2 g

Storage Preserve in tightly closed containers, stored in a dry place.

Soft Soap

Soft Soap is obtained by the saponification of suitable vegetable oils with potassium hydroxide.

Description A yellowish-white to yellowish-brown or yellowish-green soft lump, transparent or translucent, uniform and unctuous; odour, slight and characteristic. The aqueous solution exhibits an alkaline reaction to phenolphthalein IS. Soluble in water or ethanol.

Ethanol-insoluble substances Dissolve 5.0 g in 100 ml of hot neutral ethanol (previously neutralised to phenolphthalein IS). Filter through a sintered glass crucible previously dried to constant weight at 105°C, wash the residue thoroughly with hot neutral ethanol and dry for 1 hour at 105°C. The amount of residue is not more than 3.0%.

Free potassium hydroxide To the filtrate and the washings obtained in the test for ethanol-insoluble substance add 1-2 drops of phenolphthalein IS and 2.3 ml of sulfuric acid (0.05 mol/L) VS, no red or pink colour is produced.

Carbonates Wash the residue obtained in the test for ethanol-insoluble substances with 50 ml of boiling water. Allow the washings to cool, add 2-3 drops of methyl orange IS and 2.5 ml of sulfuric acid (0.05 mol/L) VS, the colour of the solution is red.

Unsaponified matter To 1.0 g add 20 ml of hot water, it is dissolved completely and the solution is almost clear.

Water Carry out the method for determination of water (Appendix VIII M, method 2). Transfer 250 ml of toluene to bottle A, add 10 g of dried barium chloride. Wrap 1.0 g of the soap with a small piece of cellophane paper and drop it into bottle A. Heat gently until the water is distilled

completely, cool to room temperature and record the volume of distillate as blank. Repeat the operations with 7 g of the soap, accurately weighed, and again record the volume of distillate obtained. The difference between the two readings is the content of water in the substance being examined; not more than 52.0%.

Category Detergent.

Storage Preserve in tightly closed containers.

Sorbitol

$C_6H_{14}O_6$ 182.17

[50-70-4]

Sorbitol is D-glucitol. It contains not less than 98.0% of $C_6H_{14}O_6$, calculated on the dried basis.

Description A white crystalline powder; odourless; taste, sweet; hygroscopic.

Freely soluble in water; slightly soluble in ethanol; insoluble in chloroform or ether.

Specific optical rotation Weigh accurately 5 g to a 50 ml volumetric flask, add 6.4 g of sodium tetraborate and a quantity of water, shake to dissolve and dilute with water to volume. Filter, if necessary. The specific optical rotation of the resulting solution is +4.0° to +7.0° (Appendix VI E).

Identification (1) Dissolve 5 g in 4 ml of water by heating, cool, add 7 ml of methanol, 1 ml of benzaldehyde and 1 ml of hydrochloric acid and mix well. Allow it to stand for 2 hours until crystals are formed. Filter, dissolve the crystals in 20 ml of a boiled 5% solution of sodium bicarbonate, filter while warming. Allow it to cool until crystals are formed. Filter, wash the crystals with 5 ml of a mixture of methanol and water (1 : 1) and dry it over phosphorus pentoxide in vacuum for 24 hours. It melts at 174-179°C (Appendix VI C).

(2) Dissolve about 50 mg in 3 ml of water, add 3 ml of a freshly prepared 10% solution of catechol, mix well, add 6 ml of sulfuric acid and mix well, a pink colour is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of sorbitol (Appendix XVI).

Acidity Dissolve 5.0 g in 50 ml of freshly boiled and cooled water, add 3 drops of phenolphthalein IS and 0.30 ml of sodium hydroxide solution (0.02 mol/L) VS, a pink colour is produced.

Clarity and colour of solution A solution of 3.0 g in 20 ml of water is clear and colourless.

Chlorides Carry out the limit test for chlorides (Appendix VII A), using 1.4 g. Any opalescence produced is not more pronounced than that of a reference solution using 7.0 ml of sodium chloride standard solution (0.005%).

Sulfates Carry out the limit test for sulfates (Appendix VII B), using 2.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of potassium sulfate standard solution (0.01%).

Reducing sugars Dissolve 10.0 g in 35 ml of water in a 400 ml beaker. Add 50 ml of alkaline cupric tartrate TS, cover the beaker with a watch glass, heat the mixture in such a manner that the solution boils in 2-4 minutes. Allow it to continue to boil for a further 2 minutes. Immediately add 100 ml of freshly boiled and cooled water, filter with a tared filter crucible, previously dried to constant weight at 105°C. Wash the precipitate and the beaker with 30 ml of hot water, 10 ml of ethanol and 10 ml of ether successively and dry it to constant weight at 105°C; the weight of the cuprous oxide is not more than 67 mg.

Total sugars Place 2.1 g in a 250 ml flask fitted with a ground-glass joint, add 40 ml of hydrochloric acid solution (9 → 1000), heat under reflux for 4 hours and cool. Transfer the solution to a 400 ml beaker, rinse the flask with 10 ml of water, neutralize with a 24% solution of sodium hydroxide. Complete the test described under the test for Reducing sugars, beginning at the words "Add 50 ml of alkaline cupric tartrate TS": the weight of the cuprous oxide is not more than 50 mg.

Loss on drying When dried over phosphorus pentoxide in vacuum at 60°C to constant weight, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Dissolve 2.0 g in 2 ml of sodium acetate BS (pH 3.5) and a quantity of water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Arsenic Dissolve 1 g in 10 ml of water, add 5 ml of dilute sulfuric acid and 0.5 ml of potassium bromide-bromine TS, warm on a water bath for 20 minutes, keeping bromine slightly in excess (if necessary, add dropwise potassium bromide-bromine TS), add water to replace the water evaporated and allow to cool. Add 5 ml of hydrochloric acid and a quantity of water to produce 28 ml. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Assay Dissolve about 0.2 g, accurately weighed, in water in a 250 ml volumetric flask, dilute with water to volume and mix well. Measure accurately 10 ml to an iodine flask, add accurately 50 ml of sodium (potassium) periodate solution [Mix 90 ml of sulfuric acid solution (1 → 20) and 110 ml of sodium (potassium) periodate solution (2.3 → 1000)], heat on a water bath for 15 minutes and cool. Add 10 ml of potassium iodide TS and stopper the flask, allow it to stand for 5 minutes, titrate with sodium thiosulfate (0.05 mol/L) VS, add 1 ml of starch IS towards the end of titration, continue the titration until the blue colour disappears. Perform a blank determination and make any necessary correction. Each ml of sodium thiosulfate (0.05 mol/L) VS is equivalent to 0.9109 mg of $C_6H_{14}O_6$.

Category Diuretics.

Storage Preserve in tightly closed containers, protected from light.

Preparation Sorbitol Injection

Sorbitol Injection

Sorbitol Injection is a sterile solution of sorbitol in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of sorbitol ($C_6H_{14}O_6$).

Description A clear, colourless solution.

Identification (1) Evaporate 20 ml on a water bath to about 10 ml, cool, the solution complies with test (1) for Identification described under Sorbitol.

(2) Dilute 0.2 ml with water to produce 3 ml. It complies with test (2) for Identification described under Sorbitol.

pH value 4.5-6.5 (Appendix VI H).

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 10 ml per kg of the rabbit's weight.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Transfer 10 ml, accurately measured, equivalent to about 2.5 g of sorbitol, to a 100 ml volumetric flask, dilute with water to volume and mix well. Transfer 10 ml, accurately measured, to a 250 ml volumetric flask, dilute with water to volume and mix well. Complete the Assay described under Sorbitol, beginning at the words "measure accurately 10 ml to an iodine flask". Each ml of sodium thiosulfate (0.05 mol/L) VS is equivalent to 0.9109 mg of $C_6H_{14}O_6$.

Category As described under Sorbitol.

Strength (1) 100 ml : 25 g (2) 250 ml : 62.5 g

Storage Preserve in well closed containers, protected from light.

Soybean Oil for Injection

Soybean Oil for Injection is the refined fixed oil obtained from the seeds of the soya plant *Glycine soya* Benth.

Description A pale yellow, clear liquid; odourless or almost odourless.

Miscible with ether or chloroform; very slightly soluble in ethanol; practically insoluble in water.

Relative density 0.916-0.922 (Appendix VI A).

Refractive index 1.472-1.476 (Appendix VI F).

Acid value Not more than 0.1 (Appendix VII H).

Saponification value 188-195 (Appendix VII H).

Iodine value 126-140 (Appendix VII H).

Light absorption The light absorption of the substance being examined at 450 nm (Appendix IV A) is not more than 0.045, taking water as the blank.

Peroxide Dissolve 10.0 g in 30 ml of acetic acid-chloroform (60 : 40) in a 250 ml iodine flask with shaking. Add accurately 0.5 ml of saturated potassium iodide solution, stopper the flask, shake thoroughly for 1 minute and add 30 ml of water. Titrate with sodium thiosulfate (0.01 mol/L) VS. Add 0.5 ml of starch TS towards the end point and continue the titration until the blue colour disappears. Perform a blank determination and make any necessary correction. Not more than 3.0 ml of sodium thiosulfate (0.01 mol/L) VS is consumed.

Unsaponifiable matter Place 5.0 g in a 250 ml conical flask, add 50 ml of potassium hydroxide solution in ethanol (dissolve 12 g of potassium hydroxide in 10 ml of water, dilute to 100 ml with ethanol). Reflux the mixture for 1 hour, cool to below 25°C. Transfer the solution to a separator, wash the flask with two portions of water, each of 50 ml, and combine the washings to the separator.

Extract with three portions of ether, each of 100 ml, combine the ether layer to another separator, wash with three portions of water, each of 40 ml, discard the washings. Wash the ether layer with 3% sodium hydroxide solution and water three times respectively, each of 40 ml, then wash with water for several times until no red colour is produced when dropping two drops of phenolphthalein IS, each of 40 ml. Transfer the ether extract to a evaporating dish, previously dried to constant weight, wash the separator with 10 ml of ether, transfer the washing to the evaporating dish, evaporating ether on a 50°C water bath, dissolve the residue with 6 ml of acetone, expel the acetone with current of air. Dry at 105°C until the variation between two continuous weight is less than 1 mg, the content of the unsaponifiable matter is not more than 1.0%.

Dissolve the residue with 20 ml of neutral ethanol, add a few drops of phenolphthalein IS and titrate with ethanolic sodium hydroxide (0.1 mol/L) VS until a pink colour persists 30 seconds, the test is invalid if more than 0.2 ml ethanolic sodium hydroxide (0.1 mol/L) VS is consumed, and the test must be done again.

Note: Ethanolic sodium hydroxide (0.1 mol/L) VS

P-eparation Measure 2 ml of 50% sodium hydroxide solution, add 250 ml of ethanol (allow to stand overnight) the solution is opalescent, and using the supernatant for standardization).

Standardization Dissolve about 0.2 g of benzoic acid, weighed accurately, in 10 ml of ethanol and 2 ml of water, add 2 drops of phenolphthalein IS and titrate with ethanolic sodium hydroxide (0.1 mol/L) VS until a persistent pink colour is produced. Each ml of ethanolic sodium hydroxide (0.1 mol/L) VS is equivalent to 12.21 mg of benzoic acid.

Heavy metals Transfer 5.0 g to a 50 ml porcelain evaporating dish, add 4 ml of sulfuric acid, mix well, heat gently until the sulfuric acid fumes are no longer evolved, add 2 ml of nitric acid and 5 drops of sulfuric acid, heat until nitrous oxide fumes are no longer evolved and ignite at 500-600°C until the incineration is complete. Cool, carry out the limit test for heavy metals (Appendix VIII H, method 2); not more than 0.0002%.

Arsenic Place 5.0 g in a quartz or platinum crucible, add 10 ml of ethanolic magnesium nitrate solution (1→50), ignite it until the incineration is complete. If the incineration is incomplete, moisten the residue with a small quantity of nitric acid, heat to the incineration. Cool, dissolve it in 5 ml of hydrochloric acid by heating on a water bath, add 23 ml of water, carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0004%.

Cottonseed oil Mix 5 ml in a test tube with a mixture of equal volumes of pentanol and 1% solution of sulfur in carbon disulfide. Place the test tube in a saturated sodium chloride water bath, warm the mixture carefully, when no foam is produced (carbon disulfide has been expelled), heat it for 15 minutes, no red colour develops.

Fatty acid composition Carry out the method for gas chromatography (Appendix V E), using a column packed with 12% polyethylene-glycol succinate as the stationary phase, and maintain the column temperature at 175°C, the number of the theoretical plates of the column is not less than 1300, calculated with reference to the peak of linoleate.

Test solution Place 20 mg in a 10 ml test tube with stopper. Add 2 ml of 0.5 mol/L methanolic potassium hydroxide solution, saponify the fatty acid for about 15 minutes in the water bath at 65°C until the oleosome is dissolved. Cool, add 2 ml of 15% methanolic boron trifluoride, esterify the fatty acid for 2 minutes in the water bath at 65°C. Cool, add 2 ml of *n*-hexane, shake well, add 2 ml of saturated sodium

chloride solution. Use the upper layer.

Procedure Inject 1 µl of the upper layer into the column, record the chromatogram. The order of elution is palmitate, stearate, oleate, linoleate and linolenate, and their relative areas, expressed as percentages of the total area of the 5 main peaks, are in the ranges 7.0%-14.0%, 1.0%-6.0%, 18.0%-30.0%, 44.0%-62.0% and 4.0%-11.0%.

Microbial limit test Complies with the requirements for microbial limit test (Appendix XI J).

Category Pharmaceutical aid.

Storage Preserve in well closed containers, protected from light, stored in a cool and dark place.

Sparfloxacin

$C_{19}H_{22}F_2N_4O_3$ 392.41

Sparfloxacin is 5-amino-1-cyclopropyl-7-[(cis-3,5-dimethyl-1-piperazinyl)-6,8-difluoro-1,4-dihydro-4-oxo-3-quinolinecarboxylic acid. It contains not less than 98.5% and not more than 102.0% of $C_{19}H_{22}F_2N_4O_3$, calculated on the dried basis.

Description A yellow crystalline powder; odourless; taste, bitter.

Sparingly soluble in chloroform; slightly soluble in acetonitrile, methanol or ethyl acetate; very slightly soluble in ethanol; practically insoluble in water; soluble in 0.1 mol/L sodium hydroxide solution; sparingly soluble in glacial acetic acid.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of sparfloxacin CRS in the chromatogram.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of sparfloxacin (Appendix XVI).

Light absorption The light absorption of a solution of 0.4 mg per ml in 0.1 mol/L sodium hydroxide solution at 440 nm (Appendix IV A) is not greater than 0.15.

Related substances Carry out the method as described under Assay. Dissolve a quantity in methanol to produce solutions containing (1) 0.2 mg per ml and (2) 2 µg per ml, respectively. Inject 20 µl of solution (2) into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 15%-20% of full scale of the chart. Inject separately 20 µl each of solution (1) and (2) into the column, and record the chromatogram for twice the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Toluene and pyridine Dissolve about 0.5 g, accurately weighed, in 5 ml of 2% sodium hydroxide solution in headspace vial and seal as the test solution. Dilute a quantity

of toluene and pyridine, accurately weighed, with 2% sodium hydroxide solution to produce a mixed solution containing 89 µg of toluene and 20 µg of pyridine per ml. Measure accurately 5 ml to a headspace vial and seal as the reference solution. Carry out the method for residual solvents (Appendix VIII P), using a capillary column packed with polyethylene glycol (PEG-20M) (or stationary phase with similar polarity), maintaining the temperature of the column at 60°C for 5 minutes, then raising the temperature at a rate of 20°C per minute to 150°C and maintaining at 150°C for 6 minutes; maintaining the temperature of the injection port at 200°C and that of the flame-ionisation detector (FID) at 230°C. The static head-space injection conditions may be used as follows: equilibration temperature is 85°C, equilibration time is 30 minutes and injection volume is 1.0 ml. Inject the reference solution into the column and record the chromatogram. The resolution factor between the principal peaks complies with the related requirements. Inject separately the test solution and the reference solution into the column and record the chromatograms. Calculate the content of toluene and pyridine respectively with respect to the peak area obtained in the chromatograms by the external standard method, the contents of toluene and pyridine comply with the relevant requirements.

Chloroform Dissolve about 0.5 g, accurately weighed, in 5 ml of 2% sodium hydroxide solution in headspace vial and seal as the test solution. Dilute a quantity of chloroform, accurately weighed, with 2% sodium hydroxide solution to produce a solution containing 6 µg of chloroform per ml. Measure accurately 5 ml to a headspace vial and seal as the reference solution. Carry out the method for residual solvents (Appendix VIII P), using a capillary column packed with polyethylene glycol (PEG-20M) (or stationary phase with similar polarity), maintaining the temperature of the column at 60°C for 10 minutes, then raising the temperature at a rate of 20°C per minute to 150°C and maintaining at 150°C for 5 minutes; maintaining the temperature of the injection port at 200°C and that of the flame-ionisation detector (FID) at 230°C. The static head-space injection conditions may be used as follows: equilibration temperature is 75°C, equilibration time is 20 minutes and injection volume is 1.0 ml. Inject the reference solution into the column and record the chromatogram. The resolution factor between the peaks complies with the relevant requirements. Inject separately the test solution and the reference solution into the column and record the chromatograms. Calculate the content of chloroform with respect to the peak area obtained in the chromatograms by the external standard method, the content of chloroform complies with the relevant requirement.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N), using 1.0 g in a platinum crucible.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for residue on ignition; not more than 0.002%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of phosphate BS (Dissolve 6.8 g of potassium dihydrogen phosphate and 3.0 ml of triethylamine in 1000 ml of water and mix well)-methanol (43 : 57) (adjust pH value to 2.5 with phosphoric acid) as the mobile phase. Detection wavelength is 298 nm and the number of theoretical plates of the column is not less than 2500, calculated with reference to the peak of sparfloxacin.

Procedure Dissolve about 50 mg, accurately weighed,

with a quantity of methanol in a 100 ml volumetric flask and dilute to volume, mix well. Transfer accurately measured 2 ml of the solution into a 25 ml volumetric flask, dilute with mobile phase to volume and mix well. Inject 20 µl into the column. Repeat the operation, using sparfloxacin CRS instead of the substance being examined. Calculate the content of $C_{19}H_{22}F_2N_4O_3$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Quinolones antibiotic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Sparfloxacin Tablets
(2) Sparfloxacin Capsules

Sparfloxacin Capsules

Sparfloxacin Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of sparfloxacin ($C_{19}H_{22}F_2N_4O_3$).

Description The contents are yellow granules, powder or crystalline powder.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of sparfloxacin CRS in the chromatogram.

(2) Dissolve a quantity of contents in 0.1% sodium hydroxide solution to produce a solution of 7.5 µg of sparfloxacin per ml, filter. The light absorption of the filtrate exhibits a maximum at 291 nm (Appendix IV A).

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of acetic acid-sodium acetate BS (pH 4.5) as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw the solution at exact 45 minutes and filter. Dilute 3 ml of the successive filtrate, accurately measured, with the dissolution medium in a 50 ml of volumetric flask and dilute to volume, mix well. Dissolve sparfloxacin CRS in the dissolution medium to produce a solution of about 6 µg per ml. Measure the absorbances of the resulting solutions at 291 nm (Appendix IV A). Calculate the dissolved amount of $C_{19}H_{22}F_2N_4O_3$ from each capsule. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Dissolve a quantity of the mixed contents in the test for weight variation of contents, equivalent to about 50 mg of sparfloxacin, with a quantity of methanol in a 100 ml volumetric flask and dilute to volume, mix well and filter. Transfer accurately measured 2 ml of the successive filtrate into a 25 ml volumetric flask, dilute with mobile phase to volume and mix well. Carry out the method for Assay described under Sparfloxacin.

Category As described under Sparfloxacin.

Strength 0.1 g

Storage Preserve in tightly closed containers, protected from light.

Sparfloxacin Tablets

Sparfloxacin Tablets contain not less than 90.0%

and not more than 110.0% of the labelled amount of sparfloxacin ($C_{19}H_{22}F_2N_4O_3$).

Description Pale yellow or yellow tablets, or film coated tablets with yellow core.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of sparfloxacin CRS in the chromatogram.

(2) Dissolve a quantity of powdered tablets in 0.1% sodium hydroxide solution to produce a solution of 7.5 µg of sparfloxacin per ml, filter. The light absorption of the successive filtrate exhibits a maximum at 291 nm (Appendix IV A).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of acetic acid-sodium acetate BS (pH 4.5) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw the solution at exact 45 minutes and filter. Dilute 3 ml of the successive filtrate, accurately measured, with the dissolution medium in a 50 ml of volumetric flask and dilute to volume, mix well. Dissolve sparfloxacin CRS in the dissolution medium to produce a solution of about 6 µg per ml. Measure the absorbances of the resulting solutions at 291 nm (Appendix IV A). Calculate the dissolved amount of $C_{19}H_{22}F_2N_4O_3$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Dissolve an accurately weighed quantity of powdered tablets equivalent to about 50 mg of sparfloxacin, with a quantity of methanol in a 100 ml volumetric flask and dilute to volume, mix well and filter. Transfer accurately measured 2 ml of the successive filtrate into a 25 ml volumetric flask, dilute with mobile phase to volume and mix well. Carry out the method for Assay described under Sparfloxacin.

Category As described under Sparfloxacin.

Strength 0.1 g

Storage Preserve in tightly closed containers, protected from light.

Spectinomycin Hydrochloride

$C_{14}H_{24}N_2O_7 \cdot 2HCl \cdot 5H_2O$ 495.35 [22189-32-8]

Spectinomycin Hydrochloride is [2R-(2α, 4aβ, 5aβ, 6β, 7β, 8β, 9α, 9αa, 10aβ)]-decahydro-4a,7,9-trihydroxy-2-methyl-6,8-bis(methylamino)-4H-pyrano[2,3-b][1,4] benzodioxin-4-one di-hydrochloride pentahydrate. It has a potency of not less than 779 Spectinomycin Units per mg, calculated on the anhydrous basis.

Description A white or almost white crystalline powder. Freely soluble in water; practically insoluble in ethanol, chloroform or ether.

Specific optical rotation +15° to +21°, in a solution of 100 mg per ml in water (Appendix VI E).

Identification (1) The infrared absorption spectrum (Appendix IV C) is concordant with the spectrum of spectinomycin (Appendix XVI).

(2) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Crystallinity Complies with the test for Crystallinity (Appendix IX D).

Acidity An aqueous solution of 10 mg per ml, pH 3.8-5.6 (Appendix VI H).

Clarity and colour of solution Dissolve 0.75 g each of 5 portions in 5 ml water respectively, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₆ (Appendix IX A, method 1).

Related substances Carry out the method for thin layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of n-propanol-water-glacial acetic acid-pyridine (50 : 40 : 5 : 5) as the mobile phase. Develop the plate with mobile phase over 12 cm previously. Apply separately to the plate 10 µl each of two solutions in water containing (1) 20 mg per ml and (2) 0.2 mg per ml of the substance being examined. After developing and removal of the plate, allow it to dry in air and spray with 0.5% potassium permanganate solution. Any secondary spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Water 16.0%-20.0% (Appendix VIII M, method 1).

Residue on ignition Not more than 1.0% (Appendix VIII N).

Consistence A suspension of 2 g per 3.2 ml in Phenylmethanol Injection passes readily through a No. 7 hypodermic needle without blockage.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.09 EU per 1000 Spectinomycin Units.

Sterility Dissolve a quantity in 500 ml of 0.9% sterile Sodium Chloride Solution, the solution complies with the test for sterility (Appendix XI H, membrane filtration method).

Assay Carry out the Microbiological Assay of Antibiotics (Appendix XI A), using a solution of about 1000 Units per ml in sterile phosphate BS (pH 7.0). 1000 Spectinomycin Units is equivalent to 1 mg of $C_{14}H_{24}N_2O_7$.

Category Aminoglycoside antibiotics.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation Spectinomycin Hydrochloride for Injection

Spectinomycin Hydrochloride for Injection

Spectinomycin Hydrochloride for Injection is a sterile powder of spectinomycin hydrochloride. It has a potency of not less than 779 Spectinomycin Units per mg, calculated on the anhydrous basis; It contains not less than 90.0% and not more than

110.0% of the labelled amount of spectinomycin ($C_{14}H_{24}N_2O_7$).

Description A white or almost white crystalline powder.

Identification Complies with the tests for Identification described under Spectinomycin Hydrochloride.

Suspending and consistence Add 3.2 ml of Phenylmethanol Injection to one container, shake thoroughly to obtain a suspension, allow it to stand for 2 minutes; neither sediment is produced nor the suspension is separated distinctly into layers. The suspension passes readily through a No. 7 hypodermic needle without blockage.

Clarity and colour of solution To each of 5 containers add water to produce solutions of 0.12 g per ml according to the labelled amount respectively, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₆ (Appendix IX A, method 1).

Acidity, Related substances, Water, Bacterial endotoxin, and Sterility Comply with the corresponding requirements described under Spectinomycin Hydrochloride.

Other requirements Comply with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Spectinomycin Hydrochloride, using an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents.

Category As described under Spectinomycin Hydrochloride.

Strength Calculated as $C_{14}H_{24}N_2O_7$
2 g (2000000 Units)

Storage Preserve in tightly closed containers, stored in a dry place.

Spironolactone

$C_{24}H_{32}O_4S$ 416.57

[52-01-7]

Spironolactone is 17β-hydroxy-7α-acetylsulfanyl-3-oxo-17α-pregn-4-ene-21-carboxylic acid acetate. It contains not less than 97.0% and not more than 103.0% of $C_{24}H_{32}O_4S$, calculated on the dried basis.

Description A white or almost white crystalline powder, with a faint odour of thiols.

Very soluble in chloroform; freely soluble in benzene or ethyl acetate; soluble in ethanol; insoluble in water.

Melting range 203-209°C, with decomposition (Appendix VI C).

Specific optical rotation -33° to -37° , in a solution of 10 mg per ml in chloroform (Appendix VI E), calculated on the dried basis.

Identification (1) To 10 mg add 2 ml of sulfuric acid and

mix well; the solution is orange yellow in colour, with a strong yellowish-green fluorescence, changes to scarlet on gentle warming, and hydrogen sulfide is evolved which blackens moist lead acetate test paper. Pour the solution into 10 ml of water, a yellowish-green emulsion is formed.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of spironolactone (Appendix XVI).

Crystal fineness Place the crystals on a slide, add 1 drop of water and cover it with a cover glass. Examine under a microscope equipped with eyepiece micrometer, shift the slide to a position where the crystals in the visual field are found to be evenly distributed, count the number of crystals above and below 10 μm in size, not less than 90% of the crystals below 10 μm in size.

Mercapto compounds Dissolve 2.0 g in 30 ml of water and filter. To 15 ml of the filtrate add starch IS and titrate with iodine (0.005 mol/L) VS. Perform a blank determination and make any necessary correction. The volume of iodine (0.005 mol/L) VS consumed is not more than 0.10 ml.

Related substances Carry out the method for thin layer chromatography (Appendix V B), using silica gel G as the coating substance and butyl acetate as the mobile phase. Apply separately to the plate 5 μl each of two solutions of the substance being examined in chloroform containing (1) 20 mg per ml and (2) 0.20 mg per ml. After developing and removal of the plate, dry in air and repeat the process once more, spray with a 10% solution of sulfuric acid in methanol and dry at 105°C for 10 minutes. Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Assay Dissolve an accurately weighed quantity in dehydrated ethanol to produce a solution of about 10 μg per ml, measure the absorbance at 238 nm (Appendix IV A). Calculate the content of $C_{24}H_{32}O_4S$, taking 471 as the value of A (1%, 1 cm).

Category Diuretic.

Storage Preserve in tightly closed containers.

Preparation (1) Spironolactone Capsules
(2) Spironolactone Tablets

Spironolactone Capsules

Spironolactone Capsules contain not less than 93.0% and not more than 107.0% of the labelled amount of spironolactone ($C_{24}H_{32}O_4S$).

Identification Shake a quantity of the contents equivalent to about 0.1 g of spironolactone with 5 ml of chloroform, filter, evaporate the filtrate to dryness on a water bath. The residue complies with tests for Identification described under Spironolactone.

Related substances Shake a quantity of the contents equivalent to about 0.2 g of spironolactone with 10 ml of chloroform, filter, use the filtrate as test solution. Measure accurately 1 ml to a 100 ml volumetric flask, dilute with chloroform to volume and mix well, use the resulting solution as reference solution. Carry out the test for Related substances described under Spironolactone. It complies with the requirement.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 1000 ml of 0.1 mol/L hydrochloric acid solution containing 0.1% of sodium lauryl sulfate as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm, withdraw 10 ml of the solution at exact 60 minutes and filter. Transfer 5 ml of the successive filtrate, accurately measured, to a 10 ml volumetric flask, dilute to volume with the dissolution medium and mix well. Measure the absorbance of the resulting solution at 242 nm (Appendix IV A); dissolve about 20 mg of spironolactone CRS, accurately weighed, in 2 ml of ethanol in a 200 ml volumetric flask, dilute to volume with the dissolution medium, mix well, transfer 5 ml of the solution, accurately measured, to a 50 ml volumetric flask, dilute to volume with the dissolution medium and mix well. Measure the absorbance in the same manner. Calculate the dissolution of $C_{24}H_{32}O_4S$ from each capsule. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Shake an accurately weighed quantity of the mixed contents obtained in the test for Weight variation of contents equivalent to about 10 mg of spironolactone in a 100 ml volumetric flask with a quantity of dehydrated ethanol, dilute to volume with the same solvent, mix well and filter. Measure accurately 5 ml of the successive filtrate to a 50 ml volumetric flask, dilute with dehydrated ethanol to volume and mix well. Measure the absorbance of the resulting solution at 238 nm (Appendix IV A), calculate the content of $C_{24}H_{32}O_4S$, taking 471 as the value of A (1%, 1 cm).

Category As described under Spironolactone.

Strength 20 mg

Storage Preserve in tightly closed containers and stored in dry place.

Spironolactone Tablets

Spironolactone Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of spironolactone ($C_{24}H_{32}O_4S$).

Description White tablets.

Identification Extract a quantity of finely powdered tablets equivalent to 0.1 g of spironolactone with 5 ml of chloroform and filter. Evaporate the filtrate to dryness on a water bath and dry the residue at 105°C. It complies with the tests for Identification described under Spironolactone.

Related substances Extract a quantity of finely powdered tablets equivalent to 0.20 g of spironolactone, accurately weighed, with 10 ml of chloroform, filter (solution 1). Measure accurately 1 ml of this solution into a 100 ml volumetric flask and dilute with chloroform to volume (solution 2). Carry out the test for related substance described under Spironolactone, the same result is obtained.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 1000 ml of 0.1 mol/L hydrochloric acid solution containing 0.1% of sodium lauryl sulfate as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm, withdraw 10 ml of the solution at exact 60 minutes and filter. Transfer 5 ml of the successive filtrate, accurately measured, to a 10 ml volumetric flask, dilute to volume with the dissolution medium and mix well. Measure the absorbance of the resulting solution at 242 nm (Appendix IV A); dissolve about 20 mg of spironolactone

CRS, accurately weighed, in 2 ml of ethanol in a 200 ml volumetric flask, dilute to volume with the dissolution medium, mix well, transfer 5 ml of the solution, accurately measured, to a 50 ml volumetric flask, dilute to volume with the dissolution medium and mix well. Measure the absorbance in the same manner. Calculate the dissolution of $C_{24}H_{32}O_4S$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Weigh accurately a quantity of the powder, equivalent to 10 mg of spironolactone, into a 100 ml volumetric flask, add dehydrated ethanol to volume and shake thoroughly. Filter, transfer 5 ml of the successive filtrate, accurately measured, to a 50 ml volumetric flask, add dehydrated ethanol to volume and mix well. Measure the absorbance of the resulting solution at 238 nm (Appendix IV A). Calculate the content of $C_{24}H_{32}O_4S$, taking 471 as the value of A (1%, 1 cm).

Category As described under Spironolactone.

Strength 20 mg

Storage Preserve in tightly closed containers, stored in a dry place.

Stanozolol

$C_{21}H_{32}N_2O$ 328.48

[10418-08-3]

Stanozolol is 17-methyl-2'-H-5 α -androst-2-en-3,20-dione pyrazol-17 β -ol. It contains not less than 96.0% of $C_{21}H_{32}N_2O$, calculated on the dried substance.

Description A white crystalline powder; odourless. Sparingly soluble in ethanol or chloroform; slightly soluble in ethyl acetate or acetone; very slightly soluble in benzene; practically insoluble in methanol or water.

Specific optical rotation +34° to +40°, in a solution of 20 mg per ml in dehydrated ethanol (Appendix VI E).

Identification (1) To about 2 mg add 3 ml of *p*-dimethylaminobenzaldehyde TS, a yellow colour is produced, and a yellowish-green fluorescence is exhibited under the ultraviolet light (365 nm).

(2) The light absorption of a solution of 0.04 mg per ml in dehydrated ethanol exhibits a maximum at 224 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of stanozolol (Appendix XVI).

Related substances Carry out the method for thin-layer chromatography (Appendix V D), using silica gel G as the coating substance and a mixture of chloroform-methanol (9 : 1) as the mobile phase. Apply separately to the plate 10 μ l of solution in a mixture of chloroform-methanol (19 : 1) (1) containing 15 mg of the substance being examined per ml and 7.5 μ l of solution (2) containing 0.6 mg per ml. After developing and removal the plate, dry in air, spray

with a 20 % of sulfuric acid solution and heat for 15 minutes at 100°C. Any spot other than the principal spot obtained in the chromatogram with solution (1) is not more intense than the principal spot with solution (2) (3.0%).

Loss on drying When dried to constant weight at 105°C, loses not more than 3.0 % of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1 % (Appendix VIII N).

Assay Dissolve about 0.5 g, accurately weighed, in 25 ml of glacial acetic acid by heating, allow to cool, add a drop of crystal violet TS, and titrate with perchloric acid (0.1 mol/L) VS to a green endpoint. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 32.85 mg of $C_{21}H_{32}N_2O$.

Category Anabolic steroid.

Storage Preserve in tightly closed container, protected from light.

Preparation Stanozolol Tablets

Stanozolol Tablets

Stanozolol Tablets contain not less than 90% and not more than 110% of the labelled amount of stanozolol ($C_{21}H_{32}N_2O$).

Description White tablets.

Identification Boil a quantity of powdered tablets, equivalent to about 2 mg of stanozolol, with 5 ml of ethanol, filter, and evaporate on a water bath to dryness. Add 3 ml of *p*-dimethylaminobenzaldehyde TS to the residue; a yellow colour develops, which exhibits a green fluorescence under ultraviolet light (365 nm).

Content uniformity Comply with the requirements (Appendix X E) with a limit of $\pm 20\%$. Disintegrate a tablet in a 25 ml volumetric flask with 0.5 ml of water by shaking. Add about 20 ml of ethanol, heat on a water bath with occasional swirling for 10 to 15 minutes, then cool, dilute with ethanol to volume and mix well. Filter, taking precautions to minimize evaporation, and proceed as directed in the Assay, beginning at the words "Transfer 5 ml of the filtrate".

Dissolution Carry out the dissolution test (Appendix X C, method 3), using 250 ml of hydrochloric acid (9→1000) as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm, withdraw the solution at exact 45 minutes and filter, use the successive filtrate as the test solution. Dissolve 20 mg stanozolol CRS, accurately measured in a 50 ml volumetric flask, add 15 ml ethanol, warm the solution in water bath, cool, add 5.0 ml 1.0 mol/L hydrochloric acid solution, and add water to volume, mix well. Transfer 2 ml of the solution, accurately measured, into a 100 ml volumetric flask, add hydrochloric acid (9→1000) to volume and mix well as reference solution freshly prepared. Measure the absorbances of the resulting solutions at 230 nm. Calculate the dissolution of $C_{21}H_{32}N_2O$ from each tablets. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To an accurately weighed quantity of the powder equivalent to about 8 mg of stanozolol in a 100 ml volumetric flask add 70 ml of

ethanol and heat in a hot water bath with constant shaking for 30 minutes. Cool, dilute with ethanol to volume, mix well. Filter, transfer 5 ml of the filtrate to a 10 ml volumetric flask, dilute to volume with ethanolic solution of hydrochloric acid (1.6→100) and mix well to prepare the acidic test solution. Transfer another 5.0 ml of the filtrate to another 10 ml volumetric flask, dilute to volume with ethanol to prepare the blank solution, measure the absorbance at 235 nm (Appendix IV A). Repeat the operation, using stanozolol CRS instead of the substance being examined. Calculate the content of $C_{21}H_{32}N_2O$.

Category As described under Stanozolol.

Strength 2 mg

Storage Preserve in tightly closed containers, protected from light.

Streptomycin Sulfate

$(C_{21}H_{39}N_7O_{12})_2 \cdot 3H_2SO_4$ 1457.40 [3810-74-0]

Streptomycin Sulfate is *O*-2-deoxy-2-(methyl-amino)- α -L-glucopyranosyl-(1→2)-*O*-5-deoxy-3-*C*-formyl- α -L-lyxofuranosyl-(1→4)-*N*¹,*N*³-bis (aminoimino-methyl)-D-streptamine sulfate(2 : 3)(salt). It has a potency of not less than 720 Streptomycin Units per mg, calculated on the dried basis.

Description A white, or almost white powder; odourless or almost odourless; taste, slightly bitter; hygroscopic. Freely soluble in water; insoluble in ethanol or chloroform.

Identification (1) Dissolve 0.5 mg in 4 ml of water, add 2.5 ml of sodium hydroxide TS and 1 ml of a 0.1% solution of 8-hydroxyquinoline in ethanol, cool to about 15°C and add 3 drops of sodium hypobromite TS; an orange-red colour is produced.

(2) Dissolve 20 mg in 5 ml of water, add 0.3 ml of sodium hydroxide TS, heat on a water bath for 5 minutes and add 0.5 ml of ferric ammonium sulfate solution prepared by dissolving 0.1 g of ferric ammonium sulfate in 5 ml of 0.5 mol/L sulfuric acid solution, a purplish red colour is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the spectrum of streptomycin sulfate (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of sulfates (Appendix III).

Acidity Dissolve a quantity in water to produce a solution of

200000 Units per ml, pH 4.5-7.0 (Appendix VI H).

Clarity and colour of solution Dissolve each 1.5 g of 5 portions in 5 ml of water the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 2 (Appendix IX B); any colour produced is not more intense than that of reference solution 5 (Appendix IX A, method 1).

Sulfates Dissolve about 0.25 g, accurately weighed, in 100 ml of water and adjust the solution to pH 11 using ammonia TS. Add 10 ml of barium chloride (0.1 mol/L) VS and 5 drops of phthalein purple IS. Titrate with disodium edetate (0.1 mol/L) VS, make sure to keep the pH value 11 during the titration, add 50 ml of ethanol when the colour of the solution begins to change, and continue the titration until the bluish-purple colour disappears. Perform a blank determination and make any necessary correction. Each ml of barium chloride (0.1 mol/L) VS is equivalent to 9.606 mg of sulfate (SO_4). The content of SO_4 is 18.0%-21.5%, calculated on the dried basis.

Streptomycin B Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the a mixture of coating substance and toluene-acetate-methanol (50 : 25 : 25) as the mobile phase. Weigh accurately about 0.25 g to a circumfluence flask, dissolve in a 5 ml freshly prepared solution of sulfuric acid-methanol (3 : 97) then heat and circumfluence for 1 hour. Cool, flush the condenser with methanol and amalgamate the wash solution and dilute the solution to 10 mg per ml by methanol as the test solution. Weigh accurately about 36 mg of mannose CRS to a circumfluence flask, use the same method to produce a solution containing 72 μg per ml as the reference solution. Apply separately to the plate 10 μl . After developing and removal of the plate, allow to dry in air. Spray with a developer freshly prepared (a mixture solution of equivalent volume of 0.2% 1,3-hydronaphthoquinone ethanol solution and 20% sulfuric acid, heat it at 110°C for several minutes. Any spot obtained with test solution is not more intense than the principal spot obtained with reference solution (3.0%).

Loss on drying When dried over phosphorus pentoxide in vacuum at 60°C for 4 hours, loses not more than 6.0% of its weight (Appendix VIII L).

Undue toxicity Complies with the test for undue toxicity (Appendix XI C), using a solution of 2600 Units per ml in Sodium Chloride Injection, injected intravenously and observed for 24 hours.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.25 EU per 1000 Streptomycin Units.

Sterility Carry out the test for sterility (Appendix XI H, membrane filtration method), each portion add not less than 500 ml of 0.9% sterile sodium chloride solution. Concomitantly transfer 0.25-0.5 ml of a solution of 20000 Units per ml to each of six tubes containing 10 ml of a 0.5% glucose broth; incubate three tubes at 30-35°C and the remainder at 20-25°C. All the results comply with the requirement.

Assay Dissolve a quantity, accurately weighed, in sterile water to prepare a solution of 1000 Units per ml and carry out the Microbiological Assay of Antibiotics (Appendix XI A). 1000 Streptomycin Units are equivalent to 1 mg of $\text{C}_{21}\text{H}_{39}\text{N}_7\text{O}_{12}$.

Category Aminoglycoside antibiotic.

Storage Preserve in hermetically sealed containers, stored in a dry place.

Preparation Streptomycin Sulfate for Injection

Streptomycin Sulfate for Injection

Streptomycin Sulfate for Injection is a sterile powder of Streptomycin Sulfate. It has a potency of not less than 720 Streptomycin Units per mg, calculated on the dried basis. It contains not less than 93.0% and not more than 107.0% of the labelled potency of streptomycin ($\text{C}_{21}\text{H}_{39}\text{N}_7\text{O}_{12}$), calculated on the basis of the average weight of contents.

Description A white, or almost white powder.

Identification Complies with the tests for Identification described under Streptomycin Sulfate.

Clarity and colour of solution Add water to each of 5 containers to produce solutions of 200000 Units per ml, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 2 (Appendix IX B); any colour produced is not more intense than that of reference solution 7 (Appendix IX A, method 1).

Loss on drying When dried in vacuum over phosphorus pentoxide at 60°C for 4 hours, loses not more than 7.0% of its weight (Appendix VIII L).

Acidity, Streptomycin B, Undue toxicity, Bacterial endotoxin and Sterility Complies with the corresponding requirements described under Streptomycin Sulfate.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Streptomycin Sulfate, using an accurately weighed quantity of the mixed contents obtained from the test for weight variation of contents.

Category As described under Streptomycin Sulfate.

Strength (1) 0.75 g (750000 Units)
(2) 1 g (1000000 Units)
(3) 2 g (2000000 Units)
(4) 5 g (5000000 Units)

Storage Preserve in tightly closed containers, stored in a dry place.

Strophanthin K

Strophanthin K is a mixture of different kinds of Glycosides made from the dried ripe seed of *Strophanthus kombe* Oliv. (Fam. Apocynaceae). The potency of each mg is equivalent to 0.4-0.5 mg of Strophanthin G standard (calculated on the anhydrous basis).

Description A white or slightly yellow powder; deteriorates on exposure to light.

Soluble in water or 90% ethanol; very slightly soluble in chloroform; practically insoluble in ether or benzene.

Identification (1) Dissolve in a mixture of sulfuric acid and water (4 : 1); a green colour is produced (distinction from strophanthin G).

(2) Dissolve about 50 mg in 5 ml of water, add 2 ml of

tannic acid TS; a deposit is formed.

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight, loses not more than 3.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 1.0% (Appendix VIII N).

Assay *Standard solution* Weigh rapidly and accurately a quantity of strophanthin G standard, calculated on anhydrous basis of the labelled potency. To every 1 mg add 4 ml of water.

Before use, dilute the standard solution, accurately measured, with sodium chloride injection so that the mean lethal dose of the diluted solution will be 25-34 ml per kg of pigeon's body weight (usually 1→40-60).

Test solution To a quantity of substance being examined, accurately weighed, add a quantity of water to produce a solution of 0.5 mg per ml. Before use, dilute the test solution as described under standard solution.

Procedure Carry out the biological assay of digitalis (Appendix XIII K), it complies with the requirement for potency.

Category Cardiotonic glycoside.

Storage Preserve in tightly closed containers, protected from light.

Preparation Strophanthin K Injection

Strophanthin K Injection

Strophanthin K Injection is a sterile solution of strophanthin K in Water for Injection. It has a potency of not less than 83% and not more than 120% of the labelled potency.

Description A clear, colourless or slightly yellow liquid; deteriorates on exposure to light.

Identification Evaporate the injection to dryness, the residue complies with the tests for Identification described under Strophanthin K.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Accurately measure a quantity of the injection, carry out the Assay described under Strophanthin K.

Category As described under Strophanthin K.

Strength (1) 1 ml : 0.25 mg (2) 2 ml : 0.5 mg

Storage Preserve in well closed containers, protected from light.

Strychnine Nitrate

$C_{21}H_{22}N_2O_2 \cdot HNO_3$ 397.44

[66-32-0]

Strychnine Nitrate is strychnidin-10-one mononitrate, contains not less than 99.0% of $C_{21}H_{22}N_2O_2 \cdot HNO_3$.

Description Colourless needle or a white crystalline powder; odourless; taste, very bitter. Freely soluble in boiling water; sparingly soluble in water; slightly soluble in ethanol or chloroform; insoluble in ether.

Identification (1) Dissolve about 0.5 mg in 1 drop of sulfuric acid in an evaporating dish, add 1 grain of potassium dichromate crystals, a violet colour is produced around. (2) The aqueous solution yields the reactions characteristic of nitrates (Appendix III).

Acidity Dissolve 0.5 g in 25 ml of water, add 1 drop of methyl red IS and 0.5 ml of sodium hydroxide (0.02 mol/L) VS, a yellow colour is produced.

Bucine To about 0.1 g add 1 ml of a mixture of nitric acid and water (1 : 1), no red or pale reddish brown colour is produced, except a yellow colour.

Residue on ignition Not more than 0.1 % (Appendix VIII N).

Assay Shake thoroughly and dissolve about 0.3 g, accurately weighed, in 20 ml of glacial acetic acid. Carry out the method for potentiometric titration, titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 397.44 mg of $C_{21}H_{22}N_2O_2 \cdot HNO_3$.

Category Central stimulant.

Storage Preserve in tightly closed container, protected from light.

Preparation Strychnine Nitrate Injection

Strychnine Nitrate Injection

Strychnine Nitrate Injection is a sterile solution of Strychnine Nitrate in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of strychnine nitrate ($C_{21}H_{22}N_2O_2 \cdot HNO_3$).

Description A clear, colourless liquid.

Identification (1) Evaporate a few drops to dryness in an evaporating dish, add 1 drop of sulfuric acid, and 1 grain of potassium dichromate crystals, a violet colour is produced around.

(2) To 1 drop add 1 drop of diphenylamine TS in a porcelain dish, a blue colour is produced.

pH value 3.0-4.5 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity and add water to produce a solution of about 16 µg per ml, measure the absorbance at 254 nm (Appendix IV A). Calculate the content of $C_{21}H_{22}N_2O_2 \cdot HNO_3$, taking 316 as the value of A (1%, 1 cm).

Category As described under Strychnine nitrate.

Strength (1) 1 ml : 1 mg (2) 1 ml : 2 mg

Storage Preserve in tightly closed containers, protected from light.

Sublimed Sulfur

S 32.06

[7704-34-9]

Sublimed Sulfur contains not less than 98.0% of S.

Description A yellow crystalline powder; odour, slight. Practically insoluble in water or ethanol.

Identification (1) Burn with a blue flame and a characteristic odour of sulfur dioxide.

(2) Melt at about 115°C to a yellow liquid; turns to a deep colour and thick liquid at about 160°C.

Acidity Shake 1.0 g with 25 ml of freshly boiled and cooled water, add a few drops of phenolphthalein IS and 0.10 ml of sodium hydroxide (0.1 mol/L) VS, a pink colour is produced.

Particle Size Sift 10.0 g through a No. 8 sieve, any masses may be pressed gently to powder if necessary, then sift. Not less than 85.0% of the powder passes through the sieve.

Residue on ignition Not more than 0.2% (Appendix VIII N).

Arsenic Immerse 0.50 g in 15 ml of ammonia TS for 3 hours and filter. Evaporate 5 ml of the filtrate on a water bath to dryness, add 1 ml of nitric acid and evaporate to dryness again. Add 5 ml of hydrochloric acid and 23 ml of water, carry out the limit test for arsenic (Appendix VII J, method 1); complies with the requirement (0.0012%).

Assay Weigh accurately about 35 mg, previously dried over phosphorous pentoxide for 4 hours, carry out the method for oxygen flask combustion (Appendix VII C), using 5 ml of hydrogen peroxide TS and 10 ml of water as the absorbing liquid. When the combustion is complete, cool the combustion flask in ice bath with frequent shaking for 20 minutes. When the fumes produced is completely absorbed, boil the solution for 2 minutes, cool to room temperature, add 2 drops of phenolphthalein IS and titrate with sodium hydroxide (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 1.603 mg of S.

Category Insecticide.

Storage Preserve in tightly closed containers.

Preparation Sulfur Ointment

Sulfur Ointment

Sulfur Ointment contains not less than 9.0% and not more than 11.0% of sulfur (S).

Description Yellow ointment; odour, characteristic of sulfur.

Other requirements Complies with the general requirements for ointment (Appendix I F).

Assay Heat about 0.5 g, accurately weighed, with 40 ml of 5% sodium sulfite solution under reflux for about 1.5 hours until the sulfur is completely dissolved. Cool and allow the ointment base to solidify, filter. Wash the residue with 30 ml of hot water, cool, filter, and repeat the washing operation for several times. Combine the filtrate and washings, add 10 ml of formaldehyde TS and 6 ml of acetic acid, dilute to 150 ml with water, add starch IS and titrate with iodine (0.05 mol/L) VS. Each ml of iodine (0.05

mol/L) VS is equivalent to 3.206 mg of S.

Category Insecticide.

Storage Preserve in well closed containers, stored at a temperature below 30°C.

Sucralfate

C₁₂H₂₂Al₁₆O₈S₈

[54182-58-0]

Sucralfate is sucrose octakis (hydrogen sulfate) aluminium complex. It contains not less than 18.0% and not more than 22.0% of Al and not less than 8.5% and not more than 12.5% of S, calculated on the dried basis.

Description A white or almost white powder; odourless; almost tasteless; hygroscopic.

Practically insoluble in water, ethanol or chloroform, freely soluble in dilute hydrochloric acid or dilute sulfuric acid; sparingly soluble in dilute nitric acid.

Identification (1) Dissolve about 0.1 g in 1 ml of dilute hydrochloric acid by boiling, cool, neutralize with sodium hydroxide TS and add slowly to warm alkaline cupric tartrate TS, a red cuprous oxide precipitate is produced.

(2) Dissolve 0.1 g in 1 ml of dilute hydrochloric acid, add barium chloride TS and filter if a precipitate is produced. Boil the filtrate, a lot of white precipitate is produced.

(3) Dissolve 0.1 g in 1 ml of dilute hydrochloric acid, make alkaline with ammonia hydroxide TS, boil and filter. Dissolve the precipitate in hydrochloric acid, the solution yields the reactions characteristic of aluminium salts (Appendix III).

Neutralizing capacity To about 0.5 g, accurately weighed, in a 250 ml conical flask add accurately 100 ml of hydrochloric acid (0.1 mol/L) VS, stopper, shake frequently for 1 hour at 37°C, cool to room temperature, filter and discard the initial filtrate. To 50 ml, accurately measured, of the successive filtrate add a few drops of bromophenol blue IS. Titrate with sodium hydroxide (0.1 mol/L) VS. Each g consumes not less than 130 ml of hydrochloric acid (0.1 mol/L) VS, calculated on the dried basis.

Acidity Heat 0.20 g with 20 ml of water on a boiling water bath for 2-3 minutes, cool to room temperature, pH 3.5-5.5 (Appendix VI H).

Clarity of solution A solution of 1.0 g in 10 ml of dilute hydrochloric acid is clear. Any opalescence produced is not more pronounced than that of reference suspension 3 (Appendix IX B).

α-Methylpyridine Pulverize a quantity of the substance being examined, heat 2.0 g in a 10 ml test tube with stopper with 5.0 ml of water on a water bath at 80-90°C for 30 minutes, shake frequently, cool; transfer it to a centrifugal tube and centrifuge, use the supernate as the test solution; Dissolve a quantity of α-methylpyridine CRS in water to produce a solution of 20 µg per ml as the reference solution. Carry out the method for gas chromatography (Appendix V E), using a column packed with ethylvinylbenzene cross-linked with divinylbenzene porous polymer beads (diameter 0.25-0.18 mm); maintain the column temperature at 200-225°C. Inject separately 2 µl of each of the test solution and the reference solution into the column. The response of the peak height of α-methylpyridine in the chromatogram obtained with the test solution is not greater than that of the

reference solution (0.005%).

Loss on drying When dried at 105°C for 3 hours, loses not more than 14.0% of its weight (Appendix VIII L).

Heavy metals Dissolve 1.0 g in 20 ml of hydrochloric acid solution (9→100), by stirring, make alkaline with ammonia hydroxide TS, add 20 ml of ammonia TS in excess and allow to stand for a few minutes, a precipitate is produced. Filter, wash the precipitate with a quantity of water, combine the filtrate and washings, dilute with water to 25 ml, Carry out the limit test for heavy metals (Appendix VIII H, method 3); not more than 0.001%.

Arsenic To 1.0 g add 10 ml of dilute sulfuric acid and 5 ml of bromine TS, boil and allow it to cool. Add a few drops of acidic stannous chloride TS until the colour disappears, then add 3 ml of hydrochloric acid and dilute with water to 28 ml. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Assay Aluminium Dissolve about 1.0 g, accurately weighed, in 10 ml of dilute hydrochloric acid in a 200 ml volumetric flask, dilute with water to volume, mix well. Neutralize 20 ml, accurately measured, with ammonia TS until the precipitate is just produced, add dropwise dilute hydrochloric acid until the precipitate is just dissolved. Add 20 ml of acetic acid-ammonium acetate BS (pH 6.0) and then 25 ml, accurately measured, of disodium edetate (0.05 mol/L) VS. Boil for 3-5 minutes, cool to room temperature and add 1 ml of xylene orange IS. Titrate with Zinc (0.05 mol/L) VS until the colour changes from yellow to red. Perform a blank determination and make any necessary correction. Each ml of Zinc (0.05 mol/L) VS is equivalent to 1.349 mg of Al.

Sulfur Boil gently about 1.0 g, accurately weighed, in a beaker with 10 ml of nitric acid solution (1→2) and 10 ml of water for 10 minutes, cool, make alkaline with ammonia TS and add 5 ml of ammonia TS in excess, boil for 1 minute, and allow to cool. Transfer it to a 100 ml volumetric flask, dilute with water to volume, mix well. Filter with dry filter paper, discard the initial filtrate and measure accurately 10 ml of successive filtrate, acidify with hydrochloric acid (1 mol/L) VS and add 3 drops of hydrochloric acid (1 mol/L) VS in excess. Add 10 ml, accurately measured, of barium chloride-magnesium chloride solution (dissolve 6 g barium chloride and 5 g magnesium chloride in water and dilute with water to 500 ml), mix well. Allow it to stand for a few minutes, add 15 ml of ammonia-ammonia chloride BS (pH 10.0), 5 ml of triethanolamine solution (1→2) and a small amount of eriochrome black T indicator mixture, titrate with disodium edetate (0.05 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 1.603 mg of S.

Category Antacid.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation (1) Sucralfate Capsules
(2) Sucralfate Dispersible Tablets
(3) Sucralfate Oral Suspension
(4) Sucralfate Tablets

Sucralfate Capsules

Sucralfate Capsules contain not less than 15.0% and not more than 21.0% of the labelled amount of sucralfate, calculated with respect to Al.

Identification Weigh a quantity of the contents equivalent to about 0.5 g of sucralfate, comply with the tests for Identification described under Sucralfate.

Neutralizing capacity Mix the contents obtained from the test for weight variation of contents, an accurately weighed quantity equivalent to about 0.5 g of sucralfate, comply with the test for Neutralizing capacity described under Sucralfate. Each g of sucralfate consumes not less than 120 ml of hydrochloric acid (0.1 mol/L) VS.

Other requirements Comply with the general requirements for capsules (Appendix I E); in the disintegration test, no particle of the contents remaining on the gauze within 15 minutes.

Assay Mix the contents obtained from the test for weight variation of contents, weigh accurately a quantity equivalent to about 1 g of sucralfate, carry out the Assay of Aluminium described under Sucralfate. Each ml of zinc (0.05 mol/L) VS is equivalent to 1.349 mg of Al.

Category As described under Sucralfate.

Strength 0.25 g

Storage Preserve in tightly closed containers.

Sucralfate Dispersible Tablets

Sucralfate Dispersible Tablets contain not less than 15.0% and not more than 21.0% of the labelled amount of sucralfate, calculated with reference to Aluminum (Al).

Description White tablets.

Identification To a quantity of the powdered tablets equivalent to about 0.5 g of sucralfate, add 10 ml each of water and dilute hydrochloric acid, shake to dissolve sucralfate and filter. Retain the filtrate for the following identification tests.

(1) Neutralize 4 ml of the filtrate with sodium hydroxide TS and pour the solution into warm alkaline cupric tartrate TS slowly, a red precipitate of cuprous oxide is produced immediately.

(2) To 4 ml of the filtrate add barium chloride TS, if a precipitate is produced, filter and boil the filtrate, a large amount of white precipitate is produced.

(3) To 4 ml of the filtrate add ammonia TS to make the solution alkaline, boil and filter, dissolve the precipitate in dilute hydrochloric acid. The solution yields the reactions characteristic of aluminium salts (Appendix III).

Neutralizing Capacity Weigh accurately a quantity of the powdered tablets obtained in assay, equivalent to about 0.5 g of sucralfate, into a 250 ml conical flask with stopper, add 100 ml of hydrochloric acid (0.1 mol/L) VS, accurately measured, stopper tightly. Allow to stand at 37°C for 1 hour with frequent shaking, cool and filter. To 50 ml of the successive filtrate, accurately measured, add several drops of bromophenol blue IS, titrate with sodium hydroxide (0.1 mol/L) VS. Each g of sucralfate consumes not less than 120 ml of sodium hydroxide (0.1 mol/L) VS.

Other requirements Comply with the general requirements for tablets (Appendix I A), except for dissolution test.

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powdered tablets equivalent to about 1 g of sucralfate into a 200 ml volumetric flask, add 10 ml of dilute hydrochloric acid, shake to dissolve sucralfate, dilute to volume with water and mix well.

Filter, neutralize with ammonia TS 20 ml of the successive filtrate, accurately measured, until a precipitate is just produced, then add dropwise dilute hydrochloric acid until the precipitate is just dissolved. Add 20 ml of acetic acid-ammonium acetate BS (pH 6.0) and 25 ml of disodium edeate (0.05 mol/L) VS, accurately measured, boil for 3-5 minutes and cool. Add 1 ml of xylenol orange IS, titrate with zinc (0.05 mol/L) VS until the colour turns from yellow to red. Perform a blank determination and make any necessary correction. Each ml of disodium edeate (0.05 mol/L) VS is equivalent to 1.349 mg of Al.

Category Antacid.

Strength 0.25 g

Storage Preserve in tightly closed containers, stored in a dry place.

Sucralfate Oral Suspension

Sucralfate Oral Suspension contains not less than 16.0% and not more than 24.0% of the labelled amount of sucralfate, calculated with reference to Aluminum (Al).

Description A white or almost white creamy suspension.

Identification Weigh a quantity equivalent to about 0.5 g of sucralfate into a beaker, add 100 ml of water and stir thoroughly, allow to stand. Shake the precipitate with 10 ml of dilute hydrochloric acid and filter. Retain the filtrate for the following identification tests.

(1) To a quantity of the filtrate equivalent to about 0.1 g of sucralfate, add 1 ml of dilute hydrochloric acid, boil and cool. Neutralize with sodium hydroxide TS, pour the solution into warm alkaline cupric tartrate TS slowly and heat on a water bath, a red precipitate of cuprous oxide is produced immediately.

(2) To a quantity of the filtrate equivalent to about 0.1 g of sucralfate, add barium chloride TS, if a precipitate is produced, filter and boil the filtrate, a large amount of white precipitate is produced.

(3) To a quantity of the filtrate equivalent to about 0.1 g of sucralfate, add ammonia TS to make the solution alkaline, boil and filter, dissolve the precipitate in dilute hydrochloric acid. The solution yields the reactions characteristic of aluminium salts (Appendix III).

Relative density 1.030-1.090 (for strength 10%); 1.120-1.200 (for strength 20%) (Appendix VI A).

Neutralizing Capacity Weigh accurately a quantity equivalent to about 0.5 g of sucralfate into a 250 ml conical flask with stopper, add 100 ml of hydrochloric acid (0.1 mol/L) VS, accurately measured, stopper, tightly. Allow to stand at 37°C for 1 hour with frequent shaking, cool and filter. To 50 ml of the successive filtrate, accurately measured, add several drops of bromophenol blue IS, titrate with sodium hydroxide (0.1 mol/L) VS. Each g of sucralfate consumes not less than 120 ml of hydrochloric acid (0.1 mol/L) VS, calculated on basis of relative density.

pH value 4.5-6.5 (Appendix VI H)

Particle size After shaking thoroughly, mix several drops with a quantity of water. Examine under a microscope in 3 fields of view, using 300-400 X magnification. Not less than 85% of the particles have a dimension of not more than 10 µm.

Other requirements Complies with the general requirements for oral suspension (Appendix I O).

Assay Weigh accurately a quantity equivalent to about 1.0 g of sucralfate into a 200 ml volumetric flask, add 10 ml of dilute hydrochloric acid, shake to dissolve sucralfate, dilute to volume with water and mix well. Measure accurately 20 ml of the solution and neutralize with ammonia TS until a precipitate is just produced, then add dropwise dilute hydrochloric acid until the precipitate is just dissolved. Add 20 ml of acetic acid-ammonium acetate BS (pH 6.0) and 25 ml of disodium edeate (0.05 mol/L) VS, accurately measured, boil for 3-5 minutes and cool. Add 1 ml of xylenol orange IS, titrate with zinc (0.05 mol/L) VS until the colour turns from yellow to red. Perform a blank determination and make any necessary correction. Calculate the content on the basis of relative density. Each ml of disodium edeate (0.05 mol/L) VS is equivalent to 1.349 mg of Al.

Category Antacid.

Strength (1) 10 ml : 1 g (2) 200 ml : 20 g
(3) 200 ml : 40 g (4) 120 ml : 24 g

Storage Preserve in tightly closed containers, stored in a cool and dry place and protected from light.

Sucralfate Tablets

Sucralfate Tablets contain not less than 15.0% and not more than 21.0% of the labelled amount of sucralfate, calculated on Al.

Description White tablets.

Identification To a quantity of the powdered tablets equivalent to about 0.5 g of sucralfate add 10 ml of water and 10 ml of dilute hydrochloric acid, shake to dissolve sucralfate and filter, the filtrate complies with the tests for Identification described under Sucralfate.

Neutralizing capacity Weigh accurately a quantity of the powder obtained from Assay equivalent to about 0.5 g of sucralfate, comply with the test for Neutralizing capacity described under Sucralfate. Each g of sucralfate consumes not less than 120 ml of hydrochloric acid (0.1 mol/L) VS.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity equivalent to about 1 g of sucralfate, carry out the Assay described under Sucralfate. Each ml of zinc (0.05 mol/L) VS is equivalent to 1.349 mg of Al.

Category As described under Sucralfate.

Strength (1) 0.25 g (2) 1.0 g

Storage Preserve in tightly closed containers.

Sulbactam Sodium

$C_8H_{10}NNaO_5S$ 255.23

[69388-84-7]

Sulbactam sodium is sodium (2S, 5R)-3,3-

dimethyl-7-oxo-4-thia-1-azabicyclo [3.2.0] heptane-2-carboxylate-4,4-dioxide. It contains not less than 88.6% of sulbactam ($C_8H_{11}NO_5S$), calculated on the anhydrous basis.

Description A white or almost white powder or crystalline powder; odour, faint; taste, slightly bitter. Freely soluble in water; slightly soluble in methanol, practically insoluble in ethanol, acetone and ethyl acetate.

Specific optical rotation $+223^\circ$ to $+237^\circ$, in a solution of 10 mg per ml in water (Appendix VI E).

Identification (1) The retention time of principal peak of sulbactam of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of the sulbactam CRS in the chromatogram of the reference solution.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of sulbactam (Appendix XVI).

(3) Yields the flame reaction of sodium salts (Appendix III).

Crystallinity Complies with the test for Crystallinity (Appendix IX D).

Clarity and colour of solution To 5 portions each of 0.3 g add 5 ml of water respectively, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y_3 or YG_3 (Appendix IX A, method 1).

Acidity To a quantity add water to produce a solution of 50 mg per ml, pH 4.5-6.5 (Appendix VI H).

Related substances Carry out the method as described under Assay. Inject $10\ \mu\text{l}$ of the reference solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% of full scale of the chart. Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase to produce a solution of 5 mg per ml as test solution. Transfer 1 ml of test solution, measured accurately in a 100 ml volumetric flask, dilute with mobile phase to volume as reference solution. Inject accurately $10\ \mu\text{l}$ of test solution and reference solution respectively into column and record the chromatogram for three times the retention time of the principal peak. In the chromatogram obtained with the test solution, secondary area of sulbactam penicillamine (response factor is 0.3) is not greater than that of the principal peak in the chromatogram obtained with the reference solution (1.0%). (Disregard any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with reference solution.)

Water Not more than 1.0% (Appendix VIII M, method 1).

Heavy metals Not more than 0.002% (Appendix VIII H, method 1).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.10 EU per mg.

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method), dissolve a quantity in appropriate solvent, transfer the solution to at least 500 ml of 0.9% sterile sodium chloride solution.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.005

mol/L tetrabutylammonium hydroxide solution (dilute 6.6 ml of 40% tetrabutylammonium hydroxide solution with water to 1800 ml. Adjust pH value to 5.0 ± 0.1 with 1 mol/L phosphoric acid solution, dilute with water to 2000 ml and mix well) and acetonitrile (75 : 25) as the mobile phase. The flow rate is 1.0 ml per minute and detection wavelength is 230 nm. Inject $10\ \mu\text{l}$ of system suitability solution (Dissolve about 40 mg in a 100 ml volumetric flask, add 2 ml of water and 0.5 ml of 1 mol/L sodium hydroxide and allow to stand for 30 minutes to produce sulbactam penicillamine. Add 0.5 ml of 1 mol/L hydrochloric acid solution and dilute to volume with mobile phase and mix well. Transfer 5 ml of the solution into a 50 ml volumetric flask. Add 20 mg of sulbactam CRS and dissolve in mobile phase, then dilute to volume and mix well) to column and record the chromatogram. The elute order is sulbactam penicillamine and sulbactam. The number of the theoretical plates of sulbactam is not less than 3500 and the tailing factor is not more than 1.5. The resolution factor between peaks of sulbactam and sulbactam penicillamine is not less than 6.0.

Procedure Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase to produce a solution of 1 mg per ml. Inject $10\ \mu\text{l}$ into the column and record the chromatogram. Repeat the operation, using sulbactam CRS instead of the substance being examined, calculate the content of $C_8H_{11}NO_5S$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category β -Lactamase inhibitor.

Storage Preserve in hermetically sealed containers, stored in a cool and dry place.

Preparation (1) Ampicillin Sodium and Sulbactam Sodium for Injection
(2) Cefoperazone Sodium and Sulbactam Sodium for Injection

Sulbenicillin Sodium

$C_{16}H_{16}N_2Na_2O_7S_2$ 458.42

Sulbenicillin Sodium is (2S, 5R, 6R)-3,3-dimethyl-6-(2-phenyl-2-sulfoacetyl-amido)-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, disodium salt. It has a potency of not less than 900 Sulbenicillin Units per mg, calculated on the anhydrous basis.

Description A white or pale-yellow powder; odourless; taste, slightly saline; hygroscopic.

Very soluble in water; freely soluble in methanol; sparingly soluble in ethanol; very slightly soluble in dehydrated ethanol; insoluble in acetone, chloroform or benzene.

Specific optical rotation $+167^\circ$ to $+182^\circ$, in a solution of 50 mg per ml in water (Appendix VI E).

Identification (1) Dissolve about 20 mg in 15 ml of water, add 2 ml of hydroxylamine hydrochloride TS and 2 ml of

sodium hydroxide TS, allow to stand for 5 minutes, add 3 ml of hydrochloric acid solution (9→100) and 1 ml of ferric chloride TS, a red-brown colour is produced on shaking.

(2) The infrared absorption spectrum is concordant with the reference spectrum of sulbenicillin sodium RS (Appendix IV C).

(3) Yield the flame reaction of sodium salts (Appendix III).

Acidity Dissolve a quantity in water to produce a solution of 20 mg per ml, pH 4.5-7.0 (Appendix VI H).

Clarity and colour of solution To each of 5 portions add water to produce a solution of 0.12 g per ml, the solution is clear and colourless. Any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₄ (Appendix IX A, method 1).

W 6.0% (pp VIII M, 1 A).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); not more than 0.05 EU per 1000 Units of Sulbenicillin Sodium.

Assay Dissolve an accurately weighed quantity in sterile water to produce a solution of about 1000 Units per ml and carry out the Microbiological Assay of Antibiotics (Appendix XI A). 1000 Sulbenicillin Units are equivalent to 1 mg of C₁₆H₁₈N₂O₇S₂.

Category β-lactam antibiotics, penicillins.

Storage Preserve in tightly closed containers, stored in a cool, dark and dry place.

Preparation Sulbenicillin Sodium for Injection

Sulbenicillin Sodium for Injection

Sulbenicillin Sodium for Injection is a sterile lyophilized powder of Sulbenicillin Sodium. It has a potency of not less than 900 Sulbenicillin Units per mg, calculated on the anhydrous basis. It contains not less than 93.0% and not more than 107.0% of the labelled amount of sulbenicillin (C₁₆H₁₈N₂O₇S₂), calculated on the basis of the average weight of content.

Description A white to pale-yellow lyophilized powder.

Identification Complies with the tests for Identification described under Sulbenicillin Sodium.

Clarity and Colour of Solution To each of 5 portions add water to produce a solution of 0.1 g per ml, the solution is clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₄ (Appendix IX A, method 1).

Water Not more than 6.0% (Appendix VIII M, method 1 A).

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method). Dissolve a quantity in appropriate solvent, transfer the solution to at least 500 ml of 0.9% sterile sodium chloride solution.

Acidity and Bacterial endotoxin Complies with the corresponding tests described under Sulbenicillin Sodium.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Sulbenicillin

Sodium, using an accurately weighed quantity of mixed contents obtained from the test for weight variation of contents.

Category As described under Sulbenicillin Sodium.

Strength Calculated as C₁₆H₁₈N₂O₇S₂
(1) 1 g (1000000 Units)
(2) 2 g (2000000 Units)
(3) 4 g (4000000 Units)

Storage Preserve in tightly closed containers, protected from light, stored in a cool, dark and dry place.

Sulfacetamide Sodium

C₈H₉N₂NaO₃S • H₂O 254.24 [6209-17-2]

Sulfacetamide Sodium is *N*-sulfanilyl-acetamide monosodium salt monohydrate. It contains not less than 99.0% of C₈H₉N₂NaO₃S, calculated on the dried basis.

Description A white crystalline powder; odourless; taste, slightly bitter.

Freely soluble in water; sparingly soluble in ethanol.

Identification (1) Dissolve 1 g in 10 ml of water, add 2 ml of acetic acid; a precipitate is produced. Filter, wash the precipitate with a quantity of water, dry at 105°C. It melts at a temperature of 180-184°C (Appendix VI C).

(2) Dissolve 0.1 g in 3 ml of water, add 5 drops of copper sulfate TS; a bluish green precipitate is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of sulfacetamide sodium (Appendix XVI).

(4) The filtrate obtained in identification test (1) yields the reactions characteristic of sodium salts (Appendix III).

Alkalinity Dissolve 0.50 g in 10 ml of water, pH 8.0-9.5 (Appendix VI H).

Clarity and colour of solution A solution of 2.0 g in 10 ml of water is clear and colourless. Any colour produced is not more intense than that of 5 ml of reference solution Y₃ diluted with water to 10 ml (Appendix IX A, method 1).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of *n*-butanol-dehydrated ethanol-water-concentrated ammonia solution (10 : 5 : 5 : 2) as the mobile phase. Apply separately to the plate 5 μl of each of three solutions in water containing (1) 100 mg of the substance being examined per ml, (2) 0.50 mg of sulfanilamide CRS per ml, (3) 0.25 mg of sulfanilamide CRS per ml. After developing and removal of the plate, dry in air and spray with ethanolic dimethylamino-benzaldehyde TS and examine immediately. Not more than one secondary spot, in the chromatogram obtained with solution (1) is more intense than the spot in the chromatogram obtained with solution (3) and none of such spot may be more intense than the spot obtained with solution (2).

Loss on drying When dried to constant weight at 150°C, loses 6.0%-8.0% of its weight (Appendix VIII L).

Heavy metals Carry out the limit test for heavy metals

(Appendix VIII H, method 3) using 1.0 g; not more than 0.001%.

Assay Weigh accurately about 0.45 g, carry out the method for dead-stop titration (Appendix VII A), titrate with sodium nitrite (0.1 mol/L) VS. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 23.62 mg of $C_8H_9N_2NaO_3S$.

Category Sulfonamide.

Storage Preserve in tightly closed containers.

Preparation Sulfacetamide Sodium Eye Drops

Sulfacetamide Sodium Eye Drops

Sulfacetamide Sodium Eye Drops contain not less than 90.0% and not more than 110.0% of the labelled amount of sulfacetamide Sodium ($C_8H_9N_2NaO_3S \cdot H_2O$).

Description A clear, colourless to pale yellow liquid.

Identification Add cupric sulfate TS dropwise to about 2 ml of the eye drops, a bluish green precipitate is formed, remaining unchanged on standing.

pH value 8.0-9.8 (Appendix VI C).

Colour Not more intensely coloured than reference solution Y_6 or OY_6 (Appendix IX A, method 1).

Sulfanilamide Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as coating substance and the organic layer of a mixture of butanol-concentrated ammonia solution-water (4 : 1 : 3) as the mobile phase. Apply separately to the plate 2 μ l each of two solutions in water containing (1) 6.0 mg of sulfacetamide sodium per ml and (2) 0.25 mg of sulfanilamide CRS per ml. After developing and removal of the plate, allow the solvent to evaporate in air and dry at 105°C for 10 minutes. Cool, spray with ethanolic dimethylamino-benzaldehyde TS and examine immediately. Any spot in the chromatogram obtained with solution (1) at the position corresponding to that of sulfanilamide is not more intense than the principal spot obtained with solution (2) (4.2%).

Other requirements Comply with the general requirements for eye preparations (Appendix I G).

Assay Carry out the assay described under Sulfacetamide Sodium, using a quantity equivalent to 0.6 g of sulfacetamide sodium. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 25.42 mg of $C_8H_9N_2NaO_3S \cdot H_2O$.

Category As described under Sulfacetamide Sodium.

Strength 15%

Storage Preserve in tightly closed containers, protected from light and stored in a cool place.

Sulfadiazine

$C_{10}H_{10}N_4O_2S$ 250.28

[68-35-9]

Sulfadiazine is 4-amino-*N*-2-pyrimidinyl benzene-sulfonamide. It contains not less than 99.0% of $C_{10}H_{10}N_4O_2S$.

Description White or almost white crystals or a powder; odourless; tasteless; darkens gradually on exposure to light.

Slightly soluble in ethanol or acetone; practically insoluble in water; freely soluble in sodium hydroxide TS or ammonia TS; soluble in dilute hydrochloric acid.

Identification (1) Dissolve about 0.1 g in 3 ml each of water and 0.4% sodium hydroxide solution with shaking and filter. To a portion of the filtrate, add 1 drop of copper sulfate TS, a yellowish-green precipitate is produced, changing to purple on standing.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of sulfadiazine (Appendix XVI).

(3) Yields the reactions characteristic of primary aromatic amines (Appendix III).

Acidity Heat 2.0 g with 100 ml of water on a water bath for 10 minutes, cool immediately and filter. To 25 ml of the filtrate, add 2 drops of phenolphthalein TS and 0.20 ml of sodium hydroxide (0.1 mol/L) VS; a pink colour is produced.

Clarity and colour of alkaline solution A solution of 2.0 g in 10 ml of sodium hydroxide TS and 15 ml of water is clear and colourless. Any colour produced is not more intense than that of reference solution Y_3 (Appendix IX A, method 1).

Chlorides Carry out the limit test for chlorides (Appendix VII A), using 25 ml of the remaining filtrate obtained in the test for Acidity. Any opalescence produced is not more pronounced than that of a reference using 5.0 ml of sodium chloride standard solution (0.01%).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 3), using 1.0 g; not more than 0.001%.

Assay Weigh accurately about 0.5 g, carry out the method for dead-stop titration (Appendix VII A), titrate with sodium nitrite (0.1 mol/L) VS. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 25.03 mg of $C_{10}H_{10}N_4O_2S$.

Category Sulfonamide.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Sulfadiazine Eye Ointment
(2) Sulfadiazine Ointment
(3) Sulfadiazine Suspension
(4) Sulfadiazine Tablets
(5) Compound Sulfadiazine Tablets

Sulfadiazine Eye Ointment

Sulfadiazine Eye Ointment contains not less than 90.0% and not more than 110.0% of the labelled amount of sulfadiazine ($C_{10}H_{10}N_4O_2S$).

Description A pale yellow to yellow ointment.

Identification To about 0.5 g add 20 ml of water and 1 ml of sodium hydroxide TS, heat with stirring to dissolve sulfadiazine. Allow it to cool. Acidify slightly the water layer with acetic acid. Filter. Wash the residue with a little

of water, dry it at 105°C for 1 hour. Complies with the tests (1) and (3) for Identification described under sulfadiazine.

Other requirements Complies with the general requirements for eye preparations (Appendix I G).

Assay Weigh accurately a quantity of the substance being examined equivalent to about 0.5 g of sulfadiazine, add 10 ml of hydrochloric acid and 40 ml of hot water, heat in a water bath for 15 minutes with constant stirring. Allow it to cool and the ointment base to congeal, separate the solution. To the ointment base add 3 ml of hydrochloric acid and 25 ml of water, heat in the water bath for 10 minutes with constant stirring, allow it to cool and separate the solution again, mix the two solutions well. Carry out the method for dead-stop titration (Appendix VII A), titrate with sodium nitrite (0.1 mol/L) VS. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 25.03 mg of $C_{10}H_{10}N_4O_2S$.

Category As described under Sulfadiazine.

Strength 5%

Storage Preserve in well closed containers, stored in a cool and dark place.

Sulfadiazine Ointment

Sulfadiazine Ointment contains not less than 90.0% and not more than 110.0% of the labelled amount of Sulfadiazine ($C_{10}H_{10}N_4O_2S$).

Description A pale yellow to yellow ointment.

Identification To a quantity of ointment equivalent to 0.1 g of sulfadiazine add 3 ml each of water and 0.4% sodium hydroxide solution, heat with stirring. Allow it to cool, filter. To the filtrate add 0.5 ml of copper sulfate TS, a blue-green precipitate is produced, changing to purple on standing.

Other requirements Comply with the general requirements for ointment (Appendix I F).

Assay Weigh accurately a quantity of the substance being examined equivalent to about 0.5 g of sulfadiazine, add 10 ml of hydrochloric acid and 40 ml of hot water, heat in a water bath for 15 minutes with constant stirring. Allow it to cool and the ointment base to congeal, separate the solution. To the ointment base add 3 ml of hydrochloric acid and 25 ml of water, heat in the water bath for 10 minutes with constant stirring, allow it to cool and separate the solution again, mix the two solutions well. Carry out the method for dead-stop titration (Appendix VII A), titrate with sodium nitrite (0.1 mol/L) VS. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 25.03 mg of $C_{10}H_{10}N_4O_2S$.

Category As described under Sulfadiazine.

Strength (1) 10 g : 0.5 g (2) 10 g : 1 g

Storage Preserve in well closed containers, stored in a cool and dark place.

Sulfadiazine Suspension

Sulfadiazine Suspension contains not less than 95.0% and not more than 105.0% of the labelled amount of sulfadiazine ($C_{10}H_{10}N_4O_2S$).

Description A suspension of fine particles in water, allow to stand, the particles precipitate and a white suspension appears after shaking.

Identification Shake well and dilute about 10 ml with 100 ml of hot water, decant the supernatant liquid, filter. Wash the residue with a little of hot water and dry it at 105°C. The residue complies with the test (1) and (3) for Identification and described under Sulfadiazine.

Other requirements Complies with the general requirements for oral suspension (Appendix I O).

Assay Place 5 ml, thoroughly shaken and accurately measured, in a beaker, wash away all suspension from the pipette with 35 ml of water, combine the washings in the beaker. Add 10 ml of hydrochloric acid and 5 ml of water, stir to dissolve Sulfadiazine. Carry out the method for dead-stop titration (Appendix VII A), titrate with sodium nitrite (0.1 mol/L) VS. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 25.03 mg of $C_{10}H_{10}N_4O_2S$.

Category As described under Sulfadiazine.

Strength 10% (g/ml)

Storage Preserve in well closed containers, stored in a cool place and protected from light.

Sulfadiazine Tablets

Sulfadiazine Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of sulfadiazine ($C_{10}H_{10}N_4O_2S$).

Description White to pale yellow tablets; darkens gradually on exposure to light.

Identification Triturate a quantity of the powdered tablets equivalent to about 0.5 g of sulfadiazine with 10 ml of ammonia TS, add 10 ml of water and filter. Heat the filtrate on a water bath until most of ammonia is expelled. Cool and acidify with acetic acid; a precipitate is produced, filter, wash the precipitate with water and dry at 105°C, and complies with tests (1) and (3) for Identification described under Sulfadiazine.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 1000 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw 5 ml of the solution at 60 minutes and filter. Transfer 1 ml of the successive filtrate, accurately measured, to a 50 ml volumetric flask. Dilute with sodium hydroxide (0.01 mol/L) VS to volume and mix well. Measure the absorbance at 254 nm (Appendix IV A) and calculate the dissolution of $C_{10}H_{10}N_4O_2S$ from each tablet, taking 866 as the value of A (1%, 1 cm), not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Weigh accurately a quantity of the powdered tablets equivalent to about 0.5 g of sulfadiazine, carry out the method for dead-stop titration (Appendix VII A), titrate with sodium nitrite (0.1 mol/L) VS. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 25.03 mg of $C_{10}H_{10}N_4O_2S$.

Category As described under Sulfadiazine.

Strength 0.5 g

Storage Preserve in tightly closed containers, protected from light.

reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 10%-25% full scale of the chart. Inject 20 μ l each of the test solution and the reference solution into column separately, record the chromatograms for 8 times the retention time of the principal peak. The area of each secondary peak and the sum of secondary peaks are not more than 2 and 2.5 times of the area of the principal peak in the chromatogram obtained with the reference solution respectively.

Chloride Carry out the limit test for chloride (Appendix VIII A), using 0.20 g. Any opalescence produced is not more pronounced than that of a reference solution using 6.0 ml of sodium chloride standard solution (0.03%).

6-Aminohexanoic acid Transfer 0.50 g in a test tube with stopper, add 10 ml of water, stopper tightly, shake for 30 minutes, filter, and take the successive filtrate as test solution. Prepare a reference solution of 100 μ g 6-Aminohexanoic Acid CRS per ml in water. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethanol-concentrated ammonia solution-water (68 : 2 : 30) as the mobile phase. Apply to the plate 10 μ l each of above two solutions separately, after developing and removal of the plate, dry it in air, spray with 0.2% ninhydrin in butanol solution [butanol-2 mol/L acetic acid solution (95 : 5)], heat at 105°C for about 15 minutes. The colour of the spot in the chromatogram obtained with the test solution corresponding to that of the reference substance, if appear, is not more intense than that of the principal spot obtained with the reference solution (0.2%).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Cadmium and lead Transfer 1.0 g in a 25 ml volumetric flask, add 8% nitric acid solution and dilute with the same solution to volume, mix well as test solution. Transfer another 1.0 g in a 25 ml volumetric flask, add 1.0 ml of cadmium solution (5.0 μ g cadmium per ml) and 1.0 ml of lead solution (10.0 μ g lead per ml), dilute with 8% nitric acid solution to volume, mix well as reference solution. Carry out the method for atomic absorption spectrophotometry (Appendix IV D, method 2). Measure the absorbance of the test solution (b) and that of the reference solution (a) at 228.8 nm and 217.0 nm separately, b is less than (a-b) (0.0005% for cadmium; 0.001% for lead).

Arsenic To 1.0 g add 23 ml of water and 5 ml of hydrochloric acid. Carry out the limit test for arsenic (Appendix VIII J): not more than 0.0002%.

Assay Dissolve 0.4 g, weigh accurately, in 50 ml of water by slightly warming, add 10 ml of ammonia-ammonium chloride BS pH 10.0 and a quantity of eriochrome black T indicator mixture, titrate with disodium edetate (0.05 mol/L) VS until the colour changes from mauve to pure blue. Perform a blank determination and make any necessary correction. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 20.49 mg of $C_{16}H_{28}N_2O_6Zn$.

Category Protective to stomach mucous membrane.

Storage Preserve in tightly closed containers.

Preparation Zinc Acexamate Capsules

Zinc Acexamate Capsules

Zinc Acexamate Capsules contain not less than 98.0% and not more than 102.0% of the labelled

amount of zinc acexamate ($C_{16}H_{28}N_2O_6Zn$).

Description Capsules containing white or almost white granules and powder.

Identification To a quantity of the contents of the capsules, equivalent to about 0.5 g of zinc acexamate, add 50 ml of water, warmly heat, shake to dissolve zinc acexamate, filter. The filtrate complies with the tests (1) and (3) for Identification described under Zinc Acexamate.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of water as the dissolution medium and adjust the rotational speed of the basket to 100 rpm. Withdraw the solution after exactly 30 minutes and filter. Transfer accurately 3 ml (for 0.15 g) or 1.5 ml (for 0.3 g) of the successive filtrate to a 50 ml volumetric flask, add 10.0 ml of borate-potassium chloride BS (pH 9.0) and 1.0 ml of freshly prepared zincon solution (to 0.13 g of zincon, add 2 ml of sodium hydroxide TS, dilute to 100 ml with water), dilute with water to volume, mix well, allow to stand for 30 minutes, measure the absorbance at 620 nm (Appendix IV A). Measure accurately 3 ml of zinc standard solution [measure accurately 3 ml of zinc (0.05 mol/L) VS, dilute with water to 500 ml (20 μ g Zn per ml)] to a 50 ml volumetric flask. Proceed the measurement described above, beginning at the words "add 10.0 ml of borate-potassium chloride BS (pH 9.0)...". Calculate the dissolution of $C_{16}H_{28}N_2O_6Zn$ from each capsule, multiply the result by 6.267. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for Capsules (Appendix I E).

Assay Dissolve a quantity of the mixed contents obtained from the test for weight variation of contents, equivalent to about 0.45 g of zinc acexamate, in 35 ml of water, add 10 ml of ammonia-ammonium chloride BS (pH 10.0) and a quantity of eriochrome black T indicator mixture, titrate with disodium edetate (0.05 mol/L) VS until the colour changes from mauve to pure blue. Perform a blank determination and make any necessary correction. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 20.49 mg of $C_{16}H_{28}N_2O_6Zn$.

Category As described under Zinc Acexamate.

Strength (1) 0.15 g (2) 0.3 g

Storage Preserve in tightly closed containers, stored in a dry place.

Zinc Citrate

$(C_6H_5O_7)_2Zn_3 \cdot 2H_2O$ 610.35

[546-46-3]

Zinc Citrate contains not less than 98.5% of $(C_6H_5O_7)_2Zn_3 \cdot 2H_2O$, calculated on the dried basis.

Description White granular crystals or a crystalline powder; odourless; tasteless; efflorescent.

Slightly soluble in water; soluble in hydrochloric acid

Identification Yields the reactions characteristic of zinc salts and citrates (Appendix III).

Acidity To about 0.10 g add 10 ml of water, stir for 5 minutes and filter, add 1 drop of methyl orange IS to the filtrate, no orange red colour is produced.

Alkalinity To about 1.0 g add 10 ml of hot water, stir for 5 minutes, allow to cool and filter, add 2 drops of phenolphthalein IS to the filtrate, no pink colour is produced.

Loss on drying When dried for 6 hours at 180°C, loses not more than 6.5% of its weight (Appendix VII L).

Iron Dissolve 0.20 g in 4 ml of dilute hydrochloric acid solution and a quantity of water by shaking. Carry out the limit test for iron (Appendix VIII G), any colour produced is not more intense than that of a reference solution, prepared in the same manner, using 1.0 ml of iron standard solution (0.005%).

Lead Mix 0.50 g with 3 ml of nitric acid and 1 ml of 30% hydrogen peroxide solution in a beaker. Boil for 2 minutes at electric heater, cool and add sufficient water to produce 10 ml as test solution. The light absorption of the test solution at 217.0 nm Appendix IV D is not more than that of a reference solution prepared in the same manner, using 0.5 ml, measured accurately, of lead standard solution (0.001%).

Arsenic Dissolve 1.0 g in 5 ml of hydrochloric acid and 21 ml of water with shaking. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Assay Dissolve about 0.2 g, accurately weighed, in 20 ml of water and 10 ml of ammonia-ammonium chloride BS (pH 10.0), add a small amount of eriochrome black T indicator. Titrate with disodium edetate (0.05 mol/L) VS until the colour changes from purple to pure blue. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 9.572 mg of $(C_6H_5O_7)_2Zn_3 \cdot 2H_2O$.

Category Zinc replenisher.

Storage Preserve in tightly closed containers.

Preparation Zinc Citrate Tablets

Zinc Citrate Tablets

Zinc Citrate Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of zinc citrate $(C_6H_5O_7)_2Zn_3 \cdot 2H_2O$.

Description White tablets.

Identification Yields the reactions characteristic of zinc salts and citrates (Appendix III).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 1000 ml of an aqueous solution containing 24 ml of dilute hydrochloric acid as the dissolution medium, adjust the rotational speed of the basket at 100 rpm. Withdraw a quantity of the solution after exactly 30 minutes and filter. Dilute 3 ml of the successive filtrate, accurately measured, with the dissolution medium to 25 ml as the test solution. Dissolve a quantity of zinc citrate CRS in the dissolution medium to produce 3 solutions of about 2 µg, 4 µg and 6 µg per ml, respectively, as the reference solutions. Measure the absorbances of the resulting solutions at 213.9 nm (Appendix IV D, method 1), calculate the dissolution of $(C_6H_5O_7)_2Zn_3 \cdot 2H_2O$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements

Assay Weigh accurately and powder 10 tablets. To an accurately weighed quantity of the powdered tablets, equivalent to about 0.4 g of zinc citrate in a 100 ml volumetric flask, add 2 ml of dilute hydrochloric acid, shake, dilute to volume with water, mix well and filter. Measure accurately 50 ml of the successive filtrate, add a drop of 0.025% methyl red solution in ethanol, add dropwise ammonia TS until the colour changes to slightly yellow, add ammonia-ammonium chloride BS (pH 10.0) and a small amount of eriochrome black T indicator. Titrate with disodium edetate (0.05 mol/L) VS until the colour changes from purple to pure blue. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 10.17 mg of $(C_6H_5O_7)_2Zn_3 \cdot 2H_2O$.

Category As described under Zinc Citrate.

Strength 12.5 mg (calculated as Zn)

Storage Preserve in tightly closed containers.

Zinc Gluconate

$C_{12}H_{22}O_{14}Zn$ 455.68

Zinc Gluconate contains not less than 97.0% and not more than 102.0% of $C_{12}H_{22}O_{14}Zn$, calculated on the dried basis.

Description A white crystalline or granular powder; odourless; taste, slightly acerbity.

Very soluble in boiling water, soluble in water, insoluble in dehydrated ethanol, chloroform or ether.

Identification (1) Dissolve about 0.5 g in 5 ml of water in a tube by warming, add 0.7 ml of glacial acetic acid and 1 ml of freshly distilled phenylhydrazine, heat in a water bath for 30 minutes and cool. Scratch the inner surface of the test tube with a glass rod, yellow crystals are produced gradually. Filter, recrystallize using 10 ml of hot water with a small quantity of active carbon, filter again, dry the precipitate at 105°C for 1 hour, the melting range is 195 to 200°C (Appendix VI C).

(2) Dissolve about 0.1 g in 50 ml of water, add 1 drop of ferric chloride TS, a deep yellow colour is produced.

(3) The aqueous solution yields the reactions characteristic of zinc salts (Appendix III).

Acidity or alkalinity Dissolve 0.5 g in 50 ml of water, pH is 5.5 to 7.5 (Appendix VI H).

Chloride Carry out the limit test for chlorides (Appendix VIII A) using 0.1 g. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.05%).

Sulfate Carry out the limit test for sulfates (Appendix VIII B), using 1 g. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of potassium sulfate standard solution (0.05%).

hydrochloric acid and about 0.5 g of high pure zinc granules, boil for 1 minute, allow to stand for 2 minutes, add 0.25 ml of freshly prepared phenylhydrazine hydrochloride solution (1→100), heat to boiling, cool immediately, add 6 ml of hydrochloric acid and 0.25 ml of freshly prepared potassium ferricyanide solution (5→100). Any colour produced is not more intense than that of a reference solution using 4 ml of sodium oxalate solution (1→10000) (0.06%).

Reducing substances Dissolve 1 g in 10 ml of water in a conical flask with stopper, add 25 ml of alkaline cupric citrate TS, boil gently for 5 minutes exactly, cool rapidly to room temperature. Add 25 ml of 0.6 mol/L acetic acid solution, 10 ml of iodine (0.1 mol/L) VS and 10 ml 3 mol/L hydrochloric acid and titrate with sodium thiosulfate (0.1 mol/L) VS, add 3 ml of starch IS towards the end of the titration, continue the titration until blue colour disappears. Perform a blank determination and make any necessary correction. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 2.7 mg of reducing substances. The limit it contains is not more than 1.0%.

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight at 80°C, loses not more than 11.6% of its weight (Appendix VIII L).

Cadmium Transfer about 1 g, accurately weighed, to a 50 ml of Kjeldahl flask, add 6 ml of each of nitric acid and hydrogen peroxide, place a small funnel on top of the kjeldahl flask inclined at an angle of 45°. Heat slowly until the solution becomes to clear, cool, transfer completely to a 25 ml volumetric flask and dilute with water to volume, mix well, as solution (B). Measure accurately 1 ml of cadmium nitrate solution (Dissolve 1 g of cadmium, accurately weighed, in 20 ml of nitric acid in a 1000 ml volumetric flask, dilute with water to volume, mix well. Transfer 1 ml of the solution to a 100 ml volumetric flask, dilute with 1% (g/ml) nitric acid solution to volume, mix well. Each ml is equivalent to 10 µg of cadmium), perform the same procedure as solution B, the resulting solution is as solution A. Measure the absorbance of the solution A and solution B at 228.8 nm respectively (Appendix IV D), calculate the content of cadmium; not more than 0.0005%.

Lead Dissolve 1 g in 5 ml of water, add 10 ml of potassium cyanide TS, mix well, allow to stand until the solution becomes clear, add 5 drops of sodium sulfide TS and allow to stand for 2 minutes. Any colour produced is not more intense than that of a reference solution using 1 ml of lead standard solution (0.001%).

Arsenic Dissolve 1 g in 23 ml of water, add 5 ml of hydrochloric acid, carry out the limit test for arsenic (Appendix VIII J): not more than 0.0003%.

Assay Dissolve 0.7 g, accurately weighed, in 100 ml of water by warming, add 5 ml of ammonia-ammonium chloride BS (pH 10.0) and several drops of eriochrome black T IS. Titrate with disodium edetate (0.05 mol/L) VS until the purple solution becomes pure blue. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 22.78 mg of $C_{12}H_{22}O_{14}Zn$.

Category Zinc replenisher.

Storage Preserve in tightly closed containers, protected from light.

Preparation Zinc Gluconate Tablets

Zinc Gluconate Tablets

and not more than 107.0% of the labelled amount of zinc gluconate ($C_{12}H_{22}O_{14}Zn$).

Description White tablets.

Identification Dissolve a quantity of the powdered tablets equivalent to about 1 g of zinc gluconate in 20 ml of water by warming, cool, filter. The filtrate complies with the test for Identification described under Zinc Gluconate.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 1000 ml of water as the dissolution medium, adjust the rotation speed of the paddle to 100 rpm ± 5 rpm. Withdraw a quantity of the solution after exactly 30 minutes and filter, using the successive filtrate as a test solution. Dissolve about 50 mg of zinc gluconate CRS, accurately weighed, in water and dilute to 1000 ml with water as a reference solution. Measure accurately 2 ml (for 174 mg tablets), or 5 ml (for 70 mg tablets), or 10 ml (for 35 mg per tablets) of the test solution and 5 ml of the reference solution into separate 50 ml volumetric flasks, add to each volumetric flask 10 ml of borate-potassium chloride BS (pH 9.0) and 3 ml accurately measured of freshly prepared zinc solution (dissolve 0.13 g of zinc reagent in 2 ml of 1 mol/L sodium hydroxide, add water to 1000 ml), mix well, dilute to volume with water, mix well. Measure the absorbance of the resulting solutions at 213.9 nm (Appendix IV D, method 1), calculate the dissolution of $C_{12}H_{22}O_{14}Zn$ from each tablet. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for Tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets, weigh accurately a quantity of the powdered tablets equivalent to about 0.7 g of zinc gluconate, carry out the Assay described under Zinc Gluconate. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 22.78 mg of $C_{12}H_{22}O_{14}Zn$.

Category As described under Zinc Gluconate.

Strength (1) 35 mg (2) 70 mg (3) 174 mg

Storage Preserve in tightly closed containers, protected from light.

Zinc Oxide

ZnO 81.38 [1314-13-2]

Zinc Oxide contains not less than 99.0% of ZnO, calculated with reference to the substance freshly ignited to constant weight.

Description A white to faintly yellowish-white fine powder, odourless; gradually absorbs carbon dioxide from the air. Insoluble in water or ethanol; soluble in dilute acids or sodium hydroxide solution.

Identification (1) Become yellow when strongly heated. The yellow colour disappears on cooling. (2) Its solution in dilute hydrochloric acid yields the reactions characteristic of zinc salts (Appendix III).

Alkalinity Shake 1.0 g in 10 ml of boiling water for 5 minutes, cool, filter and add 2 drops of phenolphthalein IS to the filtrate. If the filtrate is pink, the colour is discharged on adding 0.10 ml of hydrochloric acid (0.1 mol/L) VS.

Carbonate and acid-insoluble substances Mix 2.0 g with 10 ml of water, add 30 ml of dilute sulfuric acid and heat on a water bath. No effervescence occurs and the resulting

Loss on ignition Ignite about 1.0 g, accurately weighed, at 800°C to constant weight, loses not more than 1.0% of its weight.

Iron Dissolve 0.40 g in 8 ml of dilute hydrochloric acid, 15 ml of water and 2 drops of nitric acid by boiling for 5 minutes, allow to cool, add water to 50 ml, mix well. To 25 ml of the solution add 10 ml of water, carry out the limit test for iron (Appendix VIII G). Any colour produced is not more intense than that of a reference solution using 1.0 ml of standard iron solution (0.005%).

Lead Stir well 2.0 g with 20 ml of water, add 5 ml of glacial acetic acid and heat on a water bath. Allow to cool and filter. Add 5 drops of potassium chromate IS to the filtrate, no opalescence is produced.

Arsenic Dissolve 1.0 g in 5 ml of hydrochloric acid and 23 ml of water. The solution complies with the limit test for arsenic (Appendix VIII J, method 1) (0.0002%).

Assay Dissolve about 0.1 g, accurately weighed, in 2 ml of dilute hydrochloric acid. Add 25 ml of water and 1 drop of 0.025% methyl red ethanolic solution. Add ammonia TS dropwise until the colour of the solution becomes slightly yellow. Add 25 ml of water, 10 ml of ammonia-ammonium chloride BS (pH 10.0) and a small quantity of eriochrome black T indicator, titrate with disodium edetate (0.05 mol/L) VS until the colour changes from violet to pure blue. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 4.069 mg of ZnO.

Category Astringent.

Storage Preserve in tightly closed containers.

Preparation Zinc Oxide Ointment

Zinc Oxide Ointment

Zinc Oxide Ointment contains not less than 14.0% and not more than 16.0% of zinc oxide (ZnO).

Description Pale yellow ointment.

Identification Heat and stir 1 g with 10 ml of dilute hydrochloric acid to dissolve zinc oxide. Allow to cool and filter. The filtrate yields the reactions characteristic of zinc salt (Appendix III).

Other requirements Complies with the general requirements for ointments (Appendix I F).

Assay Weigh accurately about 0.5 g, add 10 ml of chloroform, warm slightly and allow vaseline to melt. Add 10 ml of sulfuric acid (0.5 mol/L) VS, stir until zinc oxide is dissolved. Carry out the Assay described under Zinc Oxide, beginning at the words "add 1 drop of 0.025% methyl red ethanolic solution...". Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 4.069 mg of ZnO.

Category As described under Zinc Oxide.

Strength (1) 20 g : 3 g (2) 500 g : 75 g

Storage Preserve in tightly closed containers.

Zinc Sulfate

$\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$ 287.56

[7446-20-0]

Zinc Sulfate contains not less than 99.0% and not

Description Colourless, transparent prisms, fine needles or a granular crystalline powder; odourless; taste, astringent, efflorescent.

Very soluble in water; freely soluble in glycerine; insoluble in ethanol.

Identification The aqueous solution yields the reactions characteristic of zinc salts and sulfates (Appendix III).

Acidity Dissolve 0.5 g in 10 ml of water, add 1 drop of methyl orange IS; no orange-red colour is produced.

Clarity of solution A solution of 2.5 g in 10 ml of water is clear.

Alkali and alkaline earth metals Dissolve 2.0 g in 150 ml of water in a 200 ml volumetric flask, precipitate zinc completely by means of ammonium sulfide TS and dilute with water to volume, mix and filter. To 100 ml of filtrate add 0.5 ml of sulfuric acid, evaporate to dryness in a tared dish and ignite to constant weight; the residue is not more than 5 mg (0.5%).

Lead Dissolve 0.50 g in 5 ml of water, add 10 ml of potassium cyanide TS, mix well and allow the mixture to stand. Add 5 drops of sodium sulfide TS, allow to stand for further 2 minutes. The colour produced is not more intense than that of reference solution prepared in a similar manner using 0.50 ml of standard lead solution (0.001%).

Aluminum, iron, copper and other heavy metals Dissolve 1.0 g in 10 ml of water, add 10 ml of concentrated ammonia solution, allow to stand for 30 minutes; the solution is clear and colourless; add a quantity of sodium sulfide TS, only a white precipitate is formed.

Assay Dissolve about 0.3 g, accurately weighed, in 30 ml of water, add 10 ml of ammonia-ammonium chloride BS (pH 10.0) and a small quantity of eriochrome black T IS. Titrate with disodium edetate (0.05 mol/L) VS until the violet red colour changes to pure blue. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 14.38 mg of $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$.

Category Zinc replenisher and astringent.

Storage Preserve in tightly closed containers.

Preparations (1) Zinc Sulfate Granules
(2) Zinc Sulfate Oral Solution
(3) Zinc Sulfate Tablets

Zinc Sulfate Granules

Zinc Sulfate Granules contain not less than 90.0% and not more than 110.0% of labelled amount of zinc sulfate ($\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$).

Description White, almost white to slightly yellow granules.

Identification The aqueous solution yields the reactions characteristic of zinc salts and sulfates (Appendix III).

Other requirements Comply with the general requirements for Granules (Appendix I N).

Assay Weigh accurately and powder 25 (for 5 g strength) or 70 (for 2 g strength) containers. Dissolve a quantity equivalent to 0.2 g of zinc sulfate, accurately weighed, in 50 ml of water by shaking, add 10 ml of ammonia-ammonium chloride BS (pH 10.0), 1 g of ammonium fluoride and a few drops of eriochrome black T IS. Titrate with disodium edetate (0.05 mol/L) VS until the violet red colour changes to pure blue or dark green. Each ml of

mg of $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$.

Category As described under Zinc Sulfate.

Strength (1) 2 g : 8 mg (2) 5 g : 20 mg

Storage Preserve in tightly closed containers, protected from light.

Zinc Sulfate Oral Solution

Zinc Sulfate Oral Solution contains not less than 0.18% and not more than 0.22% of zinc sulfate ($\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$).

Description A pale yellow to pale yellowish-green liquid; taste, sweetish, slightly astringent.

Identification Yields the reactions characteristic of zinc salts and sulfates (Appendix III).

Other requirements Complies with the general requirements for Oral Solutions (Appendix I O).

Assay To 100 ml measured accurately, equivalent to about 0.2 g of zinc sulfate, add 10 ml of ammonia-ammonium chloride BS (pH 10.0), 1 g of ammonium fluoride and a few drops of eriochrome black T IS. Titrate with disodium edetate (0.05 mol/L) VS until the colour changes from dark purplish-red to dark green. The end point is reached when the dark green colour persists for 1 minute. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 14.38 mg $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$.

Category As described under Zinc Sulfate.

Strength 100 ml : 0.2 g (calculated as $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$)

Storage Preserve in tightly closed containers.

Zinc Sulfate Tablets

Zinc Sulfate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of zinc sulfate ($\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$).

Description Sugar coated tablets, with white core.

Identification Remove the sugar coating of the tablets. dissolve a quantity of the powdered tablets, equivalent to about 100 mg of zinc sulfate with 10 ml of water and filter. The filtrate yields the reactions characteristic of zinc salts and sulfates (Appendix III).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh and powder 20 tablets with sugar coat removed. Weigh accurately a quantity of powdered tablets equivalent to about 0.2 g of Zinc Sulfate, carry out the Assay as described under Zinc Sulfate.

Category As described under Zinc Sulfate.

Strength (1) 25 mg (2) 50 mg

Storage Preserved in tightly closed containers.

Zinc Undecylenate

$\text{C}_{22}\text{H}_{38}\text{O}_4\text{Zn}$ 431.92

[557-08-4]

Zinc Undecylenate is 10-undecenoic acid, zinc (2^+) salt. It contains not less than 98.0% and not more than 102.0% of $\text{C}_{22}\text{H}_{38}\text{O}_4\text{Zn}$.

Description A white, amorphous powder. Practically insoluble in water or ethanol.

Melting range 116-121°C (Appendix VI C).

Identification (1) To about 3 g add 20 ml of water and 25 ml of dilute sulfuric acid, extract with two portions, each of 25 ml, of ether, combine the ethereal extracts, evaporate ether on a water bath. The residue complies with the tests (1) for Identification described under Undecenoic Acid.

(2) Dissolve about 0.1 g in 10 ml of water and 1 ml of concentrated ammonia TS, add a few drops of sodium sulfide TS; a white precipitate is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Zinc Undecylenate (Appendix XVI).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Alkali and alkaline earth metals Boil 1.5 g with 50 ml of water and 10 ml of hydrochloric acid and filter while hot with a moistened filter paper. Wash the residue with hot water until the washing is no longer acidic, combine the washings and the filtrate in a 200 ml volumetric flask and add ammonia TS until the solution is just alkaline. Add ammonium sulfide TS until the zinc is completely precipitated, add water to volume, mix well and filter. To 100 ml of the filtrate add 0.5 ml of sulfuric acid, evaporate to dryness and ignite to constant weight, the residue is not more than 7.5 mg.

Assay To about 0.5 g, accurately weighed, add 10 ml of 1 mol/L hydrochloric acid solution and 10 ml of water, boil for 10 minutes, filter while hot. Wash the residue with hot water, combine the washings and the filtrate, cool, add 1 drop of ethanolic methyl red solution (0.025%) and a quantity of ammonia TS until the solution is pale yellow; add water to produce about 35 ml, add 10 ml of ammonia-ammonium chloride BS (pH 10.0) and a small quantity of eriochrome black T indicator mixture, titrate with disodium edetate (0.05 mol/L) VS until the purple colour changes to pure blue. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 21.60 mg of $\text{C}_{22}\text{H}_{38}\text{O}_4\text{Zn}$.

Category Antifungal disinfectant.

Storage Preserve in tightly closed containers.

Preparation Compound Zinc Undecylenate Ointment

Compound Zinc Undecylenate Ointment

Compound Zinc Undecylenate Ointment contains not less than 18.5% and not more than 21.5% of zinc undecylenate ($\text{C}_{22}\text{H}_{38}\text{O}_4\text{Zn}$).

Undecylenic Acid	50 g
Base	a sufficient quantity
<hr/>	
Total	1000 g

Description A white to pale yellow ointment.

Identification (1) Heat about 5 g in 25 ml of ethanol with shaking, cool and filter. To the filtrate add a few drops of potassium permanganate TS, the colour of potassium permanganate is discharged on shaking.

(2) To the residue obtained in test (1) add 10 ml of chloroform, warm gently to dissolve, cool. Add 20 ml of dilute sulfuric acid, shake and allow to stand, the acid layer yields the reactions characteristic of zinc (Appendix III).

Other requirements Complies with the general requirements

for ointments (Appendix I F).

Assay To about 2.5 g, accurately weighed, in a conical flask add 10 ml of 1 mol/L hydrochloric acid solution and 20 ml of water, heat in a water bath for about 15 minutes, with frequent shaking until the oil layer is clear. Add 20 ml of hot water, stir, allow to stand and cool. Complies with the Assay described under Zinc Undecylenate, beginning at the words "Add 1 drop of ethanolic methyl red solution (0.025%)...". Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 21.60 mg of $C_{22}H_{38}O_4Zn$.

Category As described under Zinc Undecylenate.

Storage Preserve in tightly closed containers.

MONOGRAPHS

PART II

Acetic Acid

Acetic Acid contains not less than 36% and not more than 37% (g/g) of $C_2H_4O_2$.

Description A colourless clear liquid; odour, strong and characteristic; taste, extremely sour.

Relative density 1.04-1.05, at 25°C (Appendix VI A).

Identification When neutralized with sodium hydroxide TS, yields the reactions characteristic of acetates (Appendix III).

Chloride Dilute 1.0 ml with water to 10 ml. Carry out the limit test for chlorides (Appendix VIII A), using 2.0 ml. Any opalescence produced is not more pronounced than that of a reference using 7.0 ml of sodium chloride standard solution (0.035%).

Sulfate Carry out the limit test for sulfates (Appendix VIII B), using 2.0 ml of the diluted solution obtained in the test for Chloride. Any opalescence produced is not more pronounced than that of a reference using 3.0 ml of potassium sulfate standard solution (0.15%).

Formic acid and readily oxidizable substances Add 2.5 ml of potassium dichromate (0.01667 mol/L) solution and 6 ml of sulfuric acid to 5.0 ml of the substance being examined, allow to stand for 1 minute. Add 20 ml of water, cool to 15°C, add 1 ml of potassium iodide TS. A yellow or brown colour is produced.

Non-volatile matter Place 20 ml in an evaporating dish, previously dried to constant weight at 105°C, evaporate on a water bath to dryness and dry at 105°C to constant weight. The residue is not more than 1 mg.

Foreign odour Neutralize 5 ml with sodium hydroxide TS and boil. No other odour is produced except a faint odour of acetic acid.

Heavy metals Add 8 ml of hydrochloric acid solution (9→1000) to the residue obtained in the test for Non-volatile matter, warm to effect dissolution, dilute with water to 100 ml, mix well. To 10 ml of the solution add 2 ml of acetate BS (pH 3.5) and sufficient water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Assay Weigh accurately about 4 ml in a tared conical flask, dilute with 40 ml of freshly boiled and cooled water, add 3 drops of phenolphthalein IS and titrate with sodium hydroxide (1 mol/L) VS. Each ml of sodium hydroxide (1 mol/L) VS is equivalent to 60.05 mg of $C_2H_4O_2$.

Category Pharmaceutical aid, antiseptic.

Storage Preserve in tightly closed glass bottles.

Agar

Agar is a dehydrated mucilaginous substance extracted from *Gelidium amansii* Lamx or other related red algae.

Description Slender strips, almost white or pale yellow; translucent, surface crumpled and slightly lustrous. Light, flexible and difficult to break; brittle and easy to break when dry; odourless; taste, slight. Agar powder is scaly, colourless or pale yellow; irregular polygonal mucilaginous

odourless; taste, slight.

Soluble in boiling water; insoluble in cold water but swelled into gelatinous mass. Its aqueous solution is neutral.

Identification (1) Boil with constant stirring to dissolve about 1 g in 65 ml of water, replenish evaporated water with hot water. It coagulates into translucent elastic gelations; substance when cooled to 32-39°C and remelts when heated to 85°C.

(2) When immersed in 0.02 mol/L iodine solution for a few minutes, it is dyed brownish black. The fragments gradually become purple after macerating in water.

(3) Dissolve about 0.1 g in 20 ml of water by heating. To 4 ml of the solution add 0.5 ml of hydrochloric acid and heat on a water bath for 30 minutes. Add 3 ml of sodium hydroxide TS and 6 ml of alkaline cupric tartrate TS, heat in water bath. A red colour precipitate is produced.

Starch Dissolve 0.10 g in 100 ml of water by boiling. Allow to cool. Add 2 drops of iodine TS, no blue colour is produced.

Loss on drying When dried at 105°C for 5 hours, loses not more than 22.0% of its weight (Appendix VIII L). Strip agar must be reduced to small fragments before drying.

Ash Ignite slowly about 1 g, accurately weighed, in a crucible, previously ignited to constant weight, until the substance being examined is completely carbonized, raise the temperature gradually to 600-700°C, incinerate completely to constant weight. The residual ash is not more than 5.0% of its weight.

Water-insoluble substances Dissolve 1.5 g in 200 ml of water in a beaker by boiling, filter while hot through a No. 3 sintered glass crucible, previously dried to constant weight at 105°C. Wash the beaker with hot water for several times, filter the washings. Dry the residue to constant weight at 105°C. The residue does not exceed 15 mg (1.0%).

Water absorbability Place 5.0 g in a 100 ml measuring cylinder and add water to volume, mix well. Allow to stand at 25°C for 24 hours, filter through a layer of moistened glass wool into another measuring cylinder. Total volume of the filtrate does not exceed 75 ml.

Category Pharmaceutical aid, excipient.

Storage Preserve in tightly closed containers, stored in a dry place.

Anhydrous Sodium Sulfite

Na_2SO_3 126.04

Anhydrous Sodium Sulfite contains not less than 95.0 % of Na_2SO_3 .

Description White crystals or a powder; odourless. Freely soluble in water; very slightly soluble in ethanol; practically insoluble in ether.

Identification (1) The aqueous solution (1→10) is alkaline and yields the reaction characteristic of sulfite (Appendix III).

(2) Yields the reaction characteristic of sodium salts (Appendix III).

Clarity and colour of solution A solution of 1.0 g in 20 ml of water is clear and colourless.

Thiosulfate Dissolve 1.0 g in 15 ml of water, add 5 ml of dilute hydrochloric acid, shake, and allow to stand for 5

Iron To 1.0 g add 2 ml of hydrochloric acid, evaporate to dryness on a water bath. Dissolve the residue in a quantity of water, and carry out the limit test for iron (Appendix VIII G). Any colour produced is not more intense than that of a reference solution using 2.0 ml of iron standard solution (0.002 %).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 1), using 1.0 g; not more than 0.002 %.

Arsenic Dissolve 0.5 g in 10 ml of water, add 1 ml of sulfuric acid, evaporate on a sand bath until white fumes are evolved. Cool, add 21 ml of water and 5 ml of hydrochloric acid. Carry out the limit test for arsenic (Appendix VIII J, method 2); not more than 0.0004 %.

Assay To about 0.2 g, accurately weighed, add 50 ml of iodine (0.05 mol/L) VS, accurately measured, stopper and shake until dissolved. Allow to stand in dark for 5 minutes. Titrate with sodium thiosulfate (0.1 mol/L) VS, add 1 ml of starch IS towards the end of the titration and continue the titration until the blue colour disappears. Perform a blank determination and make any necessary correction. Each ml of iodine (0.05 mol/L) VS is equivalent to 6.302 mg of Na_2SO_3 .

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers.

Aspartame

$\text{C}_{14}\text{H}_{18}\text{N}_2\text{O}_5$ 294.31

[22839-47-0]

Aspartame is 3-amino-*N*-(α -carboxyphenethyl) succinamic acid *N*-methyl ester. It contains not less than 98.0% and not more than 102.0% of $\text{C}_{14}\text{H}_{18}\text{N}_2\text{O}_5$, calculated on the dried basis.

Description A white crystalline powder; taste, sweet.

Specific optical rotation $+14.5^\circ$ to $+16.5^\circ$, in a solution of 40 mg per ml in 70% formic acid solution (Appendix VI E). Perform the determination immediately.

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of aspartame (Appendix XVI).

Acidity Dissolve 1.0 g in 125 ml of water, pH 4.0-6.0 (Appendix VI H).

Clarity of solution The transmittance of a solution of 1% in 2 mol/L hydrochloric acid solution at 430 nm (Appendix IV A) is not less than 95.0%.

Loss on drying When dried at 105°C for 4 hours, loses not more than 4.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in

Arsenic Mix 0.67 g with 1.0 g of calcium hydroxide, triturate with 2 ml of water, and dry at 40°C . Ignite gently to carbonize and then ignite at $500-600^\circ\text{C}$ until the incineration is complete. Cool, add 8 ml of hydrochloric acid and 23 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0003%.

Related substance Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of citrate BS (dissolve 9.6 g citric acid in about 800 ml of water, adjust to pH 4.7 with 1 mol/L sodium hydroxide and dilute with water to 1000 ml.)-methanol (67 : 33) as the mobile phase. Detection wavelength is 254 nm, the number of the theoretical plates of the column is not less than 2000 calculated with reference to the peak of aspartame.

Procedure Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase to produce a solution of 6 mg per ml (solution (1)) and 0.12 mg per ml (solution (2)). Inject $10\ \mu\text{l}$ of solution (2) into the column, adjust the sensitivity of the system so that the height of the principal peak obtained in the chromatogram is 20% of the full scale of the recorder. Inject $10\ \mu\text{l}$ each of solution (1) and (2) into the column, and record the chromatogram for twice the retention time of the principal peak. The sum of impurity peak areas of solution (1) is not greater than the principal peak area of solution (2).

Assay Dissolve about 0.3 g, accurately weighed, in 3 ml of methanol and 50 ml of glacial acetic acid, add 2 drops of crystal violet IS. Titrate immediately with perchloric acid (0.1 mol/L) VS until the solution becomes blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 29.43 mg of $\text{C}_{14}\text{H}_{18}\text{N}_2\text{O}_5$.

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers, stored in a dry place.

Betacyclodextrin

$(\text{C}_6\text{H}_{10}\text{O}_5)_7$ 1134.99

[7585-39-9]

Betacyclodextrin is a cyclic oligosaccharide compound composed of seven α -1,4 linked D-glucopyranosyl units and is obtained from the action of cyclodextrin glucosyltransferase on starch. It contains not less than 96.0% and not more than 102.0% of $(\text{C}_6\text{H}_{10}\text{O}_5)_7$, calculated on the dried basis.

Description White crystals or a crystalline powder; odourless; taste, slightly sweet. Sparingly soluble in water; practically insoluble in methanol, ethanol, acetone or ether.

Specific optical rotation $+159^\circ$ to 164° , in a solution of 10 mg per ml in water (Appendix VI E).

TS by warming in a water bath, and cool to room temperature. A yellowish-brown precipitate is produced.

(2) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the reference standard.

Acidity or alkalinity Dissolve 0.2 g in 20 ml of water, add 0.2 ml of a saturated solution of potassium chloride, pH 5.0-8.0 (Appendix VI H).

Clarity and colour of solution Dissolve 0.50 g in 50 ml of water, the solution is clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 2 (Appendix IX B).

Chloride Carry out the limit test for chloride (Appendix VIII A), using 0.39 g. Any opalescence produced is not more pronounced than that of a reference solution using 7.0 ml of sodium chloride standard solution (0.018%).

Reducing sugars Dissolve about 1.0 g, accurately weighed, in 25 ml of water, add 40 ml of alkaline cupric tartrate TS. Boil gently for 3 minutes and allow to stand overnight at room temperature. Filter with a G₄ sintered glass filter, wash the precipitate with warm water until the washings are neutral. Discard the filtrates and washings. Dissolve the precipitate in 20 ml of hot ferric sulfate TS and filter. Wash the filter with 100 ml of water. Combine the filtrates and washings, and heat to 60°C. Titrate the hot solution immediately with potassium permanganate (0.02 mol/L) VS. The potassium permanganate (0.02 mol/L) VS consumed is not more than 3.2 ml (0.2%) for each g of substance taken, calculated on the dried basis.

Loss on drying When dried to constant weight at 105 °C, loses not more than 14.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel, a mixture of water-methanol (85 : 15) as the mobile phase and a differential refractometer as detector. The number of the theoretical plates of the column is not less than 1500, calculated with reference to the peak of Betacyclodextrin.

Procedure Shake about 50 mg, accurately weighed, with a quantity of water in a 10 ml volumetric flask, dilute with water to volume and mix well. Inject 10 µl of the resulting solution into the column. Repeat the operation, using Betacyclodextrin CRS in stead of the substance being examined, calculate the content of (C₆H₁₀O₅)₇ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Pharmaceutical aid, Excipient.

Storage Preserve in tightly closed containers, store in a dry place.

Black Ferric Oxide

Fe₃O₄ 231.53

Black Ferric Oxide contains not less than 96.0% of Fe₃O₄, calculated on the dried basis.

Insoluble in water; freely soluble in boiling hydrochloric acid.

Identification Boil about 0.1 g with 5 ml of dilute hydrochloric acid, allow to cool, the solution yields the reactions characteristic of ferric salts (Appendix III).

Water soluble substances Dissolve 2.0 g in 100 ml of water, heat under reflux on a water bath for 2 hours and filter. Wash the residue with a quantity of water, evaporate the combined filtrate and washings to dryness in an evaporating dish previously dried to constant weight at 105°C, dry the residue to constant weight at 105°C; not more than 10 mg (0.5%).

Acid insoluble substances Dissolve 2.0 g in 25 ml of hydrochloric acid by heating in a water bath, add 100 ml of water, filter through a sintered glass crucible (No. 4) previously dried to constant weight at 105°C, wash the residue with hydrochloric acid solution (1→100) until the washings become colourless, then wash the residue with water until the washings give no reaction of chlorides, dry the residue to constant weight at 105°C; not more than 20 mg (1.0%).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Barium To 0.2 g add 5 ml of hydrochloric acid, heat to dissolve. Add 1 drop of hydrogen peroxide TS and 20 ml of 10% sodium hydroxide solution, filter, wash the residue with 10 ml of water. Combine the filtrate and washings, add 10 ml of sulfuric acid solution (2→10), no opalescence is produced.

Lead To 0.5 g add 10 ml of hydrochloric acid, heat to dissolve. Add 3 ml of nitric acid, boil for 1 minute, allow to cool. Extract with ether for 4 times (30 ml, 20 ml, 20 ml and 20 ml), discard the ether layer. Heat the acid solution to expel the remaining ether, add ammonia TS to make the solution alkaline, add 1 ml of potassium cyanide TS and sufficient water to produce 50 ml. Add a few drops of sodium sulfide TS and mix well. Any colour produced is not more intense than that of a reference solution prepared in the same manner using 1.5 ml of lead standard solution (0.003%).

Arsenic To 0.2 g add 7 ml of hydrochloric acid, heat to dissolve. Add 21 ml of water and acid stannous chloride TS dropwise until the yellow colour disappears. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.001%.

Assay Dissolve about 0.15 g, accurately weighed, in a conical flask with stopper in 30 ml of hydrochloric acid solution (1→2), heat to dissolve. Continue to heat until the solution begins to boil. Add freshly prepared stannous chloride TS dropwise until the solution is just colourless. Then add 1 drop of freshly prepared stannous chloride TS in excess and 200 ml of water, allow to cool, add 4 ml of mercuric Chloride TS, mix well, then add 3 ml of sulfuric acid and 3 ml of phosphoric acid. Add 6 drops of 0.2% diphenylamine sulfonic acid sodium IS, titrate with potassium dichromate (0.01667 mol/L) VS until a purple blue colour persists for 30 seconds. Each ml of potassium dichromate (0.01667 mol/L) VS is equivalent to 7.72 mg of Fe₃O₄.

Category Pharmaceutical aid, colouring agent.

Storage Preserve in tightly closed containers.

Brown Ferric Oxide

proportion of red ferric oxide, black ferric oxide and yellow ferric oxide. It contains not less than 98.0% of Fe_2O_3 , calculated on dried basis.

Description A red-brown powder; odourless; tasteless.

Insoluble in water; freely soluble in boiling hydrochloric acid.

Identification Boil about 0.1 g with 5 ml of dilute hydrochloric acid, allow to cool, the solution yields the reactions characteristic of ferric salts (Appendix III).

Water soluble substances To 2.0 g add 100 ml of water, heat under reflux on a water bath for 2 hours and filter. Wash the residue with a quantity of water, evaporate the combined filtrate and washings to dryness in an evaporating dish previously dried to constant weight at 105°C, dry the residue to constant weight at 105°C; not more than 10 mg (0.5%).

Acid insoluble substances Dissolve 2.0 g in 25 ml of hydrochloric acid by heating in a water bath, add 100 ml of water, filter through a sintered glass crucible (No. 4) previously dried to constant weight at 105°C, wash the residue with hydrochloric acid solution (1→100) until the washings become colourless, then wash the residue with water until the washings give no reaction of chlorides, dry the residue to constant weight at 105°C; not more than 20 mg (1.0%).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VII L).

Barium To 0.2 g add 5 ml of hydrochloric acid, heat to dissolve. Add 1 drop of hydrogen peroxide TS and 20 ml of 10% sodium hydroxide solution, filter, wash the residue with 10 ml of water. Combine the filtrate and washings, add 10 ml of sulfuric acid solution (2→10), no opalescence is produced.

Lead To 0.5 g add 10 ml of hydrochloric acid, heat to dissolve. Add 3 ml of nitric acid, boil for 1 minute, allow to cool. Extract with anhydrous ether for 4 times (30 ml, 20 ml, 20 ml and 20 ml), discard the ether layer. Heat the acid solution to expel the remaining ether, add ammonia TS to make the solution alkaline, add 1 ml of potassium cyanide TS and sufficient water to produce 50 ml. Add a few drops of sodium sulfide TS and mix well. Any colour produced is not more intense than that of a reference solution prepared in the same manner using 1.5 ml of lead standard solution (0.003%).

Arsenic To 0.2 g add 7 ml of hydrochloric acid, heat to dissolve. Add 21 ml of water, and add acid stannous chloride TS dropwise until the yellow colour disappears. Carry out the limit test for arsenic (Appendix VII J, method 1); not more than 0.001%.

Assay Add to about 0.15 g, accurately weighed, in a conical flask with stopper 2.5 ml of hydrochloric acid, heat to dissolve on a water bath. Add 1 ml of hydrogen peroxide TS, heat to boil for a few minutes, add 25 ml of water, allow to cool. Add 1.5 g of potassium iodide and 2.5 ml of hydrochloric acid, stopper and shake thoroughly, allow to stand in a dark place for 15 minutes. Titrate with sodium thiosulfate (0.1 mol/L) VS, add 2.5 ml of starch TS towards the end of titration, continue the titration until the blue colour disappears. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 7.985 mg of Fe_2O_3 .

Category Pharmaceutical aid, colouring agent.

Storage Preserve in tightly closed containers.

Calcium Sulfate

$\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ 172.17

[10101-41-4]

Calcium Sulfate contains not less than 99.0% of CaSO_4 , Calculated on the ignited basis.

Description White powder, odourless; tasteless. Slightly soluble in water; insoluble in ethanol; soluble in dilute hydrochloric acid.

Identification The dilute hydrochloric acid solution yields the reactions characteristic of calcium salts and sulfates (Appendix III).

Chloride To 0.50 g add 5 ml of nitric acid (1→2) add 40 ml of water, shake to dissolve, carry out the limit test for chlorides (Appendix VIII A). Any in the same manner opalescence produced is not more intense than that of a reference solution prepared using 9.0 ml of sodium chloride standard solution (0.018%).

Carbonate Mix 1 g with 5 ml of water, add dropwise dilute hydrochloric acid; no effervescence is produced.

Loss on ignited When ignited to constant weight, loses not less than 18.0% and not more than 23.0% of its weight, using 1.0 g.

Iron To 0.20 g add 50 mg of ammonium persulfate and 10 ml of dilute hydrochloric acid, shake to dissolve, dilute with water to 50 ml, add 5 ml of Ammonium Thiocyanate TS, mix well. Carry out the limit test for iron (Appendix VIII G). Any colour produced is not more intense than that of the reference solution treated in similar manner using 3.0 ml of iron standard solution (0.015%).

Heavy metals To 1.0 g add 5 ml of dilute hydrochloric acid and 15 ml of water, heat to dissolve. Allow to cool, add 1 drop of phenolphthalein IS, then add dropwise concentrated ammonia solution until the solution becomes light red. Add 2 ml of acetate BS (pH 3.5), filter, dilute the filtrate with water to 25 ml and add 0.5 g of vitamin C. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.0015%.

Assay Dissolve 0.2 g, accurately weighed in 10 ml of dilute hydrochloric acid and 100 ml of water on shaking. Add accurately 20 ml of disodium edetate (0.05 mol/L) VS under stirring, mix well, then 15 ml of sodium hydroxide solution (1→5) and 0.2-0.3 g of murexide indicator mixture (triturate 0.1 g murexide, with sodium chloride to 20 g). Titrate with disodium edetate (0.05 mol/L) VS until the colour turns from pink to violet. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 6.807 mg of CaSO_4 .

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers, protected from light.

Carbomer

Carbomer is a high molecular weight polymer of acrylic acid cross-linked with allylsucrose or allyl ethers of pentaerythritol. It contains not less than 56.0% and not more than 68.0% of carboxylic acid

Description A white, fluffy powder; odour, slight and characteristic; hygroscopic.

Identification Disperse 0.1 g in 20 ml of water and add 0.4 ml of 10% sodium hydroxide solution; a gel is produced.

Acidity Swell 0.10 g in 10 ml of water till uniformly dispersed, pH 2.5-3.5 (Appendix VI H).

Benzene Dissolve a quantity of benzene, accurately weighed, in *p*-xylene to produce a solution of 10 µg per ml as the reference solution. Place about 1 g of carbomer, accurately weighed, in a test tube with stopper, add 10.0 ml of *p*-xylene, and shake to disperse carbomer. Add 10.0 ml of 0.1 mol/L sodium hydroxide solution, stopper, shake for 1 hour and use the supernatant liquid as the test solution. Carry out the method for gas chromatography (Appendix V E), using a glass column 3 m long packed with 201 pink support (60 to 80 mesh) coated with 10% of a mixture of equal parts of dinonyl phthalate and bentone as the stationary phase, and maintain the column temperature at 100°C. Inject separately 1 µl of the test solution and of the reference solution into the column, calculate the content of benzene, not more than 0.01%.

Loss on drying When dried in vacuum at 80°C for 1 hour, loses not more than 2.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 2.0% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Viscosity Disperse uniformly 0.5 g in 98 ml of water, mix well after fully swelled, adjust pH to 7.3-7.8 (tested by precision pH test paper) with 15% sodium hydroxide solution, add water to 100 ml, and mix well with taking care to avoid the formation of air bubbles. The kinematic viscosity at 25°C is 15-30 Pa · s (Appendix VI G, method 2).

Assay Disperse uniformly 0.4 g, accurately weighed, in 400 ml of water, stir to dissolve carbomer. Carry out the method for potentiometric titration (Appendix VII A). Titrate with sodium hydroxide (0.25 mol/L) VS (towards the end of the titration, stir the mixture for at least 2 minutes after each addition). Each ml of sodium hydroxide (0.25 mol/L) VS is equivalent to 11.25 mg of carboxylic acid (—COOH) groups.

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers.

Carboxymethylstarch Sodium

Carboxymethylstarch Sodium is the sodium salt of starch carboxymethyl ether prepared of starch reacted with chloroacetic acid under alkaline condition. It contains not less than 2.0% and not more than 4.0% of sodium (Na), calculated on the dried basis.

Description A white or almost white powder; odourless; hygroscopic in air. Disperses in water to viscous colloidal solution; insoluble in ethanol or ether.

Identification (1) Shake well about 0.1 g with 5 ml of water, add 1 drop of iodine TS, a blue colour is produced

(Appendix III).

Acidity or alkalinity Shake 1.0 g with 100 ml with water, pH 5.5-7.5 (Appendix VI H).

Total chlorine content Shake well about 0.5 g, accurately weighed, with 150 ml of water in a 250 ml conical flask, add 1 ml of potassium chromate IS and titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 3.545 mg of Cl. The total chlorine content is not more than 3.5%, calculated on the dried basis.

Loss on drying When dried at 130°C for 90 minutes, loses not more than 10.0% of its weight (Appendix VIII L).

Iron Ignite gently of 0.5 g in crucible to carbonize, cool, moisten the residue with 0.5 ml of sulfuric acid and heat at low temperature to expel the vapour of sulfuric acid, then raise the temperature to 550-600°C until free from carbon. Allow it to cool, warm in a water bath at 60°C for 10 minutes on adding 4 ml of dilute hydrochloric acid with stirring. Allow the solution to cool, filter if necessary and transfer it into a 50 ml Nessler cylinder. Carry out the limit test for iron (Appendix VII G), using the resulting solution. The colour produced is not more intense than that of a standard using 2.0 ml of iron standard solution (0.004%).

Heavy metals Carry out the test for heavy metals (Appendix VIII H, method 2), using 1.0 g; not more than 0.002%.

Assay To 0.45 g obtained in Loss on drying, accurately weighed, add 50 ml of glacial acetic acid in a 250 ml stoppered conical flask, shake well, Heat it on a water bath for 2 hours, shake well in an interval of 30 minutes until disperses completely. Cool, transfer the solution to a 100 ml beaker. Wash the flask with glacial acetic acid for 3 times, each of 5 ml, and combine the washings with the solution. Titrate potentiometrically (Appendix VII A) with perchloric acid (0.1 mol/L) VS. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 2.299 mg of Na.

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers, stored in a dry place.

Cellacefate

Cellacefate is a condensation compound of partially acetylated cellulose acetate and phthalic anhydride. It contains not less than 30.0% and not more than 40.0% of phthalyl ($C_8H_5O_3$) and not less than 17.0% and not more than 26.0% of acetyl (C_2H_3O), calculated on the anhydrous basis after deducting the amount of free acid.

Description A white or grey white amorphous fibriform of fine strip or powder; tast, slightly characteristic of acetic acid.

Soluble in dioxane, acetone, or aqueous solution over pH 6; insoluble in water or ethanol.

Identification (1) To 10 mg add 1 ml of ethanol and 5 drops of sulfuric acid, a characteristic odour of ethyl acetate is perceptible by heating.

(2) Mix 0.1 g and 20 mg of resorcinol in a test tube, melt by heating for several minutes on a gentle flame, allow to cool, pour the solution into 20 ml of 10% sodium hydroxide solution, a green fluorescence is produced it disappears by

Water Dissolve about 0.5 g, accurately weighed, in 20 ml of a mixture of dehydrated methanol-chloroform (1 : 1). Carry out the determination for Water (Appendix VIII M, method 1 A); not more than 5.0%.

Free acid Transfer 1.5 g to a 250 ml conical flask, accurately weighed, add 50 ml of a mixture of neutral methanol (neutral to phenolphthalein IS)-water (1 : 2), shake for 15 minutes, wash the conical flask with 10 ml of neutral methanol in divided portions, filter. To the filtrate add phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 8.306 mg of $C_8H_6O_4$. The free acid is not more than 6.0%, calculated as anhydrous benzene dicarboxylic acid.

Residue on ignition Not more than 0.2% (Appendix VIII N).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using 1.0 g: not more than 0.002%.

Assay Phthalyl Dissolve about 1 g, accurately weighed, in 50 ml of a mixture of acetone-ethanol-water (2 : 2 : 1) with shaking, add phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 14.91 mg of $C_8H_5O_3$, calculate the content by subtracting the amount of free acid multiplying by 1.795.

Acetyl Dissolve about 0.5 g, accurately weighed, in 50 ml of a mixture of ethanol-acetone (1 : 1) with shaking, add 50 ml of water and accurately 25 ml of sodium hydroxide (1 mol/L) VS, mix well, allow to stand over night. Add phenolphthalein IS, titrate with hydrochloric acid (1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sodium hydroxide (1 mol/L) VS is equivalent to 43.0 mg of C_2H_3O . Calculate the content by subtracting the amount of phthalyl multiplying by 0.5772 and the amount of free acid multiplying by 0.5182.

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers, protected from light.

Chlorobutanol

$C_4H_7Cl_3O \cdot \frac{1}{2}H_2O$ 186.47 [6001-64-5]

Chlorobutanol is 1,1,1-trichloro-2-methyl-2-propanol hemihydrate. It contains not less than 98.5% of $C_4H_7Cl_3O \cdot \frac{1}{2}H_2O$.

Description White crystals; odour, camphoraceous; readily volatile.

Freely soluble in ethanol, chloroform, ether or volatile oil; slightly soluble in water.

Melting point Not lower than 77°C (Appendix VI C), determined without drying.

Identification (1) Dissolve about 25 mg in 5 ml of water,

iodine TS; a yellow precipitate with the odour of iodoform develops.

(2) Dissolve 0.1 g in 5 ml of sodium hydroxide TS, mix well, heat on adding 3-4 drops of aniline, the odour of phenylisocyanide is produced (poisonous!).

Chloride Dissolve 0.10 g in 25 ml of dilute ethanol, add 1.0 ml of nitric acid and a quantity of dilute ethanol to 50 ml, add 1.0 ml of silver nitrate TS, mix well, and allow to stand for 5 minutes in the dark. Any opalescence produced is not more pronounced than that of a reference using 5.0 ml of sodium chloride standard solution (0.05%).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.1 g, accurately weighed, in 5 ml of ethanol, add 5 ml of 20% sodium hydroxide solution and heat under reflux for 15 minutes. Cool to room temperature, add 20 ml of water and 5 ml of nitric acid, then add accurately 30 ml of silver nitrate (0.1 mol/L) VS and 5 ml of dibutyl phthalate, shake vigorously. Add 2 ml of ammonium ferric sulfate IS, titrate with ammonium thiocyanate (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 6.216 mg of $C_4H_7Cl_3O \cdot \frac{1}{2}H_2O$.

Category Pharmaceutical aid, antiseptics.

Storage Preserve in tightly closed containers.

Chloroform

$CHCl_3$ 119.38 [67-66-3]

Chloroform is trichloromethane. It may contain 0.5%-1.5% (ml/ml) of dehydrated ethanol as stabilizer.

Description A colourless volatile liquid; odour, characteristic; taste, slight sweet with burning sensation; deteriorates on exposure to light.

Freely miscible with ethanol, ether, fatty oils, volatile oils or common organic solvents; slightly soluble in water.

Relative density 1.474-1.479, at 25°C (Appendix VI A, hydrostatic method).

Boiling range 60-62°C (Appendix VI B); the liquid distilled below 60°C is not more than 5% (ml/ml).

Identification Heat a quantity with 2 drops of aniline and 1 ml of sodium hydroxide TS, a characteristic odour of phenylisocyanide is produced (poisonous!).

Acidity and carbonyl chloride Add 4 drops of phenolphthalein IS to 20 ml of water, add dropwise with shaking sodium hydroxide (0.01 mol/L) VS until the solution becomes pink. Divide the solution into two equal parts and pour them separately into two 50 ml Nessler cylinders (A and B). To cylinder A add accurately 20 ml of the substance being examined, shake well. Add dropwise with shaking sodium hydroxide (0.01 mol/L) VS until the pink colour of the aqueous layer matches that of the liquid in cylinder B, and persists for 15 minutes; not more than 0.20 ml of sodium hydroxide (0.01 mol/L) VS is consumed.

Chloride Shake 10 ml with 25 ml of freshly boiled and cooled water for 3 minutes and allow to separate. To 10 ml of the aqueous layer add 3 drops of silver nitrate TS. No

Free chlorine To 10 ml of the aqueous layer obtained in the test for chloride add a few drops each of potassium iodide TS and starch IS. No blue colour is produced.

Aldehyde and ketone Shake 3 ml with 10 ml of ammonia-free distilled water for 5 minutes and allow to separate. To 5 ml of the aqueous layer in a 50 ml Nessler cylinder with stopper add 40 ml of ammonia-free distilled water and 5 ml of alkaline mercuric potassium iodide TS, shake well. No turbidity or precipitate is produced within 1 minute.

Readily carbonizable substances To 40 ml in a Nessler cylinder with stopper, washed with 95% sulfuric acid, add 10 ml of 95% sulfuric acid, stopper the cylinder and shake for 5 minutes, allow to separate. The chloroform layer is colourless. Any colour produced in the acid layer is not more intense than that of a reference solution (mix 0.3 ml of standard cobaltous chloride CS, 1.0 ml of standard potassium dichromate CS with 8.7 ml of water. To 2 ml of the resulting solution add water to produce 10 ml).

Decomposition product containing chlorine To 4 ml of the acid layer obtained above add carefully 10 ml of water, mix well. The solution is clear, only a very faint odour of ethanol, ether or ester is perceived on heating. Dilute with 10 ml of water, the solution remains clear. Add 3 drops of silver nitrate TS, no opalescence is produced within 1 minute.

Non-volatile matter Evaporate slowly 25 ml in an evaporating dish previously dried to constant weight at 105°C on a water bath to dryness and dry to constant weight at 105°C. The residue is not more than 1 mg.

Foreign odour Evaporate 20 ml on a water bath of 50°C to almost dryness. No foreign odour is perceived.

Category Pharmaceutical aid, Solvent, antiseptic agent.

Storage Preserve in tightly closed containers, protected from light and stored below 30°C.

Citric Acid

$C_6H_8O_7 \cdot H_2O$ 210.14

[5949-29-1]

Citric Acid is 2-hydroxy-1, 2, 3-propanetricarboxylic acid, monohydrate. It contains not less than 99.5% of $C_6H_8O_7$, calculated on the anhydrous basis.

Description Colourless, translucent crystals, white granules or a crystalline powder, odourless; taste, strongly sour; slightly efflorescent in dry air. The aqueous solution exhibits an acidic reaction.

Very soluble in water, freely soluble in ethanol, sparingly soluble in ether.

Identification (1) Decompose gradually on igniting, but no caramel odour is perceptible (distinction from tartaric acid).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of citric acid (Appendix XVI).

(3) Yields the reactions characteristic of citrates (Appendix III).

Sulfate Carry out the limit test for sulfates (Appendix VII

pronounced than that of a reference using 3.0 ml of potassium sulfate standard solution (0.03%).

Oxalate Dissolve 1.0 g in 10 ml of water, neutralize the solution with ammonia TS, add 2 ml of calcium chloride TS, allow to stand for 30 minutes at room temperature. No opalescence is produced.

Readily carbonizable substances Transfer 1.0 g to a Nessler cylinder, add 10 ml of 95% sulfuric acid, heat for 1 hour at $90^\circ\text{C} \pm 1^\circ\text{C}$, allow to cool immediately. Any colour produced is not more intense than that of a reference (a mixture of 0.9 ml of standard cobaltous chloride CS, 8.9 ml of standard potassium dichromate CS and 0.2 ml of standard copper sulfate CS).

Water 7.5%-9.0% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Calcium Dissolve 1.0 g in 10 ml of water, neutralize with ammonia TS, add a few drops of ammonium oxalate TS. No opalescence is produced.

Iron Carry out the limit test for iron (Appendix VIII G), using 1.0 g, extract with *n*-butanol. Any colour produced is not more intense than that of a reference solution using 1.0 ml of iron standard solution (0.001%).

Heavy metals Dissolve 4.0 g in 10 ml of water, add 1 drop of phenolphthalein IS and a few drops of ammonia TS until a pink colour is produced. Add 2 ml of acetate BS (pH 3.5) and sufficient water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.0005%.

Arsenic Dissolve 2.0 g in 23 ml of water, add 5 ml of hydrochloric acid. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0001%.

Assay Dissolve about 1.5 g, accurately weighted, in 40 ml of freshly boiled and cooled water. Add 3 drops of phenolphthalein IS, titrate with sodium hydroxide (1 mol/L) VS. Each ml of sodium hydroxide (1 mol/L) VS is equivalent to 64.04 mg of $C_6H_8O_7$.

Category Pharmaceutical aid, flavouring agent.

Storage Preserve in tightly closed containers.

Dextrin

Description A white or almost white amorphous powder; odourless; taste, slightly sweet.

Freely soluble in boiling water; insoluble in ethanol or ether.

Identification To 1 ml of an aqueous solution (1→10) add 1 drop of iodine TS, a purplish-red colour is produced.

Acidity Dissolve 5.0 g in 50 ml of water by heating, cool, add 2 drops of phenolphthalein IS and 2.0 ml of sodium hydroxide (0.1 mol/L) VS, a pink colour is produced.

Reducing sugar Shake 2.0 g with 100 ml of water for 5 minutes, allow to stand, filter. To 50 ml of filtrate add 50 ml of alkaline cupric tartrate TS and boil for 3 minutes. Filter with a sintered glass crucible previously dried to constant weight at 105°C. Wash the residue successively with water, ethanol and ether, then dry at 105°C for 2 hours. The residual cuprous oxide is not more than 0.20 g.

Loss on drying When dried to constant weight at 105°C, loses not more than 10.0% of its weight (Appendix VIII L).

Iron Ignite and incinerate 2.0 g. Add 1 ml of hydrochloric acid and 3 drops of nitric acid to the residue and evaporate on a water bath to almost dryness, cool. Dissolve the residue in 1 ml of hydrochloric acid, transfer the solution with water to a 50 ml volumetric flask and dilute to volume, mix well. Measure accurately 10 ml and carry out the limit test for iron (Appendix VII G). Any colour produced is not more intense than that of a reference using 2.0 ml of iron standard solution (0.005%).

Microbial limit Comply with the test for microbial limit (Appendix XI J), except that number of bacterial is not more than 1000 and that of fungi is not more than 100 per g, *Escherichia coli* is not detected.

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers, stored in a dry place.

Dilute Hydrochloric Acid

Dilute Hydrochloric Acid contains 9.5%-10.5% of HCl.

Description A clear, colourless liquid; strongly acidic.

Identification Yields the reactions characteristic of chlorides (Appendix III).

Free chlorine or bromine To 20 ml add 0.2 ml of zinc starch iodide IS, no blue colour is perceived within 10 minutes.

Sulfate Dilute 3 ml with 5 ml of water, add 5 drops of 25% barium chloride solution, no opalescence or precipitate is produced within 1 hour.

Sulfite Dilute 15 ml with 40 ml of freshly boiled and cooled water, add to the solution 50 ml of freshly boiled and cooled water, 1.0 g of potassium iodide, 0.15 ml of iodine (0.005 mol/L) VS and 1.5 ml of starch IS. The blue colour of the solution does not disappear completely.

Residue on ignition To 20 ml add 2 drops of sulfuric acid and evaporate to dryness. Carry out the test for residue on ignition (Appendix VIII N); not more than 2 mg (0.01%).

Iron Evaporate 20 ml to dryness on a water bath. To the residue add 25 ml of water, carry out the limit test for iron (Appendix VII G). Any colour produced is not more intense than that of a reference solution using 1.0 ml of iron standard solution (0.00005%).

Heavy metals Evaporate 10 ml to dryness on a water bath, add 2 ml of acetate BS (pH 3.5) and a quantity of water to produce a solution of 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.0002%.

Arsenic Dilute 1.4 ml with 22 ml of water, add 5 ml of hydrochloric acid. Complies with the limit test for arsenic (Appendix VIII J, method 1) (0.00014%).

Assay Measure accurately 10 ml, dilute with 20 ml of water, add 2 drops of methyl red IS and titrate with sodium hydroxide (1 mol/L) VS. Each ml of sodium hydroxide (1 mol/L) VS is equivalent to 36.46 mg of HCl.

Category Pharmaceutical aid, acidifying agent.

Storage Preserve in tightly closed glass bottles.

Ethylcellulose

not less than 44.0% and not more than 51.0% of ethoxy ($-\text{OC}_2\text{H}_5$) groups, calculated on the dried basis.

Description A white granules or powder; odourless; tasteless. A 5% suspension exhibits neutrality to litmus paper; freely soluble in toluene and ether; insoluble in water.

Identification Dissolve 5 g in 100 ml of a mixture of ethanol-toluene (1 : 4) with shaking, a clear and slightly yellow solution is produced. Place a quantity of the solution on a glass plate. A thin and elastic film is formed after evaporating the solvent. The film is flammable.

Viscosity Weigh accurately 2.5 g calculated on the dried basis into a conical flask with stopper. Accurately add 50 ml of a mixture of ethanol-toluene (1 : 4) with shaking until the substance is completely dissolved. Allow to stand for 8 to 10 hours. Adjust the temperature of the solution to $20^\circ\text{C} \pm 0.1^\circ\text{C}$, and determine the kinetic viscosity (Appendix VI G, method 1, using a capillary tube with 2 mm internal diameter). Its viscosity is not less than 90.0% and not more than 110.0% when the labelled viscosity is 10 $\text{mPa} \cdot \text{s}$ or more; not less than 80.0% and not more than 120.0% when the labelled viscosity is less than 10 $\text{mPa} \cdot \text{s}$ but more than 6 $\text{mPa} \cdot \text{s}$; and not less than 75.0% and not more than 140.0% when the labelled viscosity is 6 $\text{mPa} \cdot \text{s}$ or less.

Loss on drying When dried at 105°C for 2 hours, loses not more than 3.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.4% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Arsenic Mix 0.67 g with 1.0 g of calcium hydroxide, add water and mix well. After dryness, heat gently until it is thoroughly charred, then ignite at $500-600^\circ\text{C}$ until the incineration is completed. Dissolve the cooled residue in a mixture of 8 ml of hydrochloric acid and 23 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0003%.

Assay Carry out the method for determination of methoxyl (Appendix VII G) using a quantity equivalent to about 10 mg of ethoxy groups, adjust the temperature of oil bath to $150-160^\circ\text{C}$, extend the heating time for 1-2 hours longer. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 0.7510 mg of ethoxy group.

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers and stored in a dry place.

Ethylparaben

$\text{C}_9\text{H}_{10}\text{O}_3$ 166.18

[120-47-8]

Ethylparaben is ethyl *p*-hydroxybenzoate. It contains not less than 99.0% of $\text{C}_9\text{H}_{10}\text{O}_3$.

Description A white crystalline powder; odour, slight and characteristic, or odourless; taste, slightly bitter, burning

Freely soluble in ethanol or ether; sparingly soluble in chloroform; slightly soluble in glycerol; practically insoluble in water.

Melting range 114-118°C (Appendix VI C).

Identification (1) Dissolve about 0.1 g in 2 ml of ethanol, boil, add 0.5 ml of mercuric nitrate TS; a precipitate is produced gradually on standing and the supernatant liquid becomes red.

(2) The light absorption of a solution of 5 µg per ml in ethanol exhibits a maximum at 259 nm, the absorbance is about 0.48 (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with reference spectrum of ethylparaben (Appendix XVI).

Acidity Heat 2.0 g with 50 ml of water to 80°C, cool, filter; pH 4.0-7.0 (Appendix VI H), using 20 ml of the filtrate.

Chloride Carry out the limit test for chlorides (Appendix VII A), using 5 ml of the filtrate obtained in the test for Acidity. Any opalescence produced is not more intense than that of a reference using 7.0 ml of sodium chloride standard solution (0.035%).

Sulfate Carry out the limit test for sulfates (Appendix VII B), using 25 ml of the filtrate obtained in Acidity. Any opalescence produced is not more intense than that of a reference using 2.4 ml of potassium sulfate standard solution (0.024%).

Salicylic acid Dissolve 0.10 g in 1 ml of ethanol in a Nessler cylinder, add water to produce 50 ml and add immediately 1 ml of freshly prepared dilute ferric ammonium sulfate solution [to 1 ml of hydrochloric acid (1 mol/L) add 2 ml of ferric ammonium sulfate IS, add water to produce 100 ml], mix well. Any colour produced within 30 seconds is not more intense than that of a reference (dissolve 0.1 g of salicylic acid, weighed accurately, in water in a 1000 ml volumetric flask, add 1 ml of glacial acid, dilute with water to volume, mix well; measure accurately 1.0 ml, add 1 ml of ethanol, 48 ml of water, and 1 ml of the freshly prepared dilute ferric ammonium sulfate solution) (0.10%).

Residue on ignition Not more than 0.1% (Appendix VII N).

Assay Weigh accurately about 2 g to a conical flask, add 40 ml of sodium hydroxide (1 mol/L) VS, accurately measured, heat gently under reflux for 1 hour. Cool to room temperature, add 5 drops of bromothymol blue IS, titrate with sulfuric acid (0.5 mol/L) VS. To 40 ml of phosphate BS (pH 6.5) add 5 drops of bromothymol blue IS, the resulting solution is used as a reference for the endpoint. Perform a blank determination and make any necessary correction. Each ml of sodium hydroxide (1 mol/L) VS is equivalent to 166.2 mg of $C_3H_8O_3$.

Category Pharmaceutical aid, disinfectant.

Storage Preserve in tightly closed containers.

Glycerol for Injection

$C_3H_8O_3$ 92.09

[56-81-5]

Glycerol for Injection is 1, 2, 3-propanetriol. It contains not less than 98.0% of $C_3H_8O_3$.

hygroscopic; the aqueous solution (1 → 10) exhibits a neutral reaction.

Miscible with water or ethanol; slightly soluble in acetone; insoluble in chloroform or ether.

Relative density Not less than 1.257 at 25°C (Appendix VI A).

Refractive index 1.470-1.475 (Appendix VI F).

Identification The infrared absorption spectrum is concordant with the reference spectrum of glycerol (No. 77 in Spectra Atlas).

Acidity or alkalinity Dilute 25.0 g to 50 ml with water, add 0.5 ml of phenolphthalein IS, the solution is colourless. Then add 0.2 ml of 0.1 mol/L sodium hydroxide solution, the solution is pink.

Colour Transfer 50 ml to a Nessler cylinder; any colour produced is not more intense than that of a reference solution prepared by diluting 0.2 ml of potassium dichromate CS to 50 ml with water.

Chloride Carry out the limit test for chloride (Appendix VII A), using 5.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 3.0 ml of sodium chloride standard solution (0.0006%).

Sulfate Carry out the limit test for sulfate (Appendix VII B), using 10 g. Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of potassium sulfate standard solution (0.002%).

Aldehydes and reducing substances Transfer 3.75 g to a Nessler cylinder with stopper, dilute to 15 ml with water and mix. Add 1.0 ml of decolorized pararufuchsin (weigh 0.1 g of pararufuchsin hydrochloride ($C_{19}H_{18}ClN_3$) into a conical flask with stopper, add 60 ml of water and 10 ml of 7.5% sodium metabisulfite solution, then add 4.5 ml of dilute hydrochloric acid with gentle stirring. Insert the stopper and shake until completely dissolved, dilute to 100 ml with water and mix, allow to stand for 12 hours before use), mix, insert the stopper, and allow to stand for 1 hour. Any colour produced is not more intense than that of a reference solution operated in the similar manner using 7.5 ml of formaldehyde solution (containing 5.0 µg of formaldehyde (CH_2O) per ml) and 7.5 ml of water. (The test is not valid unless the reference solution is red)

Fatty acids and esters To 40 g add 40 ml of freshly boiled and cooled water, add 10 ml of sodium hydroxide (0.1 mol/L) VS, accurately measured, and mix well. Boil for 5 minutes and cool. Add several drops of phenolphthalein IS, titrate with hydrochloric acid (0.1 mol/L) VS until the pink colour disappears. Perform a blank determination and make any necessary correction. Not less than 2.0 ml of hydrochloric acid (0.1 mol/L) VS is required.

Readily carbonizable substances Carry out the limit test for readily carbonizable substances (Appendix VIII O), using 5.0 ml, allow to stand for 1 hour. Any colour produced is not more intense than that of an equal volume of a reference solution prepared by mixing 0.2 ml of cobaltous chloride CS, 1.6 ml of potassium dichromate CS and 8.2 ml of water.

Sugar Mix 5.0 g with 5 ml of water, add 1 ml of dilute sulfuric acid, warm on a water bath for 5 minutes. Add 3 ml of 2 mol/L carbonate-free sodium hydroxide solution and 1 ml of cupric sulfate TS dropwise, mix well. The solution is blue and clear, continue to warm on a water bath for 5 minutes, the solution is still blue and no precipitate is produced.

Residue on ignition Heat 20.0 g and stop heating when the substance ignites. After combustion, allow to cool; not

Iron Carry out the limit test for iron (Appendix VIII G), using 20.0 g. Any colour produced is not more intense than that of a reference solution using 1.0 ml of iron standard solution (0.00005%).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 1), using 5.0 g; not more than 0.0002%.

Arsenic Mix 6.65 g with 23 ml of water and 5 ml of hydrochloric acid. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.00003%.

Assay Mix about 0.1 g, accurately weighed, with 45 ml of water, add 25 ml of 2.14% (g/ml) sodium periodate solution, accurately measured, mix well, and allow to stand in a dark place for 15 minutes. Add 5 ml of 50% (g/ml) ethylene glycol and mix well, allow to stand in a dark place for 20 minutes. Add 0.5 ml of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 9.21 mg of $C_3H_5O_3$.

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers, stored in a dry place.

Hydrochloric Acid

HCl 36.46 [7647-01-0]

Hydrochloric Acid contains not less than 36.0% and not more than 38.0% (g/g) of HCl.

Description A clear, colourless, fuming liquid; odour, pungent. It is strongly acidic.

Relative density About 1.18 at 25°C (Appendix IV A).

Identification Yields the reactions characteristic of chlorides (Appendix III).

Free chlorine or bromine Dilute 10 g (8.5 ml) to 20 ml with water, cool, add 0.2 ml of zinc starch-iodide IS, no blue colour is produced within 10 minutes.

Sulfate Mix 25 g (21 ml) with 2 drops of sodium carbonate TS, evaporate to dryness on a water bath, dissolve the residue in 20 ml of water. Carry out the limit test for sulfates (Appendix VIII B), any opalescence produced is not more pronounced than that of a reference using 1.25 ml of potassium sulfate standard solution (0.0005%).

Sulfite Mix 1 g of potassium iodide, 0.15 ml of iodine (0.005 mol/L) VS, and 1.5 ml of starch IS with 50 ml of freshly boiled and cooled water. The blue colour does not disappear on the addition of a mixture of 5 ml of the substance being examined and 50 ml of freshly boiled and cooled water.

Residue on ignition Add 2 drops of sulfuric acid to 100 g (85 ml), evaporate to dryness, and carry out the test for residue on ignition (Appendix VIII N); not more than 2 mg (0.002%).

Iron Evaporate 10 g (8.5 ml) on a water bath to dryness, add 25 ml of water to the residue, carry out the limit test for iron (Appendix VIII G). Any colour produced is not more intense than that of a reference solution using 1.0 ml of standard iron solution (0.0001%).

Heavy metals Evaporate 10 g (8.5 ml) on a water bath to

water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.0002%.

Arsenic To 2 g (1.7 ml) add 22 ml of water and 5 ml of hydrochloric acid, carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0001%.

Assay Transfer about 3 ml to a tared glass-stoppered flask containing about 20 ml of water and weigh accurately. Add 25 ml of water and 2 drops of methyl red IS, titrate with sodium hydroxide (1 mol/L) VS. Each ml of sodium hydroxide (1 mol/L) VS is equivalent to 36.46 mg of HCl.

Category Pharmaceutical aid, acidifying agent.

Storage Preserve in tightly closed containers.

Hyprollose

[9004-64-2]

Hyprollose is low substituted 2-hydroxypropyl cellulose. It contains not less than 7.0% and not more than 16.0% of hydroxypropyloxe group ($C_3H_7O_2$), calculated on the dried basis.

Description A white or almost white powder; odourless; tasteless.

Disperses and swells in water to produce a colloidal solution; insoluble in ethanol, acetone or ether.

Identification (1) To a quantity of 2% aqueous solution in a test tube add 1 ml of a solution of 0.035% anthrone in sulfuric acid slowly along the tube wall, a blue ring is produced at the interface of the two layers and changes to green gradually.

(2) Dissolve 0.5 g of sodium hydroxide in 5 ml of 2% aqueous solution of the substance being examined with shaking. Allow it to stand for 10 minutes, a creamy white viscous solution is produced, shake with 10 ml of methanol, a white flocculent precipitate is produced.

Acidity or alkalinity Dissolve 0.10 g in 10 ml of water, pH 5.0-7.5 (Appendix VI H).

Chloride To 0.10 g add 30 ml of hot water, heat in water bath for 10 minutes and filter while hot. Wash the residue with 4 quantities of 15 ml of hot water. Combine the filtrate and the washings in 100 ml volumetric flask, allow to cool, dilute with water to volume and shake well. Carry out the limit test for chlorides (Appendix VIII A), using 10 ml of the resulting solution. Any opalescence produced is not more pronounced than that of a reference using 2.0 ml of standard sodium chloride solution (0.20%).

Loss on drying When dried at 105°C to constant weight, loses not more than 8.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 1.0% (Appendix VIII N); using 1.0 g.

Iron Ignite 1.0 g as described under Residue on ignition. Dissolve the residue with 5 ml of dilute hydrochloric acid by heat in a water bath, add water to 25 ml and mix well. Carry out the limit test for iron (Appendix VIII G), using 5 ml of the solution. The colour produced is not more intense than that of a standard using 2.0 ml of iron standard solution (0.010%).

Heavy metals Carry out the test for heavy metals (Appendix VIII H, method 2), using the residue obtained in Residue on ignition; not more than 0.002%.

ml of water, stir well and dry at 40°C. Ignite gently to carbonize and then at 500-600°C until free from carbon. Allow it to cool and dissolve the residue with a mixture of 8 ml of hydrochloric acid and 23 ml of water. Carry out the limit test for arsenic (Appendix VIII L, method 1), the resulting solution complies with the requirement (0.0003%).

Assay Carry out the determination of hydroxypropyloxy group (Appendix VII F), using about 0.1 g, accurately weighed. Calculate the content of $C_3H_7O_2$.

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers, stored in dry place.

Hypromellose

[9004-65-3]

Hypromellose is 2-hydroxypropyl methyl cellulose. It contains not less than 19.0% and not more than 30.0% of methoxyl group ($-OCH_3$) and not less than 4.0% and not more than 12.0% of hydroxypropyloxy group ($-OCH_2CHOHCH_3$), calculated on dried basis.

Description A white or almost white fibrous or granular powder; odourless.

Disperses and swells in water to produce a clear or slightly opalescent colloidal liquid; insoluble in dehydrated ethanol, acetone or ether.

Identification (1) To 1 g add 100 ml of hot water (80-90°C) with constant stirring, allow it to cool in ice bath to produce a viscous liquid. Transfer 2 ml of the liquid to a test tube and add 1 ml of 0.035% anthrone solution in sulfuric acid slowly along the tube wall, a bluish-green ring is produced at the interface of the liquids after standing for 5 minutes.

(2) Pour a quantity of the viscous liquid obtained in test (1) on a glass plate and allow the moisture to evaporate, an elastic membrane is produced.

Acidity or alkalinity Dissolve 1.0 g in 100 ml of water, pH 4.0-8.0 (Appendix VI H).

Viscosity To a quantity, calculated on dried basis, add hot water of 90°C to produce a 2.0% (g/g) solution, stir thoroughly for about 10 minutes. Allow it to cool in ice bath with continuing stirring, remove any air bubbles and adjust the weight. Carry out the determination of viscosity (Appendix VI G, method 2), using a NDJ-1 type rotatory viscosimeter with No. 1 rotator and a speed of 60 cycles per minute at $20^\circ C \pm 0.1^\circ C$, the viscosity is 0.005-0.075 Pa · s.

Water-insoluble matter Disperse 1.0 g in 100 ml of hot water (80-90°C) in a beaker and allow it to swell for about 15 minutes. Cool in an ice bath, add 300 ml of water, stir well and filter with No. 1 sintered glass crucible previously dried at 105°C to constant weight. Wash the beaker with water and combine the washings to the crucible, filter and dry to constant weight at 105°C. The residue is not more than 5 mg (0.5%).

Loss on drying When dried at 105°C for 2 hours, loses not more than 5% of its weight (Appendix VIII L).

Residue on ignition Not more than 1.5% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the test for heavy metals (Appendix

ignition; not more than 0.002%.

Arsenic Mix 1.0 g with 1.0 g of calcium hydroxide, stir well with a small amount of water. Allow it to dry, ignite gently to carbonize and then ignite at 600°C until free from carbon, cool and dissolve the residue in a mixture of 5 ml of hydrochloric acid and 23 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1), the resulting solution complies with the requirement (0.0002%).

Assay Methoxyl group Carry out the determination of methoxyl group (Appendix VIII G), using about 0.1 g, accurately weighed. Calculate the content of CH_3O from the following expression

$$\text{content of } CH_3O(\%) = A - (B \times 31/75 \times 0.93)$$

Where A is the assay value of methoxyl group (%);

B is the assay value of hydroxypropyloxy group (%).

Hydroxypropyloxy group Carry out the determination of hydroxypropyloxy group (Appendix VII F), using about 0.1 g, accurately weighed. Calculate the content of $-OCH_2CHOHCH_3$.

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers.

Kaolin

Kaolin is a natural hydrated aluminium-silicate, freed from most of its impurities by elutriation with water, treated with dilute mineral acid, washed with water repeatedly and dried.

Description A fine, almost white powder. When moistened with water, it has an odour of clay and darkens in colour. Practically insoluble in water, dilute mineral acids or sodium hydroxide solutions.

Identification To 1 g in a porcelain evaporating dish add 10 ml of water and 5 ml of sulfuric acid, heat until white fumes of sulfur trioxide appear. Cool, add slowly 20 ml of water, boil for 2-3 minutes and filter; a gray residue remains on the filter. The filtrate yields the reactions characteristic of aluminium salts (Appendix III).

Chloride Boil 0.20 g with 25 ml of water and 1 drop of nitric acid for 5 minutes and filter. Carry out the limit test for chlorides (Appendix VIII A), using the filtrate. Any opalescence produced is not more intense than that of a reference using 6.0 ml of sodium chloride standard solution (0.03%).

Sulfate Boil 0.3 g with 40 ml of water and 2 ml of dilute hydrochloric acid for 5 minutes, cool and filter. Carry out the limit test for sulfates (Appendix VIII B), using the filtrate. Any opalescence produced is not more intense than that of a reference using 3.0 ml of potassium sulfate standard solution (0.1%).

Acid-soluble substances Boil 1.0 g with 50 ml of hydrochloric acid solution (18→1000) for 5 minutes, filter, evaporate the filtrate to dryness and ignite to constant weight; the residue weighs not more than 10 mg.

Loss on ignition When ignited to constant weight, loses not more than 15.0% of its weight.

Sand particles To 2 g in a beaker add 50 ml of water and stir thoroughly, pour to a moistened sieve No. 7. Wash the beaker several times with water until the substance being examined is completely transferred to the sieve. Wash the

fingers; no feeling of gritty particles of sand.

Iron Boil 0.42 g with 25 ml of each of dilute hydrochloric acid and water for 2 minutes, cool and filter. Add water to the filtrate to produce 100 ml and mix well. To 20 ml add 50 mg of ammonium persulfate, dilute with water to 35 ml. Carry out the limit test for iron (Appendix VIII G), any colour produced is not more intense than that of a reference using 5.0 ml of iron standard solution (0.06%).

Heavy metals Boil 4.0 g with 4 ml of acetate BS (pH 3.5) and 46 ml of water, cool, filter, add water to the filtrate to produce 50 ml and mix well. Carry out the limit test for heavy metals (Appendix VIII H, method 1), using 25 ml; not more than 0.001%.

Arsenic To 1.0 g add 5 ml of hydrochloric acid and 23 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1), complies with the requirements (0.0002%).

Category Pharmaceutical aid, excipient.

Storage Preserve in tightly closed containers.

Lactose

$C_{12}H_{22}O_{11} \cdot H_2O$ 360.31 [10039-26-6]

Lactose is 4-O- β -D-galactopyranosyl-D-glucose, monohydrate.

Description White crystalline granules or a crystalline powder; odourless; taste, slightly sweet. Freely soluble in water; insoluble in ethanol, chloroform or ether.

Specific optical rotation +52.0° to +52.6°, in a solution of 0.10 g of lactose (dried at 80°C for 2 hours) and 0.02 ml of ammonia TS per ml in water (Appendix VI E).

Identification (1) To 0.2 g add 5 ml of sodium hydroxide TS and heat gently, the colour of the solution becomes yellow, then reddish-brown and a red precipitate of cuprous oxide is produced on addition of a few drops of copper sulfate TS.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of lactose (Appendix XVI).

Acidity Dissolve 1.0 g in 20 ml of water, pH 4.0-7.0 (Appendix VI H).

Clarity of solution Dissolve 3.0 g in 10 ml of boiling water, the resulting solution is clear.

Protein Dissolve 5.0 g in 25 ml of hot water, cool. Add 0.5 ml of mercuric nitrate TS; no flocculent precipitate is produced in 5 minutes.

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Dissolve 3.0 g in 20 ml of warm water, add 2 ml of acetate BS (pH 3.5) and sufficient water to produce

VIII H, method 1); not more than 0.0005%.

Microbial limit Comply with the test for microbial limit (Appendix XI J), except that number of bacterial is not more than 1000 and that of fungi is not more than 100 per g, *Escherichia coli* is not detected.

Category Pharmaceutical aid, excipients.

Storage Preserve in tightly closed containers.

Lanolin

Description A pale-yellow or brownish-yellow substance with the consistency of an ointment; odour, slight and characteristic. Freely soluble in chloroform or ether, soluble in hot ethanol, very slightly soluble in ethanol, insoluble in water but mix with about twice its weight of water without difficulty.

Melting range 36-42°C (Appendix VI C, method 2).

Acid value Not greater than 1.5 (Appendix VII H).

Saponification value 92-106 (Appendix VII H) (heat under reflux for 2 hours).

Iodine value 18-35 (Appendix VII H) (allow to stand in the 'ar' for 4 hours).

Identification Dissolve 0.5 g in 5 ml of chloroform, add 1 ml of acetic anhydride and 2 drops of sulfuric acid; a deep green colour is produced.

Acidity or alkalinity Melt 10 g with 50 ml of water on a water bath, stir continuously, cool, remove the separated fat, the aqueous solution is clear. To 10 ml of this solution add 1 drop of phenolphthalein IS, no red colour is produced. To another 10 ml, add 1 drop of methyl red IS, no red colour is produced.

Chloride To 0.2 g in a conical flask add 27 ml of ethanol, heat under reflux for several minutes, cool, add 0.5 ml of nitric acid and filter. To the filtrate add 5 drops of ethanolic silver nitrate solution (1→50). Any opalescence produced is not more pronounced than that of a reference solution [to 20 ml of ethanol, add 7.0 ml of sodium chloride standard solution, 0.5 ml of nitric acid and 5 drops of ethanolic silver nitrate solution (1→50)] (0.035%).

Readily oxidizable substances To 10 ml of the aqueous solution obtained in test for Acidity or alkalinity, add 1 drop of potassium permanganate solution (0.02 mol/L), the red colour does not completely disappear within 5 minutes.

Ethanol-insoluble substances Boil 0.5 g with 40 ml of dehydrated ethanol, the solution is clear or very slightly turbid.

Loss on drying When dried with frequent stirring to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.15% (Appendix VIII N).

Category Pharmaceutical aid, ointment base.

Storage Preserve in tightly closed containers, stored in a cool place.

Laurocapram

$C_{18}H_{35}NO$ 281.48

[59227-89-3]

Laurocapram is 1-dodecylhexahydro-2*H*-azepin-2-one. It contains not less than 97.0% and not more than 102.0% of $C_{18}H_{35}NO$.

Description A clear colourless viscous liquid; almost odourless; tasteless.

Very soluble in dehydrated ethanol, ethyl acetate, ether, benzene or cyclohexane; insoluble in water.

Relative density 0.906-0.926 (Appendix VI A).

Refractive index 1.470-1.473 (Appendix VI F).

Viscosity Kinematic viscosity (Appendix VI G, method 1, internal diameter of capillary is $1.2\text{ mm} \pm 0.05\text{ mm}$) is 32-34 mm^2/s at 25°C .

Identification (1) To 2 ml add 2 ml of methanol and 1 ml of freshly prepared 1 mol/L hydroxylamine hydrochloride solution, and 1 granule of potassium hydroxide, heat on a water bath, cool, and add 1 drop of ferric chloride TS, mix well. Heat on a water bath again, a brownish violet colour is produced.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of laurocapram (Appendix XVI).

Acidity or alkalinity To 5 ml add 5 ml of neutral ethanol, heat gently to dissolve laurocapram, cool, the litmus paper moistened by the solution exhibits a neutral reaction.

Hexalactam and related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of carbon tetrachloride-acetone (1 : 1) as the mobile phase. Apply separately to the plate $10\text{ }\mu\text{l}$ each of three solutions in acetone containing (1) 100 mg per ml and (2) 20 mg of the substance being examined per ml; (3) 0.5 mg of hexalactam CRS per ml. After developing and removal of the plate, dry in air, spray with glacial acetic acid, and put in a warm air current until no acetic acid odour perceived. Fumigate the plate in chlorine [place a small beaker containing 1 g of potassium permanganate and 10 ml of hydrochloric acid solution (1→4) in a suitable size glass chamber, put the lid on chamber tightly for 5 minutes] for a few seconds, remove the plate, expel the chlorine with a current of cool air, spray with potassium iodide-starch TS. The colour of the spot obtained with solution (1) corresponds to and is not more intense than the principal spot obtained with solution (3). No any secondary spot other than the principal spot obtained with solution (2) in the chromatogram is observed.

Bromide Shake well 1.0 g with 10 ml of water, add 3 drops of hydrochloric acid and 1 ml of chloroform, then add freshly prepared 2% chloroamine T solution dropwise with shaking. Any colour produced in the chloroform layer is not more intense than that of a chloroform layer prepared using 1 ml of potassium bromide standard solution (weigh accurately and dissolve 0.1489 g of potassium bromide previously dried to constant weight at 105°C in water to produce 100 ml, mix

manner (0.1%).

Residue on ignition Not more than 0.1% (Appendix VII N); using 2.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Carry out the method for gas chromatography (Appendix V E), using a column packed with 10% methylvinylpolysiloxane (SE-30) as the stationary phase, and maintain the column temperature at $240^\circ\text{C} \pm 10^\circ\text{C}$. The number of theoretical plates of the column is not less than 1000, calculate with reference to the peak of laurocapram and the resolution factor between the peaks of laurocapram and internal standard substance complies with the related requirements.

Dissolve a quantity of tetracosane, accurately weighed, in hexane, dilute with *n*-hexane to produce a solution of 2 mg per ml as internal standard solution. Dissolve about 20 mg of laurocapram CRS, accurately weighed, in internal standard solution and dilute to 10 ml, mix well, inject $1\text{ }\mu\text{l}$ into the column, calculate the correction factor.

Dissolve about 20 mg, accurately weighed, in internal standard solution in a 10 ml volumetric flask, dilute to volume and mix well. Inject each $1\text{ }\mu\text{l}$ for 3-5 times, calculate the content of laurocapram ($C_{18}H_{35}NO$).

Category Pharmaceutical aid, skin osmotic penetrant.

Storage Preserve in tightly closed containers, protected from light.

Macrogol 400

Macrogol 400 is a mixture of polymer of ethylene oxide and water, represented by the general molecular formula $\text{HO}(\text{CH}_2\text{CH}_2\text{O})_n\text{H}$, where *n* is the average number of ethylene oxide groups.

Description A colourless or almost colourless viscous liquid; odour, slightly characteristic.

Freely soluble in water or ethanol; insoluble in ether.

Relative density 1.110-1.140 (Appendix VI A).

Viscosity Kinematic viscosity at 40°C , 37-45 mm^2/s (Appendix VI G, method 1), using a capillary tube of 0.8 mm in inner diameter.

Average molecular weight Place about 1.2 g, accurately weighed, in a dry 250 ml conical flask with stopper, add 25 ml, accurately measured, of a solution of phthalic anhydride in pyridine, prepared by dissolving 14 g of phthalic anhydride in 100 ml of anhydrous pyridine and allow it to stand over night. Shake well and heat for 30-60 minutes in a boiling water bath. Allow it to cool after removal, add 50 ml of sodium hydroxide VS (0.5 mol/L), accurately measured, and a solution of phenolphthalein in pyridine (1→100) as indicator and titrate with sodium hydroxide (0.5 mol/L) VS until a pink colour is produced, carry out a blank determination and make any necessary correction. Multiply the weight (g) of substance being examined by 4000 and divide by the volume (ml) of sodium hydroxide (0.5 mol/L) VS consumed, the average molecular weight is 380-420.

Acidity Dissolve 1.0 g in 20 ml of water, pH 4.0-7.0 (Appendix VI H).

Clarity and colour of solution Dissolve 5.0 g in 50 ml of

produced is not more pronounced than that of reference suspension No. 2 (Appendix IX B). Any colour produced is not more intense than that of reference solution Y₂ (Appendix IX A, method 1).

Ethylene glycol and diglycol To 50 mg each of ethylene glycol and diglycol add water in a 100 ml volumetric flask, dilute to volume and shake thoroughly, use as reference solution. To 4.0 g in a 10 ml volumetric flask add water to volume, shake thoroughly and use as test solution. Carry out the method for gas chromatography (Appendix V E), using kieselguhr as the carrier, sorbitol as stationary phase and keep the column temperature at 160°C; not more than 0.25% (g/g) of ethylene glycol and diglycol, respectively.

Residue on ignition Not more than 0.2% (Appendix VIII N).

Heavy metals Dissolve 4.0 g in 5 ml of hydrochloric acid solution (9→1000) and a quantity of water, adjust to pH 3.0-4.0 with dilute acetic acid or ammonia TS, then dilute with water to 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.0005%.

Arsenic To 0.67 g in a kjeldahl flask add 5 ml of sulfuric acid, digest gently at a temperature not exceeding 120°C, add sulfuric acid if necessary, keep the total quantity not more than 10 ml. Add cautiously, in dropwise, of concentrate hydrogen peroxide solution until the reaction goes to completion. Continue to heat the reaction mixture and add, in dropwise, concentrate hydrogen peroxide solution until the solution becomes colourless. Allow it to cool, add 10 ml of water, evaporate until the fume of excess hydrogen peroxide evolves completely. Add 5 ml of hydrochloric acid and a quantity of water to the resulting solution. Carry out the limit test for arsenic (Appendix VIII J, method 1), it complies with the requirement (0.0003%).

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers.

Macrogol 600

Macrogol 600 is a mixture of polymer of ethylene oxide and water with the molecular formula represented by $\text{HO}(\text{CH}_2\text{CH}_2\text{O})_n\text{H}$, where n is the average number of ethyleneoxy groups.

Description Colourless or almost colourless viscous liquid, or translucent waxy soft substance; odour, slight and characteristic. Freely soluble in water or ethanol; insoluble in ether.

Relative density 1.115-1.145 (Appendix IV A).

Viscosity The kinematic viscosity at 40°C is 56-62 mm²/s, using a U-tube viscosimeter with a capillary tube of 1.5 mm in internal diameter (Appendix VI G, method 1).

Average molecular weight Weigh accurately about 1.6 g, carry out the determination described under Macrogol 400, the average molecular weight is 570-630.

Acidity, Clarity and colour of solution, Residue on ignition As described under Macrogol 400.

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers, stored in a dry place.

Macrogol 1000

Macrogol 1000 is a mixture of polymers of ethylene oxide and water, represented by the general molecular formula $\text{HO}(\text{CH}_2\text{CH}_2\text{O})_n\text{H}$, where n is the average number of ethylene oxide groups.

Description White waxy solids; plates or granular powder; odour, slightly characteristic.

Freely soluble in water or ethanol; insoluble in ether.

Congealing point 33-38 °C (Appendix VI D).

Viscosity Kinematic viscosity at 40°C, 8.5-11.0 mm²/s (Appendix VI G, method 1), using a test solution, prepared by dissolving 25.0 g in water and diluting to volume in a 50 ml volumetric flask and U-tube viscosimeter with a capillary tube of 0.8 mm in inner diameter.

Average molecular weight Weight accurately about 3.0 g, carry out the determination described under Macrogol 400. The average molecular weight is 900-1100.

Acidity, Clarity and colour of solution, Residue on ignition As described under Macrogol 400.

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers, stored in dry place.

Macrogol 1500

Macrogol 1500 is a mixture of polymers of ethylene oxide and water. It is represented by the molecular formula $\text{HO}(\text{CH}_2\text{CH}_2\text{O})_n\text{H}$, where n is the average number of ethyleneoxy groups.

Description White waxy solids, plates or granular powder; odour, slightly characteristic.

Freely soluble in water or ethanol; insoluble in ether.

Congealing point 41-46 °C (Appendix VI D).

Viscosity Dissolve 25.0 g in a 100 ml volumetric flask in water and dilute to volume, mix well. The kinematic viscosity at 40°C is 3.0-4.0 mm²/s, using a U-tube viscosimeter with a capillary tube of 0.8 mm in internal diameter (Appendix VI G, method 1).

Average molecular weight Weigh accurately about 4.5 g, carry out the determination described under macrogol 400, the average molecular weight is 1350-1650.

Acidity, Clarity and colour of solution, Residue on ignition As described under macrogol 400.

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers, stored in dry place.

Macrogol 4000

Macrogol 4000 is a mixture of polymers of ethylene oxide and water. It is represented by the

the average number of ethyleneoxy groups.

Description White waxy solids, plates or granular powder; odour, slightly characteristic.

Freely soluble in water or ethanol; insoluble in ether.

Congealing point 50-54 °C (Appendix VI D).

Viscosity Dissolve 25.0 g in a 100 ml volumetric flask with water, dilute to volume and mix well. The kinematic viscosity at 40°C is 5.5-9.0 mm²/s using a U-tube viscosimeter with a capillary tube of 0.8 mm in internal diameter (Appendix VI G, method 1).

Average molecular weight Weigh accurately about 12 g to a 250 ml conical flask with stopper, add 25 ml of pyridine and heat to dissolve. Allow to cool, carry out the determination described under macrogol 400 beginning at the words "Add a solution, accurately measured, of phthalic anhydride in pyridine", the average molecular weight is 3400-4200.

Acidity, Clarity and colour of solution, Residue on ignition As described under Macrogol 400.

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers, stored in a dry place.

Macrogol 6000

Macrogol 6000 is a mixtures of polymers of ethylene oxide and water. It is represented by the molecular formula $\text{HO}(\text{CH}_2\text{CH}_2\text{O})_n\text{H}$, where n is the average number of ethyleneoxy groups.

Description White waxy solids, plates or granular powder; odour, slightly characteristic.

Freely soluble in water or ethanol; insoluble in ether.

Congealing point 53-58 °C (Appendix VI D).

Viscosity Dissolve 25.0 g in a 100 ml volumetric flask with water and dilute to volume, mix well. The Kinematic viscosity at 40°C is 10.5-16.5 mm²/s using a U-tube viscosimeter with a capillary tube of 1.0 mm in internal diameter (Appendix VI G, method 1).

Average molecular weight Weigh accurately about 12.5 g to a 250 ml dry conical flask with stopper, add 25 ml of pyridine, heat to dissolve. Allow to cool, carry out the determination described under macrogol 400 beginning at the words "Add a solution, accurately measured, of phthalic anhydride in pyridine", the average molecular weight is 5400-7800.

Acidity, Clarity and colour of solution, Residue on ignition As described under Macrogol 400.

Category Pharmaceutical aid.

Magnesium Stearate

Magnesium Stearate is a mixture consisted chiefly of magnesium stearate ($\text{C}_{35}\text{H}_{70}\text{MgO}_4$) and magnesium palmitate ($\text{C}_{32}\text{H}_{62}\text{MgO}_4$). It contains the equivalent of not less than 6.5% and not more than 7.5% of

Description A very fine, light, white powder, free from grittiness; odour faint; unctuous to the touch with skin. Insoluble in water, ethanol or ether.

Identification (1) Mix 10 g with 25 ml of dilute sulfuric acid and 100 ml of hot water, then heat the mixture with frequent stirring until the fatty acids separate as an oily layer. Separate the aqueous layer and retain it for Identification test (2). Wash the oily layer with boiling water to free from sulfate. Allow it to cool and discard the washing water. Heat to melt the oily layer, filter while hot, and dry at 105°C. Its congealing point is not lower than 54°C (Appendix VI D).

(2) The aqueous layer obtained in Identification test (1) yields the reactions characteristic of magnesium salts (Appendix III).

Chloride Boil 0.20 g with 1 ml of nitric acid and 24 ml of water and allow to cool until the oily layer solidifies. Filter, dilute the filtrate with water to 50 ml, carry out the limit test for chlorides (Appendix VIII A), using 5 ml of the resulting solution. Any opalescence produced is not more pronounced than that of a reference solution using 3.0 ml of sodium chloride standard solution (0.15%).

Sulfate Boil 0.10 g with 20 ml of water and 1 ml of hydrochloric acid solution (9→100), allow to cool until the oily layer solidifies. Filter, wash the residue with 4-5 successive quantities of water, dilute the combined filtrate and washings to 40 ml with water, carry out the limit test for sulfates (Appendix VIII B). Any opalescence produced is not more pronounced than that of a reference solution using 6.0 ml of potassium sulfate standard solution (0.6%).

Loss on drying When dried to constant weight at 80°C, loses not more than 5.0% of its weight (Appendix VIII L).

Iron Ignite 0.50 g and boil the residue with 5 ml of dilute hydrochloric acid and 10 ml of water. Allow to cool, and filter. To the filtrate add 50 mg of ammonium persulfate, dilute with water to 35 ml. Carry out the limit test for iron (Appendix VIII G). Any colour produced is not more intense than that of a reference solution using 5.0 ml of iron standard solution (0.01%).

Heavy metals Heat 2.0 g with 10 ml of dilute hydrochloric acid and 20 ml of water to boiling and allow to cool until the oily layer solidifies. Filter, evaporate the filtrate to dryness. Dissolve the residue in 10 ml of water and filter. Add 2 ml of acetate BS (pH 3.5) to the filtrate and add sufficient water to produce 25 ml, carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.0015%.

Assay Heat about 1.0 g, accurately weighed, with 50 ml of sulfuric acid (0.05 mol/L) VS, measured accurately, to boiling until the oily layer is clear and heat for 10 minutes more, cool to room temperature, add 1-2 drops of methyl orange IS, titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sulfuric acid (0.05 mol/L) VS, is equivalent to 2.016 mg of MgO.

Category Pharmaceutical aid, excipient.

Storage Preserve in tightly closed containers.

Methacrylic Acid Copolymer I

Methacrylic acid copolymer I is a copolymer of methyl methacrylate, ethyl acrylate and trimethyl ammonium chloride ethyl methacrylate in a ratio of

Description Slightly white, translucent or transparent solid with different shape and size.

Soluble in boiling water or acetone; practically insoluble in isopropanol.

Refractive index Dissolve 1.25 g in 10 ml of isopropanol-acetone (6 : 4), the refractive index is 1.380-1.385 (Appendix VI F).

Viscosity Dissolve 6.0 g in 100 ml of 75% ethanol solution, the kinematic viscosity at 20°C is not more than 0.015 Pa · s, using a rotating viscosimeter with a No. 0 rotator (Appendix VI F) at the speed of 30 rpm.

Alkaline value Dissolve 1 g, previously dried to constant weight at 110°C (for about 5 hours) and accurately weighed, in 25 ml of dichloromethane, add 50 ml of glacial acetic acid and 5 ml of mercuric acetate TS, mix well and add 3 drops of quinaldine red IS, titrate with perchloric acid (0.1 mol/L) VS until the colour of the solution changes from red to colourless. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 5.61 mg of KOH. The value is 23.9-32.3 mg/g, calculated on the dried basis.

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the spectrum of methacrylic acid copolymer I CRS.

Related substances Dissolve a quantity of the substance being examined, accurately weighed, in methanol to produce a solution of 1 mg per ml as test solution; Dissolve an accurately weighed quantity of methacrylic acid CRS, ethyl acrylate CRS and methyl methacrylate CRS in methanol to produce a reference solution of each 3 µg per ml. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-phosphate buffer [dissolve 3.55 g of disodium hydrogen phosphate (Na_2HPO_4) and 3.40 g of potassium dihydrogen phosphate (KH_2PO_4) in 1000 ml of water, and adjust the pH value of the solution to 2.0 with phosphoric acid] (2 : 8) as the mobile phase. Detection wavelength is 202 nm and the number of the theoretical plates of the column is not less than 1000, calculated with reference to the peak of methacrylic acid and the resolution factor between the peaks of ethyl acrylate and methyl methacrylate complies with the related requirements. Inject separately 20 µl each of the test solution and the reference solution into the column, and record the chromatograms. Calculate the content of each monomer impurity separately with respect to the peak area obtained in the chromatogram by the external standard method. The sum of contents is not more than 0.3%.

Loss on drying When dried at 110°C for 6 hours, loses not more than 5.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.3% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for residue on ignition; not more than 0.003%.

Arsenic Transfer 1.0 g to a 150 ml conical flask, add 5 ml of sulfuric acid, heat until the substance is thoroughly charred, add concentrated hydrogen peroxide solution dropwise (if a lot of foam is involved, stop heating and rotate the conical flask to prevent the unreacted substance conglomerating at the bottom) until the solution is colourless. Allow to cool, add cautiously 10 ml of water, heat again until sulfur trioxide is evolved, cool and add slowly 5 ml of hydrochloric acid and a quantity of water to

(Appendix VIII J, method 1); not more than 0.0002%.

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers, and stored in a cool place.

Methacrylic Acid Copolymer II

Methacrylic acid copolymer II is a copolymer of methyl methacrylate, ethyl acrylate and trimethyl ammonium chloride ethyl methacrylate in a ratio of 65 : 30 : 5.

Description Slightly white, translucent or transparent solid with different shape and size.

Sparingly soluble in acetone; practically insoluble in boiling water or isopropanol.

Refractive index Dissolve 1.25 g in 10 ml of isopropanol-acetone (6 : 4), the refractive index is 1.380-1.385 (Appendix VI F).

Viscosity Dissolve 6.0 g in 100 ml of 75% ethanol solution, the kinematic viscosity at 20°C is not more than 0.015 Pa · s, using a rotating viscosimeter with a No. 0 rotator (Appendix VI F) at the speed of 30 rpm.

Alkaline value Dissolve 1 g, previously dried to constant weight at 110°C (for about 5 hours) and accurately weighed, in 25 ml of dichloromethane, add 50 ml of glacial acetic acid and 5 ml of mercuric acetate TS, mix well and add 3 drops of quinaldine red IS, titrate with perchloric acid (0.1 mol/L) VS until the colour of the solution changes from red to colourless. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 5.61 mg of KOH. The value is 12.1-18.3 mg/g, calculated on the dried basis.

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the spectrum of methacrylic acid copolymer II CRS.

Related substances Dissolve a quantity of the substance being examined, accurately weighed, in methanol to produce a solution of 1 mg per ml as test solution; Dissolve an accurately weighed quantity of methacrylic acid CRS, ethyl acrylate CRS and methyl methacrylate CRS in methanol to produce a reference solution of each 3 µg per ml. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-phosphate buffer [dissolve 3.55 g of disodium hydrogen phosphate (Na_2HPO_4) and 3.40 g of potassium dihydrogen phosphate (KH_2PO_4) in 1000 ml of water, and adjust the pH value of the solution to 2.0 with phosphoric acid] (2 : 8) as the mobile phase. Detection wavelength is 202 nm and the number of the theoretical plates of the column is not less than 1000, calculated with reference to the peak of methacrylic acid and the resolution factor between the peaks of ethyl acrylate and methyl methacrylate complies with the related requirements. Inject separately 20 µl each of the test solution and the reference solution into the column, and record the chromatograms. Calculate the content of each monomer impurity separately with respect to the peak area obtained in the chromatogram by the external standard method. The sum of contents is not more than 0.3%.

Loss on drying When dried at 110°C for 6 hours, loses not more than 5.0% of its weight (Appendix VIII L).

N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for residue on ignition; not more than 0.003%.

Arsenic Transfer 1.0 g to a 150 ml conical flask, add 5 ml of sulfuric acid, heat until the substance is thoroughly charred, add concentrated hydrogen peroxide solution dropwise (if a lot of foam is involved, stop heating and rotate the conical flask to prevent the unreacted substance conglomerating at the bottom) until the solution is colourless. Allow to cool, add cautiously 10 ml of water, heat again until sulfur trioxide is evolved, cool and add slowly 5 ml of hydrochloric acid and a quantity of water to produce 28 ml. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers, and stored in a cool place.

Methylcellulose

Methylcellulose is methyl ether cellulose. It contains not less than 27.0% and not more than 32.0% of methoxyl ($-\text{OCH}_3$), calculated on the dried basis.

Description A white or almost white, fibrous or granular powder; odourless; tasteless.

Disperses and swells in water to produce a clear or slightly opalescent colloidal solution; insoluble in dehydrated ethanol, chloroform or ether.

Identification (1) To a quantity of 1% aqueous solution in a test tube add 2 ml of a solution of 0.035% anthrone in sulfuric acid cautiously along the inner wall of the tube and allow to stand. A bluish green ring is produced at the interface of the two layers.

(2) Heat 10 ml of 1% aqueous solution. The solution becomes cloudy or a flocculent precipitate is formed. The solution becomes clear again on cooling.

(3) Place a quantity of 1% aqueous solution on a glass plate. After evaporation of the water a thin and elastic film is formed.

Acidity or alkalinity Dissolve 1.0 g in 100 ml water, pH 4.0-8.0 (Appendix VI H).

Viscosity To a quantity of the substance being examined, calculated on the dried basis, add hot water of 90°C to produce a 2.0% (g/g) solution. Stir thoroughly for about 10 minutes, cool in ice bath and continue stirring, allow to remain in ice bath for 40 minutes. Adjust the weight of the solution, and stir evenly. Determine the viscosity (Appendix VI G, method 2) with a rotating viscometer at $20^\circ\text{C} \pm 0.1^\circ\text{C}$. The viscosity is not less than 80.0% and not more than 120.0% of that stated on the label for viscosity types of 100 mPa · s or less, and not less than 75.0% and not more than 140.0% of that stated on the label for viscosity types higher than 100 mPa · s.

Loss on drying When dried at 105°C for 2 hours, loses not more than 5.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 1.0% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in

Arsenic Mix 1.0 g with 1.0 g of calcium hydroxide, add water and mix well. After dryness, heat gently until it is thoroughly charred, and then ignite at 500-600°C until the incineration is completed. Dissolve the cooled residue in a mixture of 8 ml of hydrochloric acid and 23 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Assay Weigh accurately and carry out the method for determination of methoxyl (Appendix VII G). Calculate the content of $-\text{OCH}_3$.

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers and stored in a dry place.

Microcrystalline Cellulose

Microcrystalline Cellulose is a powder prepared by hydrolysis of purified cotton cellulose. It contains not less than 97.0% and not more than 102.0% of cellulose, calculated on the dried basis.

Description A white or almost white powder; odourless; tasteless.

Insoluble in water, ethanol, acetone or toluene.

Identification Place about 10 mg on a watch glass, add 2 ml of zinc chloride-iodine TS, a blue colour is produced.

Particle size Transfer 20.0 g on a sieve No. 7, not more than 5.0% is retained on the screen; not less than 50.0% is passed through a sieve No. 9.

Acidity or alkalinity Shake 2.0 g with 100 ml of water for 5 minutes, filter. For the filtrate, pH 5.0-7.5 (Appendix VI H).

Water-soluble substances Shake 5.0 g with 80 ml of water for 10 minutes, filter and transfer the filtrate to an evaporating dish which is previously dried to constant weight, evaporate on a water bath to dryness and dry the residue at 105°C for 1 hour; not more than 0.2%.

Chloride Shake 0.10 g with 35 ml of water, filter. Carry out the limit test for chloride (Appendix VIII A), using the filtrate. Any opalescence produced is not more pronounced than that of a reference solution using 3.0 ml of sodium chloride standard solution (0.03%).

Starch Shake 0.1 g with 5 ml of water, add 0.2 ml of iodine TS, no blue colour is produced.

Loss on drying When dried to constant weight at 105°C, loses not more than 5.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N); using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Arsenic Mix 1.0 g with 1.0 g of calcium hydroxide and a quantity of water, stir and dry. Heat gently until it is thoroughly charred, and then ignite at 600 °C until the incineration is complete, allow to cool, add 5 ml of hydrochloric acid and 23 ml of water to dissolve the residue. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Assay Weigh accurately about 0.125 g to a conical flask, add 25 ml of water and 50.0 ml of potassium dichromate

standard in water to produce 200 ml), accurately measured, carefully add 100 ml of sulfuric acid, heat rapidly to boil, cool and transfer to a 250 ml volumetric flask, dilute with water to volume, mix well. Measure accurately 50 ml of the solution, add 3 drops of o-phenanthroline IS, titrate with ferrous ammonium sulfate (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of ferrous ammonium sulfate (0.1 mol/L) VS is equivalent to 0.675 mg of cellulose.

Category Pharmaceutical aid, excipient.

Storage Preserve in tightly closed containers.

Oxystarch

Oxystarch is a sodium periodate oxidation product of corn starch, which has two aldehyde groups on each monomer. It contains not less than 96.0% of oxystarch, calculated on the dried basis.

Description A white or pale yellow powder; odourless; tasteless; very hygroscopic. Insoluble in water or ethanol.

Identification (1) To about 0.1 g add 5 ml of water, heat to boil, shake vigorously and filter. To the filtrate add 0.5 ml of 2,4-dinitrophenylhydrazine TS and heat, opalescence is produced. On cooling yellow crystals are formed which is soluble in ethanol.

(2) To about 10 mg add 1 ml of alkaline cupric tartrate TS and heat, a cuprous oxide precipitate is produced immediately.

Free starch Boil 0.1 g with 5 ml of water, cool; a sediment is deposited on the bottom without burning. Add 1 drop of iodine TS; no blue colour is produced.

Iodide Weigh 1 g into a beaker, add a small quantity of water, stir thoroughly, filter and wash with a small quantity of water. Combine the washings and filtrate, dilute to 10 ml with water. Add 0.5 ml of hydrogen peroxide TS, and mix well. Add 2 drops of sulfuric acid and heat to boil. Add 0.5 ml of starch IS after cooling; no blue colour is produced.

Acidity To 1 g add 10 ml of water, stir and filter. The pH of the filtrate is not less than 2.5 (Appendix VI H).

Loss on drying When dried to constant weight at 100°C, loses not more than 15.5% of its weight, using 0.5 g (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Iron To 0.5 add 20 ml of dilute hydrochloric acid solution, shake for 5 minutes, filter and wash the residue with a small amount of water. Combine the washings and filtrate, carry out the limit test for iron (Appendix VIII G). Any colour produced is not more intense than that of a reference solution using 1.5 ml of iron standard solution (0.003%).

Other requirements Complies with the general requirements for powders (Appendix I P).

Assay To about 0.1 g, accurately weighed, add 15 ml of hydroxylamine hydrochloride solution (dissolve 7.5 g of hydroxylamine hydrochloride in 15 ml of water, add 200 ml

solution, and mix well. Add 2.5 ml of bromophenol blue IS, mix well, allow to stand over night, filter if necessary), accurately measured, and 10 ml of ethanol solution (1→2), heat gently under reflux for 10 minutes and cool. Titrate with hydrochloric acid (0.1 mol/L) VS until the solution becomes yellowish-green. Perform a blank determination and make any necessary correction. Each ml of hydrochloric acid (0.1 mol/L) VS is equivalent to 8.0 mg of oxystarch.

Category Pharmaceutical aid, urea nitrogen sorbent.

Strength 10 g

Storage Stored in a dry place and protected from light.

Paraffin

Paraffin is a mixture of solid hydrocarbons obtained from petroleum or shale oil.

Description Colourless or white translucent mass, usually exhibit a crystalline structure; odourless; tasteless; slightly greasy to the touch.

Soluble in chloroform or ether; practically insoluble in water or ethanol.

Melting range 50-65°C (Appendix VI C, method 2).

Identification (1) When strongly heated, it burns with a luminous flame to leave a carbonized residue.

(2) Heat about 0.5 g in a dry test tube with an equal quantity of sulfur; the mixture is carbonized with the evolution of hydrogen sulfide.

Acidity or alkalinity Melt about 5 g, add an equal volume of hot neutral ethanol and shake. Allow to separate, the solution is neutral to litmus paper.

Readily carbonized substances Transfer 4.0 g to a test tube with stopper, heat in a water bath at 65-70°C. Add 5 ml of 95% sulfuric acid and maintain at this temperature for 10 minutes, shake the mixture thoroughly for a few seconds at intervals of every one minute. The paraffin remains unchanged in colour, any colour produced in the acid layer is not more intense than that of a reference solution (mix standard cobaltous chloride CS 0.8 ml, standard copper sulfate CS 0.3 ml, standard potassium dichromate CS 1.0 ml and water 2.9 ml).

Residue on ignition Not more than 0.05% (Appendix VIII H).

Category Pharmaceutical aid, ointment base.

Storage Preserve in tightly closed containers.

Poloxamer

Poloxamer is a block copolymer of ethylene oxide and propylene oxide, i.e., α -hydro- ω -hydroxypoly (oxyethylene)_a poly (oxypropylene)_b poly (oxyethylene)_c, where *a* and *c* is 2-130 and *b* is 15-67. The average content of oxyethylene units is

not less than 90.0% and not more than 110.0% of the labelled nominal value if the labelled nominal value is between 1000 and 7000. It is not less than 80.0% and not more than 120.0% of the labelled nominal value if the labelled nominal value is above 7000.

Description White or slightly yellow translucent waxy solids; odour, slightly characteristic.

Freely soluble in ethanol or water; soluble in dehydrated ethanol or ethyl acetate; practically insoluble in ether or petroleum benzin.

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of poloxamer (Appendix XVI).

Acidity or alkalinity Dissolve 1.0 g in 40 ml of water, pH 5.0-7.5 (Appendix VI H).

Heavy metals Dissolve 1.0 g in 23 ml of water, add 2 ml of acetate BS (pH 3.5). Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.002%.

Arsenic To 1.0 g add 5 ml of hydrochloric acid and 23 ml of water, shake to dissolve. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Weight percent of oxyethylene Transfer 0.5-1.0 ml of 10%-20% (g/ml) solution of the substance being examined in deuteriochloroform containing 1% of tetramethylsilane (or in deuterium oxide containing 1% of sodium 4,4-dimethyl-4-silapentane-5-sulfonate as internal standard) to an NMR sample tube, add 1 drop of deuterium oxide and shake well. Measure the resulting solution with NMR instrument by Relative Method for Quantitation and scan the region from 0×10^{-6} to 5×10^{-6} , calculate the EO value with the following equation:

$$EO = 3300\alpha / (33\alpha + 58)$$

Where α is $(A_2/A_1) - 1$;

A_1 is the average area of the doublet appearing at about 1.15×10^{-6} due to the methyl groups of the oxypropylene units;

A_2 is the average area of the composite band from 3.2 to 3.8×10^{-6} due to the CH_2O groups of both the oxyethylene and oxypropylene units and the CHO groups of the oxypropylene units;

EO is the percentage of oxyethylene units, by weight, in the poloxamer molecule (%).

Unsaturation Weigh accurately about 15.0 g of the powdered poloxamer, add accurately 50 ml of mercuric acetate solution, and mix on a magnetic stirrer until the poloxamer is dissolved completely. Allow to stand for 30 minutes with occasional shaking. Add 10 g of sodium bromide crystals, and stir on a magnetic stirrer for about 2 minutes, add 1 ml of phenolphthalein IS immediately, titrate with methanolic potassium hydroxide (0.1 mol/L) VS. Perform a blank determination and determine the initial acidity (Dissolve 15.0 g of poloxamer in 75 ml of neutral methanol (neutral to phenolphthalein IS), titrate with methanolic potassium hydroxide (0.1 mol/L) VS until the solution is neutral to phenolphthalein IS) to make any necessary correction. The unsaturation is 0.065 ± 0.035 . It is calculated, in mEq per g, with the following equation:

$$\text{Unsaturation} = (V_{\text{sample}} - V_{\text{blank}} - V_{\text{initial}}) N / W,$$

Where V_{sample} , V_{blank} and V_{initial} are the volumes, of methanolic potassium hydroxide (0.1 mol/L) VS consumed for titrating the substance being examined, the blank and the initial acidity, respectively, ml;
 N is the concentration, of the methanolic pota-

W is the weight of the substance being examined, g.

Average molecular weight Weigh accurately a quantity, calculated by multiplying the molecular weight by 0.002, of poloxamer, add accurately 25 ml of phthalic anhydride-pyridine solution and a few of glass beads. Heat under a reflux condenser for 1 hour, allow to cool and wash the reflux condenser with two 10 ml portions of pyridine. Add 10 ml of water, mix well, seal and allow to stand for 10 minutes. Add accurately 50 ml of 0.66 mol/L sodium hydroxide solution and 0.5 ml of a mixture of phenolphthalein-pyridine solution (1 \rightarrow 100), titrate with sodium hydroxide (0.5 mol/L) VS until the solution changes to a light pink colour that resists for 15 seconds. Perform a blank determination and make any necessary correction. Calculate the average molecular weight for the substance being examined using the following equation:

$$\text{average molecular weight} = 2000W / [(B - S)N]$$

Where W is the weight of the substance being examined, g;

B is the volume, of the sodium hydroxide (0.5 mol/L) VS consumed for titrating blank, ml;

S is the volume, of the sodium hydroxide (0.5 mol/L) VS consumed for titrating the substance being examined, ml;

N is the concentration, of the sodium hydroxide (0.5 mol/L) VS, mol/L.

Category Pharmaceutical aid (for oral).

Storage Preserve in tightly closed containers, protected from light.

Preparation of mercuric acetate solution Dissolve 50 g of mercuric acetate in 900 ml of methanol to which 0.5 ml of glacial acetic acid has been added, dilute with methanol to 1000 ml and mix. Discard the solution if it changes to yellow. If it is turbid, filter it. Discard it if it is still turbid or presents as yellow. The solution should be freshly prepared, and preserve in an amber glass bottle, stored in dark place.

Preparation of phthalic anhydride-pyridine solution

Preparation To 500 ml of pyridine containing less than 0.1% of water (or dissolve 30 g of phthalic anhydride in 500 ml of pyridine, distill and use the middle portion of the distillate.) add 72 g of phthalic anhydride, shake vigorously or heat on a water bath at 40°C until solution is effected, allow to stand overnight with protecting from light.

Standardization Mix 10 ml of the above resulting solution, accurately measured, with 25 ml of pyridine and 50 ml of water, allow to stand for 15 minutes, add 0.5 ml of a mixture of phenolphthalein-pyridine solution (1 \rightarrow 100), titrate with sodium hydroxide (0.5 mol/L) VS; it consumes between 37.6 ml to 40.0 ml.

Polyacrylic Resin II

Polyacrylic Resin II is a copolymer of methylacrylic acid and methyl methacrylate in a ratio of 50 : 50.

Description A white strip or powder, easy to conglomerate in ethanol. Soluble in warm ethanol within 1 hour (break the strip to 1 cm long, and the powder does not need to triturate); insoluble in water.

Viscosity To 6.0 g, add 100 ml of ethanol, warm to dissolve, the kinematic viscosity at 25°C is not more than

G, method 2).

Acid value Dissolve about 0.5 g, accurately weighed, in a 250 ml conical flask with 25 ml of 75% ethanol (neutral to phenolphthalein IS) by warming. Allow to cool; add dropwise 15 ml of sodium hydroxide (0.1 mol/L) VS, accurately measured, add 5 g of sodium chloride and 10 ml of water, continue the titration with sodium hydroxide (0.1 mol/L) VS until a pink colour persists for 30 seconds. The acid value is 300-330, calculated on the dried basis (Appendix VII H).

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of polyacrylic Resin II CRS.

Acidity Dissolve 3.0 g in 100 ml of 75% ethanol (pH value about 7) by warming and allow to cool, pH is 4.0-6.0 (Appendix VIII H).

Loss on drying When dried to constant weight at 110°C, loses not more than 10.0% (Appendix VIII L).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using 1.0 g; not more than 0.003%.

Arsenic Heat 1.0 g in a 150 ml conical flask with 5 ml of sulfuric acid, until it is completely charred, add concentrate hydrogen peroxide solution dropwise (if a lot of foam evolved, stop heating and rotate the conical flask to prevent conglomeration of the unreactant on the bottom) until the solution becomes colourless. Allow to cool, add cautiously 10 ml of water, heat again, the sulfur trioxide is evolved, cool and add slowly a quantity of water to 28 ml. It complies with the limit test for arsenic (Appendix VIII J) (0.0002%).

Category Pharmaceutical acid.

Storage Preserve in tightly closed containers, stored in cool place.

Polyacrylic Resin III

Polyacrylic Resin III is a copolymer of methylacrylic acid and methyl methacrylate in a ratio of 35 : 65.

Description A white strip or powder, easy to conglomerate in ethanol.

Soluble in warm ethanol within 1 hour (break the strip to 1 cm long and the powder does not need to triturate); insoluble in water.

Viscosity To 6.0 g add 100 ml of ethanol, warm to dissolve, the kinematic viscosity at 25°C is not more than 50×10^{-3} Pa · s, using a rotating viscosimeter (Appendix VI G, method 2).

Acid value Dissolve about 0.5 g, accurately weighed in a 250 ml conical flask with 25 ml of 75% ethanol (neutral to phenolphthalein IS) by warming. Allow to cool, add dropwise 15 ml of sodium hydroxide (0.1 mol/L) VS, accurately measured, 5 g of sodium chloride and 10 ml of water, continue the titration with sodium hydroxide (0.1 mol/L) VS until a pink colour persists for 30 seconds. The acid value is 210-240, calculated on the dried basis. (Appendix VII H).

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of polyacrylic Resin III CRS.

about 7) by warming, cool, pH is 4.0-6.0 (Appendix VI H).

Loss on drying When dried to constant weight at 110°C, loses not more than 10.0% (Appendix VIII L).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using 1.0 g; not more than 0.003%.

Arsenic Transfer 1.0 g to a 150 ml conical flask, add 5 ml of sulfuric acid, heat until it is completely charred, add concentrate hydrogen peroxide solution dropwise (If a lot of foam is evolved stop heating and rotate the conical flask to prevent the unreactant to conglomerate at the bottom) until the solution is colourless. Allow to cool, add cautiously 10 ml of water, heat again, until sulfur trioxide is evolved, cool and add slowly a quantity of water to 28 ml. It complies with the limit test for arsenic (Appendix VIII J) (0.0002%).

Category Pharmaceutical acid.

Storage Preserve in tightly closed containers, stored in cool place.

Polyacrylic Resin IV

Polyacrylic Resin IV is a copolymer of dimethylaminoethyl methacrylate and methylacrylic esters.

Description Pale yellow granule or flake solid; odour, characteristic.

Soluble in warm ethanol (within 1 hour); sparingly soluble in hydrochloric acid solution (9→1000) (within 1 hour); insoluble in water.

Relative density Dissolve 10.25 g with isopropanol-acetone (3 : 2) in a 100 ml volumetric flask and dilute to volume as the test solution. The relative density of the test solution is 0.810-0.820 (Appendix VI A).

Refractive index 1.380-1.395 (Appendix VI F), using the test solution obtained in the test for Relative density.

Viscosity Dissolve 12.00 g in a 100 ml volumetric flask with ethanol and dilute to volume, the kinematic viscosity at 30°C is 0.005-0.020 Pa · s, using a model NDJ-79 rotating viscosimeter (Appendix VI G, method 2).

Alkaline value Dissolve about 0.3 g, accurately weighed, with 25 ml of neutral ethanol (reveals yellow to bromophenol blue IS), add 20 ml of hydrochloric acid (0.1 mol/L) VS, accurately measured, and several drops of bromophenol blue IS, mix well. Titrate with sodium hydroxide (0.1 mol/L) VS until the solution becomes bluish-green. Perform a blank determination. Calculate the alkaline value with the following equation; the alkaline value is 162.0-198.0.

$$\text{Alkaline value} = \frac{(B-A) \times 5.61}{G}$$

where A is volume consumed of sodium hydroxide (0.1 mol/L) VS of the substance being examined;
B is volume consumed in blank determination;
G is the weight of the substance being examined.

Identification Apply about 10 µl of the solution obtained in the test for Viscosity to a blank potassium bromide disc of 13 mm in diameter, heat to evaporate the solvent. The infrared spectrum (Appendix IV C) is concordant with the spectrum of polyacrylic Resin IV CRS treated in the same manner.

Colour of solution The light absorbance at 420 nm is not

obtained in the test for Relative density.

Loss on drying When dried to constant weight at 110°C, loses not more than 4.0% (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N, method 2), using 1 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Arsenic Add 10 ml of sulfuric acid to 1.0 g, heat until it is completely charred, add hydrogen peroxide solution dropwise until the solution is colourless, allow to cool. Add 10 ml of water, heat until sulfur trioxide is evolved. Cool and add a quantity of water to 28 ml, the solution complies with the limit test for arsenic (Appendix VIII J, method 1) (0.0002%).

Category Pharmaceutical acid.

Storage Preserve in tightly closed containers, stored in cool place.

Polyoxyl (40) Stearate

[9004-99-3]

Polyoxyl (40) Stearate is polyethylene glycol monostearate. It is represented by the molecular formula $C_{17}H_{35}COO(CH_2CH_2O)_nH$, where n is about 40.

Description White or pale yellow waxy solids; odourless. Soluble in water, ethanol or ether; insoluble in ethylene glycol.

Melting range 46-51°C (Appendix VI C, method 2).

Acid value Not greater than 2 (Appendix VII H).

Saponification value 25-35 (Appendix VII H).

Hydroxyl value 22-38 (Appendix VII H).

Clarity and colour of solution A solution of 1.0 g in 20 ml of water is clear and colourless; any colour produced is not more intense than that of reference solution Y₆ (Appendix IX A).

Residue on ignition Not more than 0.3% (Appendix VIII N).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 3), using 2.0 g; not more than 0.001%.

Category Pharmaceutical aid, surfactant.

Storage Preserve in tightly closed containers, stored in a dry and cool place.

Polysorbate 80

[9005-65-6]

Polysorbate 80 is polyoxyethylene (20) sorbitan monooleate.

Description A pale yellow to orange-yellow, viscous liquid; odour, faint and characteristic; taste, slightly bitter and astringent with a warm feeling. Freely soluble in water, ethanol, methanol or ethyl acetate.

Relative density 1.06-1.09 (Appendix VI A, hydrostatic method).

Kinematic viscosity 350-550 mm²/s (Appendix VI G, method 1), determined at 25°C, using a capillary tube of 3.4-4.2 mm in internal diameter.

Acid value Dissolve 10 g, accurately weighed, with 50 ml of ethanol neutralize to phenolphthalein IS in a 250 ml conical flask. Boil under reflux for 10 minutes, cool, add 5 drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. The acid value is not more than 2.2 (Appendix VII H).

Saponification value 45-60 (Appendix VII H).

Hydroxyl value 65-80 (Appendix VII H).

Iodine value 18-24 (Appendix VII H).

Identification (1) To 5 ml of a solution (1→20) add 5 ml of sodium hydroxide TS. Boil for a few minutes, cool, and acidify with dilute hydrochloric acid; a creamy-white turbidity is produced.

(2) To a solution (1→20) add bromine TS dropwise; the bromine is decolourized.

(3) To 6 ml add 4 ml of water, mix well; a gelatinous mass is formed.

(4) To 10 ml of a solution (1→20) add 5 ml of ammonium cobalt thiocyanate solution (dissolve 17.4 g of ammonium thiocyanate and 2.8 g of cobalt nitrate in 100 ml of water), mix well. Add 5 ml of chloroform, shake, allow to stand, chloroform layer turns blue.

Acidity or alkalinity Dissolve 0.50 g in 10 ml of water, pH 5.0-8.0 (Appendix VI H).

Colour Not more intense than that of a reference solution prepared by mixing 8.0 ml of standard potassium dichromate CS and 0.8 ml of standard cobaltous chloride CS with sufficient water to produce 10 ml.

Freezing test Allow to stand for 24 hours in a glass container at 5°C ± 2°C, it is not frozen.

Water Not more than 3.0% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.2% (Appendix VIII N); using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Category Pharmaceutical acid.

Storage Preserve in tightly closed containers, protected from light.

Polyvinyl Alcohol Resin

Polyvinyl alcohol resin is obtained by alcoholysis of polyvinyl acetate in methanol in the presence of alkali. It is represented by the formula $(CH_2CHOH)_n(CH_2CHOCOCH_3)_m$, in which $m+n$ represents the average polymerization degree.

Description White or pale yellow granules or powder; odourless; tasteless.

Freely soluble in hot water or boiling water; practically insoluble in anhydrous ethanol or benzene; insoluble in cold water.

Viscosity Dissolve by heating in a water bath 12 g, accurately weighed, in water to produce solutions of 3.8%.

G, method
Acid val
250
pH
viscosity

931

mPa · s.

Acidity To 2 g add 50 ml of water, heat in a water bath until dissolved, allow to cool, pH 4.5-6.5 (Appendix VI H).

Loss on drying When dried to constant weight at 105°C, loses not more than 6.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.5% (Appendix VIII N), using 1.0 g.

Degree of alcohololysis Accurately weigh 1 g into a 500 ml iodine flask with a stopper, add 200 ml of water, heat on a water bath until dissolved. Allow to cool, add 2-3 drops of phenolphthalein TS, and sodium hydroxide (0.1 mol/L) VS dropwise until the colour of the solution turns pink. Add 20 ml of sodium hydroxide (0.1 mol/L) VS, accurately measure, titrate with sodium hydroxide (0.1 mol/L) VS. Perform a blank determination in the same manner and make any necessary correction. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 60.05 mg of acetic acid.

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers.

Pregelatinized Starch

Pregelatinized Starch is mechanically processed starch to improve its flowability and compressibility.

Description A white powder; odourless; tasteless.

Identification (1) Boil about 1 g with 15 ml of water, cool, a semitransparent white gelatinous substance is produced. (2) Mix about 0.1 g with 20 ml of water, add a few drops of iodine TS, a blue or bluish black colour is produced which gradually disappears on heating and reappears on cooling. (3) Mix the sample and glycerine-acetic acid TS on a slide and examine under microscope; aggregates of original starch and remainders are observed, the spheroidal particulates are no longer exist, changing to irregular granules on surface. (4) Examine under polarization microscope; polarized cross of some of the granules disappears completely.

Acidity Shake 10.0 g with 10 ml of neutral ethanol, add 100 ml of boiled and cooled water, mechanically stir for 5 minutes, the pH value of the supernatant liquid is 4.5-7.0 (Appendix VI H).

Loss on drying When dried at 120°C for 4 hours, loses not more than 14.0% of its weight (Appendix VIII L).

Ash Weigh accurately about 1.0 g in a crucible, previously ignited to constant weight, ignite gently until completely carbonized. Incinerate completely to constant weight at 600-700°C which is raised gradually. The remaining ash is not more than 0.3% of its weight.

Iron To 0.50 g add 4 ml of dilute hydrochloric acid and 16

ml of water, combine the filtrate and washings, add 50 mg of ammonium persulfate and dilute with water to 35 ml. Carry out the limit test for iron (Appendix VIII G). Any colour produced is not more intense than that of a reference solution using 1.0 ml of iron standard solution (0.002%).

Sulfur dioxide To 20 g add 200 ml of water in a conical flask with stopper, shake thoroughly, filter. To 100 ml of the filtrate add 2 ml of starch IS, titrate with iodine (0.01 mol/L) VS. Not more than 2.50 ml of iodine (0.01 mol/L) VS is required (0.008%).

Oxidizing substances To 5 g add 20 ml of a mixture of methanol and water (1 : 1), and 1 ml of 6 mol/L acetic acid solution, stir until a homogenized suspension is obtained. Add 0.5 ml of a freshly prepared and saturated potassium iodine solution, mix well, allow to stand for 5 minutes; no distinct bluish brown or violet colour is produced (0.002%).

Category Pharmaceutical aid, excipient.

Storage Stored in a dry place.

Storage Stored in a dry place.

Propylene Glycol

C₃H₈O₂ 76.09

[57-55-6]

Propylene glycol is 1,2-propanediol.

Description A viscous, clear, colourless liquid; odourless; taste, slightly sweet; hygroscopic. Miscible with water, ethanol or chloroform.

Relative density 1.035-1.037 at 25°C (Appendix VI A).

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Propylene glycol (Appendix XVI).

Acidity Dissolve 10.0 ml in 50 ml of freshly boiled and cooled water and add 3 drops of bromothymol blue IS, titrate with sodium hydroxide (0.01 mol/L) VS until the colour changes to blue. Not more than 0.50 ml of sodium hydroxide (0.01 mol/L) VS is required.

Chloride Carry out the limit test for chloride (Appendix VIII A), using 1.0 ml. Any opalescence produced is not more pronounced than that of a reference solution using 7.0 ml of sodium chloride standard solution (0.007%).

Sulfate Carry out the limit test for sulfate (Appendix VIII B), using 5.0 ml. Any opalescence produced is not more pronounced than that of a reference solution using 3.0 ml of potassium sulfate standard solution (0.006%).

Oxidizing substances To 5.0 ml add 1.5 ml of potassium iodide TS and 2 ml of dilute sulfuric acid, allow to stand in a ground-glass-stoppered flask protected from light for 15 minutes and add 2 ml of starch IS, any blue colour produced requires not more than 0.2 ml of sodium thiosulfate (0.005 mol/L) VS to disappear.

Water Not more than 0.2% (Appendix VIII M, method 1 A).

Residue on ignition Heat 50 g until it ignites and allow it to burn without further application of heat in a place free from drafts. Ignite to constant weight at 700-800°C; the weight of the residue dose not exceed 3.5 mg.

Heavy metals To 4.0 ml add 19 ml of water and 2 ml of acetate buffer (pH 3.5) and mix well. Carry out the limit

more than 0.0005%.

Category Pharmaceutical aid, medicinal adjuvant solvent.

Storage Preserve in tightly closed containers, stored in a dry place.

Purple Ferric Oxide

Fe_2O_3 159.69

Purple Ferric Oxide contains not less than 98.0% of Fe_2O_3 , calculated with reference to the substance freshly ignited to constant weight.

Description A dark purple powder; odourless; tasteless. Insoluble in water; freely soluble in boiling hydrochloric acid.

Identification Boil about 0.1 g with 5 ml of dilute hydrochloric acid, allow to cool, the solution yields the reactions characteristic of ferric salts (Appendix III).

Water soluble substances To 2.0 g add 100 ml of water, heat under reflux on a water bath for 2 hours and filter. Wash the residue with a quantity of water, evaporate the combined filtrate and washings to dryness in an evaporating dish previously dried to constant weight at 105°C, dry the residue to constant weight at 105°C; not more than 10 mg (0.5%).

Acid insoluble substances Dissolve 2.0 g in 25 ml of hydrochloric acid by heating in a water bath, add 100 ml of water, filter through a sintered glass crucible (No. 4) previously dried to constant weight at 105°C, wash the residue with hydrochloric acid solution (1→100) until the washings become colourless, then wash the residue with water until the washings give no reaction of chlorides, dry the residue to constant weight at 105°C; not more than 20 mg (1.0%).

Loss on ignition When ignited to constant weight at 700–800°C, loses not more than 4.0% of its weight, using 1.0 g.

Barium To 0.2 g add 5 ml of hydrochloric acid, heat until dissolved. Add 1 drop of hydrogen peroxide TS and 20 ml of 10% sodium hydroxide solution, filter, wash the residue with 10 ml of water. Combine the filtrate and washings, add 10 ml of sulfuric acid solution (2→10), no opalescence is produced.

Lead To 0.5 g add 10 ml of hydrochloric acid, heat until dissolved. Add 3 ml of nitric acid, boil for 1 minute, allow to cool. Extract with anhydrous ether for 4 times (30 ml, 20 ml, 20 ml and 20 ml), discard the ether layer. Heat the acid solution to expel the remaining ether, add ammonia TS to make the solution alkaline, add 1 ml of potassium cyanide TS and sufficient water to produce 50 ml. Add a few drops of sodium sulfide TS and mix well. Any colour produced is not more intense than that of a reference solution prepared in the same manner using 1.5 ml of lead standard solution (0.003%).

Arsenic To 0.2 g add 7 ml of hydrochloric acid, heat until dissolved. Add 21 ml of water, and add acid stannous chloride TS dropwise until the yellow colour disappears. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.001%.

Assay Add to about 0.15 g, accurately weighed, in a conical flask with stopper 2.5 ml of hydrochloric acid, heat until dissolved on a water bath. Add 1 ml of hydrogen

water, allow to cool. Add 1.5 g of potassium iodide and 2.5 ml of hydrochloric acid, stopper and shake thoroughly, allow to stand in a dark place for 15 minutes. Titrate with sodium thiosulfate (0.1 mol/L) VS, add 2.5 ml of starch TS towards the end of titration, continue the titration until the blue colour disappears. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 7.985 mg of Fe_2O_3 .

Category Pharmaceutical aid, colouring agent.

Storage Preserve in tightly closed containers.

Red Ferric Oxide

Fe_2O_3 159.69

[1309-37-1]

Red Ferric Oxide contains not less than 98.0% of Fe_2O_3 , calculated with reference to substance freshly ignited to constant weight.

Description A dark red powder; odourless; tasteless. Insoluble in water; freely soluble in boiling hydrochloric acid.

Identification Boil about 0.1 g with 5 ml of dilute hydrochloric acid, allow to cool, the solution yields the reactions characteristic of ferric salts (Appendix III).

Water soluble substances To 2.0 g add 100 ml of water, reflux on a water bath for 2 hours and filter. Wash the residue with a quantity of water, evaporate the combined filtrate and washings to dryness in a tared evaporating dish, dry the residue to constant weight at 105°C; not more than 10 mg (0.5%).

Acid insoluble substances Dissolve 2.0 g in 25 ml of hydrochloric acid by heating in a water bath, add 100 ml of water, filter through a sintered glass crucible (No. 4) previously dried to constant weight at 105°C, wash the residue with hydrochloric acid solution (1→100) until the washing becomes colourless, then wash the residue with water until the washing gives no reaction of chlorides, dry the residue to constant weight at 105°C; not more than 20 mg (1.0%).

Loss on ignition When ignited to constant weight at 700–800°C, loses not more than 4.0% of its weight, using 1.0 g.

Barium To 0.20 g add 5 ml of hydrochloric acid heat to dissolve red ferric oxide. Add 1 drop of hydrogen peroxide TS and 20 ml of 10% sodium hydroxide solution, filter, wash the residue with 10 ml of water, combine the filtrate and the washings. Add 10 ml of sulfuric acid solution (2→10), no opalescence is produced.

Lead To 0.50 g add 10 ml of hydrochloric acid, and heat to dissolve. Add 3 ml of nitric acid, boil for 1 minute, allow to cool. Extract with dehydrated ether for 4 times (30 ml, 20 ml, 20 ml and 20 ml), discard the ether layer, heat the acid solution to expel the remaining ether, add ammonia TS to make the solution alkalize, add 1 ml of potassium cyanide TS and sufficient water to produce 50 ml. Add a few drops of sodium sulfide TS and mix well. Any colour produced is not more intense than that of a reference solution prepared in the same manner using 1.5 ml of lead standard solution (0.003%).

Arsenic To 0.20 g add 7 ml of hydrochloric acid, heat to dissolve, add 21 ml of water and stannous chloride TS dropwise until the yellow colour disappears. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.001%.

Assay To about 0.15 g, accurately weighed, in a conical

dissolve red ferric oxide on a water bath. Add 1 ml of hydrogen peroxide TS, heat to boil for a few minutes, add 25 ml of water, allow to cool. Add 1.5 g of potassium iodide and 2.5 ml of hydrochloric acid, stopper and shake thoroughly, allow to stand in dark place for 15 minutes. Titrate with sodium thiosulfate (0.1 mol/L) VS, add 2.5 ml of starch IS towards the end of the titration, continue the titration until the blue colour disappears. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 7.985 mg of Fe_2O_3 .

Category Pharmaceutical aid, colouring agent.

Storage Preserve in tightly closed containers.

Refined Corn Oil

Refined Corn Oil is fat oil made from seed embryo of maize using the method of hot-pressing.

Description A clear pale yellow oily liquid; odour, slightly characteristic; taste, mild.

Miscible with ether, chloroform, petroleum ether or acetone; slightly soluble in ethanol.

Relative density 0.915-0.923 (Appendix VI A).

Refractive index 1.472-1.475 (Appendix VI F).

Acid value Not more than 0.6 (Appendix VII H).

Saponification value 187-195 (Appendix VII H).

Iodine value 108-128 (Appendix VII H).

Composition of fatty acids Transfer 8-10 drops (about 150-200 mg) to a 10 ml volumetric flask (w/ out touching inner wall of the flask when adding), add 4 ml of 0.5 mol/L methanolic potassium hydroxide solution, and heat under reflux in a water bath at 65°C until oil droplets dissolved. Cool, add 15 ml of 15% methanolic boron trifluoride solution, and heat under reflux for 2 minutes in a water bath at 65°C. Cool, add 1-4 ml of hexane, and heat for 1 minute in a water bath at 65°C. Cool, add saturated solution of sodium chloride to the neck of the flask, mix well, allow to separate. Carry out the method for gas chromatography (Appendix V E), using a column coated with 10%-15% polyethylene glycol succinate as the stationary phase, nitrogen as carrier gas at a flow rate of 30 ml/min, the flow rate of hydrogen is 30 ml/min, the flow rate of air is 300 ml/min. Maintain the injection temperature at 250°C, the detection temperature at 250°C, and the column temperature at 185°C. Inject 1-2 µl of the supernatant into the column, and record the chromatogram. The order of elution of the peaks is methyl esters of palmitic acid, stearic acid, oleic acid, linoleic acid and linolenic acid, and the content is 8%-19%, 1%-4%, 19%-50%, 34%-62%, 0-2% respectively, calculated by the area normalization method with respect to the peak area obtained in the chromatogram.

Water and Volatile Substances Not more than 0.2% (Appendix VII H).

Microbial limit Carry out the microbial limit tests (Appendix XI J), not more than 100 bacteria per ml and not more than 100 fungi per ml, no growth of *Escherichia coli* is detected.

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Simple Syrup

Simple Syrup is an almost saturated solution of sucrose in water.

Formula	Sucrose Water	850 g sufficient quantity
	To make	1000 ml

Processing Heat 450 ml of water to boiling, add the sucrose and agitate until it is dissolved. Continue to heat at 100°C and filter through absorbent cotton, wash the cotton with sufficient hot water to produce 1000 ml at room temperature and mix well.

Description A colourless or pale yellow, viscous liquid; taste, sweet; becomes rancid on exposure to undue heat.

Relative density Not lower than 1.30 (Appendix VI A).

Category Pharmaceutical aid, excipient, flavouring agent.

Storage Preserve in tightly closed containers, protected from light and stored at a temperature below 30°C.

Sodium Benzoate

$\text{C}_7\text{H}_5\text{NaO}_2$ 144.11

[532-32-1]

Sodium Benzoate contains not less than 99.0% of $\text{C}_7\text{H}_5\text{NaO}_2$, calculated on the dried basis.

Description A white granular powder or crystalline powder; odourless or almost odourless; taste, sweetish and salty. Freely soluble in water and sparingly soluble in ethanol.

Identification (1) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of sodium Benzoate (Appendix XVI).

(2) Dissolve about 0.5 g in 10 ml of water, the solution yields the reactions characteristic of sodium salts and benzoates (Appendix III).

Acidity or alkalinity Dissolve 1.0 g in 20 ml of water, add 2 drops of phenolphthalein IS. Not more than 0.25 ml of either sulfuric acid (0.05 mol/L) VS or sodium hydroxide (0.1 mol/L) VS is required to change the colour of the solution.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.5% of its weight (Appendix VIII L).

Heavy metals To 2.0 g add 45 ml of water, stir continuously, add dropwise 5 ml of dilute hydrochloric acid and filter. Carry out the limit test for heavy metals (Appendix VIII H, method 1), using 25 ml of the filtrate; not more than 0.001%.

Arsenic Spread 1 g of anhydrous sodium carbonate on the bottom and inner wall of a crucible, add 0.40 g of the substance being examined and moisten with a small quantity of water. Dry and carbonize thoroughly with a small flame then ignite at 500-600°C until completely incinerated. Allow it to cool, dissolve the residue in 5 ml of hydrochloric acid

(Appendix VIII J, method 1); not more than 0.0005%.

Assay Transfer about 1.5 g, accurately weighed, to a separator, add 25 ml of water, 50 ml of ether and 2 drops of methyl orange IS, titrate with hydrochloric acid (0.5 mol/L) VS with constant shaking until the colour of the aqueous phase changes to reddish orange. Transfer the aqueous layer to a conical flask with stopper, wash the ether layer with 5 ml of water, add the washing to the conical flask. Add 20 ml of ether, complete the titration with hydrochloric acid (0.5 mol/L) VS, with constant shaking until a persistent reddish orange colour is obtained in the aqueous layer. Each ml of hydrochloric acid (0.5 mol/L) VS is equivalent to 72.06 mg of $C_7H_5NaO_2$.

Category Pharmaceutical aid and preservative.

Storage Preserve in tightly closed containers.

Sodium Bisulfite

$NaHSO_3$ 104.06

[7631-90-5]

Sodium Bisulfate is a mixture of sodium bisulfite and sodium pyrosulfite. It contains not less than 58.5% and not more than 67.4%, calculated as sulfur dioxide (SO_2).

Description A white crystalline powder or granules; odour resembling sulfur dioxide.

Freely soluble in water; practically insoluble in ethanol or ether.

Identification (1) The aqueous solution (1→20) exhibits acidic and yields the reactions characteristic of bisulfite (Appendix III).

(2) Yields the reactions characteristic of sodium (Appendix III).

Clarity and colour of solution Dissolve 1.0 g in 10 ml of water, the solution is clear and colourless.

Thiosulfate Dissolve 1.0 g in 15 ml of water, add 5 ml of dilute hydrochloric acid, shake, and allow to stand for 5 minutes. No turbidity is produced.

Iron To 1.0 g add 2 ml of hydrochloric acid, evaporate to dryness on a water bath and dissolve the residue in a quantity of water. Carry out the limit test for iron (Appendix VIII G), using the resulting solution. Any colour produced is not more intense than that of a reference solution using 2.0 ml iron standard solution (0.002%).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 1), using 1.0 g; not more than 0.002%.

Arsenic Dissolve 0.5 g in 10 ml of water, add 1 ml of sulfuric acid, evaporate on a sand bath until white fumes are evolved, cool. Dissolve the residue in 21 ml of water and add 5 ml of hydrochloric acid. Carry out the limit test for arsenic (Appendix VIII J, method 2); not more than 0.0004%.

Assay To about 0.15 g, accurately weighed, add 50 ml of iodine (0.05 mol/L) VS, accurately measured, stopper and shake until dissolved. Allow to stand in dark for 5 minutes. Titrate with sodium thiosulfate (0.1 mol/L) VS, add 1 ml of starch IS towards the end of the titration and continue the titration until the blue colour disappears. Perform a blank determination and make any necessary correction. Each ml of iodine (0.05 mol/L) VS is equivalent to 3.203 mg of SO_2 .

Category Pharmaceutical aid.

from light.

Sodium Cyclamate

$C_6H_{12}NNaO_3S$ 201.22

[139-05-9]

Sodium Cyclamate is sodium *N*-cyclohexylsulfamate. It contains not less than 98.0% of $C_6H_{12}NNaO_3S$, calculated on the dried substance.

Description A white, crystalline powder; odourless; taste, sweet.

Freely soluble in water, very slightly soluble in ethanol; practically insoluble in chloroform or ether.

Identification (1) Dissolve 0.1 g in 10 ml of water, add 1 ml of hydrochloric acid and 1 ml of barium chloride solution (1→10); the solution is clear. Add 1 ml of sodium nitrite solution (1→10); a white precipitate is produced.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Sodium Cyclamate (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of sodium salts (Appendix III).

Acidity or alkalinity The pH of a 100 mg per ml solution in water is 5.5–7.5 (Appendix VI H).

Light absorption The absorption of a 100 mg per ml solution in water at 420 nm is not more than 0.022 (Appendix IV A).

Sulfate Carry out the limit test for sulfates (Appendix VIII B), using 0.5 g. Any opalescence produced is not more pronounced than that of a reference using 1.2 ml of preparation 0.024%.

Cyclohexylamine Reference preparation Place 0.1 g of cyclohexylamine CRS, accurately weighed, in 100 ml volumetric flask, add 50 ml of hydrochloric acid solution (1→100) to dissolve and dilute to volume with water, mix well. Dilute a quantity of the solution, accurately measured, with water to produce the reference solution of 2.5 µl per ml.

Test preparation Weigh accurately 10 g to a 100 ml volumetric flask, add water to dissolve and dilute to volume with water, shake well.

Procedure Transfer 10 ml each of the two preparations, accurately measured, to two 60 ml separators, add 3.0 ml of the alkaline solution of disodium edetate (dissolve 10 g of disodium edetate and 3.4 g of sodium hydroxide in 100 ml of water) and 15.0 ml of chloroform-*n*-butanol (20 : 1), shake for 2 minutes and allow it to stand until separation takes place. Separate the chloroform layer, and then measure accurately 10 ml each of the chloroform extracts to other two separators, add 2.0 ml of methyl orange-boric acid solution (dissolve 200 mg of methyl orange CRS and 3.5 mg of boric acid CRS in 100 ml of water, heat in water bath to dissolve and allow to stand for 24 hours; filter before use); shake for 2 minutes and allow to stand. Separate the chloroform layer, add 1 g of anhydrous sodium sulfite CRS, shake and allow to stand. Measure accurately 5 ml each of the chloroform extracts to two cylinders, add 0.5 ml of methanol-sulfuric acid and shake well, any colour produced

measure separately the absorbances at 520 nm (Appendix IV A), the absorbance of the test solution is not greater than that of the reference solution (0.0025%).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Heavy metals Dissolve 1.0 g in 23 ml of water, add 2 ml of acetate BS (pH 3.5). Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Arsenic Dissolve 2.0 g in 22 ml of water, add 5 ml of hydrochloric acid CRS. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0001%.

Assay To 0.16 g, accurately weighted, add 40 ml of glacial acetic acid, heat gently to dissolve and cool. Add two drops of crystal violet IS and titrate with perchloric acid (0.1 mol/L) VS until the solution becomes green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 20.12 mg of $C_6H_{12}NNaO_3S$.

Category Pharmaceutical aid and sweetening agent.

Storage Preserve in tightly closed containers.

Sodium Hydroxide

NaOH 40.00 [1310-73-2]

Sodium Hydroxide contains not less than 96.0% of total alkali, calculated as sodium hydroxide (NaOH); and not more than 2.0% of sodium carbonate (Na_2CO_3), calculated on the basis of total alkali.

Description White, fused pellets, cubes, sticks or flakes; dry, hard, brittle and showing a crystalline fracture; very hygroscopic; rapidly absorbs carbon dioxide in the air. Very soluble in water, freely soluble in ethanol.

Identification The aqueous solution yields the reactions characteristic of sodium salts (Appendix III).

Chloride Carry out the limit test for chlorides (Appendix VIII A), using 0.50 g. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.01%).

Sulfate Carry out the limit test for sulfates (Appendix VIII B), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of potassium sulfate standard solution (0.02%).

Potassium Dissolve 0.25 g in 5 ml of water, acidify with acetic acid; allow to cool in an ice bath and add a few drops of sodium cobaltinitrite TS. No opalescence is produced.

Aluminum and iron Dissolve 5.0 g in 50 ml of dilute hydrochloric acid, boil, allow to cool, make alkaline with ammonia TS and filter. Wash the residue with water thoroughly and ignite to constant weight, the residue is not more than 5 mg.

Heavy metals Dissolve 1.0 g in 5 ml of water and 11 ml of dilute hydrochloric acid, boil, allow to cool. Add 1 drop of phenolphthalein IS and a quantity of ammonia TS until the solution becomes pink. Add 2 ml of acetate BS (pH 3.5) and a quantity of water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.003%.

volumetric flask in a quantity of freshly boiled and cooled water, allow to cool, dilute to volume with water and mix well. To 25 ml of the resulting solution, accurately measured, add 3 drops of phenolphthalein IS, titrate with sulfuric acid (0.1 mol/L) VS until the pink colour disappears. Read the volume (ml) of sulfuric acid (0.1 mol/L) VS consumed; add 2 drops of methyl orange IS, continue the titration with sulfuric acid (0.1 mol/L) VS until a persistent orange-red colour is produced. Each ml of sulfuric acid (0.5 mol/L) VS used in the combined titrations is equivalent to 8.00 mg of total alkali, calculated as NaOH. Each ml of sulfuric acid (0.1 mol/L) VS used in the second titration is equivalent to 21.20 mg of Na_2CO_3 .

Category Pharmaceutical aid, alkalizing agent.

Storage Preserve in tightly closed containers.

Sodium Lauryl Sulfate

Sodium Lauryl Sulfate is a mixture of sodium alkyl sulfates consisting chiefly of sodium lauryl sulfate ($C_{12}H_{25}NaO_4S$).

Description A white or pale yellow powder or crystals with a slight characteristic odour.

Freely soluble in water; practically insoluble in ether.

Identification (1) The aqueous solution (1→10) yields the reactions characteristic of sodium salts (Appendix III). (2) Acidify the aqueous solution (1→10) with hydrochloric acid, gently heat to boiling for 20 minutes. The solution gives the reactions characteristic of sulfate (Appendix III).

Alkalinity Dissolve 1.0 g in 100 ml of water, add 2 drops of phenol red IS. Not more than 0.60 ml of hydrochloric acid (0.1 mol/L) VS is required to change the colour of the indicator.

Sodium chloride Dissolve about 5 g, accurately weighed, in 50 ml of water. Add diluted nitric acid until the solution is neutral (adjust pH to 6.5-10.5), add 2 ml of potassium chromate IS, and titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 5.844 mg of NaCl.

Sodium sulfate Dissolve about 1 g, accurately weighed, in 10 ml of water. Add 100 ml of ethanol, heat to nearly boiling for 2 hour, filter while still hot. Wash the residue with 100 ml of boiling ethanol, then dissolve the residue in 150 ml of water and wash the container. To this solution add 10 ml of hydrochloric acid, heat to boiling, add 10 ml of 25% barium chloride, allow to stand overnight, filter. Wash the residue with water until the washings yield no reactions characteristic of chloride, then ignite to constant weight at 500-600°C. The combined content of the residue and sodium chloride is not more than 8.0%.

Non-esterified alcohols Dissolve about 10 g, accurately weighed, in 100 ml of water. Add 100 ml of ethanol and extract the solution with three quantities, each of 50 ml, of *n*-hexane, adding sodium chloride, if necessary, to promote separation of the two layers. Wash the combined *n*-hexane layers with three quantities, each of 50 ml, of water, dry with anhydrous sodium sulfate, filter and evaporate on a water bath. Heat the residue at 105°C for 30 minutes and cool. The weight of residue is not more than 4.0% of the weight of Sodium Lauryl Sulfate taken.

Total alcohols Dissolve about 5 g, accurately weighed, in 150 ml of water. Add 50 ml of hydrochloric acid, boil

the solution with two quantities, each of 75 ml, of ether, evaporate the combined ether layers on a water bath, heat the residue at 105°C for 30 minutes, cool and weigh. The residue represents the total alcohols, and is not less than 59.0% of the weight of Sodium Lauryl Sulfate taken.

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers.

um Py sulf te

$\text{Na}_2\text{S}_2\text{O}_5$ 190.10

Sodium pyrosulfite contains not less than 95.0% of $\text{Na}_2\text{S}_2\text{O}_5$.

Description Colourless prismatic crystals or a white powder; odour, sulfurous; taste, sour and saline, changes gradually to yellow colour on standing; aqueous solution yields an acidic reaction.

Freely soluble in water; very slightly soluble in ethanol.

Identification (1) A solution in water decolourizes iodine TS and the resulting solution yields the reactions characteristic of sulfates (Appendix III).

(2) Yields the flame test characteristic of sodium salts (Appendix III).

Thiosulfate Dissolve 1.1 g in 10 ml of dilute hydrochloric acid and heat on a water bath for 10 minutes. Allow it to cool, transfer to a Nessler cylinder and dilute with water to 20 ml. Any opalescence produced is not more pronounced than that of a reference solution using 0.20 ml of sodium thiosulfate (0.1 mol/L) VS (0.2%).

Iron Dissolve 1.0 g in 5 ml of water and 2 ml of hydrochloric acid and evaporate to dryness on a water bath. Dissolve the residue in 15 ml of water and 2 ml of hydrochloric acid, add a quantity of bromine TS until the pale yellow colour is produced, heat to remove the excess of bromine, cool and dilute with water to 25 ml. Carry out the limit test for iron (Appendix VIII G). Any colour produced is not more intense than that of a reference solution using 2.0 ml of iron standard solution (0.002%).

Heavy metals Dissolve 1.0 g in 10 ml of water, add 5 ml of hydrochloric acid, evaporate to dryness on a water bath. To the residue add 15 ml of water, boil gently for 2 minutes and filter. To the filtrate add a quantity of bromine TS to make the solution clear, heat to remove the excess of bromine and cool. Add 1 drop of phenolphthalein IS and a quantity of ammonia TS until the solution turns to pink colour, add 2 ml of sodium acetate BS (pH 3.5) and a quantity of water to 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.002%.

Arsenic Dissolve 1.0 g in 4 ml of water, add 3 ml of nitric acid and evaporate to dryness on a water bath. To the residue add a few ml of water, shake and filter. Wash the residue with water, combine the washings and filtrate, evaporate to dryness. Dissolve the residue in 5 ml of hydrochloric acid and 23 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Assay To about 0.15 g, accurately weighed, in an iodine flask add 50 ml of iodine (0.05 mol/L) VS, accurately measured, stopper the flask and shake, add 1 ml of hydrochloric acid and titrate the excess of iodine with sodium thiosulfate (0.1 mol/L) VS, add 2 ml of starch IS towards the end of titration and continue the titration until the blue

any necessary correction. Each ml of iodine (0.05 mol/L) VS is equivalent to 4.752 mg of $\text{Na}_2\text{S}_2\text{O}_5$.

Category Pharmaceutical aid, antioxidant.

Storage Preserve in tightly closed containers, protected from light.

Sorbic Acid

$\text{C}_6\text{H}_8\text{O}_2$ 112.13

[22500-92-1]

Sorbic Acid is (E, E)-2,4-hexadienoic acid. It contains not less than 98.5% of $\text{C}_6\text{H}_8\text{O}_2$, calculated on the dried basis.

Description A white or pale yellowish white crystalline powder; odour characteristic.

Freely soluble in ethanol; soluble in ether; very slightly soluble in water.

Melting range 132-136°C (Appendix VI C).

Identification (1) Dissolve about 0.2 g in 2 ml of ethanol, add a few drops of bromine TS, the colour of bromine disappears immediately.

(2) The light absorption of a solution of 2.5 µg per ml in hydrochloric acid solution (0.1 mol/L) exhibits a maximum at 264 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of sorbic acid (Appendix XVI).

Clarity and colour of ethanol solution A solution of 1.0 g in 50 ml of ethanol is clear and colourless.

Water Carry out the determination of water, not more than 0.5% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.1% (Appendix VIII N); use 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Dissolve about 0.25 g, accurately weighed, in 25 ml of neutral ethanol (neutral to phenolphthalein IS), add a few drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 11.21 mg of $\text{C}_6\text{H}_8\text{O}_2$.

Category Pharmaceutical aid, Antiseptic.

Storage Preserve in tightly closed containers, protected from light, and stored in a cool place.

Soybean Oil

Soybean Oil is the refined fixed oil obtained from the seeds of the soya plant *Glycine soya* Bentham.

Description A pale yellow, clear liquid; odourless or almost odourless.

Miscible with ether or chloroform; very slightly soluble in ethanol; practically insoluble in water.

Refractive index 1.472-1.476 (Appendix VI F).

Acid value Not more than 0.2 (Appendix VII H).

Saponification value 188-200 (Appendix VII H).

Iodine value 126-140 (Appendix VII H).

Peroxide Dissolve 10.0 g in 30 ml of acetic acid-chloroform (60 : 40) in a 250 ml iodine flask with shaking. Add accurately 0.5 ml of saturated potassium iodide solution, stopper the flask, shake thoroughly for 1 minute and add 30 ml of water. Titrate with sodium thiosulfate (0.01 mol/L) VS Add 0.5 ml of starch TS towards the end point and continue the titration until the blue colour disappears. Perform a blank determination and make any necessary correction. Not more than 10.0 ml of sodium thiosulfate (0.01 mol/L) VS is consumed.

Unaponifiable matter Place 5.0 g in a 250 ml conical flask, add 50 ml of potassium hydroxide solution in ethanol (dissolve 12 g of potassium hydroxide in 10 ml of water, dilute to 100 ml with ethanol). Reflux the mixture for 1 hour, cool to below 25°C. Transfer the solution to a separator, wash the flask with two portions of water, each of 50 ml, and combine the washings to the separator. Extract with three portions of ether, each of 100 ml, combine the ether layer to another separator, wash with three portions of water, each of 40 ml, discard the washings. Wash the ether layer with 3% sodium hydroxide solution and water three times respectively, each of 40 ml, then wash with water for several times until no red colour is produced when dropping two drops of phenolphthalein IS, each of 40 ml. Transfer the ether extract to a evaporating dish, previously dried to constant weight, wash the separator with 10 ml of ether, transfer the washing to the evaporating dish, evaporating ether on a 50°C water bath, dissolve the residue with 6 ml of acetone, expel the acetone with current air. Dry at 105°C until the variation between two continuous weight is less than 1 mg, the content of the unaponifiable matter is not more than 1.0%.

Dissolve the residue with 20 ml of neutralized ethanol, add a few drops of phenolphthalein IS and titrate with ethanolic sodium hydroxide (0.1 mol/L) VS until a pink colour last 30 seconds, the test is invalid if more than 0.2 ml ethanolic sodium hydroxide (0.1 mol/L) VS is consumed, and the test must be done again.

Note : Ethanolic sodium hydroxide (0.1 mol/L) VS

Preparation Measure 2 ml of 50% sodium hydroxide solution, add 250 ml of ethanol (allow to stand over night if the solution is opalescence, and using the supernatant for standardization).

Standardization Dissolve about 0.2 g of benzoic acid, weighed accurately, in 10 ml of ethanol and 2 ml of water, add 2 drops of phenolphthalein IS and titrate with ethanolic sodium hydroxide (0.1 mol/L) VS until a persistent pink colour is produced. Each ml of ethanolic sodium hydroxide (0.1 mol/L) VS is equivalent to 12.21 mg of benzoic acid.

Heavy metals Transfer 4.0 g to a 50 ml porcelain evaporating dish, add 4 ml of sulfuric acid, mix well, heat gently until the sulfuric fumes are no longer evolved, add 2 ml of nitric acid and 5 drops of sulfuric acid, heat until nitrous oxide fumes are no longer evolved and ignite at 500-600°C until the incineration is complete. Cool, carry out the limit test for heavy metals (Appendix VIII H, method 2); not more than 0.0005%.

Cottonseed oil Mix 5 ml in a test tube with a mixture of equal volumes of pentanol and 1% solution of sulfur in carbon disulfide. Place the test tube in a saturated sodium chloride water bath, warm the mixture carefully, when no

it for 15 minutes, no red colour develops.

Fatty acid composition Carry out the method for gas chromatography (Appendix V B), using a column packed with 12% polyethylene-glycol succinate as the stationary phase, and maintain the column temperature at 175°C, the number of the theoretical plates of the column is not less than 1300, calculated with reference to the peak of linoleate.

Test solution Place 20 mg in a 10 ml test tube with stopper. Add 2 ml of 0.5 mol/L methanolic potassium hydroxide solution, saponify the fatty acid for about 15 minutes in the water bath at 65°C until the oleosome is dissolved. Cool, add 2 ml of 15% methanolic boron trifluoride, esterify the fatty acid for 2 minutes in the water bath at 65°C. Cool, add 2 ml of *n*-hexane, shake well, add 2 ml of saturated sodium chloride solution. use the upper layer.

Procedure Inject 1 µl of the upper layer into the column, measure the 5 main peak areas of the methyl esters of the fatty acid. The order of elution is palmitate, stearate, oleate, linoleate and linolenate, and their relative areas, expressed as percentages of the total area of the 5 main peaks, are in the ranges 7.0-14.0, 1.0-6.0, 18.0-30.0, 44.0-62.0 and 4.0-11.0.

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers, protected from light, and stored in cool and dark place.

Starch

Starch is polysaccharide granules obtained from the caryopsis of maize (*Zea mays* L.) or from the tuber root of cassava (*Manihot utilisima* Pohl.)

Description A white powder; odourless; tasteless. Insoluble in cold water or ethanol.

Identification (1) Boil about 1 g with 15 ml of water, cool. A translucent whitish gelatinous substance is produced. (2) Mix about 0.1 g with 20 ml of water, add a few drops of iodine TS. A blue or dark blue colour is produced which gradually disappears on heating and reappears on cooling. (3) Examine under microscope with glycerine-acetic acid TS (Appendix II C, Volume I):

Maize starch: Simple grains, polygonal or ovoid, 5-30 µm in diameter. Central hilum, rounded or star-shaped. Striations indistinct.

Cassava starch: Simple grains, rounded or elliptical, 5-35 µm in diameter, consisting of a cavity on the side. Central hilum, rounded or star-shape. Striations indistinct.

(4) Under polarised microscope: both with polarized cross, intersecting at the hilum.

Acidity Shake 20.0 g with 100 ml of water for 5 minutes, determine the pH value immediately (Appendix VI H): pH 4.5-7.0.

Loss on drying When dried at 105°C for 5 hours, loses not more than 14.0% of the weight of maize starch and not more than 15.0% of the weight of cassava starch (Appendix VIII L).

Ash Weigh accurately about 1 g into a crucible, previously ignited to constant weight, ignite slowly until the substance being examined is completely carbonized. Raise the temperature gradually to 600-700°C, incinerate completely to constant weight. The remaining ash is not more than 0.2% of the weight of maize starch and not more than 0.3% of the

Iron To 0.50 g add 4 ml of dilute hydrochloric acid and 16 ml of water, shake for 5 minutes, filter and wash the residue with small quantity of water. Combine the filtrate and washings, add 50 mg of ammonium persulfate and dilute with water to 35 ml. Carry out the limit test for iron (Appendix VIII G). Any colour produced is not more intense than that of a reference solution using 1.0 ml of iron standard solution (0.002%).

Sulfur dioxide To 20.0 g in a conical flask with stopper add 200 ml of water, shake thoroughly and filter. To 100 ml of filtrate add 2 ml of starch IS and titrate with iodine (0.005 mol/L) VS. Perform a blank determination and make any necessary correction. The iodine (0.005 mol/L) VS consumed does not exceed 1.25 ml (0.004%).

Oxidizing substance Transfer 4.0 g of the substance being examined to a conical flask with stopper, add 50.0 ml of water, cover the stopper and shake for 5 minutes, transfer to a 50 ml centrifuge tube with stopper, centrifuge until the solution is clear. Transfer 30.0 ml of the supernatant liquid to a iodine flask, add 1 ml of acetic acid glacial and 1.0 g of potassium iodide, cover the stopper, shake, allow to stand for 30 minutes in a dark place. Add 1 ml of starch IS, and titrate with sodium thiosulfate (0.002 mol/L) VS until the blue colour disappears. Perform a blank determination and make any necessary correction. Each ml of sodium thiosulfate (0.002 mol/L) VS is equivalent to 34 µg of oxidized substance (calculated as H_2O_2), not more than 1.4 ml of sodium thiosulfate (0.002 mol/L) VS is consumed (0.002%).

Microbial limit Comply with test for microbial limit (Appendix XI J), except that number of bacterial is not more than 1000 and that of fungi is not more than 100 per g, *Escherichia coli* is not detected.

Category Pharmaceutical aid, expient.

Storage Preserve in a dry place.

Stearic Acid

Stearic Acid is a mixture of solid fatty acid obtained from fats and oils of animal or botanical resources. Its principal components are stearic acid ($C_{18}H_{36}O_2$) and palmitic acid ($C_{16}H_{32}O_2$).

Description A white or almost white creamy powder of crystalline mass. Its cross section shows needle crystals slightly lustrous; odour, slight; tasteless. Freely soluble in chloroform or ether; soluble in ethanol; practically insoluble in water.

Congeeing point Not lower than 54°C (Appendix VI D).

Iodine value Not greater than 4 (Appendix VII H).

Acid value 203-210 (Appendix VII H).

Water soluble acids Heat 5.0 g to melt, add an equal volume of boiling water, shake for 2 minutes, allow to cool and filter. Add 1 drop of methyl red IS to the filtrate, no red colour is produced.

Neutral fats or waxes Boil 1.0 g with 0.5 g of anhydrous sodium carbonate and 30 ml of water. The solution is clear.

Residue on ignition Not more than 0.1% (Appendix VIII N); use 4.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in

Category Pharmaceutical aid, excipient.

Storage Preserve in tightly closed containers.

Steviosin

Steviosin is a mixed glucoside containing mainly steviosin ($C_{38}H_{60}O_{18}$). It contains not less than 95.0% of steviosin ($C_{38}H_{60}O_{18}$), calculated on the dried basis.

Description A white or almost white powder; odourless; taste, very sweet with light bitter. Soluble in ethanol; slightly soluble in water.

Identification Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform-methanol-water (65 : 35 : 10) as the mobile phase. Apply separately to the plate 2 µl each of the two solutions in dehydrated ethanol containing (1) 10 mg of the substance being examined per ml and (2) 10 mg of steviosin CRS per ml. After developing and removal of the plate, dry in air and spray with 30% ethanolic sulfuric acid solution, heat at 110°C for about 15 minutes. The colour and position of the principal spot in the chromatogram obtained with solution (1) correspond to the principal spot obtained with solution (2).

Acidity To 0.5 g add 20 ml of ethanol (neutral to phenolphthalein IS), shake to dissolve steviosin, add 1 drop of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. Not more than 0.5 ml of sodium hydroxide (0.1 mol/L) VS is required to change the colour of the solution which lasts at least 10 seconds.

Loss on drying When dried to constant weight at 105°C, loses not more than 5.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N); use 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay To about 0.3 g, accurately weighed, in a 250 ml conical flask add 25 ml each of dilute sulfuric acid TS and water. Shake to dissolve steviosin, hydrolyze by heat to slightly boiling for 30 minutes, cool and filter. Wash the residue with water until the washing exhibits neutral reaction. Dissolve it in 50 ml of ethanol (neutral to phenolphthalein IS), add 2 drops of phenolphthalein IS, titrate with ethanolic potassium hydroxide (0.05 mol/L) VS until the colour changes to red which lasts at least 10 seconds. Each ml of ethanolic potassium hydroxide (0.05 mol/L) VS is equivalent to 40.24 mg of $C_{38}H_{60}O_{18}$.

Category Pharmaceutical aid, flavouring agent.

Storage Preserve in tightly closed containers.

Strong Ammonia Solution

(Concentrated Ammonia Solution)

Strong Ammonia Solution contains 25.0%-28.0% (g/g) of ammonia (NH_3).

Description A clear, colourless liquid; odour, strongly pungent and characteristic; volatile; strongly alkaline.

Relative density 0.900-0.908 (Appendix VI A).

Identification Dip a glass rod into hydrochloric acid, and hold it above the surface of the substance being examined, dense white fumes are produced.

Readily oxidizable substance Boil 2.0 ml with 3 ml of water, 40 ml of diluted sulfuric acid and 0.10 ml of potassium permanganate solution (0.02 mol/L) for 5 minutes, the pink colour does not disappear completely.

Heavy metals Evaporate 20 g (22 ml) to dryness on a water bath, add 1 ml of hydrochloric acid and evaporate to dryness again. Dissolve the residue in 2 ml of acetate BS (pH 3.5) and 23 ml of water. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.0001%.

Assay Transfer 2 ml, accurately weighed, to a tared stoppered conical flask containing 25 ml of water, add 2 drops of methyl red IS and titrate with sulfuric acid (0.5 mol/L) VS. Each ml of sulfuric acid (0.5 mol/L) VS is equivalent to 17.03 mg of NH_3 .

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers, stored at a temperature below 30°C.

Sucrose

$\text{C}_{12}\text{H}_{22}\text{O}_{11}$ 342.30

[57-50-1]

Sucrose is β -D-fructofuranosyl- α -D-glucopyranoside.

Description Colourless crystals or a white, loose crystalline powder; odourless; taste, sweet. Very soluble in water; slightly soluble in ethanol; insoluble in chloroform or ether.

Specific optical rotation Not less than +66°, in a solution of 0.1 g per ml in water (Appendix VI E).

Identification (1) Heat the substance being examined with a direct flame. It melts and swells, then burns with an odour of caramel, leave a large amount of charcoal.

(2) Boil with sulfuric acid (0.05 mol/L) solution, neutralize with sodium hydroxide (0.1 mol/L) solution and add alkaline cupric tartrate TS. A red precipitate of cuprous oxide is produced on heating.

Colour of solution Dissolve 5 g in 5 ml of water. Any colour produced is not more intense than that of reference solution Y_6 (Appendix IX A, method 1).

Sulfate Carry out the limit test for sulfates (Appendix VIII B), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference using 5.0 ml of potassium sulfate standard solution (0.05%).

Reducing sugar Place 5.0 g in a 250 ml conical flask, dissolve it with 25 ml of water, add accurately 25 ml of alkaline cupric citrate TS and a few pieces of glass beads. Allow to boil under reflux within 3 minutes and kept boiling for 5 minutes. Cool rapidly to room temperature, take care to avoid the contact of cuprous oxide with air. Add 15 ml of

Add slowly 25 ml of sulfuric acid solution (1→5) with constant swirling until no more carbon dioxide is evolved. Titrate immediately with sodium thiosulfate (0.1 mol/L) VS. Add 2 ml of starch IS when the end point is nearly approached, continue the titration until the blue colour disappears. Perform a blank determination and make any necessary correction. The difference of amounts of sodium thiosulfate (0.1 mol/L) VS consumed between the determination and the blank determination does not exceed 2.0 ml (0.10%).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 2.0 g.

Calcium Dissolve 1.0 g in 25 ml of water, add 1 ml of ammonia TS and 5 ml of ammonium oxalate TS, mix well and allow to stand for 1 hour. Any opalescence produced is not more pronounced than that of a reference using 5.0 ml of calcium standard solution (place 0.125 g of calcium carbonate, accurately weighed, in a 500 ml volumetric flask, add 5 ml of water and 0.5 ml of hydrochloric acid to effect dissolution, add water to volume, mix well. Each ml of the solution is equivalent to 0.10 mg of Ca) (0.05%).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.0005%.

Category Pharmaceutical aid, sweetener and excipient.

Storage Preserve in tightly closed containers, stored in a dry place.

Sucrose Stearate S-3, S-7, S-11, S-15

Sucrose Stearate S-3, S-7, S-11, S-15 are a mixture of sucrose stearates.

Description A white to slightly yellowish brown block solid or powder; odourless or with a slight odor; tasteless. Soluble in hot *n*-butanol, chloroform or tetrahydrofuran.

Identification Shake to dissolve 0.5 g in a mixture of 20 ml of *n*-butanol and 20 ml of a 5% solution of sodium chloride, previously heated to 40-60°C, allow to separate, discard the aqueous layer, wash the *n*-butanol phase with 40 ml of a 5% solution of sodium chloride in two portions, previously heated to 40-60°C. To about 2 ml of the *n*-butanol phase in an inclined test tube, add slowly about 3 ml of anthrone TS along the wall until two layers are produced, heat on a water bath at 60°C for 3 minutes; a blue to green colour between the two phases is produced.

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight at 60°C, loses not more than 3.0% of its weight (Appendix VIII L).

Acidity value Dissolve 4 g, accurately weighed, in 40 ml of tetrahydrofuran and 20 ml of water by gently heating, cool. Carry out the method of potentiometric titration (Appendix VII A), titrate with sodium hydroxide (0.1 mol/L) VS to pH 8.20. Perform a blank determination and make any necessary correction. Acidity value is not more than 5.0 (Appendix VII H).

Free sucrose Remove the silica gel zone at the origin of the plate obtained under Content of monoester and carry out the test beginning at the words "to a 10 ml centrifuge test tube...". The absorbance is not greater than 0.105 (5.0%).

Water Not more than 3.0%, using about 0.5 g, accurately

Residue on ignition Not more than 1.5% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition: not more than 0.002%.

Arsenic To 2.0 g, add 5 ml of each of sulfuric acid and nitric acid, heat gently to boiling; add dropwise nitric acid, 2-3 ml each time, until the colour of the solution changes to colourless or pale yellow. Cool, add 15 ml of saturated ammonium oxalate solution, heat until heavy smoke is produced, condense the solution to 2-3 ml, cool and dilute with water to 25 ml. Carry out the limit test for arsenic (Appendix VIII J, method 1): not more than 0.0001%.

Content of monoester Sucrose Stearates are divided into Sucrose Stearate S-3, S-7, S-11 and S-15 according to the relative content of monoester in total esters. The contents of monoester of Sucrose Stearate S-3, S-7, S-11, and S-15 are 0%-24%, 25%-44%, 45%-64% and not less than 65%, respectively.

Dissolve about 0.2 g, accurately weighed, in chloroform in a 10 ml volumetric flask, dilute to volume and mix well. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and the mixture of chloroform-methanol-glacial acetic acid-water (80 : 10 : 8 : 2) as the mobile phase. Apply to the plate 20 μ l of the above solution. After developing and removal of the plate, dry it in air, heat at 100°C for 30 minutes, cool and spray with moric acid solution (dissolve 50 mg of moric acid in methanol and dilute to 100 ml). Examine under ultraviolet light at 365 nm and identify the spots of monoester (M; the first one nearest to the origin), diester (D; the second-fourth one in the middle) and triester (T; the first-fourth one farthest to the origin) in the chromatogram (the distance between the three groups of spots is relatively larger). Remove separately the M, D and T zone from the plate to three separate 10 ml centrifuge test tubes, add 1 ml of ethanol and 7 ml of anthrone TS, both accurately measured, and mix well. Heat on a water bath at 60°C for 20 minutes, cool, centrifuge at a speed of 2500 rpm for 15 minutes and use the supernatant liquid as a test solution. Remove the silica gel zone of similar size at the blank of the plate and prepare a blank solution in the same manner. Measure the absorbances of the resulting solutions at 625 nm (Appendix IV A). Calculate the content of monoester as follows (taking the total esters as 100%).

$$\begin{aligned} & \text{Sucrose monostearate\%} \\ &= \frac{1.754A_M}{1.754A_M + 2.508A_D + 3.261A_T} \times 100\% \end{aligned}$$

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers, stored in a dry place.

Titanium Dioxide

TiO₂ 79.88 [13463-67-7]

The content of TiO₂ is not less than 98.0%, calculated on the dried basis.

Description A white powder; odourless; tasteless. Insoluble in water, hydrochloric acid, nitric acid or dilute sulfuric acid.

Identification To about 0.5 g add 5 g of anhydrous sodium sulfate and 10 ml of water, shake thoroughly, add 10 ml of sulfuric acid, heat to boiling, until the solution is clear.

slowly, dilute with water to 100 ml and mix well. Proceed the test of Identification as follows.

(1) To 5 ml of the solution add several drops of hydrogen peroxide TS; an orange-red colour is produced.

(2) To 5 ml of the solution add several granules of zinc granule, allow to stand for 45 minutes; a blueish-violet colour is produced.

Water-soluble substances To 10.0 g add 0.5 g of ammonium sulfate and 150 ml of water, heat to boiling for 5 minutes, cool, dilute with water to 200 ml, mix well, filter through double layer of quantitative filter paper, discard the initial filtrate. Measure accurately 100 ml of the successive filtrate, evaporate to dryness, ignite the residue at 600°C to constant weight. The residue is not more than 12.5 mg (0.25%).

Acid-soluble substances To 5.0 g add 100 ml of 0.5 mol/L hydrochloric acid solution, heat on a water bath for 30 minutes with stirring occasionally, filter through three layers of quantitative filter paper, wash the residue with hydrochloric acid solution (0.5 mol/L). Combine the filtrate and washings, evaporate to dryness, ignite the residue at 600°C to constant weight. The residue is not more than 25 mg (0.5%).

Barium To 1 ml of the solution obtained in the Assay add 1 ml of dilute sulfuric acid, allow to stand; no opalescence or precipitate is produced.

Loss on drying When dried at 105°C for 3 hours to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Loss on ignition Weigh accurately about 2.0 g on dried basis, ignite at about 800°C to constant weight, loses not more than 0.5% of its weight.

Heavy metals To 2.0 g add 3 ml of hydrochloric acid, shake for 1 minute, add 10 ml of water, heat to boiling and filter. Wash the residue with water, combine the filtrate and washings to a 20 ml volumetric flask, dilute with water to volume, mix well. Measure accurately 10 ml, neutralized it to phenolphthalein IS by adding ammonia TS, then add 2 ml of dilute acetic acid, dilute with water to 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1): not more than 0.002%.

Arsenic Place 0.25 g in a 250 ml conical flask, add 35 ml of water, 0.3 g of hydrazine sulfate, 0.3 g of potassium bromide, 13 g of sodium chloride and 17 ml of sulfuric acid, insert a stopper fitted with a thermometer and a glass conduit, dip the other end of glass conduit into 23 ml of water in a conical flask for determination of arsenic. Heat the conical flask to 90-100°C for 15 minutes. Remove the conical flask for determination of arsenic, cool, add 5 ml of hydrochloric acid. Carry out the limit test for arsenic (Appendix VIII J, method 1): not more than 0.0008%.

Assay Place about 1.0 g, accurately weighed, in a platinum crucible, add 2 g of potassium carbonate, mix well, ignite at 900°C for 30 minutes, cool. Transfer the residue with a mixture of 20 ml of water and 30 ml of hydrochloric acid in divided portions to a 100 ml volumetric flask, heat on a water bath until the solution is clear. Allow to cool, dilute with water to volume, mix well. Measure accurately 10 ml, add 200 ml of water and 4 ml of concentrate hydrogen peroxide solution, mix well. Add 50 ml of disodium edetate (0.05 mol/L) VS, accurately measured, allow to stand for 5 minutes, add 1 drop of methylred IS, neutralize the solution with 20% sodium hydroxide solution, add 5 g of urotropine, shake to dissolve, then add 1 ml of 0.1% xylenol solution IS, titrate with zinc (0.05 mol/L) VS, until the solution turns from

disodium edetate (0.05 mol/L) VS is equivalent to 3.995 mg of TiO_2 .

Category Pharmaceutical aid, excipient.

Storage Preserve in tightly closed containers, stored in a dry place.

White Vaseline

White Vaseline is a semisolid mixture of hydrocarbons obtained from petroleum.

Description A white or yellowish homogeneous soft mass, odourless or almost odourless; unctuous to the touch on skin.

Freely soluble in benzene at about 35°C ; soluble in chloroform at about 35°C ; slightly soluble in ether; practically insoluble in ethanol or water.

Melting range $45\text{--}60^\circ\text{C}$ (Appendix VI C, method 3).

Colour Melt 10 g on a water bath by heating in a beaker. Pour it into a Nessler cylinder, compare with the same volume of the reference solution prepared by mixing well 7.8 ml of potassium dichromate standard solution CS with 0.2 ml of copper sulfate standard solution CS and diluting 2.5 ml of the resulting solution with water to 25 ml. Any colour produced is not more intense than that of the reference solution observed under reflexed light against a white background without the interference of fluorescence.

Absorbance of impurities Measure the absorbance of a solution of 0.50 mg per ml in trimethylpentane at 290 nm (Appendix IV A), not more than 0.50.

Penetrativity, Acidity or alkalinity, Organic acid, Foreign organic compounds, Residue on Ignition, Sulfide Complies with the respective requirements described under Yellow Vaseline.

Category Pharmaceutical aid, lubricant and ointment base.

Storage Preserve in tightly closed containers.

Yellow Vaseline

Yellow Vaseline is a mixture of semi-solid hydrocarbons obtained from petroleum.

Description An unctuous mass of pale yellow or yellow colour; odourless or almost odourless; when contact with skin have a satiny feeling.

Freely soluble in benzene at 35°C ; soluble in chloroform at 35°C slightly soluble in ether; practically insoluble in ethanol or water.

Melting range $45\text{--}60^\circ\text{C}$ (Appendix VI C, method 3).

Penetrativity Melt a quantity of vaselin at $85^\circ\text{C} \pm 2^\circ\text{C}$, pour it into a metallic round cylinder of $100\text{ mm} \pm 5\text{ mm}$ in diameter and not less than 65 mm in height, fill it to a volume of 6 mm below the top of container, allow to stand for 16–18 hours at $25^\circ\text{C} \pm 2^\circ\text{C}$. Before the examination, the container is immersed in a water bath at $25.0^\circ\text{C} \pm 0.5^\circ\text{C}$ for 2 hours. Place a standard cone (total weight is $102.50\text{ g} \pm 0.05\text{ g}$ with a smooth outer surface and a detachable tip, the tip of the cone having an angle of 30° with the upper part being truncated to a diameter of $0.38\text{ mm} \pm 0.02\text{ mm}$; the base of tip is $8.40\text{ mm} \pm 0.02\text{ mm}$ in diameter, $15.00\text{ mm} \pm$

angle of $90^\circ 0' \pm 15'$, $32.1\text{ mm} \pm 0.2\text{ mm}$ in height, and a maximum diameter of $69.3\text{ mm} \pm 0.1\text{ mm}$ at the base) into a water bath and adjust the temperature to $25.0^\circ\text{C} \pm 0.5^\circ\text{C}$. Take off, put on a penetrometer platform adjusted to horizontal level beforehand, with the tip of instrument at 25–38 mm apart from the wall of container to touch the top surface of the sample. Adjust the dial indicator to zero. Quickly push the “start” button, let the cone falls down freely for 5.0 ± 0.1 seconds. Adjust the level of the cone to stop the cone continuing to fall. Read the value of penetrativity from the dial. If the value is less than 200 Units, it may be determined 3 times successively, make sure that the areas of testing do not overlap. When the value is more than 200 Units, repeat the test in the center of the container. The mean deviation of 3 testing values is within $\pm 3\%$. The average value of the three determinations is taken as the penetrativity (penetrativity represents the depth of the cone reached in vaselin in 5 seconds, calculated in depth of 0.1 mm as 1 Unit), which is 130–230 Units.

Acidity or alkalinity To 35.0 g add 100 ml of water, heat to gentle boiling, stir for 5 minutes, allow to stand and cool. Separate the aqueous layer, add 1 drop of phenolphthalein IS, the solution is colourless; add 0.10 ml of methyl orange IS, no pink colour is produced.

Colour Melt 10 g in a beaker on a water bath. Pour it into Nessler cylinder, the colour is not more intense than that of a reference solution (2.0 ml of standard cobaltous chloride CS and 6.0 ml of standard potassium dichromate CS, diluted to 10 ml with water). Compare the colour against a white background to avoid fluorescence under reflected light.

Organic acids To 20.0 g add 100 ml of neutral dilute ethanol, stir and heat to boiling, add 1 ml of phenolphthalein IS and 0.40 ml of sodium hydroxide (0.1 mol/L) VS, stir vigorously; a red colour is produced.

Absorbance of impurity Dissolve a quantity in trimethylpentane to produce a solution of 0.50 mg per ml, the absorbance at 290 nm (Appendix IV A) is not greater than 0.75.

Foreign organic matter and residue on ignition Heat 2.0 g with a direct flame, no characteristic pungent odour is produced; ignite, the residue on ignition is not more than 1 mg (0.05%).

Sulfide Carry out the limit test for sulfide (Appendix VII C), using 3.0 g; not more than 0.00017%.

Category Pharmaceutical aid, lubricant and base for ointments.

Storage Preserve in tightly closed containers.

Yellow Ferric Oxide

$\text{Fe}_2\text{O}_3 \cdot \text{H}_2\text{O}$ 177.70

Yellow Ferric Oxide is ferric oxide monohydrate. It contains not less than 97.5% of Fe_2O_3 , calculated with reference to the substance freshly ignited to constant weight.

Description A ochreous powder; odourless; tasteless. Insoluble in water; freely soluble in boiling hydrochloric acid.

Identification Boil about 0.1 g with 5 ml of dilute hydrochloric acid, allow to cool, and the solution yields the reactions characteristic of ferric salts (Appendix III).

heat under reflux on a water bath for 2 hours and filter. Wash the residue with a quantity of water, evaporate the combined filtrate and washings to dryness in an evaporating dish previously dried to constant weight at 105°C, dry the residue to constant weight at 105°C: not more than 20mg (1.0%).

Acid insoluble substances Dissolve 2.0 g in 25 ml of hydrochloric acid by heating in a water bath, add 100ml of water, filter through a sintered glass crucible (No.4) previously dried to constant weight at 105°C, wash the residue with hydrochloric acid solution (1→100) until the washings become colourless, then wash the residue with water until the washings give no reaction of chlorides, dry the residue to constant weight at 105°C: not more than 20 mg (1.0%).

Loss on ignition When ignited to constant weight at 700-800°C, loses not more than 12.0% of its weight, using 1.0g.

Barium To 0.2 g add 5 ml of hydrochloric acid, heat until dissolved. Add 1 drop of hydrogen peroxide TS and 20 ml of 10% sodium hydroxide solution, filter, wash the residue with 10ml of water. Combine the filtrate and washings, add 10 ml of sulfuric acid solution (2→10), no opalescence is produced.

Lead To 0.5 g add 10 ml of hydrochloric acid, heat to dissolved. Add 3 ml of nitric acid, boil for 1 minute, allow to cool. Extract with anhydrous ether for 4 times (30 ml, 20 ml, 20 ml and 20 ml), discard the ether layer. Heat the acid solution to expel the remaining ether, add ammonia TS to make the solution alkaline, add 1 ml of potassium cyanide TS and sufficient water to produce 50 ml. Add a few drops of sodium sulfide TS and mix well. Any colour produced is not more intense than that of a reference solution prepared in the same manner using 1.5 ml of lead standard solution (0.003%).

Arsenic To 0.2 g add 7 ml of hydrochloric acid, heat until dissolved. Add 21 ml of water, and add acid stannous chloride TS dropwise until the yellow colour disappears. Carry out the limit test for arsenic (Appendix VII J, method 1): not more than 0.001%.

Assay Add to about 0.15 g, accurately weighed, in a conical flask with stopper 2.5 ml of hydrochloric acid, heat to dissolve on a water bath. Add 1 ml of hydrogen peroxide TS, heat to boiling for a few minutes, add 25 ml of water, allow to cool. Add 1.5 g of potassium iodide and 2.5 ml of hydrochloric acid, stopper and shake thoroughly, allow to stand in a dark place for 15 minutes. Titrate with sodium thiosulfate (0.1 mol/L) VS, add 2.5 ml of starch TS towards the end of titration, continue the titration until the blue colour disappears. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 7.985mg of Fe₂O₃.

Category Pharmaceutical aid, colouring agent.

Storage Preserve in tightly closed containers.

Identification Dissolve about 20 mg in 90% ethanol, add a few drops of 10% lead acetate solution, a white precipitate is produced immediately.

Ether soluble substances Transfer about 1 g, calculated on the dried basis, to a Soxhlet's extractor, add 80-100 ml of anhydrous ether, heat under reflux for 6 hours, evaporate ether and dry to constant weight at 80°C. The residue is not more than 2.0%.

Loss on drying When dried to constant weight at 105°C, loses not more than 10.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.3% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition: not more than 0.002%.

Microbial limit Carry out the microbial limit tests (Appendix XI J): bacteria count is not more than 1000 per g, fungi count is not more than 100 per g, and no growth of *Escherichia coli* is detected.

Assay Weigh accurately 0.2 g and carry out the method for determination of Nitrogen (Appendix VII D, method 1).

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers, stored in a dry place.

Zein

Zein is a prolamine derived from corn gluten. It contains not less than 14.0% of N, calculated on the dried basis.

Description Yellow or pale yellow flakes, moderately lustrous on one side; odourless; tasteless. Freely soluble in 80%-92% ethanol or 70%-80% acetone;

Appendix I General Requirements for Preparations

I A Tablets

Tablets are solid preparations of various shapes, round or heteromorphic, and obtained by compressing uniform volumes of particles containing medicaments with suitable excipients.

They are mainly conventional oral tablets, also include lozenges, sublingual tablets, dental patches, chewable tablets, dispersible tablets, soluble tablets, effervescent tablets, vaginal tablets, effervescent vaginal tablets, sustained-release tablets, controlled-release tablets, and enteric-coated tablets, etc.

Lozenges Lozenges are tablets intended to be placed in the mouth where they dissolve slowly to exert prolonged local action.

The medicaments in lozenges should be freely soluble in water. Lozenges are intended mainly for local antiphlogistic, antimicrobial, apocrustic, analgetic or local anesthetic action. Unless otherwise stated, lozenges disintegrate completely within 30 minutes when examined by the test for disintegration (Appendix X A).

Sublingual Tablets Sublingual Tablets are tablets, intended to be inserted beneath the tongue, where they dissolve rapidly and the medicaments are absorbed directly through mucosa to obtain a systemic effect.

The medicaments and excipients are freely soluble in water. Sublingual tablets are intended mainly for treatment of emergency.

Unless otherwise stated, sublingual tablets disintegrate within 5 minutes when examined by the test for disintegration (Appendix X A).

Dental Patches Dental Patches are preparations that are intended for adhesion to the mucous membrane of mouth for local or systemic effect.

They comply with the requirements for tests of dissolution or drug release.

Chewable Tablets Chewable Tablets are tablets intended to be chewed or sucked to disintegrate and then swallowed to effect in gastrointestinal track, or to be absorbed by gastrointestinal track for systemic action.

Mannitol, sorbitol, or sucrose, which are excipients freely soluble in water, are usually utilized as fillers and binders. The hardness of chewable tablets should be suitable.

Dispersible Tablets Dispersible Tablets are tablets which are intended to be dispersed rapidly in water giving a uniform dispersion before administration.

The medicaments in the dispersible tablets are usually insoluble in water. Dispersible tablets may be administered after being dispersed in water or sucked in the mouth or swallowed whole. Dispersible tablets comply with the requirements for the tests of dissolution and uniformity of dispersion.

Soluble Tablets Soluble Tablets are film-coated or uncoated tablets which are dissolved in water before administration. Soluble tablets are freely soluble in water, and their solutions may be slightly opalescent and are intended for oral administration, external application or gargling.

Effervescent Tablets Effervescent Tablets are tablets containing sodium bicarbonate and organic acids which release carbon dioxide in effervescent appearance when dissolved in water.

The medicaments in effervescent tablets are freely soluble in water as well as in the effervescent solution. Organic acids such as citric acid, tartaric acid and fumaric acid are usually used.

Vaginal Tablets and Effervescent Vaginal Tablets They are tablets intended for administration to the vagina. Their shape should be suitable for vaginal administration, and they may be inserted into the vagina with a suitable device. They are conventional tablets and may readily dissolve, disperse, melt, or disintegrate and the medicaments are released in the vagina to obtain a local antiphlogistic and antimicrobial effect. Sexual hormones can also be administered in this way while those medicaments with local irritant effect should not be prepared in such a way.

Vaginal tablets comply with the test for disintegration (Appendix X B).

Effervescent vaginal tablets comply with the requirements for the test of effervescent volume.

Sustained-release tablets Sustained-release tablets are tablets which release medicaments in a gradual, non-constant rate way in water or a prescriptive release medium. They comply with the related requirements for sustained-release preparations (Appendix XX D) and the test for drug release.

Controlled-release tablets Controlled-release tablets are tablets which release medicaments in a gradual, constant rate way or nearly constant rate way in water or a prescriptive release medium. They comply with the related requirements for controlled-release preparations (Appendix XX D) and the test for drug release.

Enteric-coated tablets Enteric-coated tablets are tablets coated with enteric-coating material.

Tablets may be coated with gastro-resistant coating to prevent the medicaments from decomposition and failing to effectiveness or irritation to stomach, or to control the targeted release of the medicaments in the intestinal fluid. Tablets may be coated with colon-specific film for treatment of colon diseases.

Enteric-coated tablets, unless otherwise stated, comply with the test for drug release.

The production and storage of tablets comply with the following requirements.

1. The medicaments should be mixed with the excipients thoroughly. Tablets containing medicaments toxic or potent in nature or those administered in small dosage are dispersed uniformly in a way appropriate for the substances concerned.
2. Tablets containing volatile, thermolabile or photosensitive substances are processed in a way to avoid loss and failing to effectiveness or heating or to avoid decomposition by

protecting from light.

3. The moisture content of the drug substances or granules used in the process should be controlled to meet the requirements of processing and to prevent mold contamination or deterioration during storage.

4. Excipients such as flavouring, aromatic and colouring agents may be added to lozenges, dental patches, chewable tablets, dispersible tablets and effervescent tablets, if necessary.

5. Tablets may be coated with sugar or film for a variety of reasons, including enhancement of stability, masking of unpleasant tastes, and improvement of appearance.

6. Tablets have a clean, smooth appearance and uniformly coloured surface. They possess suitable hardness and wearability. The uncoated tablets should comply with the test for tablet friability to protect them from wearing or cracking during transportation.

7. Tablets comply with the requirements for the tests of dissolution, drug release, content uniformity and microbial limit. If necessary, film-coated tablets should be examined for residue of organic solvents.

8. Unless otherwise stated, tablets should be stored in tightly closed containers.

Unless otherwise stated, tablets comply with the following requirements.

Weight variation Suppositories comply with the following requirements.

Average weight or labelled weight	Weight variation limit
Less than 0.30 g	$\pm 7.5\%$
Not less than 0.30 g	$\pm 5.0\%$

Procedure Weigh accurately 20 tablets and calculate the average weight; then weigh individually each of the 20 tablets and compare the weight of each tablets with the average weight (if assay is not required, the weight of each tablet should be compared with the labelled weight). Not more than 2 of the individual weights deviate from the average weight by more than the weight variation limit shown in the table, and none deviations by more than twice the limit.

Before being coated with sugar, the tablet cores comply with the test for weight variation. Sugar coated tablets are not required to carry out the test for weight variation which film coated tablets are required to comply with.

Where the test for content uniformity is specified, the test for weight variation may not be required.

Disintegration Unless otherwise stated, tablets comply with the Determination of Disintegration (Appendix X A). Vaginal tablets comply with the Disintegration Test for Suppositories and Vaginal Tablets (Appendix X B). Chewable tablets may not be required to comply with the test for disintegration.

Where dissolution test or drug release test is specified, disintegration test may not be required.

Effervescence volume Effervescent vaginal tablets comply with the following requirements.

Procedure Add 2 ml each of water, accurately measured, to ten 25 ml graduated test tubes with stopper (the internal diameter is about 1.5 cm) separately, place on a water bath at $37^{\circ}\text{C} \pm 1^{\circ}\text{C}$ for 5 minutes. Add 1 tablet each to the ten test tubes respectively, stopper the test tubes for 20 minutes. Examine the maximum volume of effervescence, the average volume of effervescence is not less than 6 ml, and not more than 2 tablets lower than 3 ml.

Uniformity of disintegration Dispersible tablets comply with the

following requirements.

Procedure Place 2 tablets in 100 ml water at $20^{\circ}\text{C} \pm 1^{\circ}\text{C}$ and shake, they should disintegrate within 3 minutes. A smooth dispersion is produced, which passes through No. 2 sieve.

Microbial limit Dental patches, vaginal tablets, effervescent vaginal tablets and soluble tablets, which are all for local use, comply with the requirements of Microbial Limit Tests (Appendix XI J).

I B Injections

Injections are sterile products prepared using medicaments with suitable solution or disperse medium as solutions, emulsions, or suspensions which are intended for administration by injection into the body, and as sterile preparations, such as powders or concentrated solutions, which, should be dispensed or diluted as solutions or suspensions before use.

Injections are classified as liquid for injection, sterilized powders for injection and concentrated solutions for injection.

Liquid for injection Liquid for injection are sterile aqueous solutions, emulsions and suspensions which are intended for parenteral administration into the body, which can be applied to intramuscular injection, intravenous injection and intravenous infusion. The large volume injections (unless otherwise specified, the volume is not less than 100 ml) for intravenous infusion are also called intravenous transfusions.

Sterilized powders for injection Sterilized powders for injection are sterilized powders or sterilized nubby materials containing medicaments, which should be dispensed as clear solutions or uniform suspensions using suitable sterile solution before use. They should be prepared by addition of a suitable sterile solvents for Injection before injection, or be prepared by addition of intravenous transfusion before intravenous infusion. The sterilized powders may be prepared by menstruum crystallization, spray-drying process or lyophilization, and other methods.

Concentrated solutions for injection Concentrated solutions for injection are sterile solutions containing medicaments which are intended for injection or intravenous infusion after dilution. The production and storage of injections should comply with the following requirements.

1. Aqueous solutions for injection should be clear; Unless otherwise specified, particles contained in suspensions for injection should not exceed $15\ \mu\text{m}$ in diameter, particles of $15\text{--}20\ \mu\text{m}$ in diameter should not be more than 10% (rarely up to $20\text{--}50\ \mu\text{m}$ in diameter). If a sediment appears, the suspensions for injection should be readily dispersed on shaking. Suspensions for injection can not be used by intravenous or vertebral canula injection. Emulsions for injection should be stable and do not show any evidence of phase separation. They can not be used by vertebral canula injection. Over 90% of the globules in the emulsions for intravenous infusion should be less than $1\ \mu\text{m}$, and none is greater than $5\ \mu\text{m}$ in diameter. Intravenous infusions should be isotonic with blood as far as possible.

2. The solvents for injections should be safe and innocuous, and not affect the therapeutic efficacy and drug quality. Aqueous solvents and non-aqueous solvents are generally used as vehicles for injections.

(1) Water for injection is the most commonly used aqueous solvents. A 0.9% Sodium Chloride solution or the aqueous

solutions of other suitable substance may also be used.

(2) Vegetable oil is the most commonly used non-aqueous solvents. Soya-bean oil for injection is commonly used as oil solvents. Provided it complies with the requirements for Soya-bean Oil (for injection). Non-aqueous solvents also include solutions of ethanol, propanediol and polyethylene glycol.

3. Suitable additives may be added according to the nature of the medicaments in the manufacturing of injections. The common additives include the substances which are used for regulating the osmotic pressure, adjusting the pH, and enhancing the solubility of the medicaments, and antioxidants, anti-microbial preservatives, and emulsifying agents, suspending agents, etc. The additives should not affect the therapeutic efficacy, not interfere with quality testing. The concentration used should not cause toxicity or excessive stimulation. Antioxidants commonly used are Sodium Sulfite, Sodium Bisulfite and Sodium Pyrosulfite, etc, the concentration used is generally 0.1%-0.2%; Antimicrobial preservatives commonly used are 0.5% of Phenol, 0.3% of Cresol, 0.5% of Chlorobutanol, etc. Multi-dose injections may contain an appropriate concentration of suitable anti-microbial preservatives. The concentration of anti-microbial preservatives should be enough to prohibit the growth of micro-organisms in the injections. Sterilization should be conducted for those injections with added anti-microbial preservatives. It is not allowed to use anti-microbial preservatives for the injections to be administered by intravenous infusion, intracisternal injection, extradural injection, or vertebral canula injection. Unless otherwise specified, no anti-microbial preservative is added when the volume to be injected in a single dose exceeds 15 ml.

4. Containers commonly used for injections include glass ampoules, glass bottles, plastic ampoules and plastic bottles, etc. The tightness of the containers should be ensured by suitable means. Unless otherwise specified, containers should comply with the related requirements of the National Standards for glass and plastic containers for injections. The rubber closures, especially the closures for multi-dose containers, should be sufficiently firm and elastic, should comply with the related requirements of the National Standards.

5. The time for manufacturing the injections should be reduced as far as possible. Injections are prepared by methods designed to avoid the contamination of microorganism, pyrogens and to prevent the medicaments from deterioration. In the manufacture of intravenous infusions, it should be controlled more strictly. In the manufacture of emulsions for injection and suspensions for injection, the necessary measures should be taken to ensure that the particle size complies with the requirement of standards. Sterilized powders for injection should be manufactured under aseptic conditions.

6. Each container of injection is filled with a volume in slight excess of the labelled quantity if labelled volume of injection is 50 ml or less. The excess quantities are recommended in the accompanying table. A container may contain medicaments of multiple doses. Unless otherwise specified, it should not contain more than 10 doses, and the excess quantity in such containers should be sufficient to permit withdrawal and administration of the labelled quantity of each doses.

Labelled quantity/ml	Excess quantity/ml	
	Mobile liquid	Viscous liquid
0.5	0.10	0.12
1	0.10	0.15
2	0.15	0.25

continue

Labelled quantity/ml	Excess quantity/ml	
	Mobile liquid	Viscous liquid
5	0.30	0.50
10	0.50	0.70
20	0.60	0.90
50	1.0	1.5

The containers for filling the medicaments which are readily deterioration on exposure to air should be evacuated and displaced by carbon dioxide or nitrogen, etc, during filling, and then they are sealed by fusion or hermetic close.

7. After being sealed by fusion or hermetic seal, injections are sterilized by appropriate method according to the nature of the medicaments to ensure the sterility of the finished products. Containers of injections should undergo a leakage test under reduced pressure or by other suitable methods during or after the sterilizing process.

8. Unless otherwise stated, the storage of injections should be protected from light.

9. Where the injections contain a suitable anti-microbial preservative, the label should states the name and concentration of the anti-microbial preservative added. For sterilized powders for injection, the label should states the vehicle used.

Unless otherwise specified, injections should comply with the following requirements.

Filling The volume of injections and liquid concentrates for injection should comply with the following requirement.

Procedure Take 5 containers (the labelled quantity is not more than 2 ml); 3 containers (the labelled quantity is more than 2 ml and less than 50 ml); Open the containers with caution to avoid any loss of the contents. Take up individually the contents of each container into a dry syringe, then discharge the contents of the syringe into a calibrated cylinder (of such size that volume to be measured occupies at least 40% of its rated volume), and measure the volume at room temperature. For injections of oily liquids or suspensions, warm and thoroughly shake the containers before removing the contents, then process as mentioned above. Cool to room temperature before measuring the volume. The content in each container is not less than the labelled quantity of the injection.

If the labelled volume is over 50 ml, carry out the test for Minimum Fill (Appendix X F), the result should comply with the requirements.

Weight variation Unless otherwise specified, the weight variation of powders for injection should comply with the following requirements.

Procedure Take 5 containers, remove any adherent label and the aluminium cover from the sealed container, wash the outside with ethanol and dry thoroughly, weigh accurately each container as soon as possible, open the container with caution to avoid foreign matter such as glass bits falling into container, and weigh accurately the whole container immediately, remove the contents, wash the container with water or ethanol, dry it in a suitable condition and weigh accurately, calculate the weight of each container and the average weight of 5 containers. The weight variation of each container does not deviate from the average weight by a percentage greater than that shown in the table. If the weight variation of contents of one container does not comply with the above requirements, repeat the operation with another 10 containers, all of them should comply with the requirements.

Average weight	Weight variation limit
0.05 g or less	±15%
More than 0.05 g to 0.15 g	±10%
More than 0.15 g to 0.50 g	±7%
More than 0.50 g	±5%

If the test for uniformity of content is specified for a sterilized powder for injection, the test for weight variation is generally not required.

Visible particles Unless otherwise specified, comply with the requirements of the Test for Visible particles in Injections (Appendix IX H).

Particulate matter Unless otherwise specified, aqueous intravenous infusions, sterilized powders for infusion and liquid concentrates for injection, should comply with the requirements of the Test for Particulate matter in Injections (Appendix IX C).

Sterility Comply with the requirements of the Test for Sterility (Appendix XI H).

Bacterial Endotoxin or Pyrogens Unless otherwise specified, the injections for intravenous infusions should comply with the requirements of the Test for Bacterial Endotoxin (Appendix XI E) or the Test for Pyrogens (Appendix XI D) as specified in individual monograph.

I C Tinctures

Tinctures are clear liquid preparations of medicinal substances macerated or dissolved in ethanol of specified concentration or made by diluting the fluid extracts. They are intended for oral administration or external application. The production and storage of tinctures comply with the following requirements.

1. Unless otherwise stated, tinctures containing poisonous or potent drugs are generally equivalent to 10 g of the drug in 100 ml of the tincture; most of other tinctures represent 20 g of the drug in 100 ml of the tincture.

2. The active ingredients of a tincture containing poisonous or potent drugs may be determined by an assay of intermediate product and then the potency adjusted to produce a finished product that complies with the requirements stated in the monograph concerned.

3. Tinctures may be prepared by dissolution, dilution, maceration or percolation.

(1) *Dissolution or dilution* Dissolve a quantity of drug powder or dilute the liquid extracts with a quantity of ethanol of specified concentration, allow to stand, filter if necessary.

(2) *Maceration* Macerate the powdered drugs with a quantity of solvent in a closed vessel for 3-5 days or a specified time, stirring or shaking occasionally. Separate the supernatant liquid, to the residue add a quantity of the solvent and continue maceration in the same way until the active ingredients are completely extracted. Combine the extracts and add solvent to the required volume, allow to stand for 24 hours and filter.

(3) *Percolation* Percolate with a quantity of solvent as described under Extracts and Liquid Extracts (Volume I of this Pharmacopoeia, Appendix I O), until sufficient quantity of the percolate is obtained as required, allow to

stand and filter.

4. Precipitates produced after prolonged standing of the tincture may be removed by filtration provided that the content of active ingredients and ethanol still comply with the requirements stated in the monograph concerned.

5. Tinctures should be preserved in light-resistant, tightly closed containers and preserved in a cool place. Tinctures comply with the following requirements, unless otherwise stated.

Filling Comply with the test for Minimum Fill (Appendix X F).

Microbial limit Unless otherwise stated, tinctures comply with Microbial Limit Tests (Appendix XI J).

I D Suppositories

Suppositories are preparations made by incorporating medicaments in suitable bases, intended for administration to cavities.

Based on the different cavities they are intended to apply to, suppositories may be classified as rectal suppositories, vaginal suppositories and urethral suppositories. Rectal suppositories have the shape of torpedo, cone or cylinder, etc. Vaginal suppositories have the shape of drawing pen, ball or oval. Urethral suppositories are usually rodlike.

Suppositories may be classified into conventional and sustained-release suppositories.

The production and storage of suppositories comply with the following requirements.

1. Semi-synthetic fatty glycerides, cocoa butter, polyoxyethylene stearate, polyoxyethylene sorbitan fatty esters, hydrogenated vegetable oil, glycerogelatin, poloxamers, polyethylene glycol and other suitable materials may be used as suppository bases.

2. Bases which are soluble in water or able to mix with water are usually used for preparation of vaginal suppositories.

3. Solid drug substances, unless otherwise specified, should be finely powdered, and all the particles should pass through No. 6 sieve beforehand. Suppositories may be made in different shapes according to their usage and the cavities they are intended to apply to.

4. Surfactants, diluents, absorbents, lubricants and preservatives, etc. may be added, if necessary.

5. The drug substances and bases in suppositories should be thoroughly mixed. The suppositories should look intact and smooth. Suppositories are non-irritating and able to melt, soften or dissolve when inserted in the cavities and are miscible with body fluid to release the medicament gradually thus exert local or systemic effects. Suppositories are sufficiently hard to withstand packaging or storing without deformation.

6. Suppositories comply with the requirements for test of drug release and may not be necessary for test of disintegration.

7. Unless otherwise stated, suppositories should be preserved in well closed containers and preserved at a temperature below 30°C to protect from deformation, mould contamination or deterioration due to excessive heat and moisture. Unless otherwise specified, suppositories comply with the following requirements.

Weight variation Suppositories comply with the following

requirements.

Average weight	Weight variation limit
1.0 g or less	$\pm 10\%$
More than 1.0 to 3.0 g	$\pm 7.5\%$
More than 3.0 g	$\pm 5.0\%$

Procedure Weigh accurately together 10 suppositories and determine the average weight; then weigh individually each of the 10 suppositories. Not more than one of the individual weight deviates from the average weight by more than the weight variation limit shown in the table and none deviates from twice of the limit.

Where the test for content uniformity is specified, the test for weight variation may not be required.

Disintegration test Suppositories comply with the requirements of Disintegration Test for Suppositories and Vaginal Tablets (Appendix X B).

Microbial limit Suppositories comply with the requirements of Microbial Limit Tests (Appendix XI J).

I E Capsules

Capsules are solid preparations consisting of medicaments with or without excipients, filled in hollow hard capsules or sealed in soft shells.

Capsules may be classified into hard, soft, sustained-release, controlled-release, and enteric-coated capsules. They are mainly intended for oral administration.

Hard capsules (usually known as capsules) Hard capsules are capsules made of a quantity of powders, granules, minitabets or pellets of medicaments, with or without suitable excipients, which are produced by suitable preparative technology and enclosed in a hollow capsule shell.

Soft capsules Soft capsules are capsules prepared by enclosing directly a quantity of liquid medicament, or by enclosing a solution, suspension, emulsion and semi-solid, which are made by dissolving or dispersing solid medicaments, into spherical or elliptical soft capsule shells. The soft capsule shells are made of gelatin, glycerin or/and other suitable materials.

Sustained-release capsules Sustained-release capsules are capsules which release medicaments in a gradual, non-constant rate way in water or a prescriptive release medium. Sustained-release capsules comply with the related requirements for sustained-release preparations and the test for drug release.

Controlled-release capsules Controlled-release capsules are capsules which release medicaments in a gradual, constant rate way or nearly constant rate way in water or a prescriptive release medium. They comply with the related requirements for controlled-release preparations and the test for drug release.

Enteric-coated capsules Enteric-coated capsules are hard or soft capsules of which the shell is prepared by suitable enteric-coating material, or are capsules filled with granules or pills coated with enteric-coating material. Enteric-coated capsules are insoluble in gastric fluid, but can disintegrate in intestinal fluid to release active ingredients. Unless otherwise specified, enteric-coated capsules comply with the requirements for the test of drug release (Appendix X D).

The production and storage of capsules comply with the following requirements.

1. The active ingredients or excipients enclosed in capsules should not cause the deterioration of the shells.
2. Hard capsules may be enclosed with the following contents according to different preparative technologies.
 - (1) uniform powders, granules or minitabets made of a quantity of medicaments and suitable excipients such as diluents, lubricants and disintegrating agents;
 - (2) pills, fast-release pills, sustained-release pills, controlled-release pills or enteric-coated pills, in either simple form or compound form, and a quantity of blank pills may be added as the filler if necessary;
 - (3) medicinal powders without any excipients;
 - (4) inclusion complexes, solid dispersion, microcapsules or microspheres of medicaments;
 - (5) solutions, suspensions, emulsions, etc., filled with a special machine, and sealed if necessary.
3. Potent medicaments given in small doses are usually mixed thoroughly with a suitable diluent before filling.
4. Capsules should have a clean, smooth surface and well shaped without adhesion, deformation, leakage or breakage. Capsules should not have foreign odour.
5. Capsules comply with the requirements for tests of dissolution, drug release, content uniformity and microbial limit. If necessary, capsules with coated films should be examined for the residues of organic solvents.
6. Unless otherwise stated, capsules should be preserved in tightly closed containers at temperatures not exceeding 30°C and suitable humidity to protect from moisture, mold contamination or deterioration.

Unless otherwise stated, capsules comply with the following requirements.

Weight variation Capsules comply with the following weight variation limit.

Average weight	Weight variation limit
Less than 0.3 g	$\pm 10\%$
0.3 g or more	$\pm 7.5\%$

Procedure Weigh accurately each of 20 capsules, unless otherwise specified, and open each capsule without loss of shell material, remove the content as completely as possible; for hard capsules, clean the shell with a small brush; for soft capsules, wash the shell with ether or other volatile solvents, and allow to stand until the odour of the solvents is no longer perceptible. Weigh the shell of each capsule. The difference between the weights represents the weight of the content of each capsule and calculate the average weight of the capsule content. Not more than 2 of the individual weights deviate from the average weight by more than the weight variation limit shown in the table, and none deviates by more than twice of the limit.

Weight variation test may not be required if the capsules have proceeded content uniformity test.

Disintegration test Unless otherwise specified, capsules comply with the test for Determination of Disintegration (Appendix X A).

Where dissolution test or drug release test is specified, disintegration test may not be required.

I F Ointments, Creams and Pastes

Ointments Ointments are uniform semi-solid preparations made of medicaments and oleaginous or water-soluble bases and are intended for external application to the skin. Ointments may be divided into solution or suspended ointments according to different dispersion states of the medicaments in the bases. Solution ointments are the ointments of which the medicaments dissolve or melt into the simple or compound bases; suspended ointments are the ointments in which the fine powders of the medicaments are dispersed into the bases evenly.

Creams Creams are uniform semi-solid preparations made of emulsified bases in which medicaments are dissolved or dispersed. Creams are intended for external application to the skin. According to different bases, ointments may be divided into two types, oil-in-water and water-in-oil.

Pastes Pastes are semi-solid preparations which contain a large amount (usually more than 25%) of medicament powders uniformly dispersed in suitable bases. Pastes may be divided into homogeneous hydrogel and oleaginous pastes. The production and storage of the ointments, creams and pastes comply with the following requirements.

1. Bases utilized for ointments, creams and pastes are selected based on the characteristics of the preparation formulation, properties of the medicaments, therapeutic effect of the preparation and stability of the product. Mixed bases of different types can also be used.

Bases for ointments are divided into oleaginous and water-soluble bases. Oleaginous bases usually include vaseline, paraffin, liquid paraffin, silicone oil, beeswax, stearic acid, wool fat, etc.; water-soluble bases mainly include polyethylene glycols. Emulsifiers for creams are usually divided into two types, oil-in-water and water-on-oil. Oil-in-water emulsifiers include sodium soaps, triethanolamine soaps, sodium fatty alcohol sulphate (sodium lauryl sulphate) and tweens; water-in-oil emulsifiers include calcium soaps, wool fat, mono glycerides, fatty alcohols, etc.

2. The bases of ointments, creams and pastes should be uniform, fine and smooth without any irritation for use on skin or mucous membranes. Insoluble solid medicaments in suspended ointments and solid components in pastes should be powdered finely in advance with suitable method to ensure the specified particle size.

3. If necessary, wetting agents, preservatives, thickening agents, antioxidants and the transdermal accelerants may be added to the ointments and creams.

4. Ointments, creams and pastes should be applied easily to the skin or mucous membrane with proper consistency (pastes usually have larger consistency) but should not be melt, the consistency should only change a little with different temperatures.

5. Ointments, creams and pastes should show no evidence of deterioration such as rancidity, foreign odour, discolouration, hardening and creams no evidence of flatulence and separation of oil and water.

6. Unless otherwise specified, ointments, creams and pastes should be preserved in well closed containers, protected from light; creams should be preserved below 25°C but not frozen.

Unless otherwise specified, ointments, creams and pastes comply with the following requirements.

Particle size For suspended ointments, unless otherwise specified, spread a quantity of the ointments onto three microscope slides separately to form a thin layer whose area is equivalent to the cover-glass. Examine them according to the test for Particle Size and Its Distribution (Appendix IX E, method 1), no particle of greater than 180 μm in dimension is observed.

Filling Comply with the test of Minimum Fill (Appendix X F).

Sterility Ointments and creams for use on burns or grievous injuries comply with the Test for Sterility (Appendix XI H).

Microbial limit Unless otherwise specified, they comply with the requirements of Microbial Limit Tests (Appendix XI J).

I G Eye Preparations

Eye Preparations are preparations intended for direct application to the eye to display therapeutic effect. Eye preparations may be classified into liquid eye preparations (eye drops, eye lotions, ophthalmic injections), semi-solid eye preparations (eye ointments, eye creams, eye gels), solid eye preparations (eye pellicles, eye pilules, ophthalmic inserts), etc. They can also be packed in a solid form with a separate solvent, from which solutions or suspensions are prepared before use.

Eye Drops Eye Drops are sterile liquid eye preparations in the form of aqueous or oily, clear solutions, suspensions or emulsions made of medicaments and suitable excipients, intended for instillation onto the eye. The medicaments can be packed in the form of powder, granules, masses or tablets with a separate solvent, from which clear solutions or suspensions are prepared before use.

Eye Lotions Eye Lotions are sterile aqueous solutions intended for use in washing or bathing the eye to wash off the foreign matter or secretion or to neutralize foreign chemical materials.

Ophthalmic Injections Ophthalmic Injections are sterile liquid eye preparations in the form of clear solution prepared from medicaments and suitable excipients, intended for injection into the tissues around the eye (including subconjunctival injection, subtenon injection, and retrobulbar injection, etc.) or into the eye (including anterior chamber injection, anterior chamber washing, intravitreal injection and intravitreal perfusion, etc.).

Eye Ointments Eye Ointments are semi-solid eye preparations in the pasty form of sterile solution or suspension made of medicaments with suitable bases.

Eye Creams Eye Creams are semi-solid eye preparations in the form of sterile cream made of medicaments with suitable bases.

Eye Gels Eye Gels are semi-solid eye preparations in the form of sterile gel made of medicaments with suitable bases. Eye gels have large viscosity and mix easily with tears.

Eye Pellicles Eye Pellicles are solid eye preparations in the form of sterile film made of medicaments with suitable high polymer excipients, intended for use in the conjunctiva sac for slow release of medicaments.

Eye Pilules Eye Pilules are solid eye preparations in the

form of sterile sphere, almost sphere shape or ring made of medicaments with suitable excipients.

Ophthalmic Inserts Ophthalmic Inserts are sterile solid eye preparations of suitable size and shape, made of medicaments and suitable excipients, intended to be inserted in the conjunctiva sac for slow release of medicaments.

The production and storage of eye preparations comply with the following requirements.

1. Eye preparations may contain auxiliary substances to adjust the tonicity, pH value and viscosity, or excipients to increase the solubility of the medicaments or to stabilize the preparation, or bacteriostatics and antioxidants of suitable concentration. Such additives do not adversely affect the medicinal action, nor cause undue local irritation.

2. Unless otherwise stated, eye drops should be isotonic with tears and their osmolarity determined. Suspended eye drops may show a sediment which is readily dispersed on shaking and should not be a cake mass; their ratio of sedimental volume should be determined. Unless otherwise stated, each container of eye drops should not hold more than 10 ml.

3. Eye lotions are used in large amount and should be basically isotonic with tears and have a close pH value. Eye lotions packaged in multi-dose should contain suitable bacteriostatic which displays bacteriostatic effect during the period of use. Unless otherwise stated, each container of eye lotions should not hold more than 200 ml.

4. The selected bases of semi-solid eye preparations should be filtered and sterilized, and the insoluble medicaments should be finely powdered in advance. Eye ointments, eye creams and eye gels should be homogenized, fine and smooth. They should be applied easily to the eye for easy dispersion and absorption of the medicaments without any irritation. Each container should not hold more than 5 g.

5. Ophthalmic injections, ophthalmic inserts and eye preparations for injuries, surgical procedures or corneal perforation should not contain bacteriostatics, antioxidants or unsuitable buffering agents. They should be packaged in sterile containers of single dose.

6. The container should be cleaned and sterilized, and not break easily. Unless otherwise stated, the wall of the containers should be transparent enough to carry out the test for Visible Particles in Injections.

7. Unless otherwise stated, eye preparations comply with the general requirements for preparations of the dosage forms concerned. For example, eye gels should comply with the requirements of gels.

8. The content uniformity of eye preparations comply with the requirements.

9. Unless otherwise stated, eye preparations should be preserved in tightly closed containers protected from light.

10. Eye preparations must not be used for exceeding 4 weeks after opening.

Unless otherwise stated, eye preparations comply with the following requirements.

Visible particles Unless otherwise stated, eye drops comply with the test for Visible particles in Injections (Appendix IX H) of eye drops; ophthalmic injections comply with the test for Visible particles in Injections (Appendix IX H).

Particle size Unless otherwise stated, suspended eye preparations comply with the following test.

Procedure for suspended eye drops Shake the test sample

of the medicament onto the slide, carry out the test for determination of particle size and its distribution (Appendix IX E, method 1), not more 2 particles greater than 50 μm and no particle greater than 90 μm in dimension are allowed.

Procedure for suspended semi-solid eye preparations Take 10 tubes and extrude the content of each tube as completely as possible into a suitable container, stir thoroughly, and on each of three slides, spread a quantity of the content (equivalent to about 10 μg of the medicament) to form a thin layer with an area approximately corresponding to that of the cover-glass. Carry out the test for determination of particle size and its distribution (Appendix IX E, method 1), not more 2 particles greater than 50 μm and no particle greater than 90 μm in dimension are allowed.

Ratio of sedimental volume The ratio of sedimental volume of suspended eye drops should be not less than 0.90.

Procedure Unless otherwise stated, shake vigorously 50 ml of the test sample in a stoppered cylinder for 1 minute, and record highness H_0 in the beginning. Allow to stand for 3 hours, record the final highness H . Calculate the ratio of sedimental volume according to the following equation:

$$\text{Ratio of sedimental volume} = H/H_0$$

Metal particles Unless otherwise specified, semi-solid eye preparations comply with the following requirements.

Procedure Take 10 tubes, extrude the content of each tube, individually, as completely as possible into culture dishes which are 6 cm in diameter with flat bottom, free from gas bubbles and visible particles. Cover the dishes, heat at 85°C for 2 hours, unless otherwise stated, and allow the test sample to distribute uniformly, cool at room temperature until the ointment is congealed and invert each dish on the stage of a suitable microscope. Each dish is illuminated from above direction by a spotlight placed at an angle of 45° to the bottom of the plate. Examine at a 30 magnification and count the lustrous metal particles not less than 50 μm in dimension. Not more than one tube is found to contain more than 8 metal particles, and not more than 50 particles are totally found in the 10 tubes. If the test does not comply with the requirements above, repeat the test with another 20 tubes. The requirements are met if not more than 3 tubes in the 30 tubes are found to contain more than 8 metal particles in each tube, and not more than 150 particles are totally found.

Weight variation Unless otherwise stated, solid eye preparations comply with the following requirements.

Procedure Weigh accurately together 20 test samples (or their contents) and calculate the average weight; then weigh individually each of the 20 samples. Not more than 2 of the individual weight deviate from the average weight by more than $\pm 10\%$ and none more than $\pm 20\%$.

Where the test for content uniformity is specified, the test for weight variation may not be required.

Filling Semi-solid and liquid eye preparations comply with the test of Minimum Fill (Appendix X F).

Sterility Ophthalmic injections, ophthalmic inserts and eye preparations for injuries, surgical procedures or corneal perforation comply with Test for Sterility (Appendix XI J).

Microbial limit

Procedure for liquid eye preparations Unless otherwise stated, carry out the test of film filtration and direct inoculation (Appendix XI H). Take prescribed amount of at least 2 test samples (2 samples inoculated in one type of culture dishes, 1 ml each sample), inoculate in fluid thioglycollate medium or modified Martin medium, directly or with pre-treatment, then culture for 7 days. No evidence

of microbial growth is found. Should any fungi have grown, repeat the test using twice the number of samples. No evidence of microbial growth is found in any one of the tubes.

Procedure for semi-solid and solid eye preparations
Unless otherwise specified, they comply with the Microbial Limit Tests (Appendix XI J).

I H Pills

Pills are the solid preparations in spherical or almost spherical shape made of the uniform mixture of the medicaments and suitable excipients. Pills may be classified into dripping pills, sugar pills and pellets, etc.

Dripping Pills Dripping Pills are the preparations made of dripping a uniformly melted, emulsified or suspended mixture of solid or liquid medicaments and appropriate bases into an immiscible and non-interacting cooling liquid and congealing to pill form due to the action of surface tension. They are mainly intended for oral administration.

Sugar Pills Sugar Pills are the preparations made of appropriate sugar granules or base pills as the cores, sugar powder or the mixture of other excipients as the powdering materials, and suitable materials as adhesive or wetting agents, and the medicaments are encapsulated with an appropriate method in divided quantities.

Pellets Pellets are solid preparations in spherical or almost spherical shape prepared with suitable method from a uniform mixture of medicaments and suitable excipients with suitable adhesive or wetting agents. The diameter of pellets is usually 0.5-3.5 mm.

The production and storage of pills comply with the following requirements.

1. The bases used for the preparation of dripping pills consist of water-soluble and water-insoluble bases. Commonly used bases include polyethylene glycols (such as polyethylene glycol 6000, polyethylene glycol 4000, etc), poloxamers, polyoxyl (40) stearate, gelatin, stearic acid, glycerin monostearate, hydrogenated vegetable oil, etc. The cooling liquid for dripping pills must be innocuous and does not interact with the medicaments. Liquid paraffin, vegetable oil, methylsilicone oil and water are commonly used for this purpose.

Pills should be uniform in size and colour without adhesion.

2. Pills comply with the requirements for the tests of content uniformity and microbial limit, etc.

3. The surface cooling liquid of dripping pills should be removed after preparation.

4. Oral dripping pills or pellets may be sugar-coated or film-coated as required to suit for the properties of the medicaments and for the clinical usage and storage.

5. Unless otherwise stated, sugar pills and pellets should be dried under a suitable condition before packing. They should be sieved with sieves of suitable sieve number according to the dimensions of the pills.

6. Unless otherwise specified, pills should be kept in tightly closed containers, protected from moisture, mold and prevented from deterioration.

Unless otherwise stated, the following examinations should be carried out for pills.

Weight variation The limit of weight variation for pills complies with the following requirements.

Average weight	Weight variation limit
0.03 g or less	±15%
More than 0.03 g to 0.30 g	±10%
More than 0.3 g	±7.5%

Procedure Unless otherwise stated, weigh accurately 20 pills and calculate the average weight, then weigh each of them accurately. Compare the weight of each pill with the average weight. Not more than 2 pills deviate from the limit of weight variation, and none deviates from twice of the limit.

For pills packed in single dose, examine 20 doses, the limit of weight variation should comply with the above requirements.

The core weight variation of coating pills should be examined before coating, and comply with the requirements in the table mentioned above. The examination for weight variation is not required for sugar pills after coating, but required for film-coated pills.

Dispersion limit Unless otherwise specified, carry out the disintegration test (Appendix X A), pills comply with the requirements.

I J Implants

Implants are the sterile solid preparations containing medicaments and excipients, which will be implanted into the body. Implants are commonly implanted with the special syringe, or embedded by surgical open. They can continuously release the active substances over an extended period of time. Implants should comply with the requirements of the test for drug release.

The production and storage of implants should comply with the following requirements.

1. The excipients of the implants should be biological consistent, the material can be unbiodegradable, such as silica gel, also can be biodegradable. For unbiodegradable, it should be taken out when reached the designed time.

2. Implants should comply with the requirements of Drug Release Test.

3. Implants should be packaged in a single-dose sterilized container.

4. Implants should be preserved in tightly closed container, protected from light.

Unless otherwise stated specified, implants should comply with the following requirements.

Weight variation Unless otherwise specified, the weight variation of implants should comply with the following requirements.

Procedure Take 5 containers, remove any adherent label and the aluminium cover from the sealed container, wash the outside with ethanol and dry thoroughly, open the container with caution to avoid foreign matter such as glass bits falling into container, and weigh accurately each of the whole containers immediately, remove the contents, wash the container with water or ethanol, dry it in a suitable condition and weigh accurately, calculate the weight of each container and the average weight of 5 containers. The weight variation of each container does not deviate from the average weight by a percentage greater than that shown in the table. If the weight variation of contents of one container does not comply with the above requirements, repeat the operation with another 10 containers, all of them should comply with the requirements.

Average weight	Weight variation limit
0.05 g or less	±15%
More than 0.05 g to 0.15 g	±10%
More than 0.15 g to 0.50 g	±7%
More than 0.50 g	±5%

Sterility Comply with the requirements of the test for sterility (Appendix XI H).

I K Syrups

Syrups are concentrated aqueous solutions of sucrose containing medicaments. They are intended for oral administration. The production and storage of syrups comply with the following requirements.

1. Syrups should contain not less than 45% (g/ml) of sucrose.
2. Unless otherwise specified, syrups are generally prepared by dissolving the medicaments with freshly boiled-water and adding simple syrup. If prepared by direct addition of sucrose, they should be boiled, and filtered, if necessary, and a quantity of freshly boiled-water is added through the filter to prescribed amount.
3. Additives may be added to syrups if necessary. If preservatives are added in need, not more than 0.3% of sorbic acid or benzoic acid (potassium or sodium salts are calculated to their equivalent amount of corresponding acid), or not more than 0.05% of *p*-hydroxybenzoic acid esters, may be used. If other additives are added, the varieties and amount being used should comply with the related requirements of the National Standards, and they do not affect the stability of the product and quality control of the preparation concerned. Suitable amount of ethanol, glycerol or other polyhydric alcohols may be added if necessary.
4. Syrups should be clear, unless otherwise specified. Syrups should not be moldy or rancid, or generate gases and other deteriorations during storage.
5. Syrups should be kept in tightly closed containers and preserved at the temperature not exceeding 30°C. Unless otherwise specified, syrups should comply with the following requirements.

Filling Syrups comply with the test of Minimum Fill (Appendix X F).

Microbial limit Syrups comply with the Microbial Limit Tests (Appendix XI J).

I L Aerosols, Powders for Spray and Sprays

Aerosols, powders for spray and sprays are intended for application by special devices for the deep respiratory tract, mucosa of various body cavities or the skin to obtain a local or systemic effect. They can be classified as the preparations for inhalation, non-inhalation and for topical use according to the route of administration. Inhalation aerosols, powders for spray for inhalation and sprays for inhalation are presented as single-dose or multi-dose preparations. They should be manufactured according to the following requirements.

respiratory tract and various body cavities or their cilia.

Aerosols

Aerosols are solutions or emulsions or suspensions of one or more medicaments in suitable propellants that are packed in pressure resistant containers fitted with a specified valve system. Upon actuation of the valve the preparations are released from the container and inhaled into the lung, on mucosa of the respiratory tract, on skin, or specially for the purpose of sterilization of the space. Aerosols may be inhalation aerosols, non-inhalation aerosols and topical aerosols according to the route of administration. Aerosols may be two phase aerosols (gas and liquid) or three phase aerosols (gas, liquid, and solid or liquid) according to the formulation. Aerosols may be metered-dose aerosols and non-metered dose aerosols according to the delivery device. The manufacturing and storage of aerosols should comply with the following requirements.

1. In the processing of aerosols, suitable auxiliary substances may be added such as solvents, cosolvents, antioxidants, antiseptics and surfactants or other ingredients. The added substances to aerosols (inhalation, non-inhalation and topical) should be nonirritating to skin or mucosa.
2. Two phase aerosol is prepared according to the formula as a clear solution, which is filled in the containers with the required content. Three phase aerosol is a stable suspension or emulsion prepared by mixing and triturating the micronized powders or emulsifying the active ingredients and added substances thoroughly, if necessary, filled in the containers after quality control of the preparation. Strict control of water content of active ingredients, propellants, containers and apparatus is needed to prevent them from water infiltration. The hygroscopic drugs should be dispensed rapidly. The particle and droplet size of inhalation aerosols must be not more than 10 μm , most of them should be not more than 5 μm .
3. The propellants commonly used are liquids with low-boiling range. Mixtures of appropriate proportions of two or more propellants may be used to obtain the required pressure.
4. The containers are resistant to the internal pressure. Component units of the container should be compatible with the active substances and additives, and their precision of sizes and solubilizing or swelling properties should comply with the relevant requirements. Uniform and fine mist particles, and accurate emitted dose should be released in an actuation.
5. Appropriate method should be adopted to monitor the pressure and any leakage for safety use.
6. Aerosols should be stored in dark, cool place, not to be exposed to heat or sunlight. The container should not be punctured.
7. For metered-dose aerosols the following contents should be stated on the label: (1) the weight of the content in the container; (2) the quantity of active ingredient; (3) the total number of deliveries; and (4) the content of actives ingredient in an actuation. Unless otherwise specified, carry out the tests as follows.

Leakage rate The leakage rate per year of aerosols should comply with the following requirements.

Select 12 aerosol containers in random, wash the surfaces with ethanol, allow the containers to stand in an upright position at room temperature for 24 hours, and weigh accurately each container (W_1). Stand again for 72 hours (accuracy required ± 30 minutes) and weigh accurately (W_2). Cool them at $-4-20^\circ\text{C}$, drill quickly a hole in the

temperature until the propellants are expelled completely. Remove each of the valves from the containers, rinse with ethanol and dry at room temperature. Weigh accurately (W_3) and calculate the leakage rate according to the following formula. The average leakage rate per year is less than 3.5% and no one is not more than 5%.

$$\text{Leakage rate per year} = \frac{365 \times 24 \times (W_1 - W_2)}{[72 \times (W_1 - W_3)] \times 100\%}$$

Total number of deliveries per container The total number of deliveries per container of metered-dose aerosols should comply with the following requirements.

Select 4 aerosol containers, remove the caps and covers. Weigh each container accurately (W_1), shake thoroughly, and delivery the contents for ten times to a container containing a quantity of absorbent solution in a fume hood. Wash the mouthpieces with a suitable solvent, dry, and weigh each container accurately (W_2). Shake, and again delivery the contents for another ten times to the container. Wash the mouthpieces with a suitable solvent, dry and weigh each container accurately (W_3). Punch a small hole in the aluminium cap of the container, after the propellant has completely evaporated, discharge the contents, wash each container with a suitable solvent, dry, and weigh each container accurately (W_4). Calculate the total number of delivery per container by the formula: $10 \times (W_1 - W_4) / (W_2 - W_3)$, they are not less than the labelled number of delivery.

Content of active ingredient in an actuation The Content of active ingredient in an actuation of metered-dose aerosols should comply with the following requirements.

Procedure Select 1 aerosol container, shake thoroughly, and remove the cap and cover. Discharge 5 deliveries, wash the mouthpiece with a suitable solvent and dry. Invert the container in a beaker containing a quantity of absorbent solution. Immerse the mouthpiece under the surface of the absorbent solution (at least 25 mm). Discharge 10 or 20 deliveries. Remove the container, wash the exterior and interior of the mouthpiece with the absorbent solution. Transfer the combined solution and washings to a suitable volumetric flask, and dilute with the absorbent solution to volume. Determine the content, and divide the result by 10 or 20. The average content of active ingredient in an actuation, should be not less than 80% and not more than 120% of the labelled amount of ingredient in an actuation.

Particle or Droplet Size Distribution of Inhalation Preparations Unless otherwise specified, carry out the test for Determination of Particle or Droplet Size Distribution of Inhalation Preparations (Appendix X H), not less 15% of the labelled amount is deposited in the second impingement chamber.

Delivery rate The delivery rate of non-metered dose aerosols should comply with the following requirements.

Procedure Select 4 aerosol containers, remove the caps and covers, actuate each valve for a few seconds, clean the outside of the containers. Weigh each container accurately, immerse in a constant temperature water bath $25^\circ\text{C} \pm 1^\circ\text{C}$ for 30 minutes. After removal and blotting up, unless otherwise specified, actuate each valve continually for accurately 5 seconds. Weigh each container accurately after blotting to remove the residual contents. Return the containers to the constant temperature water bath $25^\circ\text{C} \pm 1^\circ\text{C}$, repeat the foregoing procedure for three times. Calculate the average delivery rate (g/s) for each container, the result should comply with the requirements described in the individual monograph.

Total amount of spray The total amount of spray of non-

metered dose aerosols should comply with the following requirements.

Procedure Select 4 aerosol containers, remove the caps and covers. Weigh each container accurately, actuate each valve continually in a 1000 ml or 2000 ml of conical flask in a fume hood until the container is empty, clean and weigh each container again. The total amount of spray for each container is not less than 85% of the labelled amount.

Sterility Aerosols intended to treat burns, wounds or ulcer should comply with the Test for Sterility (Appendix XI H).

Microbial limit Comply with the requirements for Microbial Limit Test (Appendix XI J).

Powers for spray Powers for spray may be classified as powders for spray for inhalation, for non-inhalation and for topical use according to the route of administration. Powders for spray for inhalation are micronized powders of one or more active ingredients together with or without carriers supplied in capsules, blisters, or powder reservoirs. After breathing by the patient the powder is delivered to the lung. They are administered by dry-powder inhalers. Powders for spray for non-inhalation are preparations of active ingredient together with or without carriers supplied in capsules or blisters. They are sprayed onto mucosa of various body cavities by a special dry-powder administration device. Powders for spray for topical use are products that the drug substance or drug substance with suitable added substance are packed in special administration devices, the drug substance is sprayed onto skin or mucosa with the outside force when used.

The manufacturing and storage of powers for spray should comply with the following requirements.

1. In the processing of powders for spray, suitable carriers or lubricants may be added to improve the flowability of the powders. The added substances should be nonirritating to mucosa of the respiratory tract or its cilia. The added substances of powders for spray for non-inhalation and for topical use should be nonirritating to skin or mucosa.
2. All the component units of the dry-powder inhaler should be nontoxic, nonirritating, stable and compatible with the contents.
3. The particle size of the powder must be not more than $10\ \mu\text{m}$, most of them should be less than $5\ \mu\text{m}$.
4. Unless otherwise specified, powders for spray for topical use should comply with the requirements described under the Powders.
5. Powders for spray should be stored in dark, cool place, and protected from moisture.

6. For powders for spray supplied in capsules or blisters the following contents should be stated on the label: ① the quantity of active ingredient contained in each capsule or blister; ② the capsules are intended for use in an inhaler and are not to be swallowed; ③ the expiration date; ④ the storage conditions.

For multi dose powders for spray for inhalation the following contents should be stated on the label: ① the quantity of each container; ② the content of the active ingredient; ③ the total number of inhalation; ④ the content of active ingredient of each inhalation.

Unless otherwise specified, carry out the tests as follows.

Content uniformity Unless otherwise specified, powders for spray supplied in capsules or blisters should comply with the requirements of the Test for Content Uniformity (Appendix X E).

Weight variation Unless otherwise specified, powders for spray supplied in capsules or blisters should comply with the

following requirements.

Procedure Weigh accurately 20 units, unless otherwise specified, and open each unit without loss of shell material, remove the content as far as possible, weigh the shell of each unit. Calculate the weight of content of each unit, and the average weight of content. Not more than 2 of the individual weights deviate from the average weight by more than the weight variation limit shown in the table, and none deviates by more than twice the limit.

Average weight of content	Weight variation limit
Less than 0.30 g	$\pm 10\%$
0.30 g or more	$\pm 7.5\%$

For the powders for spray, if the Test of Content Uniformity is specified, the test of weight variation is generally not required.

Inhaled percentage Powders for spray supplied in capsules or blisters should comply with the following requirements.

Procedure Unless otherwise specified, select 10 units, weigh each unit accurately. Place them one by one in the inhaler, withdraw the contents by suction at a flow rate of $60 \text{ L} \pm 5 \text{ L}$ per minute for 4 times, each time for 1.5 seconds, weigh each unit again. Remove all the residual contents with a brush or a suitable device, weigh each empty container. Calculate the inhaled percentage, and it is not less than 90%.

Total number of doses per container For powders for spray for inhalation supplied in powder reservoirs.

Procedure Unless otherwise specified, select one container, load the inhaler with a dose by turning the grip. Withdraw by suction at a flow rate of $60 \text{ L} \pm 5 \text{ L}$ per minute. Repeat the procedure until the last labelled dose is withdrawn. Determine the content of the last labelled dose. Repeat the test for a further 3 containers. Total number of doses per container should be not less than the labelled number of the preparation.

Content of active ingredient in a dose Powders for inhalation supplied in multiple dose powder reservoirs should comply with the following requirements.

Procedure Unless otherwise specified, select 6 containers, remove the caps and covers, discard the first 5 doses. Perform the test using the sampling apparatus for uniformity of dosage units of powder for spray for inhalation with 20 ml of a suitable absorbent solution in the container. (as Fig. 1) Place a suitable rubber mouthpiece adapter in the position at the end of the induction port to produce an airtight seal

Fig. 1 Apparatus of the test for the uniformity of powder inhalers
A-Mouthpiece; B-Bronchia simulation; C-Outlet; D-160 ml glass container; E-fused glass of 100-160 μm

between the inhaler mouthpiece and the induction port. Prepare the inhaler for use by turning the grip (equivalent to one dose). Delivery the powders into the apparatus at a flow rate of $60 \text{ L} \pm 5 \text{ L}$ per minute for 5 seconds. Repeat the delivery sequence for a further 9 or 19 times. Rinse the interior of the apparatus with the same absorbent solution. Combine the solution and washings and dilute to a suitable volume. Determine the quantity of the active ingredient and divide the result by 10 or 20, to obtain the content of active ingredient in a dose, and it is not less than 65% and not more than 135% of the labelled amount in a dose. If 1 or 2 containers are outside the range of 65% to 135% of the labelled amount in a dose, but not outside range of 50% to 150% of the labelled amount in a dose, test 12 additional containers. The requirements are met if not more than 2 containers of the 18 are outside of the range of 65% to 135% of the labelled amount in a dose, but none outside the range of 50% to 150% of the labelled amount in a dose.

Particle or Droplet Size Distribution of Inhalation Preparations

Unless otherwise specified, carry out the test for Determination of Particle or Droplet Size Distribution of Inhalation Preparations (Appendix X H), not less 10% of the labelled amount is deposited in the second impingement chamber.

Microbial limit Comply with the requirements of Microbial Limit Test (Appendix XI J).

Sprays

Sprays are preparations of solutions or emulsions or suspensions of drugs, packed in special devices, which are released from the container in the form of nebulized substance with pressure of hand pump, high pressure of gas, ultrasonic vibration and others, to the deep respiratory tract, mucosa of various body cavities or the skin to obtain a local or systemic effect, or to the space. Sprays may be classified as sprays for inhalation, for non-inhalation and for topical use according to the route of administration. They are presented as metered dose and non-metered dose sprays. The manufacturing and storage of sprays should comply with the following requirements.

1. In the processing of sprays, suitable auxiliary substances may be added such as solvent, antioxidants, surfactant or other additives. The added substances in the sprays for inhalation should be physiologically acceptable, nonirritating and innocuous to the respiratory tract, skin or mucosa. All auxiliary substances in the sprays for non-inhalation and for topical use should be nonirritating and innocuous to skin or mucosa.
2. All the component units of the atomizing device should be nontoxic, nonirritating, stable and compatible with the contents.
3. The liquid in the solution sprays should be clear. Droplets of the emulsion sprays should be dispersed uniformly in the vehicle. The fine drug powder and the added substance in suspension sprays should be well mixed, and prepared as a stable spray. The particle size of the sprays for inhalation must be not more than $10 \mu\text{m}$, most of them should be less than $5 \mu\text{m}$.
4. The sprays should be stored in dark, cool place, and protected from moisture.
5. For single-dose sprays for inhalation the following contents should be stated: ① quantity of contents; ② the liquid should be put in the inhalation device before use, not be taken orally; ③ the expiration date; and ④ the conditions under which the sprays should be stored. For multi-dose sprays the following contents should be stated

of active ingredient; ③ the total number of deliveries; ④ the content of active ingredient in a dose; ⑤ the conditions under which the sprays should be stored.

Unless otherwise specified, the sprays should comply with the following requirements.

Total number of deliveries per container The metered-dose sprays should comply with the following requirements.

Procedure Select 4 containers, remove the caps and covers. Weigh each container accurately (W_1), shake thoroughly, and delivery the contents for ten times to a container containing a quantity of absorbent solution in a fume hood according to the insert-sheet. Wash the mouthpieces with a suitable solvent, dry, and weigh each container accurately (W_2). Shake, and again delivery the contents for another ten times to the container. Wash the mouthpieces with a suitable solvent, dry and weigh each container accurately (W_3). Open the container, discharge the contents, wash each container with a suitable solvent, dry, and weigh each container accurately (W_4). Calculate the total number of delivery per container by the formula: $10 \times (W_1 - W_4) / (W_2 - W_3)$. Not less than the labelled number of delivery.

Delivery amount in a dose Unless otherwise specified, the metered dose sprays should comply with the following requirements.

Procedure Select 4 containers, discharge several doses according to the insert-sheet, clean the containers, weigh accurately. Continuously discharge 3 doses, clean the containers each time after discharging and weigh each container accurately. Calculate the delivery amount in a dose based on the 3 doses. Continuously discharge 10 doses, clean the containers and weigh each container accurately. Repeat the procedure and calculate the delivery amount in a dose based on the other 3 doses. Continuously discharge 10 doses, clean the containers and weigh each container accurately. Repeat the procedure and calculate the delivery amount in one dose based on the another 4 doses. Calculate the average delivery amount in one dose based on the 10 deliveries. Unless otherwise specified, the result should not less than 80% and not more than 120% of the labelled amount in one delivery. Where the test for content of active ingredient per spray is specified, the test for delivery amount in a dose may not be required.

Content of active ingredient in a unit spray Unless otherwise specified, the metered dose sprays should comply with the following requirements.

Procedure Select 1 container, discharge 5 deliveries according to the insert-sheet, wash the mouthpiece with a suitable solvent and dry thoroughly. Discharge 10 or 20 deliveries (the time interval is 5 second with shaking gently) the delivered substance is collected in a quantity of absorbing solvent (avoiding any loss) Transfer to a suitable volumetric flask, and dilute to volume. Determine the content, and divide the result by 10 or 20. The average content of active ingredient in a unit spray, should be not less than 80% and not more than 120% of the labelled amount of ingredient in a unit spray.

Particle or Droplet Size Distribution of Inhalation Preparations Unless otherwise specified, carry out the test for Determination of Particle or Droplet Size Distribution of Inhalation Preparations (Appendix X H), not less 15% of the labelled amount is deposited in the second impingement chamber.

Weight variation Single-dose sprays should comply with the following requirements.

weight of each unit and the average weight; according to the individual monograph. Not more than 2 of the individual weights deviate from the average weight by more than the weight variation limit shown in the table, and none deviates by more than twice the limit.

Average weight	Weight variation limit
Less than 0.30 g	$\pm 10\%$
0.30 g or more	$\pm 7.5\%$

Fill Multi-dose sprays should comply with requirements of the test for minimum fill (Appendix X F).

Sterility Sprays intended to treat burns, wounds or ulcer should comply with requirements of the Test for Sterility (Appendix XI H).

Microbial limit Unless otherwise specified, sprays should comply with the requirements of Microbial Limit Test (Appendix XI J).

I M Pellicles

Pellicles are preparations in pellicular form processed by the active ingredients with appropriate pellicular material. They are intended for oral use or topical use on external mucous membranes.

The production and storage of pellicles comply with the following requirements.

1. Pellicular materials and other excipients should be innocuous, nonirritating, stable and compatible with the active ingredients. Pellicular materials in general use are polyvinyl alcohol or polyacrylic acid resins, cellulose and other natural materials of high molecular weights.

2. For water-soluble active ingredients, a solution of suitable viscosity may be made by adding pellicular material. For water-insoluble active ingredients, they should be finely powdered and a uniform mixture of the fine powders and the pellicular material may be made.

3. Pellicles should look smooth and without breakage, uniform in colour and in thickness and contain no obvious bubble remainings. Pellicles of multiple dose are prepared with clear and uniform subdivision by pressing and can be separated along the pressed mark.

4. The packaging materials used for pellicles should be innocuous, convenient to use, efficient in prevention from contamination and compatible with the active ingredients and pellicular material.

5. Unless otherwise specified, pellicles are preserved in tightly closed containers, protected from moisture, molds and prevented from deterioration. Unless otherwise specified, pellicles comply with the following requirements.

Weight variation The weight variation complies with the following requirements.

Average weight	Limit of weight variation
0.02 g or less	$\pm 15\%$
More than 0.02 g to 0.2 g	$\pm 10\%$
0.2 g or more	$\pm 7.5\%$

Procedure Unless otherwise specified, take at random 20

weight of each. Calculate the average weight of the samples and compare with the weight of individual sample. Not more than 2 samples deviate outside of the limit of weight variation, and none deviates more than twice of the limit. Where the test for content uniformity is prescribed, the test for weight variation may not be required.

Microbial limit Unless otherwise specified, pellicles comply with Microbial Limit Tests (Appendix XI J).

I N Granules

Granules are dry granular preparations with appropriate particle size made of medicaments and suitable excipients. Granules may be classified into soluble granules (usually known as granules), suspended granules, effervescent granules, enteric-coated granules, sustained-release granules and controlled-release granules. They are intended for oral administration.

Suspended Granules Suspended Granules are dry granules with appropriate particle size made of insoluble solid medicaments and suitable excipients. Water or other suitable liquid is added with shaking before use to distribute and form a suspension for oral administration. Unless otherwise specified, suspended granules comply with Dissolution Test.

Effervescent Granules Effervescent Granules are granules containing sodium bicarbonate and organic acids which release a large amount of carbon dioxide in effervescent appearance when water is added. The active ingredients in effervescent granules are freely soluble in water and in the effervescent solution. Organic acids such as citric acid, tartaric acid, etc. are usually used. Effervescent granules are dissolved or distributed in water before oral use.

Enteric-Coated Granules Enteric-Coated Granules are granules coated with enteric-coating material or made by other suitable method.

Enteric-coated granules prevent the active ingredients from decomposition and failing to effectiveness, from irritation to stomach, or can control the specific-site release of the active ingredients in the intestinal fluid.

Enteric granules comply with Drug Release Test.

Sustained-Release Granules Sustained-Release Granules are granules which release medicaments in a gradual, non-constant rate way in water or a prescriptive release medium. They comply with related requirements for sustained-release preparations (Appendix XX D) and Drug Release Test.

Controlled-Release Granules Controlled-Release granules are granules which release medicaments in a gradual, constant rate way or nearly constant rate way in water or a prescriptive release medium.

They comply with relate requirements for controlled-release preparations and Drug Release Test.

The production and storage of granules should comply with the following requirements.

1. The medicaments and excipients should be mixed well. A suitable temperature is controlled during the manufacture of volatile or heat-labile medicaments, and medicaments unstable to light should be protected from light.

2. Granules should be dry, uniform in particle size and

agglomeration and deliquescence.

3. If necessary, some suitable auxiliary substances, such as flavoring agent, aromatics, colouring agents, dispersing agents and preservatives, etc. may be added during the manufacture.

4. Granules comply with the requirements for tests of dissolution, drug release, content uniformity, microbial limit, etc. If necessary, coated granules should be examined for residue of organic solvents.

5. Unless otherwise specified, granules are preserved in tightly closed containers and stored in a dry place and protected from moisture.

6. The name and content of the active ingredients of single-dose granules should be provided and stated on the label. The name and weight of the active ingredients of multi-dose granules should be provided and stated on the label, and the precise method for subdivision provided.

Unless otherwise specified, granules comply with the following requirements.

Particle size Unless otherwise specified, carry out the test of particle size and its distribution [Appendix IX E, method 2 (2)]. The total weight of granules, which can not pass through No. 1 sieve (2000 μm) and can pass through No. 5 sieve (180 μm), should not be more than 15% of the test sample.

Loss on drying Unless otherwise specified, carry out the method for loss on drying (Appendix VIII L). Dry to a constant weight at 105°C, or at 80°C under vacuum for granules containing sugar, weight loss should not be more than 2.0 percent.

Dispersion Unless otherwise specified, soluble and effervescent granules comply with following requirements.

Procedure for soluble granules To 10 g granules add 200 ml of hot water and stir for 5 minutes, the granules should be completely dissolved or show slight turbidity without foreign matter.

Procedure for effervescent granules Take 6 packs of single-dose packages and transfer each to a 250 ml beaker containing 200 ml of 15-20°C water. Bubbles of carbon dioxide in effervescent appearance should generate at once. Granules of the 6 packs should be dispersed completely or dissolved in the water in 5 minutes.

Dispersion test may not be required for suspended granules or granules that comply with Dissolution Test or Drug Release Test.

Weight variation Weight variation limit of single-dose granules should comply with the following requirements.

Average weight or labelled weight	Weight variation limit
0.1 g or less	$\pm 10\%$
More than 0.1 g to 1.5 g	$\pm 8\%$
More than 1.5 g to 6.0 g	$\pm 7\%$
More than 6.0 g	$\pm 5\%$

Procedure Take 10 packs (bottles) of test sample, discard the wrapper, and accurately weigh the content of each separately. Calculate the weight of each pack and the average weight. Compare the weight of each with the average weight (compare the weight of each with the labelled weight for granules that assay is not required). Not more than 2 individual values deviate outside of the limit, and none deviate more than twice of the limit. The test of weight variation may not be required for granules that comply with the Test for Content Uniformity.

Minimum Fill (Appendix X F).

I O Oral Solutions, Oral Suspensions, Oral Emulsions

Oral Solutions Oral Solutions are clear liquid preparations made of soluble medicaments dissolved in a suitable solvent, intended for oral administration.

Oral Suspensions Oral Suspensions are suspended liquid preparations made of insoluble solid medicaments dispersed in a liquid medium, intended for oral administration. Oral suspensions include also dried suspensions or concentrated suspensions.

Oral Emulsions Oral Emulsions are emulsified preparations of stable oil-in-water emulsions, made of two immiscible liquids.

Oral solutions, oral suspensions or oral emulsions measured in small quantity with a suitable measuring device or in drops are called oral droppings.

The production and storage of oral solutions, oral suspensions and oral emulsions comply with the following requirements.

1. Purified water is commonly used as the solvent for oral solutions or dispersion medium for oral suspensions.
2. Suitable auxiliary substances such as preservatives, dispersion agents, suspending agents, thickening agents, solubilizing agents, wetting agents, buffering agents, emulsifiers, stabilizing agents, flavouring agents and pigments, etc. may be added. The varieties and amount of the selected auxiliary substances comply with related requirements of the National Standards and should not interfere with the stability and testing of the preparations.
3. They should not be contaminated by mould, nor should they become rancid or discoloured, nor should they generate foreign material, gases or other deterioration phenomena.
4. Oral emulsions should be uniformly opal coloured. When they are centrifuged for 15 minutes by 4000 revolutions per minute (about $1800 \times g$), no phase is separated.
5. The particles of oral suspensions should be dispersible uniformly and redispersed easily on shaking when a sediment is produced on standing, and the ratio of sedimental volume should be determined.
6. The package of oral droppings should usually include a dropper with aspirating bulb or other measuring device.
7. Single-dose oral suspensions or oral emulsions comply with the requirements for the Test for Content Uniformity.
8. Unless otherwise stated, they should be preserved in tightly closed containers and protected from light.
9. "Shaking before use" should be designated on the label of oral suspensions. The number of drops per milliliter or per gram should be designated on the label of oral droppings. Unless otherwise specified, oral solutions, oral suspensions and oral emulsions comply with the following requirements.

Weight variation Unless otherwise specified, single-dose dry suspensions comply with the following requirements.

Procedure Weigh individually the content of 20 test samples and calculate the average content weight. Not more than 2 of the individual weight deviate from the average weight by more than $\pm 10\%$ and none more than $\pm 20\%$.

for weight variation may not be required.

Filling Unless otherwise specified, single-dose oral solutions, oral suspensions and oral emulsions comply with the following requirements.

Procedure Take 10 test samples and remove the content as completely as possible and weigh the content weight individually. No content weight should be less than the labelled weight.

Multi-dose oral solutions, oral suspensions, oral emulsions and oral droppings comply with the test of Minimum Fill (Appendix X F).

Loss on drying Unless otherwise specified, carry out the method for loss on drying (Appendix VIII L). The weight loss should not be more than 2.0 percent.

Ratio of sedimental volume The ratio of sedimental volume of oral suspension should be not less than 0.90.

Procedure Unless otherwise specified, shake vigorously 50 ml of the test sample in a stoppered cylinder for 1 minute, and record highness H_0 in the beginning. Allow to stand for 3 hours, record the final highness H . Calculate the ratio of sedimental volume according to the following equation:

$$\text{Ratio of sedimental volume} = H/H_0$$

For oral dried suspensions a certain proportion of water is added according to the monograph concerned, they should be dispersed uniformly on shaking. The ratio of sedimental volume is determined and comply with the above requirements.

Microbial limit They comply with Microbial Limit Tests (Appendix XI J).

I P Powders

Powders are preparations in the form of dry powder made of pulverized and uniform mixtures of medicaments and suitable excipients. They may be classified into oral powders and powders for topical use.

Oral Powders Oral Powders are powders for oral administration and administered directly with water or after dissolving or dispersing in water or other liquid.

Powders for Topical Use Powders for Topical Use may be applied to the skin, mouth, throat, cavities, etc. The powders which are used particularly for therapeutic, prophylactic or lubricating purposes may be called as dusting-powders or dusting preparations.

The production and storage of powders should comply with the following requirements.

1. The ingredients for preparing powders should be finely powdered. Unless otherwise stated, oral powders should be fine powder, powders for topical use should be very fine powder.
2. Powders should be dry, loose, mixed well and uniform in appearance and colour. If they contain poisonous, potent drug, or drug in small dosage, they should be prepared or compoundedly mixed well and sifted.
3. Powders are prepared with or without auxiliary substances. Flavouring, colouring agents or aromatics may be added if necessary.
4. Powders are packaged as single-dose or multi-dose preparations, and for latter a dose dividing tool should be

5. Unless otherwise stated, powders should be preserved in well-closed containers. Powders containing volatile or hygroscopic drugs should be preserved in tightly closed containers.

Unless otherwise specified, powders comply with the following requirements.

Particle size Unless otherwise stated, powders for topical use comply with the following requirements of fineness.

Procedure Weigh accurately about 10 g of the powder and place on a No. 7 sieve, cover the lid on top of the sieve, fit tightly an appropriate receiver. Carry out the test for fineness and its distribution [Appendix IX E, method 2, single screening]. Weigh accurately the fractions passed through the sieve, and not less than 95 percent of the powder should be weighed.

Uniformity of appearance

Procedure Spread evenly a sufficient quantity of powders in an area of about 5 cm² on a piece of smooth paper, press the surface even, observe the powder under a bright light. It should be uniform in colouration with no discolourations and colour stains.

Loss on drying Unless otherwise specified, carry out the test for loss on drying (Appendix VIII L).

Loss on drying to constant weight at 105°C should be not more than 2.0%.

Weight variation The weight variation of powders packaged in single-dose should comply with the requirement of the following table.

Average weight or labelled weight	Weight variation limit
0.1 g or less	±15%
More than 0.1 g to 0.5 g	±10%
More than 0.5 g to 1.5 g	±8%
More than 1.5 g to 6.0 g	±7%
More than 6.0 g	±5%

Procedure Weigh accurately the content of each 10 packs (bottles) of powders and calculate the average content weight. Compare the content weight with the average weight (compare the weight of each with the labelled weight for powders that assay is not required). Not more than 2 packs deviate outside of the weight variation limit, and none of individual weight deviates by more than twice the limit.

Where the Test for Content Uniformity is specified, the test for weight variation may not be required.

Filling Multi-dose packaged powders comply with the test of Minimum Fill (Appendix X F).

Sterility Powders used for burns or skin injuries comply with Test for Sterility (Appendix XI H).

Microbial limit Unless otherwise specified, comply with the requirements of Microbial Limit Tests (Appendix XI J).

I Q Ear Preparations

Ear preparations are preparations intended for direct application to the auditory meatus to display topical therapeutic effect.

Ear preparations may be classified into liquid ear preparations (ear drops, ear washes, ear sprays), semi-solid ear

solid ear preparations (ear powders, ear pilules, ear tampons), etc. They can also be packed in a solid form with a solvent, from which solutions or suspensions are prepared before use.

Ear Drops Ear Drops are clear solutions, suspensions or emulsions made of medicaments, suitable excipients and suitable solvents or dispersion media such as water or glycerol, etc., intended for instillation in external auditory meatus. They can also be in the form of powders, granules, masses or tablets with a separate solvent, from which clear solutions or suspensions are prepared before administration.

Ear Washes Ear Washes are liquid ear preparations in the form of clear aqueous solutions made of medicaments and suitable excipients, intended for cleaning the external auditory meatus. They are usually aqueous solutions of physiological pH value; when used for injuries and surgical procedures, they should be sterilized.

Ear Sprays Ear Sprays are liquid ear preparations in the form of clear solutions, suspensions or emulsions made of medicaments and suitable excipients and are intended for administration to the auditory meatus through nebulization by atomizing devices.

Ear Ointments Ear Ointments are semi-solid ear preparations in the pasty form of solution or suspension made of uniform mixtures of medicaments and suitable excipients.

Ear Creams Ear Creams are semi-solid ear preparations in the form of cream made of uniform mixtures of medicaments and suitable excipients.

Ear Gels Ear Gels are semi-solid ear preparations in the form of gel made of medicaments and suitable excipients.

Ear Tampons Ear Tampons are solid ear preparations made of medicaments and suitable excipients, intended to be inserted into the external auditory meatus.

Ear Powders Ear Powders are solid ear preparations in the form of powder made of medicaments and suitable excipients, intended to be put or insufflated into the external auditory meatus.

Ear Pilules Ear Pilules are solid ear preparations in the form of sphere or almost sphere shape made of medicaments and suitable excipients, intended to be applied in the external or medium auditory meatus.

The production and storage of ear preparations should comply with the following requirements.

1. Ear preparations may contain a variety of excipients used for adjusting tension, viscosity, or pH value of the preparations, increasing the solubility of active ingredients, stabilizing the preparation and providing adequate antimicrobial properties. These excipients should not adversely affect the intended medicinal action of the preparation, and should not be nocuous nor topically irritant. Solvents (for example, water, glycerol or fatty oil, etc.) should not exert harmful pressure on the eardrum. Unless otherwise stated, multi-dose packaged aqueous ear preparations should contain bacteriostatics of suitable concentration; bacteriostatics may not be added if the preparation itself has sufficient bacteriostatic effect.

2. Unless otherwise stated, for ear preparations packaged in multi-dose, an integral dropper or suitable device should be provided, usually consisting of a screw cap incorporating with a dropper and rubber or plastic teat. The container should be innocuous and properly cleaned, and compatible with the medicaments and excipients. The wall of containers should be uniform and of definite thickness. The containers should not contain more than 10 ml or 5 g of the preparation.

3. Ear solutions should be clear and without sediments of foreign materials. Ear suspensions may show a sediment which is readily dispersed on shaking. Ear emulsions may show evidence of separation but are easily reformed on shaking.

4. Unless otherwise stated, ear preparations comply with the general requirements for preparations of the dosage forms concerned. For example, eye ointments should comply with the requirements of ointments.

5. Ear preparations comply with the requirements of the Test for Content Uniformity, etc.

6. Unless otherwise stated, ear preparations should be preserved in well closed containers.

7. Ear preparations must not be used for exceeding 4 weeks after opening.

Unless otherwise specified, ear preparations comply with the following requirements.

Ratio of sedimental volume The ratio of sedimental volume of suspended ear drops should be not less than 0.90.

Procedure Unless otherwise stated, shake vigorously 50 ml of the test sample in a stoppered cylinder for 1 minute, and record highness H_0 in the beginning. Allow to stand for 3 hours, record the final highness H . Calculate the ratio of sedimental volume according to the following equation:

$$\text{Ratio of sedimental volume} = H/H_0$$

Weight variation Unless otherwise specified, solid ear preparations comply with the following requirements.

Procedure Weigh individually 20 test samples (or their contents) and determine the average weight. Not more than 2 of the individual weight deviate from the average weight by more than $\pm 10\%$ and none more than $\pm 20\%$.

Where the Test for Content Uniformity is specified, the test for weight variation may not be required.

Filling Semi-solid and liquid ear preparations comply with the test of Minimum Fill (Appendix X F).

Sterility Ear drops and ear washes for surgical procedures, injured ear and perforated ear-drum comply with Test for Sterility (Appendix XI H).

Microbial limit Unless otherwise stated, they comply with the requirements of Microbial Limit Tests (Appendix XI J).

I R Nasal Preparations

Nasal preparations are preparations intended for direct administration to the nasal cavities to obtain a systemic or local therapeutic effect.

Nasal preparations may be classified into liquid nasal preparations (nasal drops, nasal washes, nasal sprays), semi-solid nasal preparations (nasal ointments, nasal creams, nasal gels) and solid nasal preparations (nasal powders, nasal powders for spray, nasal sticks), etc. They can also be packed in a solid form with a solvent, from which solutions or suspensions are prepared before use.

Nasal Drops Nasal Drops are liquid nasal preparations in the form of clear solutions, suspensions or emulsions made of medicaments and suitable excipients, intended for administration to the nasal cavities. The medicaments may be packed in the form of powder, granules, masses or tablets with a separate solvent, from which clear solutions or

Nasal Washes Nasal Washes are liquid nasal preparations made of medicaments in isotonic aqueous solutions of physiological pH value, intended for washing nasal cavities. Nasal washes used for nasal injuries or surgical procedures should be sterilized.

Nasal Sprays Nasal Sprays are liquid nasal preparations in the form of clear solutions, suspensions or emulsions made of medicaments and suitable excipients, intended for administration to the nasal cavities through nebulization by atomizing devices.

Nasal Ointments Nasal Ointments are semi-solid nasal preparations in the pasty form of solution or suspension made of medicaments with suitable bases.

Nasal Creams Nasal Creams are semi-solid nasal preparations in the form of cream made of uniform mixtures of medicaments with suitable bases.

Nasal Gels Nasal Gels are semi-solid nasal preparations in the form of gel made of medicaments with suitable bases.

Nasal Powders Nasal Powders are solid nasal preparations in the form of powder made of medicaments and suitable excipients, intended for insufflation into nasal cavities with a suitable tool.

Nasal Powders for Spray Nasal Powders for Spray are solid nasal preparations in the form of powder made of medicaments and suitable excipients, intended for the powders to be sprayed into nasal cavities by a suitable valve system.

Nasal Sticks Nasal Sticks are solid nasal preparations in the form of stick or almost stick shape made of medicaments and suitable excipients, intended for inserting into nasal cavities. The production and storage of nasal preparations comply with the following requirements.

1. Nasal preparations may contain auxiliary substances to adjust the viscosity and pH value, to increase the solubility of the medicaments, to stabilize the preparation, or to maintain the shape of the preparation. Unless otherwise stated, aqueous nasal preparations of multi-dose should contain bacteriostatics of suitable concentration; bacteriostatics may not be required when the preparation itself has sufficient bacteriostatic effect.

2. Nasal preparations packaged in multi-dose should be provided with an integral dropper or with a screw cap incorporating with a dropper and rubber or plastic teat. The containers should be innocuous and cleanly washed, and compatible with the medicaments and excipients. The wall of the containers should be of a definite and uniform thickness. Unless otherwise stated, the containers hold not more than 10 ml or 5 g of the preparation.

3. Nasal solutions should be clear without sediments or foreign material. Nasal preparations in the form of suspension may show a sediment which is readily dispersed on shaking. Nasal preparations in the form of emulsion may show evidence of separation but are easily reformed on shaking.

4. The particle size of the medicaments and excipients of nasal powders for spray should be mostly in the range of 30-150 μm .

5. Nasal preparations should be nonirritating and do not adversely affect the function of the nasal mucosa and its cilia. Aqueous nasal preparations should be isotonic.

6. Unless otherwise stated, nasal preparations comply with the general requirements for preparations of the dosage forms concerned. For example, nasal ointments should comply

7. Nasal preparations comply with the requirements of the Test for Content Uniformity.

8. Unless otherwise stated, nasal preparations should be preserved in well-closed containers.

9. Nasal preparations packaged in multi-dose must not be used for exceeding 4 weeks after opening.

Unless otherwise specified, nasal preparations comply with the following requirements

Ratio of sedimental volume Unless otherwise specified, the ratio of sedimental volume of suspended nasal drops should be not less than 0.90.

Procedure Unless otherwise stated, shake vigorously 50 ml of the test sample in a stoppered cylinder for 1 minute, and record highness H_0 in the beginning. Allow to stand for 3 hours, record the final highness H . Calculate the ratio of sedimental volume according to the following equation:

$$\text{Ratio of sedimental volume} = H/H_0$$

Weight variation Unless otherwise specified, solid nasal pre-parations comply with the following requirements.

Procedure Weigh individually 20 test samples (or their contents) and determine the average weight. Not more than 2 of the individual weight deviate from the average weight by more than $\pm 10\%$ and none more than $\pm 20\%$.

Where the Test for Content Uniformity is specified, the test for weight variation may not be required.

Filling Semi-solid and liquid nasal preparations comply with the test of Minimum Fill (Appendix X F).

Sterility Nasal preparations for surgical procedures or injuries comply with Test for Sterility (Appendix XI H).

Microbial limit Unless otherwise specified, they comply with the requirements of Microbial Limit Tests (Appendix XI J).

I S Lotions, Irrigants, Enemas

Lotions Lotions are liquid preparations in the form of solutions, suspensions or emulsions containing medicaments, intended for bathing or smearing the unbroken skin.

Irrigants Irrigants are sterile solution intended for irrigating open injuries or cavities.

Enemas Enemas are liquid preparations of aqueous or oily solutions or suspensions, intended to be perfused into rectum for therapy, diagnosis or nutrition. The production and storage of lotions, irrigants and enemas comply with the following requirements.

1. They should be innocuous and without local irritation. Irrigants should be sterile.

2. During storage, lotions in the form of emulsion may show evidence of separation but are easily reformed on shaking. Lotions in the form of suspension may show a sediment which is readily dispersed on shaking to give a suspension which remains sufficiently stable to enable the correct dose to be delivered. Lotions which deteriorate easily should be prepared before use.

3. Irrigants may be made of medicaments, electrolytes or isotonic modifiers dissolving in water for injection; lotions may also be water for injection, of which "for irrigation"

Irrigants are usually isotonic to blood. Irrigants should be clear when examined visually under suitable conditions. The containers of irrigants comply with the requirements of those of injections.

4. Irrigants should not be used as injection. "For use only once" should be designated on the label of irrigants and the remainder should be discarded. Enemas of large volume should be warmed to body temperature before use.

5. Unless otherwise stated, lotions are preserved in well-closed containers, irrigants in very tightly closed containers, enemas in tightly closed containers. Lotions, irrigants and enemas comply with the following requirements.

Filling Unless otherwise specified, lotions, irrigants and enemas comply with the test of Minimum Fill (Appendix X F).

Sterility Irrigants comply with Test for Sterility (Appendix XI H).

Microbial limit Lotions and enemas comply with the requirements of Microbial Limit Tests (Appendix XI J).

Bacterial endotoxin or Pyrogens

Unless otherwise specified, irrigants comply with the requirements of the Test for Bacterial Endotoxin (Appendix XI E) or Test for Pyrogens (Appendix XI D). The bacterial endotoxin per milliliter should be less than 0.5 EU endotoxin.

Irrigants which can not be examined by the test for bacterial endotoxin should comply with the requirements for the test of pyrogens. Unless otherwise specified, the dose is 10 ml per kilogram body weight of rabbit.

I T Liniments, Paints, Pigments

Liniments Liniments are liquid preparations in the form of solutions, suspensions or emulsions, intend for external use to rub on unbroken skin.

Paints Paints are liquid preparations in the form of aqueous or oily solutions, suspensions or emulsions, intended to be smeared on the skin or mucous membrane of mouth or throat with the aid of gauze or cotton impregnated with the liquid.

Pigments Pigments are liquid preparations made of medicaments dissolved or dispersed in a solvent containing film-forming material, intended for external use on affected area to form a film.

The production and storage of liniments, paints and pigments comply with the following requirements.

1. They should be innocuous and without local irritation.

2. During storage, liniments or paints in the form of emulsion may show evidence of separation but are easily reformed on shaking. Liniments or paints in the form of suspension may show a sediment which is readily dispersed on shaking to give a suspension which remains sufficiently stable to enable the correct dose to be delivered. Liniments or paints which deteriorate easily should be prepared before use.

3. Generally used solvents for liniments include water, ethanol, liquid paraffin, glycerol or vegetable oil, etc. Paints are basically glycerol solutions of disinfectants or anti-inflammatory agents, and ethanol or vegetable oil may also be used as the solvents.

by epiderm. It is necessary to put the liniments on flannel or other soft tissues first, and then apply it gently to the affected area. The flannel or other soft tissues used must be clean. Pigments are intended for smearing on the affected area. After evaporation of the organic solvents, a film is generated to protect the affected area and the medicaments released slowly to exert therapeutic effect. Pigments are usually used for injured dermatosis without exudate, etc. Film-forming material generally used for pigments include polyglycol, polyethylene pyrrolidone, ethylcellulose and polyglycol aldehyde methylacetal, etc.; plasticizers used include glycerol, propylene glycol, dibutyl phthalate, etc.; solvents used include ethanol, etc.

5. They should not be rancid, discolouring, etc. If necessary, preservatives and antioxidants may be added.

6. Unless otherwise specified, they should be preserved in well-closed containers and protected from light.

7. Unless otherwise stated, paints and pigments must not be used for exceeding 4 weeks after opening.

8. "Not for oral use" should be designated on the label.

Unless otherwise stated, liniments, paints and pigments comply with the following requirements.

Filling Unless otherwise stated, liniments, paints and pigments comply with the requirements of Minimum Filling (Appendix X F).

Microbial limit They comply with the requirements of Microbial Limit Tests (Appendix XI J).

I U Gels

Gels are thick liquid or semi-solid preparations in the form of uniform suspension or cream containing medicaments with suitable gelling excipients. Unless otherwise stated, gels are restricted to topical use such as skin or body cavities (nasal cavity, vagina and rectum, etc.). Emulsified gels are also known as emulsion gels. Gels consisted of natural high molecular bases such as tragacanth are also known as mucilages. A gel of small particles of inorganic chemical medicaments (e.g. aluminum hydroxide), which consists of a network of discrete colloidal particles of drug substances, is classified as a two-phase dispersion system, and is also referred to as a magma. Magma may have thixotropic property; a semi-solid is formed on standing which becomes liquid on stirring or shaking.

Gel bases are single-phase dispersion systems and classified into hydrophilic and hydrophobic. Hydrophilic gel bases usually consist of water, glycerin or propylene glycol gelled with cellulose derivative, carbomer and alginates, tragacanth, gelatin, starch, etc. Hydrophobic gel bases consist of liquid paraffin with polyethylene or fatty oil gelled with colloidal silica or aluminum soap or zinc soap, etc.

The production and storage of gels comply with the following requirements.

1. Colloid particles in suspended gels should disperse uniformly. No sedimentation or caking occurs.

2. Gels should be uniform, fine and smooth, and kept in gel structure without drying up or being liquified at room temperature.

3. Wetting agents, preservatives, antioxidants, emulsifiers, thickening agents and percutaneous accelerators may be

4. Gel bases should not interact physically or chemically with the medicaments.

5. Unless otherwise stated, gels should be preserved in tightly close containers, protected from light, at a temperature below 25°C, and not allowed to freeze.

6. The label of gels states that they should be shaken well before use.

Unless otherwise specified, gels comply with the following requirements.

Particle size Unless otherwise specified, take suitable amount of suspended gels and spread a quantity of the content to three slides separately to form a thin layer with an area approximately corresponding to that of the cover-glass. Carry out the test for determination of particle size and its distribution (Appendix IX E, method 1), no particle greater than 180 μm in dimension is allowed.

Filling They comply with the test of Minimum Filling (Appendix X F).

Sterility Gels intended for use for severe injuries comply with Test for Sterility (Appendix XI H).

Microbial limit They comply with the requirements of Microbial Limit Tests (Appendix XI J).

I V Patches

Patches are a class of laminar pharmaceutical preparations applied to skin to produce systemic or topical effect. Patches normally consist of an outer covering, a drug reservoir, which may have a rate controlling membrane or not, a contact adhesive and a protective liner being removed before applying the patch to the skin. Patches are intended to be applied to the surface of the unbroken skin, include the surface of the ill skin and the broken skin. Transdermal patches are intended to be applied to the surface of the unbroken skin in order to deliver the active substance(s) to the systemic circulation after passing through the skin barrier.

There are several diffusion patterns for the Transdermal patches. The active substance(s) may delivered to the skin and the systemic circulation directly through a reservoir. Perhaps the active substance(s) may delivered to the skin and the systemic circulation through the rate controlling membrane and the adhesive liner. The activity duration of the active ingredient(s) is determined by its (their) quantity in the patch and the release rate from the patch.

The outer covering of transdermal patches is impermeable to the active substance(s) and normally impermeable to water. The reservoir of transdermal patches can be the matrix style or the controlling membrane style.

The protective liner works on preventing the adhesion and protecting the preparation, generally consists of preventing adhesion paper, a sheet of plastic or metal material. When removed, the protective liner does not detach the preparation reservoir or the adhesive liner from the patch.

When applied to the dried, clean and unbroken skin, the patches adheres firmly to the skin by gentle pressure of the hand or the fingers and can be peeled off without causing appreciable injury to the skin or detachment of the preparation from the outer covering. The patch must not be irritant or sensitizing to the skin, even after repeated applications.

The manufacturing and storage of patches should comply

1. The materials and excipients of patches should comply with the relevant requirements of national standards, innocuous, non-irritating, stable and compatible with active ingredient(s). The commonly used materials include aluminum foil-ethylene composite membrane, adhesion-preventive paper, ethylene-vinyl acetate copolymer, acrylic acid or polyisobutylene pressure-sensitive adhesive, silicone rubber and polyethylene glycol, etc.
2. Substances such as surfactant, emulsifier, humectant, preservative or antioxidant may be added to patches if necessary. Transdermal absorption promoter may be added to transdermal patches.
3. The appearance of the patches should be intact and clean, the applying area should be uniform, and the cut border should be smooth, without sharp edges.
4. Active ingredient(s) may be dissolved in solvent and filled into the reservoir. No air bubble is allowed to contain in the reservoir which is sealed without leakage. The active ingredient(s) suspended in the preparation should be homogenous, stable and spreaded evenly.
5. Pressure-sensitive adhesive should be spreaded evenly. Organic solvent residual should be monitored (Appendix VIII

P) when Organic solvent is used in the processing.

6. It should be stated on the label that the patches should not be applied to individuals with a history of allergy to solvent such as ethanol etc.
7. The content uniformity, the drug release, the adhesive force of the patches should comply with the requirements.
8. Unless otherwise specified, patches should be preserved in well closed containers.
9. The quantity of active substance(s) per patch, the total activity duration and the effective area of the releasing surface should be stated on the label of patches. Unless otherwise specified, the following corresponding tests should be conducted for the patches.

Content Uniformity Transdermal patches should comply with the Test for Content Uniformity (Appendix X E).

Drug Release Test Transdermal patches should comply with the Drug Release Test (Appendix X D, method 3).

Microbial limit Unless otherwise specified, comply with the requirements of Microbial Limit Tests (Appendix XI J).

Appendix III General Identification Tests

Acetates

(1) Heat a quantity of the substance being examined with sulfuric acid and ethanol; the characteristic odour of ethyl acetate is liberated.

(2) To a neutral solution of the substance being examined add 1 drop of ferric chloride TS; a deep red colour is produced which disappears on addition of dilute mineral acid.

Aluminium Salts

(1) Add sodium hydroxide TS to a solution of the substance being examined; a gelatinous white precipitate appears which is soluble in an excess of sodium hydroxide TS.

(2) Add ammonia TS to a solution of the substance being examined until a gelatinous white precipitate is formed. Add a few drops of sodium alizarinsulfonate IS; the precipitate becomes cherry red in colour.

Ammonium Salts

(1) Heat a quantity of the substance being examined with an excess of sodium hydroxide TS; the characteristic odour of ammonia is perceived, the vapour turns moistened red litmus paper to blue and blackens a strip of filter paper moistened with mercurous nitrate TS.

(2) To a solution of the substance being examined add 1 drop of alkaline mercuric potassium iodide TS; a reddish brown precipitate is produced.

Antimony Salts

(1) Acidify a solution of the substance being examined with acetic acid, heat on a water bath and to the hot solution add a few drops of sodium thiosulfate TS; an orange red precipitate is produced gradually.

(2) Acidify a solution of the substance being examined with hydrochloric acid, pass hydrogen sulfide gas into the solution; an orange precipitate, soluble in ammonium sulfide TS or sodium sulfide TS, is produced.

Barium Salts

(1) Moisten the substance being examined with hydrochloric acid on a platinum wire, it imparts a yellowish green colour to a nonluminous flame, or a blue colour when viewed through a green glass plate.

(2) Add dilute sulfuric acid to a solution of the substance being examined; a white precipitate is produced which is insoluble in hydrochloric acid or nitric acid.

Benzoates

(1) Add ferric chloride TS to a neutral solution of the substance being examined; a dull yellow precipitate is formed which turns to white on addition of dilute hydrochloric acid.

(2) Introduce a quantity of the substance being examined into a dry test tube, add sulfuric acid and heat gently; no charring occurs, a white sublimate of benzoic acid is deposited on the inner wall of the test tube.

Bismuth Salts

(1) Add potassium iodide TS to a solution of the substance being examined; a reddish brown colour or dark brown precipitate is produced, the precipitate is soluble in an excess of the reagent, forming a yellowish brown solution. Dilute the solution with water; an orange precipitate is produced.

(2) Acidify a solution of the substance being examined with dilute sulfuric acid, add a quantity of 10% thiourea solution, an intense yellow colour is produced.

Borates

(1) A solution of the substance being examined, acidified with hydrochloric acid, turns turmeric paper to brownish red, the colour deepens on drying and becomes greenish black when moistened with ammonia TS.

(2) Mix a quantity of the substance being examined with sulfuric acid and add methanol, when the mixture is ignited, it burns with a green-bordered flame.

Bromides

(1) Add silver nitrate TS to a solution of the substance being examined; a curdy, pale yellow precipitate is formed which is slightly soluble in ammonia TS and practically insoluble in nitric acid.

(2) Add chlorine TS dropwise to a solution of the substance being examined; bromine is liberated, add chloroform and shake, a yellow or reddish brown colour is developed in the chloroform layer.

Calcium Salts

(1) Moisten the substance being examined with hydrochloric acid on a platinum wire, it imparts a brick red colour to a nonluminous flame.

(2) Add 2 drops of methyl red IS to a solution of the substance being examined (1→20), neutralize with ammonia TS and then acidify with hydrochloric acid. Add ammonium oxalate TS; a white precipitate is produced which is soluble in hydrochloric acid but insoluble in acetic acid.

Carbonates and Bicarbonates

(1) Add dilute acid to a solution of the substance being examined, it effervesces with the evolution of carbon dioxide, producing a white precipitate when passed into calcium hydroxide TS.

(2) Add magnesium sulfate TS to a solution of the substance being examined; a white precipitate is produced immediately (carbonates) or on boiling (bicarbonates).

(3) A solution of the substance being examined is colourless or only slightly coloured on the addition of phenolphthalein IS (bicarbonates); or an intense red colour is produced (carbonates).

Chlorides

(1) Acidify a solution of the substance being examined with nitric acid and add silver nitrate TS; a curdy, white precipitate is formed which is soluble in ammonia TS and reprecipitated on addition of nitric acid. Organic bases should be removed by the addition of ammonia TS and filtration prior to the test.

(2) Mix a small quantity of the substance being examined with an equal part of manganese dioxide, moisten with sulfuric acid and heat gently; chlorine is evolved which turns a strip of moistened starch-potassium iodide paper to blue.

Citrates

(1) To 2 ml of a solution of the substance being examined equivalent to about 10 mg of citric acid, add a few drops of dilute sulfuric acid and heat to boiling, then add a few drops

of potassium permanganate TS and shake; the violet colour disappears. Divide the solution into two portions, to one portion add a drop of mercuric sulfate TS, to the other portion add a few drops of bromine TS; a white precipitate is produced in both solutions.

(2) To about 5 mg of the substance being examined add about 5 ml of pyridine-acetic anhydride (3 : 1), shake, a yellow to red or violet-red colour is produced.

Copper Salts

(1) Add a few drops of ammonia TS to a solution of the substance being examined; a light blue precipitate is produced which is soluble in an excess of the reagent, forming a dark blue solution.

(2) Add potassium ferrocyanide TS to a solution of the substance being examined; a reddish brown colour or precipitate is produced.

Ferric Salts

(1) Add potassium ferrocyanide TS to a solution of the substance being examined; a dark blue precipitate is formed which is insoluble in dilute hydrochloric acid, it decomposes to form a brown precipitate on addition of sodium hydroxide TS.

(2) Add ammonium thiocyanate TS to a solution of the substance being examined; a red colour is produced.

Ferrous Salts

(1) Add potassium ferricyanide TS to a solution of the substance being examined; a dark blue precipitate is formed which is insoluble in dilute hydrochloric acid, it decomposes to form a brown precipitate on addition of sodium hydroxide TS.

(2) To a solution of the substance being examined add a few drops of a 1% solution of *o*-phenanthroline in ethanol; a deep red colour is produced.

Iodides

(1) Add silver nitrate TS to a solution of the substance being examined; a curdy, yellow precipitate is produced which is insoluble in nitric acid or ammonia TS.

(2) Add chlorine TS dropwise to a solution of the substance being examined; iodine is liberated, add chloroform and shake, a violet colour is produced in the chloroform layer; if starch IS is added instead of chloroform, a blue colour is produced.

Lactates

To 5 ml of a solution of the substance being examined equivalent to about 5 mg of lactic acid in a test tube, add 1 ml of bromine TS and 0.5 ml of dilute sulfuric acid. Heat on a water bath with stirring until the colour is discharged, add 4 g of ammonium sulfate and mix well, add dropwise along the inner wall of the tube 0.2 ml of a 10% solution of sodium nitroprusside in dilute sulfuric acid and 1 ml of concentrated ammonia TS, allow to stand for 30 minutes without mixing; a dark green ring is developed at the interface of the two layers.

Lithium Salts

(1) Alkalize the solution of the substance being examined with sodium hydroxide TS, add sodium carbonate TS, a white precipitate is produced on boiling which is soluble in ammonium chloride TS.

(2) Moisten the substance being examined with hydrochloric acid on a platinum wire, it imparts a crimson colour to a nonluminous flame.

(3) To a quantity of the substance being examined add dilute sulfuric acid or soluble sulfates solution, no precipitate is produced (distinction from strontium).

Magnesium Salts

(1) Add ammonia TS to a solution of the substance being

on addition of ammonium chloride TS. Add 1 drop of disodium hydrogen phosphate TS and shake; a white precipitate insoluble in ammonia TS is produced.

(2) Add sodium hydroxide TS to a solution of the substance being examined; a white precipitate is produced, filter, the precipitate is insoluble in an excess of sodium hydroxide TS but is coloured reddish brown on addition of iodine TS.

Malonylureas

(1) Dissolve about 0.1 g of the substance being examined in 1 ml of sodium carbonate TS and 10 ml of water, shake for 2 minutes and filter. To the filtrate add a few drops of silver nitrate TS; a white precipitate is produced which redissolves on shaking, but it is insoluble in an excess of the reagent.

(2) Dissolve about 50 mg of the substance being examined in 5 ml of pyridine solution (1 → 10), add 1 ml of copper pyridine TS; a violet colour or precipitate is produced.

Mercuric Salts

(1) Add sodium hydroxide TS to a solution of the substance being examined; a yellow precipitate is produced.

(2) Add potassium iodide TS to a neutral solution of the substance being examined; a scarlet precipitate is produced which is soluble in an excess of the reagent. To the solution add sodium hydroxide TS and an ammonium salt; a reddish brown precipitate is produced.

(3) When applied to bright copper foil, solutions of mercury salts, free from an excess of Aitric acid, yield a deposit that upon rubbing, becomes bright and silvery in appearance.

Mercurous Salts

(1) To a quantity of the substance being examined add ammonia TS or sodium hydroxide TS; a black colour is developed.

(2) To a quantity of the substance being examined add potassium iodide TS and shake; a yellowish green precipitate is produced, changing to greyish green rapidly and then to greyish black gradually.

Nitrates

(1) Mix cautiously a solution of the substance being examined with an equal volume of sulfuric acid and allow to cool, add ferrous sulfate TS along the inner wall of the test tube; a brown ring is developed at the interface of the two layers.

(2) To a solution of the substance being examined add cautiously sulfuric acid and metallic copper; a reddish brown fume is evolved on heating.

(3) Add dropwise potassium permanganate TS to a solution of the substance being examined; the violet colour does not disappear (distinction from nitrites).

Organic Fluorinated Compounds

Weigh about 7 mg of the substance being examined, carry out the method for oxygen flask combustion (Appendix VII C), using 20 ml of water and 6.5 ml of 0.01 mol/L sodium hydroxide solution as the absorbing liquid. To 2 ml of the resulting solution add 0.5 ml of alizarin fluorine blue TS and 0.2 ml of a solution containing 12% of sodium acetate in dilute acetic acid, dilute with water to 4 ml and add 0.5 ml of cerous nitrate TS; a bluish violet colour is produced. Perform a blank determination in the same manner.

Phosphates

(1) Add silver nitrate TS to a neutral solution of the substance being examined; a light yellow precipitate is formed which is freely soluble in ammonia TS or dilute nitric acid.

(2) Add magnesium ammonium chloride TS to a solution of the substance being examined; a white crystalline precipitate is produced.

(3) To a solution of the substance being examined add

precipitate soluble in ammonia TS is produced on heating.

Potassium Salts

(1) Moisten the substance being examined with hydrochloric acid on a platinum wire, it imparts a violet colour to a nonluminous flame. If sodium is also present, the yellow colour can be screened out by viewing through a blue glass plate.

(2) Ignite the substance being examined to remove any ammonium salt contaminated, cool, dissolve it in water, add acetic acid and a 0.1% solution of sodium tetraphenylborate; a white precipitate is produced.

Primary Aromatic Amines

To about 50 mg of the substance being examined add 1 ml of dilute hydrochloric acid and boil gently to effect dissolution if necessary, cool, add a few drops of 0.1 mol/L sodium nitrite solution and alkaline β -naphthol TS; a precipitate coloured from orange yellow to scarlet is formed depending on the identity of the substance being examined.

Salicylates

(1) To a dilute solution of the substance being examined add 1 drop of ferric chloride TS; a violet colour is produced.

(2) Add dilute hydrochloric acid to a solution of the substance being examined; a white precipitate of salicylic acid is produced which is soluble in ammonium acetate TS.

Silver Salts

(1) Add dilute hydrochloric acid to a solution of the substance being examined; a curdy, white precipitate is produced which is soluble in ammonia TS and reprecipitated on addition of nitric acid.

(2) Add potassium chromate TS to a neutral solution of the substance being examined; a brick red precipitate is produced which is soluble in nitric acid.

Sodium Salts

(1) Moisten the substance being examined with hydrochloric acid on a platinum wire; it imparts an intense yellow colour to a nonluminous flame.

(2) Add zinc uranylacetate TS to a neutral solution of the substance being examined; a yellow precipitate is produced.

Stannous Salts

One drop of an aqueous solution of the substance being examined turns ammonium molybdophosphate test paper to blue.

Sulfates

(1) Add barium chloride TS to a solution of the substance being examined; a white precipitate is formed which is insoluble in hydrochloric acid or nitric acid.

(2) Add lead acetate TS to a solution of the substance being examined; a white precipitate is formed which is soluble in ammonium acetate TS or sodium hydroxide TS.

(3) Add hydrochloric acid to a solution of the substance being examined; no white precipitate is produced (distinction from thiosulphates).

Sulfites and Bisulfites

(1) Add hydrochloric acid to the substance being examined; the pungent odour of sulfur dioxide is perceived, the vapour blackens a strip of filter paper moistened with mercurous nitrate TS.

(2) Add iodine TS dropwise to a solution of the substance being examined; the colour of iodine is discharged.

Tartrates

(1) To a neutral solution of the substance being examined in a clean test tube, add a few drops of ammoniacal silver nitrate TS and heat in a water bath; silver is deposited on the inner wall of the test tube as a mirror.

(2) Acidify a solution of the substance being examined with acetic acid, add 1 drop of ferrous sulfate TS and 1 drop of hydrogen peroxide TS, make the solution alkaline with sodium hydroxide TS when the colour is discharged; a violet colour is produced.

Tropane Alkaloids

To about 10 mg of the substance being examined add 5 drops of fuming nitric acid, evaporate to dryness on a water bath, a yellow residue is obtained. Cool, moisten the residue with 2-3 drops of ethanol, add a small pellet of potassium hydroxide; an intense violet colour is produced.

Zinc Salts

(1) Add potassium ferrocyanide TS to a solution of the substance being examined; a white precipitate is formed which is insoluble in dilute hydrochloric acid.

(2) Acidify a solution of the substance being examined with dilute sulfuric acid, add 1 drop of 0.1% copper sulfate solution and a few drops of mercuric ammonium thiocyanate TS; a violet precipitate is produced.

Appendix IV Spectrophotometry

Spectrophotometry is a method used in qualitative and quantitative analysis in which the light absorption or the intensity of light emission of the substance being examined is measured at a definite wavelength or within a definite range of wavelength.

The spectral ranges involved in pharmaceutical analysis mainly consist of 3 regions: (1) the ultraviolet region (200-400 nm), (2) the visible region (400-760 nm) and (3) the infrared region (2.5-25 μm or 4000-400 cm^{-1}). The instruments used are the ultraviolet-visible spectrophotometer, visible spectrophotometer (or colourimeter), infrared spectrophotometer or atomic absorption spectrophotometer. All instruments should be calibrated regularly to insure the precision and the accuracy.

When monochromatic radiation passes through an absorbing medium, the absorbance of the radiation is proportional to the concentration of the absorbing substance and the thickness of the absorbing medium, this relation is expressed by the following equation:

$$A = \lg 1/T = ECL$$

Where A is the absorbance, T is the transmittance, E is the absorption coefficient, C is the concentration of the substance expressed in g per 100 ml, calculated on the dried or dehydrated basis and L is the absorption path length expressed in cm. The term $E_1^{1\%}$ is used in this pharmacopoeia to denote the absorbance of a 1% solution in a 1 cm cell.

The wavelength of the selective absorption and the corresponding absorption coefficient are physical constants of the substance being examined. When the absorption coefficient of a substance is known, its content can be calculated from the above equation. In the visible region, the content of a colourless substance can be determined colourimetrically after the addition of a colour developing agent or any other treatment.

IV A Ultraviolet-Visible Spectrophotometry

Calibration and performance test of the instrument

1. Wavelength The change of environment may affect the mechanical parts of the spectrophotometer and cause a drift of the wavelength scale, therefore it must be calibrated regularly and immediately before the measurement. Mercury lamp is the best choice of light source for this purpose, the following spectral lines of the mercury lamp can be used: 237.83 nm, 253.65 nm, 275.28 nm, 296.73 nm, 313.16 nm, 334.15 nm, 365.02 nm, 404.66 nm, 435.83 nm, 546.07 nm and 576.96 nm. The wavelength scale may also be calibrated by means of the 486.02 nm and 656.10 nm lines of deuterium discharge lamp. Holmium glass filter exhibits sharp absorption peaks at 279.4 nm, 287.5 nm, 333.7 nm, 360.9 nm, 418.5 nm, 460.0 nm, 484.5 nm, 536.2 nm

wavelength. However, the exact values for the position of these peaks may change slightly depending on the commercial source of the filter or along with the time goes by.

2. The absorbance scale. Check the absorbance with a solution of potassium dichromate in sulfuric acid. Dissolve about 60 mg of potassium dichromate primary standard, previously dried to constant weight at 120°C and accurately weighed, in 0.005 mol/L sulfuric acid solution to make 1000 ml. Check the absorbance at wavelength indicated in the following table and calculate the absorption coefficient which should accord with the specified range in the table when compared with the specified absorption coefficient.

Wavelength/nm	235(min)	257(max)	313(min)	350(max)
Specific absorbance $E_1^{1\%}$	124.5	144.0	48.6	106.6
Maximum tolerance	123.0- 126.0	142.8- 146.2	47.0- 50.3	105.5- 108.5

3. Limit of stray light. Stray light may be detected at the given wavelength with suitable solutions indicated in the following table. The transmittance of these solutions measured in a 1 cm quartz cell against water should accord with the limit specified in the table.

Reagent	Concentration/% (g/ml)	Wavelength/ nm	Transmittance/ %
Sodium Iodide	1.00	220	<0.8
Sodium Nitrite	5.00	340	<0.8

Requirements for the solvents

The organic solvents containing heteroatoms usually have strong absorption at the lower wavelength. Thus, their ranges of use should be less than the cut off wavelength. For example, the cut off wavelength of methanol and ethanol is 205 nm. Otherwise, impurity of solvents would enhance the interference of absorption. The solvent used in spectrophotometric determinations should be checked for any interfering absorption peak around the selected wavelength for the measurement of the absorbance being examined. The absorbance of a solvent should not exceed 0.40 in the range of 220 nm to 240 nm, 0.20 in the range of 241 nm to 250 nm, 0.10 in the range of 251 nm to 300 nm and 0.05 at wavelengths above 300 nm, when measured in a 1 cm quartz cell against air.

Procedure

Unless otherwise specified, the same batch of solvent used to prepare the solution of the substance being examined should be employed as the blank in matched 1 cm quartz cells. The wavelength of maximum absorption should be checked by measuring the absorbance of the substance being examined in the vicinity of the specified wavelength, within a range of ± 2 nm, to check the wavelength of the absorption maximum is correct or not. Unless otherwise specified, the absorption maximum must be within ± 2 nm as specified in the monograph, otherwise, the identity, purity of the substance and the correctness of the wavelength of the

spectrophotometer should be considered. The assay should be carried out at the wavelength of maximum absorption. The concentration of the solution should be adjusted to give an absorbance reading of 0.3 to 0.7 where the experimental error is the smallest. The width of the spectral slit must be smaller than the tenth of half-width of the absorption band, otherwise low absorbance will be resulted. The slit width is appropriate if further reduction does not result in an increase of the absorbance reading. The absorbance of an unmatched cell with the solvent concerned as a blank must be subtracted from the absorbance of the substance being examined or be automatically deducted by the spectrophotometer.

When the pH value affects the results determined, the pH of the test preparation should be adjusted equal to that of the reference preparation.

Ultraviolet spectrophotometry used for identification and quality tests is proceeded according to the method described in the items specified under the corresponding monograph.

Ultraviolet spectrophotometry is used for assay usually as the following methods.

(1) *Reference substance comparison method* Prepare separately solutions of the substance being examined and CRS according to the method described under item of the individual monograph. The content of the CRS in the solution should be within $100\% \pm 10\%$ of the labelled amount of the solution prepared with substance being examined and with solvent of the same batch. Determine the absorbances of solutions of test preparation and of reference preparation at specified wavelength, calculate the concentration of the test preparation in the solution according to the following equation:

$$C_x = (A_x/A_R)C_R$$

Where C_x is the concentration of the test preparation; A_x is the absorbance of the test preparation; C_R is the concentration of the reference preparation and A_R is the absorbance of the reference preparation.

(2) *Absorption coefficient method* Prepare the solutions of the substance being examined according to the method described under the individual monograph, determine the absorbance at specified wavelength. Calculate the concentration of the test preparation with the absorption coefficient specified in the monograph concerned. Usually, absorption coefficient should be more than 100. Pay attention to the calibration and check of the instrument being used.

(3) *Chemometric methods* Carry out the assay as described under the specified monograph. Absorbances are measured at wavelengths of the ascending or descending position of the absorption curve, the minor variation of the wavelength may affect the result significantly. It is essential to determine the reference and test preparations under the same condition. Commonly, chemometric method is not suitable for the assay.

(4) *Colourimetry* Colourimetry is used with the addition of suitable developer before determination when the substance being examined has no strong absorption in the ultraviolet-visible region, or though absorption in that region, to avoid the interference or increase the sensitivity. Colourimetric determination should be carried out with a reference substance concomitantly. Unless otherwise specified, an equal volume of solvent, added with the same reagent and treated in the same manner is used as blank. Calculate the concentration of test preparation as "(1) Reference substance comparison method" described under the above method (1).

If the linear relation between absorbance and concentration is

preparations containing gradient amounts of the reference substance should be measured, and a calibration curve should be produced by plotting the absorbance against concentration. The concentration of the test preparation can be determined by interpolating its absorbance on the calibration curve.

IV C Infrared Spectrophotometry

Equipment and Calibration

Fourier-transform infrared spectrophotometers or dispersive infrared spectrophotometers are often used for pharmaceutical analysis. The wave-number scale of an infrared spectrophotometer may be calibrated by use of a polystyrene film of 0.04 mm thickness. The absorption peaks at 3027 cm^{-1} , 2851 cm^{-1} , 1601 cm^{-1} , 1028 cm^{-1} and 907 cm^{-1} are used for the calibration. Tolerance should be not more than $\pm 5\text{ cm}^{-1}$ in the vicinity of 3000 cm^{-1} and not more than $\pm 1\text{ cm}^{-1}$ in the vicinity of 1000 cm^{-1} for the Fourier-transform infrared spectrophotometer.

The resolution factor of the instrument between $3110\text{--}2850\text{ cm}^{-1}$ requires that seven peaks should be clearly isolated, the depth of the trough from the maximum absorption at about 1583 cm^{-1} to the minimum at about 1589 cm^{-1} should be not less than 12% transmittance and that from the maximum at about 2851 cm^{-1} to the minimum at about 2870 cm^{-1} should be not less than 18% transmittance.

Unless otherwise specified, the nominal resolution factor of the instrument should not be less than 2 cm^{-1} .

Preparation and Determination

1. *Identification for drug substances* Unless otherwise specified, for the identification test the substance being examined must be prepared according to the method described in each volume of "Atlas of Infrared Spectra of Drugs", edited by Chinese Pharmacopoeia Commission. Detailed procedures see also the Introduction of the Atlas.

2. *Identification for preparations* The test preparation should be prepared as specified in the individual monograph. If excipients have no interference after treatment, compare directly with the reference spectrum of its drug substance. If excipients have interference to some extent, according to the reference spectrum of its drug substances, choose 3 to 5 specific peaks of absorption, where excipients have no interference for the component being examined, in the fingerprint region, and take these positions as the basis for identification. The tolerance of the wave-number determined should less than 0.5% of specified wave-number.

3. *Polymorphism inspection, limit test of the isomers and assay* The method of sample preparation and determination is performed according to the procedure described in the individual monograph.

Announcements

1. In the monograph where infrared absorption spectrum is concordant with the reference spectrum refers to the spectrum specified in the above "Atlas of Infrared Spectra of Drugs", consisted of Vol. I (1995 edition), Vol. II (2000 edition) and Vol. III (2005 edition). If the spectra for the same compound are described in different volume, the latter one should be taken as the reference.

2. The spectrum of a solid substance may be different from the reference spectrum due to polymorphism. In this case, the substance being examined should be pre-treated according

Atlas or individual monograph. If the crystalline type and suitable pre-treatment method are not specified, the reference substance can be used. The substance being examined and the reference substance are recrystallized synchronously under the same condition and then be determined and compared. If the crystalline type is specified, the reference substance with corresponding crystalline type should be used.

3. Several factors such as difference in instrument performance of various models, inadequate or successive grinding in preparation of the disc, moisture affect or halide carrier, may give rise to unsatisfactory spectrum in shape. It should be kept in mind during the comparison with the reference spectrum.

IV D Atomic Absorption Spectrophotometry

Atomic absorption spectrophotometry is used in the determination of metal elements and some non-metal elements in the atomic state.

The light of characteristic wavelength emitted from a cathodic discharge lamp is absorbed when it passes through the atomic vapor generated from sample containing the element being examined atomized to the ground state. The assay of the element being examined is tested by determining the decreased degree of light intensity of radiation. Atomic absorption obeys the general rule for absorption spectrophotometry. The assay is carried out by comparing the absorbance of the test preparation with that of the reference preparation.

Apparatus

An atomic absorption spectrophotometer consists of a light source, an atomic generator, a monochromator and a detector system. Some are equipped with a background compensation system and automatic sampling system, etc.

1. Light source A hollow-cathode discharge lamp is usually used. The cathode is made of the element being examined.

2. Atomic generator There are four main types: flame atomizer, graphite furnace atomizer, hydride-generated atomizer and cold vapor atomizer.

(1) *Flame atomizer* It mainly consists of a nebulizer and a burner. Its function is to nebulize the test solution into aerosol which is mixed with combustion gas. And the mixture is introduced into the flame generated by the burner. So that the substance being examined is to be dried, evaporated to form the ground state atoms of the element being examined. The burning flame is generated by different mixtures of gases, acetylene-air is mostly used. By modifying the proportion of combustion gas, the temperature of the flame can be controlled, and a better stability and a better sensitivity can be obtained.

(2) *Furnace atomizer* It consists of electric furnace and a power supply. Its function is to dry and incinerate the substance being examined. During the stage of high temperature atomization, the ground state atoms of the element being examined are to be formed. Graphite is commonly used as the heater. Protection gas is introduced into the furnace to avoid oxidation and used to transfer the sample vapor.

(3) *Hydride-generated atomizer* It consists of hydride generator and atomic absorption cell. It is used for the

stannum and antimony etc. Its function is to reduce the element to be examined in acidic medium to the low-boiling and easily pyrolyzed hydride. And then the hydride is swept by a stream of carrier gas into the atomic absorption cell which consists of quartz tube and heater etc., in which the hydride is pyrolyzed by heating to form the ground-state atom.

(4) *Cold vapor atomizer* It consists of a mercury vapor atomizer and an absorption cell. It is suitable for the determination of mercury. Its function is to reduce the mercuric ion into mercury vapor which is swept into the quartz absorption cell by carrier gas.

3. Monochromator Its function is to separate the specified wavelength radiation from the electromagnetic radiations radiated from the light source. The optical path of the apparatus should assure the good spectra resolution and has the ability to work well at the condition of narrow spectral band ($<0.2 \text{ nm}$). The commonly used wavelength region is $190.0-900.0 \text{ nm}$.

4. Detector system It consists of a detector, a signal processor and a recording system. It should have relatively higher sensitivity and better stability, and can follow the rapid change of the signal absorption.

5. Background compensation system System employed for the correction of atmospheric effects on the measuring system. Four principles can be utilized for background compensation: continuous spectrum sources (a deuterium lamp is often used in the UV region), the Zeeman effect, the self-inversion phenomena and the nonresonance spectrum.

In the analysis using atomic absorption spectrophotometry, the interference to the determination caused by background and other reasons should be noticed. Changes of some experimental conditions, such as the wavelength, the slit width, the atomizing condition, etc., may affect the sensitivity, the stability and the interference. If it is flame, the suitable wavelength, slit width and flame temperature, the addition of complexing agents and releasing agents, and the use of Standard addition method may eliminate interference. If it is furnace, the selection of suitable background compensation system and the addition of suitable matrix modifying agents, etc. may remove the interference. Background compensation method should be selected as specified in the individual monograph.

Procedure

Method 1 (Direct calibration method) Prepare not less than 3 reference solutions of the element being examined of different concentrations, covering the range recommended by the instrument manufacturer and add separately the corresponding reagents as that for the test solution and prepare the blank reference solution with the corresponding reagents. Measure the absorbances of the blank reference solution and each reference solution of different concentrations separately, record the readings and prepare a calibration curve with the average value of 3 readings of each concentration on the ordinate and the corresponding concentration on the abscissa.

Prepare a test solution of the substance being examined as specified in the monograph, adjust the concentration to fall within the concentration range of the reference solution. Measure the absorbance 3 times, record the readings and calculate the average value. Interpolate the mean value of the readings on the calibration curve to determine the concentration of the element.

Method 2 (Standard addition method) Place equal volumes of the test preparation prepared as specified in the individual

each of the flasks, except the first one, add an accurately measured amount of the reference preparation containing increasing amounts of the element being determined. Dilute separately with de-ionized water to the volume and proceed as directed in the direct calibration method. Measure the absorbances and record the readings. Plot the mean values of each group of 3 readings against the corresponding concentration of the element contributed by the reference preparation, extrapolate the straight line to intersect with the axis of zero absorbance. The interception represents the concentration of the element contributed by the test preparation (as Fig. 2). Calculate the concentration of the element in the test preparation from the result so obtained. This method can be used only when the standard curve obtained in method 1 is linear and passes the origin.

Fig. 2

When used in the test for impurities, prepare two test preparations of the same concentration as specified in the monograph. To one of the test preparation add an amount of the reference substance equivalent to the limit of the element specified in the monograph. Proceed as directed above and measure this solution to give an appropriate reading a ; then measure the test preparation without the addition of the reference substance under the same condition and record the reading b ; b is not greater than $(a-b)$.

IV E Fluorimetry

When substances are exposed to ultraviolet or visible radiation, some of them may emit fluorescence at a wavelength longer than that of the exciting radiation. The excitation and emission spectra of a substance can be used for qualitative analysis. The intensity of the fluorescence emitted by a substance, when the intensity and wavelength of the exciting radiation, the solvent and the temperature are constant, is directly proportional to the concentration of the substance within a definite range, therefore, this relation can be used for quantitative determinations. The sensitivity of fluorescence spectrophotometry is usually higher than that of UV and visible spectrophotometry. However, if a solution is too concentrated, a self-quenching effect and an absorption of the exciting radiation near the surface may result in a declination of the intensity of emitted radiation, and the intensity of fluorescence emitted is not directly proportional to the concentration. Therefore, fluorescence spectrophotometry should be carried out only in dilute solutions.

Procedure The instrument used is fluorometer or fluorometry spectrophotometer. Select the excitation and emission bands and prepare the reference and the test solutions as specified in the monograph.

selected reference substance to determine the linear relation of fluorescence intensity and concentration. When the linear relation is good, adjust the sensitivity of the instrument with appropriate dilutions of the reference solution before each test; record the fluorescence intensities of the test preparation and reference preparation and their corresponding blanks. The following equation can be used for calculation of the content in the test preparation:

$$C_x = \frac{R_x - R_{xb}}{R_r - R_{rb}} \times C_r$$

Where C_x is the concentration of the test preparation; C_r is the concentration of the reference preparation; R_x is the fluorescence intensity of the test preparation; R_r is the fluorescence intensity of the reference preparation; R_{xb} and R_{rb} are the fluorescence intensity of the corresponding blanks.

The range within which the fluorescence intensity is directly proportional to the concentration of the substance is usually very narrow, therefore, the ratio $(R_x - R_{xb}) / (R_r - R_{rb})$ should not be less than 0.5 or more than 2, otherwise the concentration of the solutions should be adjusted and the measurements made again. If the fluorescence intensity is not strictly proportional to the concentration, the previously drawn calibration curve under the same conditions should be used.

For a substance which decomposes on exposure to light or its relaxation time is too long, in order to avoid the fluorescence intensity affected by multi-irradiation of the exciting radiation, the sensitivity of the instrument maybe checked with a stable reference solution of another fluorescent substance with excitation and emission bands similar to those of the substance being examined in place of reference substance of the substance being examined. For instance, quinine in dilute sulfuric acid is usually used for blue fluorescence, sodium fluorescence for green fluorescence and rhodamine B for red fluorescence.

Announcements The interferences of fluorometry are great due to high sensitivity.

- (1) The purity of solvent may markedly affect the intensity of fluorescence, blank test should be carried out and the solvent distilled in a glass distillator before use if necessary.
- (2) The presence of suspended particles may cause the light to be scattered, therefore, it is necessary to eliminate such particles by centrifugation or filtration with a sintered glass filter.
- (3) All glasswares and cells must be cleaned thoroughly.
- (4) It is also important to regulate the temperature because it would notably affect the fluorescence intensity.
- (5) Oxygen dissolved in the solution has a strong quenching effect, it can be removed by passing a current of inert gas through the solution when necessary.
- (6) The effect on the fluorescence intensity by the pH value of the solution and the purity of the reagents, etc. should be noticed during the determination.

IV F Flame Photometry

When a test solution containing the element of alkali metals and alkaline-earth metals being examined is introduced into a flame as the form of aerosol by an equipment of nebulization, the element being examined is atomized by the heat energy of the flame and excited its characteristic spectrum. The content of the element being examined is determined by measuring the light intensity of the element using

reference solution and the test solution.

Apparatus Flame photometer consists of a combustion system including nebulizer-burner, combustion lamp, combustion gas and supply of assisted combustion gas, a monochromator and a detector.

The combustion gas is often a mixture of air-coal gas or air-liquefied petroleum gas (LPG) using air as assisted-combustion gas and coal gas or LPG as combustion gas.

Any variation of the experimental condition, such as type

and state of flame, the pressure supplied by air-compressor may affect and interfere with the sensitivity and steadiness of the instrument, so they should be selected as specified in the monograph.

Procedure When used for assay and limit test of impurities, flame photometry is carried out respectively as method 1 and 2 described under Atomic Absorption Spectrophotometry (Appendix IV D).

Appendix V Chromatography

Depending on the mechanism of the separation process, chromatographic can be classified into adsorption chromatography, partition chromatography, ion-exchange chromatography, size-exclusion chromatography etc.

Adsorption chromatography is based on the different affinity of individual components to the adsorbent (stationary phase), so that they can be eluted successively with a solvent or gas (mobile phase). The adsorbents commonly used are aluminum oxide, silica gel, polyamide powder etc.

Partition chromatography is based on the distribution of individual components between two phases. The stationary phase is coated on or chemically bonded to a solid support of large surface area. The mobile phase is a liquid or a gas. The supports commonly used are silica gel, kieselguhr, diatomaceous earth, cellulose powder, polymers with suitable functional groups etc.

In ion-exchange chromatography, the stationary phase is either a cation exchange resin or an anion exchange resin. The mobile phase is usually an aqueous buffer solution, sometimes a definite quantity of organic solvent is added to modify the exchange property.

Size exclusion chromatography is also known as gel permeation chromatography or gel filtration chromatography. It is based on the different permeability of components of different molecular size into a support of definite pore size. Molecular sieves, cross-linked polystyrene gels, glucosan gels, silica gel and porous glass beads are commonly used as the stationary phase. Water or organic solvent is used as the mobile phase, depending on the chemical characteristics of the support and the substance being examined.

Chromatography may be classified into paper chromatography, thin layer chromatography, column chromatography, gas chromatography, high performance liquid chromatography and so on based on the method of separation.

Solvents used in chromatography must be of high purity and must not react with the substance being examined. Except gas chromatography, the operation is carried out at room temperature, unless otherwise specified. In column chromatography, paper chromatography and thin layer chromatography, the coloured zones can be detected visually, colourless substances can be detected under ultraviolet radiation of 254 nm or 365 nm. In paper chromatography or thin layer chromatography, colourless substances can also be detected by spraying with a colour-developing agent. Silica gel plates containing a fluorescent substance are sometimes used in thin-layer chromatography, so that colourless substance can be detected by the fluorescence quenching method. In column chromatography, gas chromatography and high performance liquid chromatography, the components can be detected by a suitable detector connected to the outlet of the column. In column chromatography, the components sometimes can be determined quantitatively by a suitable method after fractionation.

V A Paper Chromatography

Paper chromatography is a partition chromatographic technique, in which paper is used as a support and the water or other substance contained in the paper is used as a stationary phase.

The substance being examined is developed by the mobile phase, after which the shift ratio value (R_f) could be used to denote the location of each component. (R_f is the ratio of the distance between the center of the origin and that of the spots to the distance between the center of the origin and the frontal of the mobile phase). In practice, R_f values may vary considerably due to experimental conditions. Therefore, the identification of a compound is usually carried out by comparing the behaviour of the compound to be identified with that of a reference substance under the same conditions. For drug identification, the position and colour (or fluorescence) of the main spots of the substance being examined on the chromatogram should be identical with those of the reference substances. For purity inspection, the number or colour intensity (or fluorescence intensity) of the impurities contained should be examined according to the requirements specified under each monograph, after a certain amount of substance being examined has been developed. For assay, the main chromatographic spot could be cut out from the paper, eluted with a solvent and subjected to a suitable measurement.

1. Apparatus and Materials

(1) *Developing chamber* It is usually a glass chamber, cylindrical or rectangular, which could be tightly closed with a glass lid. When it is used for descending method, a separator could be inserted through the lid with a hole on it for the addition of the mobile phase. A solvent trough supported by a rack is placed inside near the top of the chamber, a glass rod is used for holding the chromatographic paper, on both sides of the trough, there are two glass rods used to guide the paper so that no part of it is in contact with the wall of the trough. When it is used for ascending method, the hole on the lid is blocked by a stopper with a glass hook where the paper is suspended. The hook is capable of being lowered without opening the chamber. Remove the trough and rack.

(2) *Sample applicator* Microsyringe or capillary tubes with a rack are often used, which could ensure a correct and compact position of the applied spot.

(3) *Chromatographic filter paper* Filter paper should be clean and uniform in texture and thickness, and has a tensile strength. It should contain no impurities which may affect developing process or react with visualizing reagent employed, and affect the separation or identification. It may be pretreated before use if necessary. For descending method, cut a piece of filter paper along the grain direction

into strips of sufficient length and a convenient width, and draw a fine pencil line horizontally across the paper at such a distance from one end to make the line a few centimeters below the guide rod. When this end is secured in the solvent trough and the remainder of the paper is hanging freely outside the trough. The lower end of the paper may be cut into saw-toothed form to facilitate the mobile phase to drop down homogeneously, if necessary. For ascending method, the length of the paper is about 25 cm, the width of the paper is varied as required. Sometimes the paper can be rolled into cylindrical form to save space, the spotting line is about 2.5 cm from the lower edge of the paper.

2. Procedure

(1) *Descending method* Dissolve the substance being examined in a suitable solvent or solvent mixture to prepare a solution of specified concentration. Apply the solution in portions to the pencil line, allow it to dry in air or in a stream of warm air before the next application. The spots are commonly 2-4 mm in diameter, and spaced about 1.5-2.0 cm apart from each other in circular shape. Place the spotted end of paper in the solvent trough and hang the paper freely over the guide rod. Put a Petri dish containing the specified solvent or a strip of chromatographic filter paper moistened with the specified solvent into the chromatographic chamber to pre-equilibrate the chamber with the vapour of the specified solvent. Introduce a sufficient quantity of the mobile phase into the solvent trough and allow it to move along the chromatographic paper for the prescribed distance. Remove the chromatographic paper from the chromatographic chamber, mark the position of the solvent frontal and visualize the chromatogram prescribed in the monograph when the solvent is volatilized.

(2) *Ascending method* The solution of substance being examined is applied on the pencil line as directed in the descending method. The chamber is saturated with the vapour of a specified solvent or the developer placed in it. Lower the hook so that the paper is immersed in the developer to a depth of 0.5 cm, allow the mobile phase to ascend for about 15 cm, unless specified otherwise. Remove the paper from the chamber, mark the position of the solvent frontal and visualize the chromatogram as prescribed in the monograph when the solvent is volatilized.

One dimensional chromatography is that the development proceeds along one direction. Sometimes two-dimensional chromatography may be performed by turning the filter paper at right angle and then continue the development with the original developer or a different solvent system. Other chromatographic techniques, such as multiple development, continuous development and wedge shaped strip development etc., may also be used.

V B Thin-layer Chromatography

Thin-layer chromatography is a separation technique in which the test solutions are deposited on the thin-layer plate. The chromatogram obtained after development and visualization can be compared with that of appropriate reference substance under the same conditions. The results can be used for drug identification and impurity testing.

1. Apparatus and Materials

(1) Thin-layer plates

Home-made plates Unless otherwise specified, the glass plates should be smooth, flat and dry, no bead on it after

Silica gel G, Silica gel GF₂₅₄, Silica gel H, Silica gel H₂₅₄, Diatomaceous earth, Diatomaceous earth G, Aluminum oxide, Aluminum oxide G, Microcrystalline cellulose, Microcrystalline cellulose G, etc. are commonly used stationary phases. Their particle size is usually 5-40 μm in diameter.

For coating the plate, the adsorbent or support can be applied to the glass plate with or without a binder. When the binder is needed, mix the adsorbent or support with 10%-15% of gypsum ($\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$, dried at 140°C for 4 hours) and sufficient water, or with a 0.2%-0.5% solution of carboxymethyl-cellulose sodium as binder. Triturate the mixture to a homogeneous paste and spread the slurry on the glass plates. *Spreader* is used to spread the adsorbent or support on glass plate to form a uniform layer of definite thickness.

Pre-coated plates It includes normal thin-layer plates and high-performance thin-layer plates, such as silica gel thin-layer plates, silica gel GF₂₅₄ thin-layer plates polyamide thin-layer plates, aluminum film thin-layer plates etc.

(2) *Sample applicator* Same as described under Paper Chromatography

(3) *Developing chamber* Glass chamber of suitable size with tight lid and a flat bottom or twin trough may be used.

(4) *Visualization reagents* As specified in the monograph. The spots can be visualized by spraying, exposure to vapour of I_2 or immersion.

(5) *Visualization device* The spray visualization requires that the visualizing reagent should be ejected by the compressed gas as fine and even fogdrops. Special glass apparatus or suitable glass tank can be used for the immersion visualization. The twin trough chamber or desiccator with suitable size can be used for iodine vapour method.

(6) *Detection device* It consists of a dark chamber with filter, a light source with visible light, short (254 nm) and long (360 nm) UV wavelengths light, and photographic equipment. The light source should have enough illumination.

2. Procedure

(1) Preparation of thin layer plate

Home-made plates Unless otherwise specified, one part of stationary phase and three parts of water are triturated in one direction to a homogeneous paste, remove gas bubbles on the surface, put the paste in the spreader, spread on glass plates. The thickness of the layer is generally 0.2-0.3 mm. Allow the plate to dry on a horizontal plane, activate at 110°C for 30 minutes and store in a desiccator with silica gel.

Commercial pre-coated plates The plates should be usually activated in an oven at 110°C for 30 minute before use. Polyamide thin-layer need not be activated. Aluminum film thin-layer plates can be cut to meet the need, but it should be noted that silica gel thin-layer of thin-layer bottom can not be damaged after cutting. If be polluted during storage by impurities in air, thin-layer plates can be ascending washed by suitable solvent in developing chamber before use. The plates may be activated by heating in an oven at 110°C and stored in a desiccator.

(2) *Sample application* Unless otherwise specified, apply the sample to the plate using an sample applicator, circular spots are spaced 2.0 cm from the end of the plate. The distance between the adjacent spots is usually 1.0-2.0 cm, which can be adjusted according to the diffusion of the spot in order not to interfere with the detection. It is essential not to

phase and the particle size of the support, the flow rate of the mobile phase and the ratio of each component in the mixed mobile phase, the time span in the gradient elution program, the temperature of the column, the injection volume and the sensitivity of the detectors could be changed appropriately to meet the requirement of the system suitability test. But for some certain monographs, in which only the specific brand of packing material is able to satisfy the requirement of the separation, clear indications should be given under them.

2. The system suitability test

The suitability test of the chromatographic system generally includes four indexes, number of theoretical plates, resolution, repeatability and tailing factors, in which the resolution and the repeatability are more practical indexes.

To carry out the suitability test of the chromatographic system according to the requirement under the individual monograph is to test the chromatographic system by using specific reference substance. The separation conditions of the chromatography should be adjusted in case if the requirement cannot be met.

(1) *Theoretical plates of the column* (n) Inject the test solution or the internal standard specified under the monograph into the system according to the prescribed chromatographic conditions. Record the chromatogram and measure the retention time (t_R (in minutes or length unit), the same as below, which should be in the same unit) and the peak width at half peak height ($W_{h/2}$) of the principle component peak of the test solution or that of the internal standard. Calculate the theoretical plates of the chromatographic column by the equation: $n = 5.54(t_R/W_{h/2})^2$.

(2) *Resolution* (R) No matter in qualitative analysis or quantitative analysis, the peak(s) of substance being examined and other peaks, such as internal standard peak(s) or specific impurity peak(s) must have good resolution. The equation for calculating the resolution is:

$$R = \frac{2(t_{R2} - t_{R1})}{W_1 + W_2}$$

Where t_{R2} is the retention time of the latter of the two adjacent peaks, t_{R1} is the retention time of the former of the two adjacent peaks.

W_1 and W_2 are the peak width of the two adjacent peaks (as Fig. 3).

Unless specified otherwise, the resolution value should not be less than 1.5 in quantitative analysis.

Fig. 3

(3) *Repeatability* Inject the reference solution described under the monograph for 5 times successively. Unless specified otherwise, the relative standard deviation of the measured value of the peak areas should be no more than 2.0 per cent.

According to the measurement of the correction factor specified under each monograph, prepare a series of reference solutions equivalent to 80%, 100% and 120% of the content of the substance being examined, each containing

solution at least 2 times, calculate the average correction factors, the relative standard deviation of which should be no more than 2.0%.

(4) *Tailing factor* (T) In order to guarantee the performance of the separation and the precision of the measurement, the tailing factor should be inspected to see whether it meets the prescription under each monograph. The equation for calculating the tailing factor is as follows:

$$T = \frac{W_{0.05h}}{2d_1}$$

Where $W_{0.05h}$ is the peak width at 5% of the peak height, d_1 is the distance between the perpendicular line passing through the peak maximum and that of the leading edge of the peak (as Fig. 4).

Fig. 4

Unless otherwise specified, the T value should be within 0.95-1.05 in the quantitative analysis by using peak height. In the quantitative analysis by using peak area, the over deviation of the T value will also effect the detection and the quantification precision of the small peak(s).

3. Procedure

(1) Corrected internal standard method for the determination of individual impurities or the main components

Prepare solutions containing an accurately weighed quantity of the reference substance and the internal standard respectively as specified in the monograph. Accurately measure each solution and prepare the reference solution for determining the correction factors. Inject a certain amount of solution into the equipment and record the chromatogram. Measure the peak area or height of the reference substance and the internal standard and calculate the correction factor according to the following equation:

$$\text{Correction factor}(f) = \frac{A_s/C_s}{A_R/C_R}$$

Where A_s is the peak area or the peak height of the internal standard

A_R is the peak area or the peak height of the reference substance

C_s is the concentration of the internal standard

C_R is the concentration of the reference solution

Prepare solutions containing the substance being examined and the internal standard as described in the monograph. Inject the solution into the equipment and record the chromatogram. Measure the peak area or the peak height of the substance being examined and that of the internal standard. Calculate the content as follows:

$$\text{Content}(C_x) = f \times \frac{A_x}{A_s/C_s}$$

Where A_x is the peak area or peak height of the substance being examined (or its impurity)

C_x is the concentration of the solution of the substance being examined (or its impurity)

internal standard

C_s is the concentration of the internal standard solution

f is the correction factor.

If an equal amount of the internal standard of the same concentration is used both in preparing the reference solution for measuring the correction factor and in preparing the test solution, that is $C_s = C'_s$. In this case accurate weighing is not necessary for preparing the internal standard solution.

(2) External standard method for the determination of the individual impurity or the main component

Prepare solutions containing an accurately weighed quantity of the reference substance and the substance being examined respectively and inject a certain amount of each solution into the equipment. Record the chromatogram and measure the peak area (or peak height). Calculate the content as follows:

$$\text{Content}(C_x) = C_R \frac{A_x}{A_R}$$

Where each symbol has the same meaning as that mentioned above.

As the micro syringe is not able to control the amount of solution being injected precisely, the sampling loop or automatic sampler may be used in measuring the content of the impurity and main components in the substance being examined.

(3) Corrected peak areas of impurities compared with that produced by the main peak of a diluted solution of substance being examined

This method could be used to measure the content of the impurity. Prepare solutions containing an accurately weighed quantity of the reference substances of impurities and the main component as specified in the monograph. Inject a volume and record the chromatogram. Calculate the correction factor of the impurity according to the method described in the (1). The correction factor could be directly recorded in the individual monograph and used for correction of the measured peak areas of impurities. These impurities, which need correction computation, are generally located by the relative retention time to the main component as the reference and all these data are recorded in the individual monograph.

When measuring the content of the impurities, dilute the solution of the substance being examined to a concentration as specified in the individual monograph so that its peak area is around that produced by the impurities in the original concentration. Inject and adjust the attenuation of the detector (limited by the noise level that can be accepted) or vary the injection volume (limited by the load ability of the column) until the peak height of the main component is about 10%-25% of the full scale or the peak area which could be accurately measured (generally, for the impurity, the content of which is lower than 0.5%, the RSD of the peak area should be less than 10%; while for the impurity, the content of which is between 0.5%-2%, the RSD of peak area should be less than 5%; for the impurity whose content is higher than 2%, the RSD of the peak area should be less than 2%). Inject separately an appropriately amount of test solution and reference solution. The recorded time span of the test solution, unless specified otherwise, should be 2 times that of the main component. Measure the peak areas of each impurity on the chromatogram of the test solution. Multiply them by the respective correction factors and then compare them with the peak area of the main component of the reference solution and calculate the content of the impurities accordingly.

(4) Peak areas of impurities compared with that produced

examined

This method could be used when the impurity reference substance is not available. Prepare the reference solution according to method (3) and adjust the attenuation of the detector. Inject separately an appropriate volume of the test solution and reference solution. The record time span of the former should be 2 times the retention time of the main component, unless specified otherwise. Measure the peak areas of the impurities on the chromatogram of the test solution and compare them with those of the main component of the reference solution and calculate the content of the impurities.

If there are some impurities in the substance being examined which are not completely separated from the solvent peak, record the chromatogram I of the substance being examined according to the specification and then record the chromatogram II of the pure solvent of equal volume. The peak area of the solvent solution on the chromatogram II is subtracted from the total peak area of the impurities in the chromatogram I (including the solvent peak). The result is equal to the correction peak area of the total impurities. Calculate the content of the impurities accordingly.

(5) Peak area normalization method

As the deviation of this method is so large that it can be only used to roughly inspect the contents of impurities in the substance being examined. It is not suitable for the determination of minute impurities, unless specified otherwise. In this method, the peak area of the impurities and the total peak area on the chromatogram except the solvent peak are measured. Calculate the peak area of each impurity and the percentage of their sum in the total peak area.

V E Gas Chromatography

Gas chromatography (GC) is a separation technique in which the mobile phase, an inert gas known as carrier gas, is passing through the chromatographic column packed with packing materials for separation and determination. The substance or its derivatives are injected into the vaporizer with a micro-syringe and vaporized, separated on the stationary phase, each component passes through the detector in succession and a chromatogram is thus recorded by integrator, recorder or data acquisition system.

1. General requirements for the instrument

The apparatus consists of a carrier gas source, an injector port, a chromatographic column contained in an oven, a detector and a data acquisition system. The injection port, column, and detector are temperature-controlled.

(1) **Carrier gas source** The mobile phase of gas chromatography is gas, known as carrier gas. Carrier gases used are usually nitrogen, helium and hydrogen. The gas is supplied by a high-pressure steel cylinder or high-purity gas generator and passes through suitable pressure-reducing valves and a flow meter to the injector port and column. The gas selection depends on the properties of the substances being examined and the species of the detector. The commonly used carrier gas is nitrogen, unless specified otherwise.

(2) **Injection port** Direct injections of solutions and headspace injection are the usual modes of injection. Direct injection may be carried out by using a syringe or an injection valve, or into a vaporization chamber which may be equipped with a stream splitter. The temperature of the

when using direct injection. The volume of solution injected is not more than several μl . The smaller the column diameter the less volume of injected solution is. Capillary column is used with injectors which is able to split samples into two fractions to avoid overloading.

Headspace injectors are suitable for separation and determination of volatile component in solid or liquid substance being examined. The test solutions produced with solid or liquid substance being examined and stored in tightly closed containers are heated in the chamber for a period of time, allowing the volatile components in the test solution to reach a equilibrium between the nongaseous phase and the gaseous phase. A predetermined amount of the head-space of the vial is flushed into the column by automatic syringe.

(3) **The chromatographic column** The chromatographic columns are classified into the packed columns and capillary columns. The packed columns, which are made of stainless steel or glass, are 2-4 mm in internal diameter and 2-4 m in length. The columns are packed with the sorbent, porous polymer bead or the supports coated with liquid phase, particle size of which is 0.25-0.18 mm, 0.18-0.15 mm or 0.15-0.125 mm. The support usually used is acid washed and silanized diatomaceous earth or porous polymer beads; the liquid phase commonly used is methylpolysiloxane, polysilphenylene of different consist, polyethyleneglycol etc. The capillary columns are made of glass or quartz. The inner wall of the column is coated or cross-linked with stationary liquid, the internal diameter is usually 0.25 mm, 0.32 mm or 0.53 mm, the length is 5-60 m, and the film thickness of the stationary liquid is 0.1-5.0 μm . The stationary liquid commonly used are methyl polysiloxane, phenylmethyl polysiloxane with different ratio of composition and carbowax, etc. New packed and capillary column must be conditioned before use to remove oxygen and residual solvents. The chromatographic column must be conditioned before use until the baseline is stable if the column is not in use long time.

(4) **The column oven** The temperature-controlled precision of the oven should be $\pm 1^\circ\text{C}$ and fluctuation of temperature should be less than 0.1°C per hour, as the temperature fluctuation of oven will influence the reproducibility of chromatographic analysis result. Temperature-controlled system may be classified into constant temperature and temperature programming.

(5) **Detector** The detectors suitable for the gas chromatography include flame-ionization detector (FID), thermal conductivity detector (TCD), nitrogen-phosphorus detector (NPD), flame-photometer detector (FPD), electron-capture detector (ECD), mass spectrometric detector (MSD) etc.. FID responses well to hydrocarbon and is suitable for the determination of most drug compounds; NPD is sensitive to organic nitrogen and phosphorus compounds; FPD is sensitive to organic sulfur and phosphorus compounds; ECD is suitable for determination of halogen compounds; MSD can offer chemical construction information of the compounds which is useful for structure verification. Unless specified otherwise, the detector should be FID which employs hydrogen as combustion gas and air as combustion-supporting gas. When FID is used, its temperature is higher than that of the column and not less than 150°C to prevent condensation of the vapour, which usually is $250-350^\circ\text{C}$.

(6) **Data process system** It is classified into recorder, integrator and computer station etc.

If necessary, parameters which specified under the individual monograph, except the kind of the detector, the type of the stationary phase and the material of the column, other parameters such as the internal diameter and length of the

stationary phase, the flow rate of carrier gas, the temperature of the column, the injection volume, the sensitivity of the detector etc, may be varied to meet the requirement of the system suitability test. Usually the chromatogram is completed within 30 minutes.

2. System suitability test

The requirements are the same as described under High Performance Liquid Chromatography, unless otherwise specified.

3. Procedure

(1) Corrected internal standard method for the determination of individual impurities or the main component.

(2) External standard method for the determination of individual impurities or the main component.

(3) Peak area normalized method.

The specific content of (1)-(3) is the same as described under High Performance Liquid Chromatography.

(4) Standard addition method for the determination of individual impurities or the main component. Dissolved an accurately weighed quantity of impurities or reference substance of the substance to be examined to produce reference solution with a suitable concentration. Measure accurately the solution and add to the test solution, then calculate the content of individual impurities or the main component by internal standard method or external standard method. Deduct the content of added standard solution and gain the content of individual impurities or the main component in the test solution.

The content may also be calculated by the following equation. The correction factor is the same as that of adding the reference solution.

$$\frac{A_{is}}{A_x} = \frac{C_x + \Delta C_x}{C_x}$$

The concentration C_x of component being examined may be calculated by the following equation.

$$C_x = \frac{\Delta C_x}{(A_{is}/A_x) - 1}$$

Where C_x is the concentration of component X being examined;

A_x is the peak area of component X being examined;

ΔC_x is the concentration of added reference substance of component being examined.

A_{is} is the peak area of component X after adding reference substance of component being examined.

In quantitative assay of gas chromatography, a major source of error is the irreproducibility in the amount of sample injected, which is affected by retaining time of syringe and room temperature, notably when manual injections are made with a syringe. The effects of variability can be minimized by an internal standard. Automatic injectors greatly improve the reproducibility of sample injections and reduce the need for internal standards. When headspace injectors are equipped, the effect of matrix may be eliminated by standard addition method because the test solution and reference solution are in different matrix. When the quantitative result of standard addition method is different from others, the result of standard addition method should be adopted.

V F Electrophoresis

supporting medium (such as paper, cellulose acetate, agarose gel and polyacrylamide gel, etc.), in which the electrically charged test samples (protein and nucleic acid, etc.) migrate towards the electrode of opposite charge under the action of an electric field. Each component migrates at its own speed and is separated in narrow zone. The electrophoretogram and percentage content of every component can be examined with appropriate assaying methods. Unless otherwise specified, carry out the following methods.

Method 1 Paper electrophoresis

1. Apparatus

The apparatus consists of two parts, electrophoretic chamber and a direct current power source.

The horizontal electrophoresis chamber shown in figure (as Fig. 5), consists of two troughs A and a hermetic lid B made of glass (or appropriate material). Both troughs are separated respectively into two compartments by plexiglass plate C (or appropriate material). In the outer compartments, there are platinum electrodes D with a diameter of 0.5-0.8 cm connected to the outside power supply by insulated cables through the trough walls; and in the inner compartments, there are movable plexiglass stands supporting the filter papers.

Fig. 5 The horizontal electrophoresis chamber

The power source supplying a direct current is composed with a voltage stabilizer. Ordinary voltage electrophoresis refers to that proceeded at 100-500 V, and high voltage electrophoresis refers to that proceeded at 500-10000 V.

2. Procedure

(1) *Electrophoretic buffer* Citrate buffer solution (pH 3.0): Dissolve 39.04 g of citric acid ($C_6H_8O_7 \cdot H_2O$) and 4.12 g of sodium citrate ($C_6H_5Na_3O_7 \cdot 2H_2O$) in 4000 ml of water.

(2) *Filter paper* Immerse a chromatographic filter paper in formic acid solution (1 mol/L) overnight, and then wash with water until the pH value of elute is not lower than 4. Dry the filter paper at 60 °C and preserve for use. The filter paper can be cut into strips of 27 cm in length and 18 cm in width, or appropriate for the size of electrophoresis chamber. Draw a line about 5-8 cm from one end of the paper and, along the line, mark points every 2.5-3 cm apart for application of the solution being examined.

(3) *Loading the samples* It may be divided into two categories, wet applying and dry applying. In wet applying, immerse the trimmed paper entirely into the citrate buffer (pH 3.0), take out and remove the surplus buffer solution with filter paper. Place the paper in the stand and place the application line near the cathode and the both ends of the paper immersed into the buffer solution. Apply 10 μ l of the test solution, accurately measured, to 3 marked points using microinjector. Leave two marked points for blank control. Dry applying is suitable for dilute samples. In this method, apply the test solution on the paper, after drying, apply again and repeat these steps until all the sample solution has been completed. Wet the filter paper with sprayer and allow the application spots wet at the end.

(4) *Electrophoresis* Fill the troughs of the chamber with

Connect the cables to the power source on a constant voltage mode. Adjust the voltage gradient to about 18-20 volts per cm of the paper and allow electrophoresis to proceed for about one hour and forty-five minutes. Remove the paper, dry immediately in a current of air, examine under ultraviolet light (254 nm) and mark the violet spot with pencil.

(5) *Assay* Cut the spots containing the test sample in the filter paper, as well as a piece of blank filter paper with a similar area, into slim strips and place into test tubes respectively. Add accurately measured 5 ml of hydrochloric acid solution (0.01 mol/L) to each tube, shake thoroughly and allow to stand for 1 h. Filter through a No. 3 sintered glass filter and collect the filtrate, or collect the supernatant by natural sedimentation or centrifugation. Measure the absorbance of the collected solutions at the wavelength as specified in the monograph and calculate the content.

Method 2 Cellulose acetate film electrophoresis

1. *Apparatus* The electrophoretic chamber and power source supplying direct current are the same as that of paper electrophoresis.

2. Reagents

(1) *Barbital buffer solution* (pH 8.6) Dissolve 2.76 g of barbitone and 15.45 g of barbital sodium in water to produce 1000 ml.

(2) *Amino black staining solution* Dissolve 0.5 g of amino black 10B in a mixture of 50 ml of methanol, 10 ml of glacial acetic acid and 40 ml of water.

(3) *Washing solution* Mix together 45 ml of ethanol, 5 ml of glacial acetic acid and 50 ml of water.

(4) *Hyalinization solution* Mix together 25 ml of glacial acetic acid and 75 ml of dehydrated ethanol.

3. Procedure

(1) *Cellulose acetate film* Cut the cellulose acetate foil into strips with a dimension of 2 cm \times 8 cm, immerse in the barbital buffer solution (pH 8.6), with the glossy side upwards. After steeping, take out the strip and press between filter paper to remove surplus buffer solution. Place the strip on the electrophoretic support with the glossy side downwards, immerse into the barbital buffer solution (pH 8.6) through filter paper bridge.

(2) *Application of sample and electrophoresis* Apply to the foil as a band at 2 cm from the cathode edge 2-3 μ l of test solution with a protein content of about 5%. Allow the electrophoresis to proceed at a voltage gradient of 10-12 V/cm until the electrophoretic bands are 4-5 cm apart.

(3) *Staining* After electrophoresis, remove the strip and immerse in amino black staining solution for 2-3 minutes, wash with washing solution until the background is free from colour.

(4) *Hyalinization* Immerse the washed and dry foil in the hyalinization solution for 10-15 minutes, remove and place evenly on a clean glass plate. After drying, it will become a transparent film and ready to be measured in a spectrophotometer and be kept as specimen for long-term preservation.

(5) *Assay* The electrophoretogram of the cellulose acetate foil that is untreated for hyalinization can be examined by the method specified in the monograph. Generally, the elution method or scanning method is used to determine the relative percentage content of every protein component in the sample. Elution method: Press the washed foil dry with filter paper, clip out every electrophoretic band derived from the test solution and immerse separately in 1.6% solution of sodium

complete. Measure the absorbance at appropriate wavelength. At the same time, cut out a corresponding band of foil without proteins, treated in the same manner as blank. Calculate the total absorbance and the percentage content of each protein component in the sample.

Scanning method: Scan the dry cellulose acetate foil with chromatographic scanner by means of reflection (for non-transparent film) or transmission (for transparent film). The scanning chromatogram for every protein component is recorded automatically with the length of foil as abscissa and the absorbance as ordinate. Calculate the percentage content for each protein component in the sample, which also could be performed by integrater.

Method 3 Agarose-gel electrophoresis

1. Apparatus The electrophoretic chamber and power source supplying direct current are the same as that of paper electrophoresis.

2. Reagents

(1) *Acetic acid-lithium salt buffer solution* (pH 3.0) Mix 50 ml of glacial acetic acid and 800 ml of water, adjust to pH 3.0 with lithium hydroxide and dilute to 1000 ml with water.

(2) *Toluidine blue solution* Dissolve 0.1 g of toluidine blue in 100 ml of water.

3. Procedure

(1) *Gel preparation* Add about 0.2 g of agarose to 10 ml of water, heat in a water-bath to swell completely, add 10 ml of hot acetic acid-lithium salt buffer solution (pH 3.0) and shake thoroughly, spread on a glass plate with an appropriate dimension (2.5 cm × 7.5 cm or 4 cm × 9 cm) to yield a layer of about 3 mm thick while it is still warm. Allow it to congeal and to form a uniform thickness gel without bubbles.

(2) *Preparation of the reference substance solution and test solution* Prepare the solutions as described in the monograph.

(3) *Loading the sample and electrophoresis* Fill the electrophoresis troughs with acetic acid-lithium salt buffer solution (pH 3.0), place the gel plate on the electrophoretic support and immerse into the electrophoretic buffer solution through filter paper. Apply separately 1 µl of sample solutions to the gel at the cathode edge. Connect the electrodes to the power supply immediately and allow the electrophoresis to proceed at voltage gradient of about 30 V/cm, and a current of 1-2 mA/cm for about 20 minutes. Switch off the current.

(4) *Staining and destaining* Remove the gel plate and stain the gel with toluidine blue solution. Destain the excess by washing with water until the background being colourless.

Method 4 Polyacrylamide-gel electrophoresis

1. Apparatus It consists of power source supplying constant current and disc or plate electrophoretic troughs. The electrophoretic chamber is assembled with upper trough and lower trough, in which platinum electrodes are fixed and connected by the insulated cables to the power supply at constant current mode.

2. Reagents

(1) *Solution A* Dissolve 36.6 g of tris-hydroxymethyl methylamine, 0.23 ml of N, N, N', N'-tetramethylethylene diamine and 48 ml of hydrochloric acid solution (1 mol/l) in water to produce 1000 ml. Store in an amber

(2) *Solution B* Dissolve 30.0 g of acrylamide and 0.74 g of N, N'-methylene bisacrylamide in water to produce 100 ml, filter and store in an amber coloured bottle, place in refrigerator.

(3) *Electrode buffer solution* (pH 8.3) Dissolve 6 g of tris (hydroxymethyl) methylamine, 28.8 g of glycine in water to produce 1000 ml, store in refrigerator. Dilute to 10 volumes before use.

(4) *Bromophenol blue indicator solution* Dissolve 0.1 g of bromophenol blue in 3.0 ml of sodium hydroxide solution (0.05 mol/l) and 5 ml of 95% ethanol solution by gentle heating, add 20% ethanol solution to produce 250 ml.

(5) *Staining solution* To 2.5 ml of 0.25% (g/ml) coomassie brilliant blue G₂₅₀ solution add 12.5% (g/ml) trichloroacetic acid solution to produce 10 ml.

(6) *Dilute staining solution* Dilute 2 ml of staining solution with 12.5% (g/ml) trichloroacetic acid solution to produce 10 ml.

(7) *Destaining solution* 7% acetic acid solution.

3. Procedure

(1) *Gel preparation* Dissolve 2.9 g of urea in 2 ml of solution A and 5.4 ml of solution B, add 4 ml of water, evacuate to remove air bubbles. Add 2 ml of 0.56% ammonium persulphate to form gel solution. Introduce the gel solution along the wall of the tubes using a syringe fitted with long needle or a thin pipette into glass tubes (10 cm × 0.5 cm) with rubber stopper at the bottom, until the gel column raises up to 6-7 cm. Air bubbles must not be trapped at the bottom of the tube. Cover the gel mixture in the tubes with a layer of water and allow to set for about 30 minutes. Gel polymerization is complete when a sharp interface form between the gel and water layer. Remove the water layer.

(2) *Preparation of the reference substance solution and test sample solution* Prepare the solutions as prescribed in the monograph.

(3) *Electrophoresis* Fit the tubes with prepared gel into the disc electrophoresis trough. Apply separately 50-100 µl of sample solution or reference substance solution to the tubes. To each tube add 1-2 drops of glycerol or 40% solution of sucrose and 1 drop of 0.04% bromophenol blue indicator solution to prevent from diffusion. Alternatively, several drops of 0.04% bromophenol blue indicator solution could be added directly to the buffer solution in upper trough. Fill the top of glass tubes with electrolyte buffer solution. Connect the electrodes to the power supply and allow electrophoresis to proceed at a constant current of 1 mA per tube for several minutes, then increase the current to 2-3 mA per tube. Switch off the current when the bands of bromophenol blue migrate to 1 cm from the bottom of glass tube.

(4) *Staining and destaining* After electrophoresis, extrude the gel by injecting water between the gel and the wall of the tube from the bottom by means of a syringe fitted with a fine needle. Immerse the gel strips for 10-30 minutes in staining solution or overnight in dilute staining solution. Wash with water and decolourize in destaining solution until the background of the gel in the zone without protein is transparent.

(5) *Results valuation* Examine the gel strips under lamp. Determination is made by comparing the position and colour of the bands between the reference substance and the test sample.

Relative mobility: The electrophoretic bands of the test sample and the reference substance can be compared by means of relative mobility, which can be calculated as

$$\text{Relative mobility}(R'_m) = \frac{\text{distance from origin to test sample zone or reference substance zone}}{\text{distance from origin to bromophenol blue zone}}$$

Scanning: Scan the clear gel strips in a thin layer scanner with double wavelength or gel electrophoretic scanner, calculate the percentage content of individual component based on its peak area.

Method 5 SDS-polyacrylamide gel electrophoresis

Determining the molecular weight of proteins by the way of SDS-polyacrylamide gel electrophoresis (SDS-PAGE) is based on the experience that great majority of proteins can bind with sodium dodecyl sulfate (SDS), a kind of cation surfactant, to form complex. The negative charges carrying by the protein complexes are much higher than that of the natural proteins, resulting in eliminating the discrepancy in charge effect derived from different proteins. Therefore, the relative mobility (R'_m) of protein depends completely on its molecular weight, and the molecular weight of test sample can be interpolated from the standard curve of the log of the known molecular weight of the standard proteins against their relative mobilities.

1. Apparatus Unless otherwise specified, it is the same as that of polyacrylamide gel electrophoresis.

2. Reagents

(1) **30% Acrylamide solution** Dissolve 60 g of acrylamide and 1.6 g of N, N' -methylene bisacrylamide in 200 ml of water, filter, store in a brown bottle and keep in low temperature.

(2) **Separating gel buffer solution** Dissolve 36.3 g of tris-hydroxymethyl methylamine in 70 ml of water, adjust pH to 8.8 with hydrochloride acid and dilute with water to 100 ml.

(3) **Stocking gel buffer solution** Dissolve 6.0 g of tris-hydroxymethyl methylamine in 70 ml of water, adjust pH to 6.8 with hydrochloride acid and dilute with water to 100 ml.

(4) **Electrode buffer solution** Dissolve 6.0 g of tris-hydroxymethyl methylamine, 28.8 g of glycine and 1.0 g of SDS in water to produce 1000 ml.

3. Procedure

(1) **Gel preparation** Prepare separating gel solution using a mixture of 30% acrylamide solution-separating gel buffer solution-20% SDS solution-10% ammonium persulphate solution (freshly prepared) - N, N, N', N' -tetramethylethylenediamine-water (5.0 : 1.5 : 0.08 : 0.1 : 0.01 : 5.3), and pour into electrophoretic troughs to the required heights. Seal the top of separating gel with water, polymerized, pour out the water. Pour stocking gel solution using a mixture of 30% acrylamide solution-stockung gel buffer solution-20% SDS solution-10% ammonium persulphate solution- N, N, N', N' -tetramethylethylenediamine-water (0.8 : 1.3 : 0.025 : 0.05 : 0.005 : 2.4) on the separating gel, insert the comb of the sample (seal the top of stocking gel with water for disk troughs). Polymerized, remove the comb or pour out water.

(2) **Reference and test solution preparation** Carry out the method of individual monograph.

(3) **Electrophoresis** Vertical plate electrophoretic troughs; at constant voltage mode for 80 V of starting voltage. When the test solution move into separating gel, adjust the voltage to 150-200 V. When the bands of bromophenol blue migrate to 1 cm from the bottom of glass plate, stop electrophoresis.

4. Staining

(1) Staining with coomassie brilliant blue

① **Reagents** Fixing solution: Dissolve 5 g of trichloroacetic acid in 200 ml of water, add 200 ml of methanol, add water to produce 500 ml.

Staining solution: Dissolve 0.5 g of coomassie brilliant blue R_{250} in 200 ml of water, add 200 ml of methanol and 50 ml of glacial acetic acid, add water to produce 500 ml.

Destaining solution: To 400 ml of methanol and 100 ml of glacial acetic acid add water to produce 1000 ml, mix well.

Storing solution: To 75 ml of glacial acetic acid add water to produce 1000 ml, mix well.

② **Fixing and staining** Immerse the gel slice or strips for 30 minutes in fixing solution, for 1-2 hours in staining solution, decolourize in destaining solution until the background of the gel in the zone without protein is transparent, and then preserve it in the storing solution.

(2) Silver staining

① **Reagents** Silver nitrate solution: To 0.8 g of silver nitrate in 4 ml of water. Add this solution dropwise to a mixture of 0.1 mol/L sodium hydroxide-25% ammonium solution (20 : 15), mix well, add water to produce 100 ml.

Fixing solution: To 50 ml of methanol and 54 μ l of 37% formaldehyde solution, add water to produce 100 ml.

Developing solution: To 2.5 ml of 1% citric acid solution and 270 μ l of 37% formaldehyde solution, add water to produce 500 ml.

Stopping solution: To 100 ml glacial acetic acid add water to produce 1000 ml.

② **Fixing and staining** Immerse the gel slice for 2 hours at least in fixing solution; wash the gel with water for 1 hour at least; for 15 minutes in 1% glutaraldehyde solution; wash twice the gel slice with water, each time for 15 minutes, for 15 minutes in silver nitrate solution, wash three times the gel slice with water, each time for 15 minutes; Immerse the gel slice in developing solution, when all bands is examined, put the gel slice in stopping solution.

5. Calculation

Measure the migration distance of the dye zone and the protein zone, and the length of gel strip before staining and after decolourization. Calculate the relative mobility by the following formula:

$$\text{Relative mobility}(R'_m) = \frac{\text{migration distance of the protein zone}}{\text{the length of gel strip after destaining}} \times \frac{\text{the length of gel strip before staining}}{\text{migration distance of the dye zone}}$$

(1) Relative mobility of main component in the test solution is identical to that of reference standard.

(2) **Molecular weight** Plot graphically in semi-log coordinate paper by taking the R'_m as abscissa and the log of the molecular weight of the standard proteins as ordinate. Interpolate the molecular weight of the test sample from the standard curve.

(3) **Purity** Scan the clear gel in a thin layer scanner with double wavelength or gel electrophoretic scanner and calculate the percentage content of individual component based on its peak area.

V G Capillary Electrophoresis

Capillary electrophoresis is a separation technique using

generally suitable for determination of molecular weight of protein and peptide. Carry out the method stated in the monograph, using a column and reference substances suitable for the molecular weight of samples. Reference substance and samples should both be processed by dithiothreitol (DTT) and sodium lauryl sulfate (SDS) in order to break disulfide bond and make the molecule configuration and conformation concord. Usually the processed protein and peptides which have been turned to a straight line are separated. Plot a graph of the retention time of the reference substance as a function of the logarithm molecular weight and calculate the equation of linear regression, $\lg M_w = a + bt_R$. Calculate molecular weight or subunit molecular weight from the regression equation

(2) *Determination of molecular weight and molecular weight distribution of polymers* Molecular weight of biopolymers, such as amylose, nucleic acid and collagen, is usually unhomogeneous. Molecular weight and molecular weight distribution of the biopolymer is a key index. To determine the molecular weight and molecular weight distribution of biopolymers, it is important to adopt reference substances with similar structures and properties to the samples.

Carry out the method stated in the monograph, unless otherwise specified, use molecular weight reference substance and suitable GPC software, plot a graph of the retention time of the reference substance as a function of the logarithm of weight-average molecular weight and calculate the equation of linear regression $\lg M_w = a + bt_R$. Process the result with suitable GPC software and calculate the molecular weight and molecular weight distribution of samples.

$$\begin{aligned} M_n &= \sum RI_i / \sum (RI_i / M_i) \\ M_w &= \sum (RI_i / M_i) / \sum RI_i \\ D &= M_w / M_n \end{aligned}$$

Where M_n is number-average molecular weight

M_w is weight-average molecular weight

D is distribution coefficient

RI_i is peak height of samples at retention time i

M_i is molecular weight of samples at retention time i

(3) *Determination of macromolecule impurities* Macromolecule impurities are the impurities with higher molecular weight than drug molecule, which produced during

procedure of manufacture or storage and cannot be removed completely (sensitizing polymers). Separation is carried out according to the chromatographic condition stated in the monograph.

Quantitative method

① *Peak areas of impurities compared with those produced by the main peak of the sample* See the section of High Performance Liquid Chromatogram. The method is typically used for determination of macromolecule impurities with low content in the samples.

② *Peak area normalization method* See the section of High Performance Liquid Chromatogram.

③ *Retention time limit method* Unless otherwise specified, it is specified that component with shorter retention time than that of the main peak is not allowed to be detected. This method is typically used to control macromolecule impurities in the mixture.

④ *External standard method by the substance to be examined* This method is typically used for determination of macromolecule impurities in β -lactam antibiotics by Sephadex G-10 gel chromatography system. Except for some oligomers, macromolecule impurities in β -lactam antibiotics are not retained in this system and only appear to be one peak. Calculate content of the macromolecule impurities by external standard method, using the substance to be examined as reference substance.

Announcements Processing method for Sephadex G-10

Packing chromatographic column Soak about 15 g of Sephadex G-10 with water for 48 hours before packing and make it swelling thoroughly, stir to expel air bubbles. Slowly add the mixture as slurry into the chromatographic tube. Wash down the Sephadex G-10 adhering to the inner wall of the tube with water, smooth the surface of the column. Newly packed column should be eluted with water for 4-6 hours to expel air bubbles.

Loading the sample Both automatic inject valve and manual loading can be adopted to load the substance being examined into the column. Add the test solution slowly along the inner wall of the tube, care should be taken that the packing material is not disturbed. Wash down the samples adhering to the inner wall of the tube with 3-5 ml mobile phase after sample solution permeate through the column surface.

Appendix VI

VI A Determination of Relative Density

Relative density is defined as the ratio of the mass density of a substance to that of water under the same conditions of temperature and pressure. Unless otherwise specified, the measuring temperature is 20°C.

Relative density of the pure substance is a constant under particular condition. But, when the substance is not purified the determined value of relative density changes with the purity. So relative density is indicative of the identity and purity of the substance being examined.

The relative density of a liquid can be determined with a pycnometer (as Fig. 6 or as Fig. 7). In some cases, the Westphal balance (as Fig. 8) is used, for example, in the determination of the relative density of a volatile liquid.

The temperature of the determination environment of the pycnometer and balance should be a little bit below 20°C or that specified under individual monograph.

1. Pycnometric method

(1) Fill a clean, dry and accurately weighed pycnometer (as Fig. 6) with the substance being examined (keep the temperature below 20°C or that specified under individual monograph), fix the thermometer (no air bubble is left in the pycnometer). Place the pycnometer in a water bath maintained at 20°C or the specified temperature, allow to stand in the water bath for several minutes, so as to raise the temperature of the content to 20°C or to the temperature specified in the monograph. Wipe away the liquid overflowed from the side tube with a piece of filter paper and put the cap immediately. Remove the pycnometer from the water bath and clean off any material on the outside with a piece of filter paper, weigh the pycnometer accurately and calculate the weight of its content.

Fig. 6

Fig. 7

Fig. 8

Discard the content of the pycnometer and wash the pycnometer with water, fill it with freshly boiled and cooled water. Determine the weight of the water in the pycnometer in a similar manner. The relative density of the substance being examined can be calculated from the following formula:

$$\text{Relative density} = \frac{\text{weight of the substance being examined}}{\text{weight of water}}$$

(2) Fill a clean, dry and accurately weighed pycnometer (as Fig. 7) with the substance being examined (keep the temperature below 20°C or that specified under individual monograph). Insert the capillary stopper and wipe away the overflowed liquid with a piece of filter paper. Place the pycnometer in a water bath maintained at 20°C or the specified temperature, allow to stand in the water bath for several minutes.

Some of the liquid spills out through the capillary constantly with the rise of the temperature of the content. Wipe away the overflowed liquid with a piece of filter paper at any time until the fluid does not overflow anymore. Remove the pycnometer from the water bath rapidly. Proceed as described under method (1), starting from the words "clean off any material on the outside with a piece of filter paper..."

2. Hydrostatic method

Fill the glass cylinder of the Westphal balance (as Fig. 8) with freshly boiled and cooled water to about 80% of the volume. Place the cylinder and stir the content of it in a water bath maintained at 20°C or the specified temperature. Dip the plunger hung on the end of the beam into the water in the cylinder, the liquid in the cylinder should be 1.0000. Adjust the equilibrating screw until the beam is horizontal. Discard the water and wipe away any water left in the cylinder, fill the cylinder with the substance being examined to about 80% of the volume and adjust the temperature as mentioned above. Dip the plunger into the substance being examined and equilibrate again by placing suitable riders at appropriate marks along the beam. The reading gives directly the relative density of the substance being examined.

VI E Determination of Optical Rotation

The plane of polarized light can be rotated clockwise or counterclockwise when plane polarized light passes through some liquids or solutions of compounds which are optically active. Optical rotation is expressed in degrees by which the plane of polarization is rotated under specified condition. Specific optical rotation is defined as the optical rotation measured under given wavelength and temperature, when polarized light passes through a layer of a solution 1 dm thick containing 1 g of optically active substance per ml. The measurement of specific optical rotation (or optical rotation) may be used as an identification test, a purity test or a method of assay.

Unless otherwise specified, the values of optical rotation cited in this method are measured at 20°C with sodium D line (589.3 nm), in a tube of 1 dm. Conversion factor should be applied if the tube used is not of the appropriate length. Optical rotation is measured with a calibrated polarimeter accurately read to 0.01°. Rinse the polarimeter tube several times with the liquid or solution prepared as described in the individual monograph. Fill the polarimeter tube slowly with the liquid or solution, taking care to avoid creating or leaving air bubbles. Put the tube into the polarimeter and read the degrees of optical rotation. Substances are described as dextrorotatory or levorotatory according to whether the plane of polarization is rotated clockwise or counterclockwise, respectively, as viewed toward the light source. Dextrorotation is designated (+) and levorotation is designated (-). Carry out 3 measurements, take the average and calculate the specific optical rotation from one of the following equations:

$$\text{For liquids} \quad [\alpha]_D^t = \frac{\alpha}{l d}$$

$$\text{For solid substances} \quad [\alpha]_D^t = \frac{100 \alpha}{l c}$$

Where $[\alpha]$ is specific optical rotation;
D is sodium D line;
 t is measuring temperature;
 l is the length of the polarimeter tube, dm;
 α is the observed rotation in angular degrees;
 d is the relative density of the liquid;
 c is the weight of solute (g) in 100 ml of the solution, calculated on the dried basis or anhydrous basis.

Standard quartz polarimetric tube may be used to calibrate the polarimeter, the deviation of reading should comply with the requirements.

Announcements (1) Blank tests should be performed to check the zero point before and after each measurement. If the deviation of reading does not comply with the requirements after measurement, repeat the measurement.

(2) The temperature of the solution being tested should be kept constant at 20°C ± 0.5°C (or at the temperature specified in the individual monograph).

(3) Liquids or solutions of solid substance should be completely dissolved, and the test solution should be clear.

(4) The specific rotation of a liquid or a substance in solution is affected by several factors including light source, wavelength, solvent, concentration and temperature. When describing the specific optical rotation, the measuring condition should be provided.

VI F Determination of Refractive Index

Refraction takes place when a beam of light is transmitted from a transparent medium into another transparent medium, since the velocity of light changes in a medium of different density. The refractive index of a substance is the ratio of the velocity of light in air to its velocity in the substance. The refractive index may also be defined as the ratio of the sine of the angle of incidence to the sine of the angle of refraction:

$$n = \frac{\sin i}{\sin r}$$

Where n is the refractive index;
 i is the angle of incidence;
 r is the angle of refraction.

The refractive index varies with the temperature of the substance being examined and the wavelength of incident light. It decreases with the increase of temperature. The shorter the wavelength of incident light, the larger the refractive index. Refractive indices are usually stated in terms of sodium line D at a temperature of t and symbolized by n_D^t . The measurement of refractive index is employed to establish the identity of oils and test for purity of the substance being examined.

Unless otherwise specified, the values of refractive index cited in this method are measured at 20°C with sodium line D (589.3 nm) against air (White light may be used if an Abbe refractometer is available).

The refractometer should be able to give readings accurate to 0.0001 in the range of 1.3-1.7. If an Abbe refractometer or other equivalent instrument is used, the measurement should be conducted at 20°C ± 0.5°C (or in accordance with the temperature stated under individual monograph). Three readings should be taken and the mean value is used as the refractive index of the substance being examined. The readings of the refractometer should be calibrated before use with a prism or against water. The refractive index of water is 1.3330 at 20°C, 1.3325 at 25°C and 1.3305 at 40°C.

VI G Determination of Viscosity

Viscosity is the property of a liquid related to resistance to flowing. It is defined in terms of kinetic viscosity, kinematic viscosity or intrinsic viscosity. The viscosity of a substance being examined can be used for purity check. There are two major kinds of fluids; Newtonian and non-Newtonian. The shearing force needed for Newtonian fluids does not change as the flow rate is changing. Pure liquids and solutions of low molecular weight substances belong to this category. For non-Newtonian fluids, the shearing force needed varies with flow rate. This category of liquid consists of high polymer solutions, suspensions, emulsifying dispersive liquids and surfactant solutions.

Viscosity can be determined with viscosimeters. Many types of viscosimeter can be used for this purpose. In this method, the capillary type and the rotating type are adopted. Linear velocity cannot be adjusted when capillary viscosimeter is used, it is therefore unsuitable for the determination of the viscosity of non-Newtonian fluids. But it is convenient for the viscosity determination of diluted polymer solutions or liquids

viscosity determination of non-Newtonian fluids.

The kinetic viscosity of a liquid (η) is the shearing force required per square centimeter to cause the liquid flow at a rate of 1 centimeter per second. The unit of kinetic viscosity is expressed in pascal second ($\text{Pa} \cdot \text{s}$). The ratio of the kinetic viscosity to the density of the liquid at the same temperature multiplied by 10^{-6} equals to kinematic viscosity of the liquid (ν), which is expressed in mm^2/s .

In this method, the kinematic viscosity of the liquid determined under specified condition by measuring the flow time (in seconds) through Ostwald-type viscosimeter and multiplying by the constant (mm^2/s^2) of the same viscosimeter determined using a calibration liquid.

The viscosity of solvent, η_p , increases usually with the dissolution of polymers of high molecular weight. The ratio of the viscosity of a solution (η), to that of the solvent (η_p), is termed as "relative viscosity (η_r)" which is usually expressed by the ratio of flow time (T/T_0) measured with Ubbelohde-type viscosimeter. When the concentration of high polymer is low, the ratio of logarithmic value of relative viscosity to the concentration of polymer solution is the intrinsic viscosity (η) of that polymer. The mean molecular weight of the polymer concerned may be estimated from its intrinsic viscosity.

Apparatus (1) *Constant temperature water bath* A glass or plexiglass vessel, 30 cm or more in internal diameter, 40 cm or more in height, equipped with a mechanical stirrer and an electric heating device.

Unless otherwise specified, kinetic viscosity or kinematic viscosity is measured at $20^\circ\text{C} \pm 0.1^\circ\text{C}$.

(2) *Thermometer* Graduated in divisions of 0.1°C .

(3) *Stopwatch* Graduated in divisions of 0.2 second.

(4) *Ostwald-type Viscosimeter* (as Fig. 11) Internal diameter of the capillary tube is $0.8 \text{ mm} \pm 0.05 \text{ mm}$, $1.0 \text{ mm} \pm 0.05 \text{ mm}$, $1.2 \text{ mm} \pm 0.05 \text{ mm}$, $1.5 \text{ mm} \pm 0.1 \text{ mm}$ or $2.0 \text{ mm} \pm 0.1 \text{ mm}$.

(5) *Rotating viscosimeter*

(6) *Ubbelohde-type viscosimeter* (as Fig. 12) Unless otherwise specified, the capillary tube E is $0.5 \text{ mm} \pm 0.05 \text{ mm}$ in internal diameter, $140 \text{ mm} \pm 5 \text{ mm}$ long and the capacity of bulb A is $3.5 \text{ ml} \pm 0.5 \text{ ml}$ (with an appropriate dropping time of 120-180 seconds).

Method 1 Determination of kinematic or kinetic viscosity with Ostwald-type viscosimeter

Select a suitable viscosimeter with required internal diameter of the capillary tube as described under individual monograph.

Connect a rubber tubing to the side tube F of the Ostwald-type viscosimeter, block the mouth of tube 2 with a finger and turn the viscosimeter upside down so that tube 1 is plunged into the liquid or the solution being examined. Suck from the other end of the rubber tubing until the liquid or solution is filled to the mark m_2 . Remove the viscosimeter and immediately revert it, wipe away the liquid adhering to the exterior of tube 1 and disconnect the rubber tubing from side tube F and connect it to tube 1. Place the viscosimeter upright in the water bath so that the water surface is above the middle of bulb C. Allow to stand in the water bath for 15 minutes, suck from the other end of the rubber tubing until the liquid or solution fills the bulb A and rises above the mark m_1 . Release the suction and allow the liquid to drop spontaneously. Record the time required for the liquid surface to drop from m_1 to m_2 . Repeat this measurement 3 times or more and perform another series of measurements with a second sample of the liquid or solution, the dropping time recorded in each case should not deviate from the mean value by more than $\pm 5\%$. Calculate the kinematic (or kinetic) viscosity of the liquid (or solution) being examined using the average of the results of the two samplings as follows:

$$\nu (\text{mm}^2/\text{s}) = K t$$

$$\eta (\text{Pa} \cdot \text{s}) = 10^{-6} K t \rho$$

Where K is constant of the viscosimeter determined using standard liquid of known viscosity, mm^2/s^2 ;

t is the mean dropping time, s;

ρ is the density of the solution being examined, measured at the same temperature, kg/m^3 .

Method 2 Determination of kinetic viscosity with rotating viscosimeter

Rotating viscosimeters for the determination of kinetic viscosity of a liquid are based on the measurement of shearing forces during rotation in a liquid medium. Calculate the kinetic viscosity of the substance being examined as follows:

$$\eta (\text{Pa} \cdot \text{s}) = K \cdot (T/\omega)$$

Where K is constant of the rotating viscosimeter determined using standard liquid of known viscosity;

T is torque;

ω is the angular velocity.

Commonly used types of rotating viscosimeters are as follows:

(1) *Coaxial cylinder rotating viscosimeter*. Fill the gap of internal and external cylinders, which revolve individually, with the substance being examined. When one cylinder is revolving at specified angular velocity or torque, measure the angular velocity or the torque transmitted to the other cylinder, thus the viscosity of the substance being examined can be calculated.

cylinder into the substance being examined and make it revolve at specified angular velocity. Measure the torque exerted on the surface of the cylinder, thus the viscosity of the substance being examined can be calculated.

(3) Cone-plate viscosimeter. Fill the gap of a cone and a flat plate, which can revolve coaxially, with the substance being examined. Measure the torque or the angular velocity exerted on the cone or the plate, thus the viscosity of the substance being examined can be calculated.

(4) Rotating spindle viscosimeter. Select a proper spindle specified under individual monographs, immerse the spindle into the substance being examined, make the spindle revolve at specified angular velocity, and measure the torque exerted on the spindle, thus the viscosity of the substance being examined can be calculated.

Select a proper one among the commonly used rotating viscosimeters according to the character and the range of viscosity of the substance being examined.

Measure the kinetic viscosity according to the instructions for the operation of the specified rotating viscosimeter described under individual monographs.

Method 3 Determination of intrinsic viscosity with Ubbelohde-type viscosimeter

Dissolve the substance being examined in a solvent to produce a solution of appropriate concentration as described under individual monograph, filter through a No. 3 sintered glass filter and discard the initial filtrate (about 1 ml). Fill not less than 7 ml of the successive filtrate along the inner wall of tube 2 into bulb B of a clean and dry Ubbelohde-type viscosimeter. Place the viscosimeter upright in the constant temperature water bath ($25^{\circ}\text{C} \pm 0.05^{\circ}\text{C}$, unless otherwise specified) so that bulb C is entirely immersed under the surface of water. Allow it to stand in the water bath for 15 minutes. Connect a rubber tubing to tube 1 and 3 and clamp the rubber tubing connected to tube 3. Suck from the end of the rubber tubing connected to tube 1 until the solution rises to the middle of bulb C. Release the suction and remove the clamps of tube 3 and tube 1 in succession and allow the solution to drop spontaneously. Record the time required for the surface of the solution to drop from m_1 to m_2 . Repeat the operation once more. The difference between the two measurements should not be more than 0.1 second and take the average value as the dropping time of the solution being examined (T). Perform the same determination with the solvent previously filtered through a No. 3 sintered glass filter. Repeat the operation once more. The values of the two measurements should be the same and it is taken as the dropping time of the solvent (T_0). Calculate the intrinsic viscosity as follows:

$$\text{Intrinsic viscosity } [\eta] = \frac{\ln \eta_r}{C}$$

Where η_r is T/T_0 ;

C is concentration of the solution being examined, g/ml.

VI H Determination of pH Value

The pH value of an aqueous solution is determined by a pH meter using a glass electrode as the indicator electrode, and a saturated calomel electrode as the reference electrode. Metrological verification of the pH meter should be carried out at regular intervals to meet the related national requirements. Before each measurement, the pH meter should be calibrated with the standard buffer solutions prepared as follows, or those of a declared pH value accurate

department of certified reference material (CRM).

1. Standard buffer solutions used for the calibration of pH meters are prepared as follows.

(1) *Standard tetraoxalate BS* Dissolve 12.71 g of potassium tetraoxalate, previously dried at $54^{\circ}\text{C} \pm 3^{\circ}\text{C}$ for 4-5 hours and accurately weighed, in water to produce 1000 ml.

(2) *Standard biphthalate BS* Dissolve 10.21 g of potassium biphthalate, previously dried at $115^{\circ}\text{C} \pm 5^{\circ}\text{C}$ for 2-3 hours and accurately weighed, in water to produce 1000 ml.

(3) *Standard phosphate BS* Dissolve 3.55 g of anhydrous disodium hydrogen phosphate and 3.40 g of potassium dihydrogen phosphate, previously dried at $115^{\circ}\text{C} \pm 5^{\circ}\text{C}$ for 2-3 hours and accurately weighed, in water to produce 1000 ml.

(4) *Standard sodium tetraborate BS* Dissolve 3.81 g of sodium tetraborate, accurately weighed (avoid efflorescence), in water to produce 1000 ml. Preserve the solution in well closed polyethylene containers, protected from carbon dioxide in the air.

(5) *Standard calcium hydroxide BS* Use the supernatant of a saturated solution of calcium hydroxide, saturated with carbon dioxide-free water at 25°C . Store protected from carbon dioxide in the air. Discard and repeat the preparation if the solution becomes turbid.

Standard buffer solutions mentioned above must be prepared from the certified reagents for pH determination. The exact pH values of the standard buffer solutions at different temperatures mentioned above are given in the following table.

Temp. $^{\circ}\text{C}$	Standard buffer solutions ^①				
	1	2	3	4	5
0	1.67	4.01	6.98	9.64	13.43
5	1.67	4.00	6.95	9.40	13.21
10	1.67	4.00	6.92	9.33	13.00
15	1.67	4.00	6.90	9.28	12.81
20	1.68	4.00	6.88	9.23	12.63
25	1.68	4.01	6.86	9.18	12.45
30	1.68	4.02	6.85	9.14	12.29
35	1.69	4.02	6.84	9.10	12.13
40	1.69	4.04	6.84	9.07	11.98
45	1.70	4.05	6.83	9.04	11.84
50	1.71	4.06	6.83	9.01	11.71
55	1.72	4.08	6.83	8.99	11.57
60	1.72	4.09	6.84	8.96	11.45

① The standard buffer solutions are numbered here in the same sequence as shown in the preceding paragraph.

2. Announcements Operate the pH meter according to the manufacturer's instructions and pay attention to the following precautions when pH value is determined.

(1) Select two standard buffer solutions with difference in pH value of 3 units before determining test solution, and the pH value of the test solution is between that of two standard buffer solutions.

(2) Calibrate the apparatus using the primary standard buffer solution whose pH value is closer to test solution, adjusting the meter (fixed position) to read the appropriate pH value given in table mentioned above.

(3) Then calibrate the apparatus using the second standard buffer solution. The deviation should not be more than \pm

observed pH value meet the value in the table mentioned above if it is not. Repeat the adjusting procedure for fixed position and slope until the difference between the observed value on the apparatus and the value of standard buffer solution is not more than 0.02 pH units. Otherwise the apparatus should be examined or the electrode should be exchanged till comply with the requirement.

(4) The electrode should be rinsed with water and dried (or rinsed with the solution being examined) before each measurement.

(5) A highly alkaline glass electrode should be used if the pH value of the solution being examined is high. The error caused by alkalinity should be corrected if the electrode used is apt to produce such an error.

(6) The determination of the pH value of a liquid with weak

buffering capacity (e.g. water) should be conducted after the pH meter is calibrated with standard potassium biphthalate BS and repeated after the pH meter is calibrated with standard sodium tetraborate BS. The readings should not be recorded until the shift in 1 minute is within 0.05 unit. The pH value of the liquid being examined is the mean value of the two readings provided that they do not differ by more than 0.1 unit.

(7) Freshly boiled and cooled distilled water with a pH value of 5.5-7.0 should be used for preparing standard buffer solutions and dissolving the substance to be examined in pH determinations.

(8) Usually, the standard buffer solutions can be kept for 2-3 months, but should not be used if any turbidity, mould or precipitate is discovered.

Appendix VII

VII A Potentiometric Titration and Dead-stop Titration

The potentiometric method and dead-stop method may be used for the confirmation of end point or the colour change of indicators at the end point. Using a suitable electrode system, these methods can be applied to oxidation-reduction, neutralization aqueous solution or non-aqueous solution, argentometric and nitrite titrations as well as the method 1 of volumetric determination of water. Two different electrodes are used in potentiometric titration, one is an indicator electrode, whose potential is sensitive to the ionic concentration of the substance being examined, the other is a reference electrode, whose potential is constant. At the end point of the titration, the ionic concentration of the substance being examined changes sharply, causing an abrupt increase or decrease of the potential (a potential jump) of the indicator electrode.

In the dead-stop titration, a low voltage of about 50 mV is applied across two same platinum electrodes. Since the electrodes are polarized, there is no current or only a very weak current flows. When the end point is reached, a slight excess of the titrant depolarizes the electrodes and a current flows, causing a permanent deflection of the galvanometer needle. On the other hand, if non-polarized electrodes are polarized, the deflected galvanometer needle turns back to zero permanently.

Apparatus In potentiometric titration, a pH meter or potentiometer, or any model of a potentiometric titration apparatus may be used. In dead-stop titration, any model of a dead-stop titration apparatus or an assembly illustrated in the following figure may be used (as Fig. 13).

Fig. 13

the value of R is approximately equivalent to the critical damping resistance of the galvanometer

Unless otherwise specified, the sensitivity of galvanometer is

10^{-9} A per graduation for nitrite titration. The electrode system employed are shown in the following table.

Procedure	Electrode system	Note
Redox titration in aq. solution	Platinum-calomel	Platinum electrode cleaned with nitric acid containing a small quantity of ferric chloride, or with chromic acid cleaning solution
Neutralization titration in aq. solution	Glass-calomel	
Neutralization titration in non-aqueous solution	Glass-calomel	Use a saturated solution of KCl in dehydrated methanol as the salt bridge. Wash the glass electrode after each titration and immerse in water while not in use
Argento-metric titration	Silver-glass	Silver electrode cleaned with dilute nitric acid
	Silver-KNO ₃ salt bridge-calomel	
Hydrogen displacement in $-C\equiv CH$	Glass-KNO ₃ salt bridge-calomel	
Mercury potentiometric titration	Platinum-mercury-mercurous sulfate	Platinum electrode rinsed with water after being immersed in 10% (w/v) sodium thiosulfate. Platinum-mercury-mercurous sulfate electrode rinsed with water after being immersed in dilute nitric acid
Dead-stop titration	Platinum-platinum	Cleaned with nitric acid containing a small quantity of ferric chloride, or with chromic acid cleaning solution

Titration

(1) **Potentiometric Titration** Place a beaker containing the solution of the substance being examined on a magnetic stirrer, dip the electrodes into the solution and start the stirrer. Add the titrant from a burette in portions, record the potential after each addition. When the end point is nearly reached, add the titrant dropwise and record the potential. Add a few drops more after the potential jump and record the potential reading.

Potentiometric end point detection Plot an $E-V$ curve with the potential (E) as ordinate and the volume of titrant (V) as abscissa, the midpoint of the rapid ascent or descent portion is the end point. Alternatively, plot a $(\Delta E/\Delta V)-V$ curve (ΔE is the potential difference between successive measurements and ΔV is the volume of titrant added between successive measurements), the volume corresponding to the maximum of $\Delta E/\Delta V$ is the end point. Also the end point can be determined by second derivative method. Plot a $\Delta^2 E/V^2-V$ curve, calculate the difference between successive

$\Delta V^2 = 0$ is the end point.

If the colour changes of an indicator at the end point is to be checked, add the indicator solution before the titration and observe the colour changes in the vicinity of the end point.

(2) Dead-stop Titration For the indication of the end point of diazotization reaction by a nitrite titration, apply a voltage of about 50 mV across the electrodes by adjustment R_1 . Place an accurately weighed quantity of the substance being examined in a beaker on a magnetic stirrer, add 40 ml water and 15 ml of hydrochloric acid solution (1 → 2), unless otherwise specified, stir to effect dissolution. Add 2 g of potassium bromide, dip the electrodes into the solution, plunge the burette into the solution so that about 2/3 of the tip is under the liquid surface, titrate with sodium nitrite (0.1 or 0.05 mol/L) VS quickly with stirring. Withdraw the burette tip when the end point is nearly reached, rinse it with water and add the washings to the solution, continue the titration slowly until the galvanometer needle is permanently deflected.

For the indication of the end point of the method 1 of volumetric determination of water, adjust the resistance R_1 until the galvanometer shows an initial current of 5-10 μ A, titrate with Fischer reagent until the current rises to 50-150 μ A abruptly and the deflection of galvanometer needle persists for a few minutes.

VII B Non-aqueous Titration

Non-aqueous titration is carried out in a non-aqueous solvent and used mainly for the determination of organic bases; organic salts of hydrohalic acid, phosphoric acid and sulfuric acid or organic acids and the alkali metal salts of organic acids, as well as some weak organic acids.

Non-aqueous Solvents

(1) Acidic solvents The relative alkalinity of weak organic bases can be remarkably enhanced in acidic solvents. The most commonly used acidic solvent is glacial acetic acid.

(2) Basic solvents The relative acidity of weak organic acids can be remarkably enhanced in basic solvents. The most commonly used basic solvent is dimethylformamide.

(3) Amphiprotic solvents They have the properties of acids and bases. The most commonly used amphiprotic solvent is methanol.

(4) Aprotic solvents They are neither acidic nor basic, such as benzene, chloroform etc.

Method 1

Unless otherwise specified, dissolve an accurately weighed quantity, equivalent to about 8 ml of perchloric acid (0.1 mol/L) VS, of the substance being examined in 10-30 ml of glacial acetic acid, add 1-2 drops of the indicator solution as specified in the monograph and titrate with perchloric acid (0.1 mol/L) VS. The colour change of the indicator should be checked by potentiometric method and a blank determination performed to make any necessary correction.

If the temperature at which the titration is performed differs by more than 10°C from the temperature at which the perchloric acid VS was standardized, the titrant must be standardized again. If the difference does not exceed 10°C, the concentration of the titrant can be corrected as follows:

$$N_1 = \frac{N_0}{1 + 0.0011(t_1 - t_0)}$$

Where 0.0011 is the volume expansion coefficient of glacial acetic acid

t_0 is the temperature at which perchloric acid VS was standardized;

t_1 is the temperature at which the titration is performed;

N_0 is the concentration of perchloric acid VS at t_0 ;

N_1 is the concentration of perchloric acid VS at t_1 .

When the substance being examined is a salt of hydrohalic acids, the titration should be carried out after the addition of 3-5 ml of mercuric acetate TS. Phosphates and sulfates can be titrated directly, but in the case of sulfates, the reaction stops when bisulfate is formed. In the titration of nitrates, the end point should be determined by potentiometric method, because the indicator can be discoloured by nitric acid.

In non-aqueous potentiometric titration, the indicator electrode is a glass electrode and the reference electrode is a saturated calomel electrode using a saturated solution of potassium chloride in dehydrated methanol as the salt bridge.

Method 2

Unless otherwise specified, dissolve an accurately weighed quantity, equivalent to 8 ml of the titrant (0.1 mol/L), of the substance being examined in a solvent specified in the monograph, add 1-2 drops of the specified indicator solution and titrate with the specified basic titrant (0.1 mol/L). The colour change of the indicator should be checked by potentiometric method and a blank determination performed to make any necessary correction.

In the course of the titration, protect the solvent and titrant from atmospheric carbon dioxide and moisture, avoid the evaporation of the titrant.

The electrodes used in potentiometric titration is the same as that described in method 1.

VII C Oxygen Flask Combustion

In the oxygen flask method, organic substances containing halogen or sulfur are burned in a combustion flask filled with oxygen, the combustion products are absorbed with an absorbing liquid which is then analysed to determine the content of halides, sulfur etc.

Apparatus A 500, 1000 ml or 2000 ml hard glass conical flask with a tightly fitted ground glass stopper is used as the combustion flask. One end of a platinum wire 1 mm in diameter is fused into the stopper, the other end of the wire is twisted into a helix or attached to platinum gauze. The length of the wire is about 2/3 of that of the bottle (as Fig. 14 A).

Procedure Weigh accurately a specified quantity of the substance being examined (solid material should be finely powdered). Unless otherwise specified, the substance being examined is wrapped in a piece of ashless filter paper as illustrated in Fig. 14 B and C. If the substance being examined is a liquid, stick a piece of ashless filter paper (16 mm × 6 mm) onto the center of a piece of cellophane adhesive paper and another piece (6 mm × 35 mm) to the protruding part (as Fig. 14 D and as Fig. 14 E). Weigh accurately, fold the paper as illustrated in Fig. 14 F, leaving the upper end open. Add the liquid being examined dropwise to the filter paper, close the end immediately and weigh again accurately. The difference of two weighings indicate the weight of the substance being examined.

Secure the package containing the substance being examined, in the platinum gauze or helix, leaving the narrow strip out. Place the specified absorbing liquid in the flask, moisten the

Fig. 14

neck of the flask with water, fill the flask with oxygen for 1 minute. The stream of oxygen should be introduced near the surface of the liquid, so as to expel the air from the flask completely and cover the flask with a watch glass. Light the free end of the narrow strip of filter paper and immediately insert the stopper. Hold the stopper firmly in place and add a little water around the rim of the flask. When the combustion is complete, shake the flask until the fume produced is completely absorbed. Allow to stand for 15 minutes, wash the stopper and the platinum wire with a little water and add the washings to the absorbing liquid. Carry out the assay as specified in the monograph and perform a blank determination in the same manner.

Annotations Protective measures should be taken against explosion.

VII D Determination of Nitrogen

Method 1 (Macro Method) Place an accurately weighed quantity of the substance being examined equivalent to about 25-30 mg of nitrogen in a 500 ml Kjeldahl flask. Solid or semi-solid substances may be wrapped in a sheet of nitrogen-free filter paper and then transferred to the Kjeldahl flask. Add successively 10 g of potassium sulfate or anhydrous sodium sulfate, 0.5 g of powdered cupric sulfate and then add slowly 20 ml of sulfuric acid along the inner wall of the Kjeldahl flask inclined at an angle of 45°. Heat the mixture gently, keep the temperature below boiling point until frothing subsides. Raise the temperature and boil the mixture briskly until a clear, green solution is obtained. Continue the heating for 30 minutes, unless otherwise specified. Cool, add cautiously 250 ml of water along the inner wall of the flask, mix well and allow to cool. Add 75 ml of 40% sodium hydroxide solution along the inner wall of the flask to form a layer beneath the acid solution. Add a few pieces of zinc granules, connect one end of a nitrogen bulb to the flask and the other end to a condenser. The 500

ml conical flask add 50 ml of 2% boric acid solution and 10 drops of a mixed methyl red-bromocresol green IS. Dip the end of the condenser into the boric acid solution, mix the contents of the Kjeldahl flask by gentle rotation and distill. When 250 ml of distillate is collected, draw the end of the condenser above the surface of the distillate. Continue the distillation for about 1 minute and rinse the tip of the condenser with water. Titrate the distillate with sulfuric acid (0.05 mol/L) VS until the colour changes from bluish green to greyish-violet. Perform a blank determination and make any necessary correction. Each ml of sulfuric acid (0.05 mol/L) VS is equivalent to 1.401 mg of N.

Method 2 (Semi-micro Method) The distillation plant (as Fig. 15). The apparatus consists of a 1000 ml round bottom flask A, a safety tube B, a distillator C with a nitrogen bulb, a funnel D, a condenser E and a 100 ml conical flask F. G and H are two clamps.

Add a few drops of methyl red IS and a quantity of water in flask A and acidify with dilute sulfuric acid, add a few pieces of zinc granules. Add about 50 ml of water through funnel D, close clamp G, turn on the condensation water and heat the water in flask A to boiling. Stop heating when water vapour condenses and drips out of the condenser. The water in distillator C backflushes to tube B on the closure of clamp H. Open clamp G and drain the water in tube B. Close the stopcock of tube B and clamp G, dip the end of the condenser into about 50 ml of water which backflushes to C and B in turn, again drain the water in tube B. Repeat this process 2-3 times so that the apparatus inside is washed clean.

Fig. 15

Place an accurately weighed quantity of the substance being examined equivalent to 1.0-2.0 mg of nitrogen in a 30-50 ml Kjeldahl flask, add 0.3 g of potassium sulfate or anhydrous sodium sulfate and 5 drops of 30% cupric sulfate solution, then add dropwise 2.0 ml of sulfuric acid along the wall of the flask. Place a funnel on top of the Kjeldahl flask inclined at an angle of about 45°, heat the mixture gently, keep the temperature below boiling point until frothing subsides. Raise the temperature and boil the mixture briskly until a clear, green liquid is obtained. Continue the heating for 10 minutes more, unless otherwise specified, allow to cool and add 2 ml of water.

To the conical flask F add 10 ml of 2% boric acid solution and 5 drops of a mixed methyl red-bromocresol green IS. Dip the end of the condenser into the boric acid solution. Transfer the content of the Kjeldahl flask into the distillator C through funnel D, rinse the Kjeldahl flask and funnel several times with small amounts of water. Add 10 ml of 40% sodium hydroxide solution and again wash the funnel several times with small amounts of water. Close clamp G and heat the mixture in flask A and distill with stirring until the

colour of the boric acid solution changes from red to bluish green. Continue the distillation for 10 minutes more. lift the end of the condenser above the surface of the distillate, flash the condenser with steam for about 1 minute and stop the distillation and wash the tip of the condenser with water. Titrate the distillate with sulfuric acid (0.005 mol/L) VS until the colour changes from bluish green to greyish violet. Perform a blank determination and make any necessary correction (the volume of distillate collected in the blank determination should be approximately the same as that collected in the determination made with the substance being examined, i.e. about 70-75 ml). Each ml of sulfuric acid 0.005 mol/L VS is equivalent to 0.1401 mg of N. The amount of sulfuric acid should be increased when the substance being examined is more than 0.1 g so as to make the digestion complete, and the amount of sodium hydroxide solution should also be increased proportionally.

VII E Determination of Ethanol

The gas chromatographic method (Appendix V E) is used for the determination of the content expressed in percentage (ml/ml) of ethanol (C_2H_5OH) in various preparations at 20°C, unless otherwise specified.

Chromatographic system suitability Measure accurately 4 ml, 5 ml, 6 ml of dehydrated ethanol, add separately 5 ml of *n*-propanol (as internal standard) and dilute with water to 100 ml, mix well (diluted further, if necessary). Carry out the method for gas chromatography (Appendix V E), using porous polymer beads of ethylvinylbenzene cross-linked with divinylbenzene 0.25-0.18 mm in diameter as the support; maintain the column temperature at a range of 120-150°C. The performance of the instrument complies with following requirements.

- (1) The number of theoretical plates of the column is more than 700 calculated with reference to *n*-propanol.
- (2) The resolution of the peaks of ethanol and *n*-propanol is more than 2.
- (3) Carry out 5 replicate injections for each of the three solutions mentioned above, the relative standard variation of 15 correction factors is not more than 2.0%.

Procedure Measure accurately a quantity of the solution being examined (equivalent to 5 ml of ethanol) and 5 ml of *n*-propanol, dilute with water to 100 ml and mix well as the test preparation.

Measure accurately 5 ml each of dehydrated ethanol and *n*-propanol, maintained at 20°C dilute with water to 100 ml and mix well as the standard preparation.

The standard preparation and the test preparation may be further diluted if necessary.

Carry out successively 3 injections of the standard preparation, followed by 3 injections of the test preparation at the above conditions. Calculate the mean value of the correction factor obtained from the 3 injections of the standard preparation, and the mean value of ethanol content obtained from the 3 injections of the test preparation.

Annotations (1) Be sure that no peak due to impurity corresponding to the internal standard appears in the chromatogram obtained from the test preparation in the absence of internal standard.

(2) The relative deviation of individual values of the correction factor and the ethanol content should not be more than 1.5% of their mean value respectively, otherwise the

(3) System suitability must comply with the requirements described above, when any supports are used.

VII F Determination of Hydroxypropoxy

Apparatus The apparatus is shown in Fig. 16. D is the 25 ml boiling flask provided with a side arm, the outlet is fitted with an aluminium foil-jacketed fractionating column E of 95 mm long; C is an adapter bleeder tube with a capillary tip of 0.25-1.25 mm in inner diameter, inserting into the distilling flask; B is the steam generating tube (25 mm × 150 mm) with capillary tip of 0.25-1.25 mm in inner diameter, attached to the bleeder tube C; F is a condenser with a jacket of 100 mm long attached to E. G is a graduated, stoppered conical flask of 125 ml in capacity to collect the distillate. D and B are immersed in an electric heated oil bath A, adjusting to keep the temperature at 155°C.

Fig. 16

Procedure Place a quantity of the substance being examined, specified under individual monograph and accurately weighed, in the distilling flask D, add 10 ml of 30% (g/g) solution of chromium trioxide. Fill the steam generator B with water almost to the bottom of the joint, assemble the apparatus. Immerse B and D in the oil bath (glycerin may be used) until the liquid surface in the bath reach the level of the chromium trioxide solution in D. Start the cooling water in condenser, pass nitrogen gas through the flask at a rate of 1 bubble per second if necessary. Raise the temperature of the oil bath to 155°C within 30 minutes and maintain at the temperature throughout the determination to collect about 50 ml of the distillate. Detach the condenser from the fractionating column and rinse with water. Combine the washings with the distillate, add 2 drops of phenolphthalein IS, titrate with sodium hydroxide (0.02 mol/L) VS to a pH of 7.0 ± 0.1 (determined by the pH meter). Record the volume consumed, V_1 (ml), add 0.5 g of sodium bicarbonate and 10 ml of dilute sulfuric acid, allow the solution to stand until the evolution of carbon dioxide ceases. Add 1.0 g of potassium iodide, stopper the flask, shake thoroughly and allow it to stand in the dark for 5 minutes. Titrate with sodium thiosulfate (0.02 mol/L) VS to the end point, using 1 ml of starch IS, and record the consumed volume of sodium thiosulfate solution, V_2 (ml). Perform a blank test and record the consumed volumes of sodium hydroxide (0.02 mol/L) VS and sodium thiosulfate (0.02 mol/L) VS as V_3 and V_4 respectively. Calculate from the following expression:

$$\text{Percentage of } OCH_2CHOHCH = \frac{(V_1 - V_3) \times 100}{V_2 - V_4} \times 100\%$$

Where K is the blank correction coefficient M_1V_a/M_2V_b ;
 W is weight of the substance being examined, g;
 M_1 is the concentration of sodium hydroxide volumetric solution;
 M_2 is the concentration of sodium thiosulfate volumetric solution.

0.0751 is the milli-molar weight of hydroxy propoxy group.

VII G Determination of Methoxyl

Apparatus As Fig. 17. The apparatus consists of a 50 ml round bottom flask (A) with a capillary side arm of 1 mm in diameter to provide an inlet for a stream of carbon dioxide or nitrogen. The flask is fitted with an upright air condenser (E) about 25 cm long and about 9 mm in internal diameter, bent at the top into an outlet which is contracted into a glass capillary of 2 mm in diameter, dipping into a small scrubber (B) containing about 2 ml of water. The outlet of the scrubber is a tube of about 7 mm in diameter with a removable tube of 4 mm in diameter as the termination, dipping below the surface of the liquid in the first (C) of two receivers (C and D) connected in series.

Fig. 17

Procedure Place a quantity of the dry substance being examined equivalent to approximate 10 mg of methoxyl group, accurately weighed, in the boiling flask. Add 2.5 ml of melted phenol and 5 ml of hydroiodic acid and connect the apparatus in their right position. Add to the two receivers 6 ml and 4 ml respectively of a solution of 10% potassium acetate in glacial acetic acid and 0.2 ml of bromine. Pass a slow, uniform stream of carbon dioxide or nitrogen through the side arm into the flask (1-2 bubbles per second are suitable), heat the liquid gently at such a rate that the boiling liquid vapour rises halfway up the condenser (The temperature of oil bath rises to 135-140°C in about 30 minutes). Usually, the reaction is completed in 45 minutes at the temperature (The time of heating is determined by the characteristic and/or structure of substance being examined. If it contains more than two methoxyl groups, the time of heating should be 1-3 hours). Disconnect the apparatus and transfer the contents of two receivers into a 250 ml stoppered conical flask containing 5 ml of 25% sodium acetate solution. Wash the inside of two receivers with water up to about 125 ml in total volume. Add 0.3 ml of formic acid, rotate the flask until the colour of bromine is discharged. Add further 0.6 ml of formic acid, stopper the flask, shake thoroughly to remove the excess bromine and allow to stand for 1-2

hours. Titrate with sodium thiosulfate (0.1 mol/L) VS. Perform a blank test to make any necessary correction. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 0.5172 mg of methoxyl group.

VII H Tests of Fats and Fatty Oils

If a liquid sample being examined shows turbid owing to the separation of stearin, warm the container on a water bath at 50°C until the sample melts to form a clear liquid. If it does not become clear on warming, centrifuge or filter through a dry filter with hot-water jacket. Mix while hot and not solidified, weigh as many portions as needed for the various determinations, using preferably a weighing bottle having a pipette dropper, or a weighing beaker having a glass spoon. Solid sample is previously melted at a temperature not more than 10°C above its melting range, centrifuge or filter and then weigh.

Determination of relative density Carry out the method for Determination of relative density (Appendix VI A).

Determination of refractive index Carry out the method for Determination of refractive index (Appendix VI F).

Determination of melting range Carry out the method for Determination of melting range (Appendix VI C, method 2).

Determination of congealing point of fatty acids

(1) **Preparation of the fatty acids** Heat 75 g of 20% (g/g) solution of potassium hydroxide in glycerin and 50 g of the substance being examined, in a 800 ml beaker, at 150°C with frequent stirring for about 15 minutes until saponification is complete. Cool to about 100°C, add 500 ml of freshly boiled water, stir and mix well, add slowly 50 ml of sulfuric acid solution (1→4), and heat the solution until the fatty acids separate clearly as a transparent layer. Transfer the fatty acids to another beaker while hot, wash the acids with freshly boiled water repeatedly until the washing shows yellow colour to methyl orange IS. Collect the clear fatty acids in a dry small beaker while hot, add 5 ml of dehydrated ethanol, mix well and heat gently until there is no small bubbles evolved.

(2) **Determination of congealing point** Carry out the method for Determination of congealing point (Appendix VI D), using the dry fatty acid obtained above.

Determination of acid value Acid value is the number of mg of potassium hydroxide required to neutralise the free acid in 1 g of fat, fatty oil or other related substances. In its determination, sodium hydroxide (0.1 mol/L) VS may also be used.

Presumed acid value	Quantity of substance being examined/g
0.5	10
1	5
10	4
50	2
100	1
200	0.5
300	0.4

Unless otherwise specified, weigh accurately a quantity of the substance being examined as indicated in the above table, in a 250 ml conical flask, add 50 ml of a mixture of ethanol-ether (1 : 1) which has been neutralised to 1.0 ml of phenolphthalein IS with sodium hydroxide (0.1 mol/L) VS before use, shake to effect the solution (heat under reflux gently, if necessary, until the substance is completely dissolved). Titrate the resulting solution with sodium hydroxide (0.1 mol/L) VS until a pink colour which persists for 30 seconds is obtained. Take the number of ml of sodium hydroxide (0.1 mol/L) VS required as *A* and weight of substance being examined (g) as *W*, calculate the acid value from the expression:

$$\text{Acid value} = \frac{A \times 5.61}{W}$$

Use semi-micro burette of 10 ml in capacity for the titration when the acid value is less than 10.

Determination of saponification value The saponification value is the number of mg of potassium hydroxide required to neutralise and saponify the free acids and esters contained in 1 g of fat, fatty oil or other related substances. Weigh accurately a quantity of the substance, equivalent to about 250/maximum saponification value of the substance, in a 250 ml conical flask, add 25 ml, accurately measured, of ethanolic potassium hydroxide (0.5 mol/L) VS, heat under reflux for 30 minutes, cool. Rinse the inner wall of condenser and the lower part of stopper with 10 ml of ethanol, add 1 ml of phenolphthalein IS, titrate with hydrochloric acid (0.5 mol/L) VS until the pink colour just disappears. Heat the solution to boiling, continue the titration if pink colour reappears. Note the volume (ml) of hydrochloric acid (0.5 mol/L) VS required in titration for the substance being examined as (*A*). Perform a blank determination and note the volume (ml) of hydrochloric acid (0.5 mol/L) VS required in blank determination as (*B*). Calculate the saponification value from the expression:

$$\text{Saponification value} = \frac{(B-A) \times 28.05}{W}$$

Where *W* is the weight of the substance being examined, g.

Determination of hydroxyl value The hydroxyl value is the number of mg of potassium hydroxide equivalent to the hydroxyl group contained in 1 g of the substance being examined after acetylation.

Presumed hydroxyl value	Quantity of substance being examined/g
10-100	2.0
100-150	1.5
150-200	1.0
200-250	0.75
250-300	0.60

Unless otherwise specified, weigh accurately a quantity of the substance being examined as indicated in the table, in a 250 ml dry glass stoppered conical flask, add 5 ml, accurately measured, of acetylation agent (prepared by dissolving 14.4 g of *p*-toluene-sulfonic acid in 360 ml of ethyl acetate in a 500 ml conical flask, then add slowly 120 ml of acetic anhydride, mix well and allow to stand for 3 days). Moisten the glass stopper with a small quantity of pyridine, stopper the flask tightly and shake gently to effect the solution. Place the flask in a water bath at $50^{\circ}\text{C} \pm 1^{\circ}\text{C}$ for 25 minutes (shake gently at every 10 minutes interval). Cool, add 20 ml of a mixture of pyridine-water (3 : 5). After 5 minutes, add 8-10 drops of cresol red-thymol blue mixed

sodium hydroxide) (1 mol/L) VS until the colour of solution changes to grey-blue or blue. Note the volume (ml) of potassium hydroxide (or sodium hydroxide) (1 mol/L) VS required as *A*, perform a blank determination and note the volume (ml) of potassium hydroxide (or sodium hydroxide) (1 mol/L) VS required as *B*. Calculate the hydroxyl value from the expression:

$$\text{Hydroxyl value} = \frac{(B-A) \times 56.1}{W} + D$$

Where *W* is the weight of the substance being examined, g;
D is the acid value of the substance being examined.

Determination of iodine value Iodine value is the weight of iodine in g, required to halogenate 100 g of fat, fatty oil or other related substances. Weigh accurately a quantity of the substance (g), equivalent to 25/maximum iodine value of the substance being examined, in a 250 ml dry iodine flask. Dissolve it in 10 ml of chloroform, add 25 ml of iodine bromide solution, accurately measured, stopper the flask, mix well and allow to stand in a dark place for 30 minutes. Then add 10 ml of freshly prepared potassium iodide TS and 100 ml of water, mix well. Titrate with sodium thiosulfate (0.1 mol/L) VS with constant shaking until the colour changes to pale yellow, add 1 ml of starch IS, continue to titrate until the blue colour just disappears. Note the volume (ml) of sodium thiosulfate (0.1 mol/L) VS as *A*. Perform a blank determination, and note the volume (ml) of sodium thiosulfate (0.1 mol/L) VS as *B*. Calculate the iodine value from the expression:

$$\text{Iodine value} = \frac{(B-A) \times 1.269}{W}$$

Where *W* is the weight of the substance being examined, g.

Determination of peroxide value The peroxide value is the number that expresses in milliequivalents of active oxygen the quantity of peroxide contained in 1000 g of the substance. Unless otherwise specified, place accurately weighed 5 g of the substance being examined in a 250 ml iodine flask fitted with a ground-glass stopper. Add 30 ml of a mixture of 2 volumes of chloroform and 3 volumes of glacial acetic acid. Shake to dissolve the substance and add 0.5 ml of saturated potassium iodine TS. Shake for exactly 1 min, then add 30 ml of water. Titrate with sodium thiosulfate (0.01 mol/L) VS, adding the titrant slowly with continuous vigorous shaking, until the yellow colour is almost discharged. Add 5 ml of starch IS and continue the titration, shaking vigorously, until the blue colour is discharged. Note the volume (ml) of sodium thiosulfate (0.01 mol/L) VS as *A*. Carry out a blank test under the same conditions, and note the volume (ml) of sodium thiosulfate (0.01 mol/L) VS as *B* and weight of substance being examined (g) as *W*. The volume of sodium thiosulfate (0.01 mol/L) VS used in the blank titration must not exceed 0.1 ml. Calculate the peroxide value from the expression:

$$\text{peroxide value} = \frac{10(A-B)}{W}$$

Heating test Heat about 50 ml of the substance being examined, in a beaker, on a sand bath to about 280°C at a rate of 10°C per minute. Note the change in colour or other character of the oil.

Foreign matter Dissolve about 20 g, accurately weighed, in 20 ml of petroleum ether (boiling range $60-90^{\circ}\text{C}$), in a conical flask. Filter through a dry and weighed sinter-glass filter (if necessary, add more volume of petroleum ether to facilitate filtration). Wash the residue and filter with petroleum ether, dry to constant weight at 105°C and weigh accurately. The weight increased represents the content of

Water and volatile matter Weigh accurately about 5 g of the substance being examined in a bottle dried to constant weight previously, weigh accurately, dry at 105°C for 40 minutes, allow to cool in desiccator and weigh accurately. Repeat the drying at 105°C for further 20 minutes, cool and weigh again until the difference of two successive weighings is not greater than 0.001 g. The loss on drying is the content of water and volatile matter in the substance being examined.

Annotations *Preparation of iodine bromide solution* Dissolve completely 13.0 g of powdered iodine in 1000 ml of glacial acetic acid by warming in a dry glass-stoppered flask. Add promptly 2.5 ml (or 7.8 g) of bromine, stopper the flask and mix well. In order to check the quantity of bromine added, two titrations may be performed.

(1) Before the addition of bromine, pipette 20.0 ml of the solution, titrate with sodium thiosulfate (0.1 mol/L) VS, note the volume (ml) required as A.

(2) After the addition of bromine, pipette 20.0 ml of the solution, add 10 ml of freshly prepared potassium iodide TS, titrate with sodium thiosulfate (0.1 mol/L) VS, note the volume (ml) required as B. B is slightly less than 2 A. Iodine bromide solution should be kept in a well-closed container and protected from light.

VII J Assay of Vitamin A

The potency of vitamin A, expressed in units, is determined by measuring the absorbance of a test preparation at the specified wavelength, 1 Unit is equivalent to 0.344 μg of alltrans retinol acetate or 0.300 μg of alltrans retinol.

Since other materials present in the preparation, such as the oil used for dilution and some of the impurities in vitamin A, may be contributing to the absorbance of vitamin A, the measured absorbance must be corrected. Under the conditions described below, the irrelevant absorption of nonvitamin A substances can be precluded by applying a special equation for the calculation of results.

The correction equation used involves 3 points measurements, one is absorption at the maximum wavelength, the other 2 points are absorption on the two sides of the absorption peak. Since the accuracy of results depends on the precision of measurement, it is essential that the wavelength scale of the spectrophotometer should be checked before the assay.

The assay should be carried out as fast as possible and care must be taken to avoid exposure to actinic light.

Synthetic vitamin A and vitamin A in cod-liver oil are usually present in the form of ester. If the preparation being examined contains only a small amount of impurities interfering with the assay procedure and complies with the requirements mentioned in method 1, it can be dissolved directly and used for the assay, otherwise it should be saponified and extracted to eliminate any possible interference in the assay.

Method 1 Dissolve an accurately weighed quantity of the substance being examined in cyclohexane to produce a solution of 9-15 units per ml. Find out the wavelength of maximum absorption, measure the absorbances at the following listed wavelengths (Appendix IV A). Calculate the relative absorbances from the ratio of absorbances at each wavelength to the absorbance at 328 nm, and calculate the value of $E_{1\%}^{1\text{cm}}$ at 328 nm.

Wavelength/nm	Relative absorbance
300	0.555
316	0.907
328	1.000
340	0.811
360	0.299

If the wavelength of maximum absorption lies between 326 and 329 nm, and the observed relative absorbances are within ± 0.02 of those listed in the table, the potency of vitamin A in units per g can be calculated from the expression:

$$E_{1\%}^{1\text{cm}}(328\text{ nm}) \times 1900$$

If the wavelength of maximum absorption lies between 326 and 329 nm, but the relative absorbances exceed ± 0.02 of those listed in the table, the absorbance at 328 nm can be corrected as follows:

$$A_{328}(\text{corr.}) = 3.52 (2 A_{328} - A_{316} - A_{340})$$

If the corrected absorbance at 328 nm is within 97%-103% of the uncorrected absorbance, the potency of vitamin A should still be calculated from the uncorrected absorbance. If the corrected absorbance is within 85%-97% of the uncorrected absorbance, the potency of vitamin A should be calculated from the corrected absorbance.

If the corrected absorbance exceeds 85%-97% of the uncorrected absorbance, or the absorption wavelength is not within 326-329 nm, the preparation being examined should be assayed by method 2.

Method 2 Place an accurately weighed quantity (not more than 2 g) of the substance being examined equivalent to not less than 500 Units of total vitamin A in a saponification flask. Add 30 ml of ethanol and 3 ml of 50% (g/g) potassium hydroxide solution. Boil on a water bath for 30 minutes under a reflux condenser. Allow to cool and rinse the inner wall of the condenser with 10 ml of water. Transfer the saponified liquid to a separator (use glycerin starch paste as the lubricant for the stopcock of the separator). Wash the flask with 60-100 ml of water subdivide in several portions, add the washings to the separator and extract with 4 quantities (60, 40, 40 ml and 40 ml) of peroxide-free ether successively, shaking for 5 minutes in each extraction. Combine the ether extracts and wash with several 100 ml portions of water by swirling gently to avoid emulsification until the water layer does not become red on the addition of phenolphthalein IS. Filter the ether layer through a funnel containing anhydrous sodium sulfate and absorbent cotton wool. Wash the funnel with ether and combine the washings and the filtrate in a 250 ml volumetric flask, dilute with ether to volume and mix well. Transfer an accurately measured quantity of the ethereal solution into an evaporating dish, warm the dish on a water bath at low temperature until the volume of ethereal solution is reduced to 5 ml. Place the dish in a vacuum desiccator and remove the remaining ether by suction. Dissolve the residue immediately in isopropanol, measured accurately, to produce a solution of 9-15 Units per ml. Find out the wavelength of maximum absorption and measure the absorbances at 300 nm, 310 nm, 325 nm and 334 nm (Appendix IV A). If the wavelength of maximum absorption lies between 323 nm and 327 nm and the ratio of A_{300}/A_{325} does not exceed 0.73, the absorbance at 325 nm can be corrected as follows:

$$A_{325}(\text{corr.}) = 6.815 A_{325} - 2.555 A_{310} - 4.260 A_{334}$$

The potency of vitamin A in units per g can be calculated

$$E_{1\text{cm}}^{1\%}(325\text{ nm, corr.}) \times 1830$$

except that, when the corrected absorbance is within 97%-103% of the uncorrected absorbance, the potency of vitamin A should be calculated from the uncorrected absorbance. If the wavelength of maximum absorption does not lie between 323 nm and 327 nm or the ratio of A_{300}/A_{325} exceeds 0.73, it is necessary to measure accurately another quantity (equivalent to 300-400 Units of vitamin A) from the 250 ml of ethereal extract obtained after saponification. Evaporate the ether under reduced pressure to about 5 ml and continue the evaporation to dryness under a current of nitrogen. Dissolve the residue immediately in exact 3 ml of methanol, measure accurately 500 μl and inject into a column system for purification described under method II in Assay of Vitamin D (Appendix VII K). Accurately collect the eluate containing vitamin A and evaporate to dryness under a current of nitrogen. Continue the procedure described above beginning at the words "Dissolve the residue immediately in isopropanol...", and calculate the content of vitamin A.

Annotations (1) *Glycerin starch paste* To 22 g of glycerin add 9 g of soluble starch and heat at 140°C for 30 minutes with stirring, allow to cool.

(2) *Peroxide-free ether* Carry out the test for peroxide as described under the monograph of Anaesthetic Ether. If the reagent fails to comply with the requirements, shake it with 5% sodium thiosulfate solution, allow to stand, separate the ether layer. Wash the ether layer with water and distil, discard the initial and final aliquots of the distillate, each about 5% of the total volume. Examine the remaining distillate for peroxide, it should comply with the requirement.

VII K Assay of Vitamin D

High performance liquid chromatographic method (Appendix V D) is used for determination of vitamin D and *pre*-vitamin D content (includes vitamin D₂ and D₃) and calculated with reference to the total amount of vitamin D in units of activity, each unit is equivalent to 0.025 μg of vitamin D. The method is applicable to the assay of vitamin D in drug substances, preparations, vitamin A and D preparations, and cod liver oil. Throughout this assay, protect the solutions containing, or derived from the substance being examined and the reference standard from the atmosphere and light, preferably operate under inert gas and in darksome room.

Method 1 is used for assay of the substance being examined that no retinol and impurities which interfere the determination; otherwise it should be treated according to Method 2 before assay; if the impurities still interfere the determination even after the treatment by Method 2, proceed the assay by Method 3.

Method 1

Stock solution of reference substance Dissolve 25 mg of vitamin D₂ or D₃ CRS, accurately weighed, according to the kind of vitamin D of the substance being examined, in 80 ml *iso*-octane by ultrasonication within one minute without heating, make up volume to 100 ml with *iso*-octane in an amber coloured volumetric flask, mix well, fill with nitrogen, and keep below 0°C.

For the assay of vitamin D₂, a vitamin D₃ CRS solution should be also prepared for the system suitability test.

Internal standard solution Prepare a solution of 1 mg of

Chromatographic system and system suitability test Use a column packed with silica gel and *n*-hexane-*n*-amyl alcohol (997 : 3) as the mobile phase, the wavelength of detector is 254 nm. Measure about 5 ml of vitamin D₃ CRS stock solution in a glass stoppered flask, pass nitrogen in it to form an inert gas blanket, stopper tightly, put it in a water bath of 90°C for 1 hour, then cool quickly to room temperature, add 5 ml of *n*-hexane and mix well. Fill the solution in a 1 cm quartz cell, incline the cell at 45°. Excite under two 8 W ultraviolet lamps of 254 nm and 365 nm wavelength each at a distance of 5-6 cm for 5 minutes to convert some vitamin D₃ to *pre*-vitamin D₃, *trans*-vitamin D₃, and tachysterol D₃. Inject this solution into chromatographic column for five times, the standard deviation of peak areas of vitamin D₃ is not more than 2.0%; the resolution between *pre*-vitamin D₃ (the relative retention time with respect to vitamin D₃ is about 0.5) and *trans*-vitamin D₃ (the relative retention time with respect to vitamin D₃ is about 0.6), and that between vitamin D₃ and tachysterol D₃ (the relative retention time with respect to vitamin D₃ is about 1.1) should be larger than 1.0.

Determination of correction factor Accurately measure 5 ml of each of the CRS stock solution and internal standard solution, dilute to 50.00 ml with *n*-hexane, mix well. Inject a suitable volume into the chromatograph column and calculate the correction factor of vitamin D (f_1). Accurately measure another 5 ml of the CRS stock solution into a 50 ml volumetric flask, add a grain of 2,6-di-*tert*-butyl-*p*-cresol crystal, pass nitrogen and stopper the flask. Put it in a water bath of 90°C for 1.5 hours, cool quickly to room temperature; add accurately 5 ml of internal standard solution, dilute to volume with *n*-hexane and mix well. Inject a suitable volume into the chromatographic column, calculate the correction factor for conversion of *pre*-vitamin D to vitamin D (f_2):

$$f_2 = (A_s \times m_i - f_1 \times m_s \times A_{i1}) / (A_{i2} \times m_s)$$

Where A_s is the peak area of internal standard, m_i is the content of CRS, f_1 is the correction factor of vitamin D, m_s is the content of internal standard, A_{i1} is the peak area of vitamin D, and A_{i2} is the peak area of *pre*-vitamin D.

Assay Inject a quantity of the solution of substance being examined prepared as specified in the monograph, calculate the total content of vitamin D (m_t) from the content of vitamin D and *pre*-vitamin D:

$$m_t = (f_1 \times A_{i1} + f_2 \times A_{i2}) \times m_s / A_s$$

Where A_{i1} is the peak area of vitamin D, A_{i2} is the peak area of *pre*-vitamin D, m_s is the quantity of internal standard added, and A_s is the peak area of internal standard.

Method 2

Place an accurately weighed quantity (not more than 2 g) of the substance being examined equivalent to not less than 600 Units of total vitamin D in a saponification flask. Add 30 ml of ethanol, 0.2 g of ascorbic acid, and 3 ml of 50% (g/g) potassium hydroxide solution (if the substance being examined is 3 g, add 4 ml). Boil on a water bath for 30 minutes under reflux. Allow to cool and wash the inner wall of the condenser with 10 ml of water. Transfer the saponified liquid to a separator. Wash the flask with 60-100 ml of water in portions, add the washings to the separator and extract with 3 quantities (60, 40, 40 ml) of peroxide-free ether. Combine the ether extracts and wash with several portions of 100 ml of water cautiously to avoid emulsification until the water layer does not become red on the addition of phenolphthalein IS, allow to stand until the layers are separated completely. Discard the aqueous layer, to the ethereal layer add several pieces of dry filter paper strip and

the ether solution in a flask, wash the separator and filter paper with a few ml of ether and combine it into the flask, evaporate the ether at low temperature to about 5 ml. Remove the residual ether with a stream of nitrogen. Immediately dissolve the residue in exact 3 ml of methanol by ultrasonication. Transfer the solution into a centrifuge tube and centrifugalize, the supernatant liquid is used as test solution A.

Fractionating collection of vitamin D by high performance liquid chromatography Accurately measure 500 μ l of test solution A into the column packed with octadecylsilane bonded silica gel, using a mixture of methanol-acetonitrile-water (50 : 50 : 2) as the mobile phase and the wavelength of detector is 254 nm. Observe the chromatogram that the peak of vitamin D is overlapped with the peak of *pre*-vitamin D, and they are separated from the peak of vitamin A and other peaks due to impurities. Accurately collect the total fractions of mobile phase containing the total amount of vitamin D and *pre*-vitamin D into a flask, remove the mobile phase quickly with a stream of nitrogen. Accurately add a suitable volume of internal standard solution (not less than 2 ml, which contains 50-140 Units of vitamin D per ml, the proportion of internal standard and vitamin D in weight by weight is about 4:1) immediately, stopper tightly, dissolve it by ultrasonication, used as test solution B.

Assay Perform the method of Assay described under Method 1, the injection volume is 100-200 μ l.

Method 3

Preparation of the test solution Prepare test solution A according to the method described under the individual monography. Perform the fractionating collection of vitamin D as described under Method 2, after the mobile phase is removed with nitrogen stream, add immediately 2 ml of *iso*-octane to dissolve the residue, pass nitrogen to drive off the air in the flask, stopper tightly. Put in a water bath of 90°C for 1.5 hours, evaporate immediately the solvent with nitrogen stream in 2 minutes and add accurately 2 ml of *n*-hexane to dissolve the residue. This is used as the test solution C.

Preparation of reference solution Accurately measure a quantity of the CRS stock solution above method 1, dilute to produce a solution of 50 Units/ml of vitamin D in *iso*-octane, accurately measure 2 ml into a flask and proceed the treatment as described under Preparation of test solution beginning at the words "pass nitrogen to drive...".

Assay The parameters are described under Method 1, inject 200 μ l, accurately measured, of the CRS solution and the test preparation alternately, calculate vitamin D content by external standard method from their peak areas.

Appendix VIII

VIII A Limit Test for Chlorides

Test preparation Unless otherwise specified, weigh a quantity of the substance being examined as prescribed under individual monographs, dissolve it in about 25 ml of water (if the solution is alkaline, neutralize with nitric acid dropwise). Add 10 ml of dilute nitric acid and filter if necessary, transfer the solution to a 50 ml Nessler cylinder, add water to produce 40 ml and mix well.

Reference preparation Transfer a volume of sodium chloride standard solution as prescribed under individual monographs to a 50 ml Nessler cylinder, add 10 ml of dilute nitric acid and sufficient water to produce 40 ml, mix well.

Procedure To each of the Nessler cylinders described above add 1.0 ml of silver nitrate TS, dilute with water to 50 ml and mix well. Allow to stand in the dark for 5 minutes, compare the opalescence produced by viewing down the vertical axis of the cylinders against a black background. If the test preparation is coloured, unless otherwise specified, place two aliquots of the test preparation in Nessler cylinders separately, to one cylinder add 1.0 ml of silver nitrate TS, mix and allow to stand for 10 minutes, filter the content of the cylinder repeatedly until the filtrate is perfectly clear, then add the prescribed volume of standard sodium chloride solution to the filtrate, use it as the reference preparation. To the other cylinder add 1.0 ml of silver nitrate TS, use it as the test preparation. Dilute the test preparation and the reference preparation with water to 50 ml, mix well and allow to stand in the dark for 5 minutes, compare the opalescence as described above.

Sodium chloride standard solution Dissolve 0.165 g of sodium chloride in water in a 1000 ml volumetric flask, and dilute to the volume, mix well (stock solution). Transfer 10 ml of the stock solution, accurately measured, into a 100 ml volumetric flask immediately before use, dilute with water to the volume and mix well (each ml is equivalent to 10 µg of Cl).

Annotations The filter paper used in this test, if necessary, should be previously washed with water containing nitric acid until the washing is free from chlorides.

VIII B Limit Test for Sulfates

Test preparation Unless otherwise specified, weigh a quantity of the substance being examined as prescribed under individual monographs, dissolve it in about 40 ml of water, neutralize the solution with hydrochloric acid and filter if

add 2 ml of dilute hydrochloric acid and mix well.

Reference preparation Transfer a volume of potassium sulfate standard solution as prescribed under individual monographs to a 50 ml Nessler cylinder, dilute with water to about 40 ml, add 2 ml of dilute hydrochloric acid and mix well.

Procedure To each of the Nessler cylinders described above add 5 ml of 25% barium chloride solution, dilute with water to 50 ml and mix well, allow to stand for 10 minutes and compare the opalescence produced by viewing down the vertical axis of the cylinder against a black background. If the test preparation is coloured, unless otherwise specified, place two aliquots of the test preparation in Nessler cylinders separately, to one cylinder add 5 ml of 25% barium chloride solution, mix well and allow to stand for 10 minutes, filter the content of the cylinder repeatedly until the filtrate is perfectly clear, then add the prescribed volume of potassium sulfate standard solution to the filtrate and use it as the reference preparation. To the other cylinder add 5 ml of 25% barium chloride solution, use it as the test preparation. Dilute the test preparation and the reference preparation with water to 50 ml, mix well and allow to stand for 10 minutes, compare the opalescence as described above.

Potassium sulfate standard solution Dissolve 0.181 g of potassium sulfate in water in a 1000 ml volumetric flask, and dilute to the volume, mix well (each ml is equivalent to 100 µg of SO₄).

VIII C Limit Test for Sulfides

Apparatus Use the same apparatus as shown in Fig. 20 under Limit Test for Arsenic (Appendix VIII J, method 1), except that there is no lead acetate cotton wool in tube C and a lead acetate test paper is placed between D and E instead of mercuric bromide test paper.

Sodium sulfide standard solution Dissolve 1.0 g of sodium sulfide in 200 ml of water, transfer 50 ml of the solution, accurately measured, into an iodine flask, add 25.0 ml of iodine (0.05 mol/L) VS and 2 ml of hydrochloric acid, mix well. Titrate with sodium thiosulfate (0.1 mol/L) VS until the end point is nearly reached, add 2 ml of starch IS and continue the titration until the blue colour disappears. Perform a blank determination and make any necessary correction. Each ml of iodine (0.05 mol/L) VS is equivalent to 1.603 mg of S. Dilute an accurately measured volume of the sodium sulfide solution with water to produce a solution containing 5 µg of S per ml. This standard solution should be freshly prepared.

Standard sulfide stain Transfer 1 ml of sodium sulfide standard solution, accurately measured, into flask A, add 10 ml of water and 10 ml of dilute hydrochloric acid. Fit

paper on its top. Immerse the flask in a water bath at 80-90°C for 10 minutes, a stain is produced on the test paper.

Procedure Unless otherwise specified, place a quantity of the substance being examined as prescribed under individual monographs in flask A, add 10 ml of water (or ethanol for oily substances) and 10 ml of dilute hydrochloric acid. Fit tube C into flask A immediately proceed as directed above, any stain produced is not more intense than the standard stain.

VIII D Limit Test for Selenium

Selenium standard solution Dissolve an accurately weighed quantity of sodium selenite of known purity in nitric acid solution (1→30) to produce a solution of 1.00 mg Se per ml. Transfer 5 ml of this solution, accurately measured, into a 250 ml volumetric flask, dilute with water to the volume and mix well; transfer 5 ml of this solution, accurately measured, into a 100 ml volumetric flask, add water to the volume and mix well (each ml is equivalent to 1 µg of Se).

Reference preparation Place 5 ml of the selenium standard solution, accurately measured, in a 100 ml beaker, add 25 ml of nitric acid solution (1→30) and 10 ml of water, mix well.

Test preparation Unless otherwise specified, weigh a quantity of the substance being examined as prescribed under individual monographs. Carry out the method for oxygen flask combustion (Appendix VII C) in a 1000 ml combustion flask, using 25 ml of nitric acid solution (1→30) as the absorbing liquid. After the combustion of organic matter is completed, transfer the absorbing liquid and washings to a 100 ml beaker.

Procedure Treat the two preparations concomitantly as follows: adjust pH to 2.0 ± 0.2 with ammonia TS, transfer to a separator, wash the beaker with successive small quantities of water and add the washings to the same separator, dilute with water to 60 ml. Add 1 ml of hydroxylamine hydrochloride solution (1→2) and 5.0 ml of diaminonaphthalene TS, mix well and allow to stand at room temperature for 100 minutes. Add 5.0 ml of cyclohexane, shake vigorously for 2 minutes, allow to separate and discard the aqueous layer. Remove any trace of water in the cyclohexane layer with anhydrous sodium sulfate and measure its absorbance at 378 nm (Appendix IV A). The absorbance of the test preparation is not greater than that of the reference preparation.

Annotations *Determination of Se in sodium selenite* Place about 0.1 g of sodium selenite, accurately weighed, in an iodine flask, dissolve it in 50 ml of water, add 3 g of potassium iodide and 10 ml of hydrochloric acid solution (1→2), insert the stopper and allow to stand for 5 minutes. Add 50 ml of water and titrate with sodium thiosulfate (0.1 mol/L) VS until the colour changes from reddish brown to orange red. Add 2 ml of starch IS and continue the titration until the colour changes from blue to violet-red. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 4.324 mg of Na_2SeO_3 or 1.974 mg of Se.

VIII E Limit Test for Fluorides

fluoride previously dried for 1 hour at 105°C, accurately weighed, in water in 100 ml volumetric flask and dilute to volume, mix well. Dilute 20 ml, accurately measured, of the solution with water in another 100 ml volumetric flask to volume and mix well. Each ml is equivalent to 20 µg of F.

Test solution Carry out the method for oxygen flask combustion (Appendix VII C), using a quantity of the substance being examined equivalent to about 2.0 mg of fluorine, accurately weighed, and 20 ml of water as the absorbing liquid. Shake for further 2-3 minutes after combustion and absorption are complete, rinse the stopper, platinum wire and gauze with water. Combine the washing liquids with the absorbing liquid in an 100 ml volumetric flask, dilute with water to volume and mix well.

Procedure To each 2 ml of the fluoride standard solution and the test solution, accurately measured, in 50 ml volumetric flasks separately add 10 ml of alizarin fluorine blue TS, mix well, add 3.0 ml of a solution of 12% sodium acetate in dilute acetic acid and 10 ml of cerous nitrate TS respectively, mix well and allow the solutions to stand in the dark for 1 hour. Carry out the method of colourimetry (Appendix IV A), using absorption cells, measure the absorbances at 610 nm and calculate the content of F.

VIII F Limit Test for Cyanides

Method 1

Apparatus Use the same apparatus as shown in Fig. 20 under Limit Test for Arsenic (Appendix VIII J, method 1), except that there is no lead acetate cotton wool in tube C and an alkaline ferrous sulfate paper (freshly prepared by moistening a piece of filter paper with 1 drop each of ferrous sulfate TS and sodium hydroxide TS) is placed between D and E instead of mercuric bromide test paper.

Procedure Unless otherwise specified, place a quantity of the substance being examined as prescribed under individual monographs in flask A, add 10 ml of water and 3 ml of 10% tartaric acid solution. Fit tube C immediately into the mouth of flask A with the alkaline ferrous sulfate test paper on its top. Boil gently for 1 minute, remove the test paper, add 1 drop each of ferric chloride TS and hydrochloric acid, no green or blue colour is developed within 15 minutes.

Method 2

Apparatus See Fig. 18, A is a 200 ml glass-stoppered conical flask, B is a 5 ml beaker which can be placed into the flask A.

Fig. 18

Potassium cyanide standard solution Weigh accurately 25 mg of potassium cyanide into a 100 ml volumetric flask, dissolve it in water and dilute to volume, mix well. Measure accurately 5 ml of this solution to a 250 ml volumetric flask, dilute with water to volume and mix well (each ml is equivalent to 2 µg of CN).

This standard solution should be freshly prepared.

Procedure Unless otherwise specified, place a quantity of the substance being examined as prescribed under individual monographs in flask A, add sufficient water to produce 5 ml and mix well. Place 1.0 ml of lithium trinitrophenol TS in the beaker, stopper the flask and allow to stand overnight in a dark place. Remove the beaker, add 2.0 ml of water to the solution in the beaker and mix well. Measure its absorbance at 500 nm (Appendix IV A), the absorbance does not exceed that of a solution obtained in the same manner with a volume of potassium cyanide standard solution as prescribed under individual monographs.

VIII G Limit Test for Iron

Unless otherwise specified, dissolve a quantity of the substance being examined as described under individual monographs in water to 25 ml. Transfer the solution to a 50 ml Nessler cylinder, add 4 ml of dilute hydrochloric acid and 50 mg of ammonium persulfate. Dilute with water to about 35 ml, add 3 ml of 30% ammonium thiocyanate solution and sufficient water to produce 50 ml, mix well. Compare the colour produced with that of a reference preparation containing a volume of standard iron solution as prescribed under individual monographs and subjected to the same treatment.

If the colour of the test preparation is of a different shade as compared with that of the reference preparation, transfer each preparation to a separator and extract with 20 ml of *n*-butanol. Transfer each of the *n*-butanol layers to a 50 ml Nessler cylinder, add *n*-butanol to 25 ml and compare the colour of the two solutions.

Iron standard solution Dissolve 0.863 g of ferric ammonium sulfate $\text{FeNH}_4(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$, accurately weighed, in water in a 1000 ml volumetric flask, add 2.5 ml of sulfuric acid, dilute with water to volume and mix well. This is the stock solution.

Transfer 10 ml of the stock solution, accurately measured, to a 100 ml volumetric flask immediately before use, add water to volume and mix well (each ml is equivalent to 10 µg of Fe).

VIII H Limit Test for Heavy Metals

The term "heavy metals" refers to those metals that react with thioacetamide or sodium sulfide under the specified conditions to produce a coloured compound.

Lead standard solution Dissolve 0.160 g of lead nitrate in 5 ml of nitric acid and 50 ml of water in a 1000 ml volumetric flask, dilute to volume with water, mix well (stock solution).

Transfer 10 ml of the stock solution, accurately measured, to a 100 ml volumetric flask, dilute with water to volume and mix well (each ml is equivalent to 10 µg of Pb). This

All glassware used for the preparation and preservation of standard lead solution should be free from lead.

Method 1

Unless otherwise specified, use two 25 ml Nessler cylinders. To cylinder A add the specified volume of lead standard solution and 2 ml of acetate BS (pH 3.5), dilute with water or other solvent as specified under individual monographs to 25 ml. To cylinder B add 25 ml of the test preparation containing a quantity of the substance being examined as specified under individual monographs.

If the original test preparation is coloured, it may be matched by the addition of a few drops of dilute caramel solution or other suitable solution to cylinder A.

To each cylinder add 2 ml of thioacetamide TS and mix well, allow to stand for 2 minutes, compare the colour produced by viewing down the vertical axis of the cylinders against a white background. The colour produced in cylinder B is not more intense than that produced in cylinder A.

If the colour cannot be matched by the addition of caramel solution, dissolve the double amount of the substance being examined and the reagent, in water or other solvent as specified under individual monographs to produce 30 ml of test preparation. Divide the test preparation into two equal portions and transfer to Nessler cylinders A and B. To cylinder B add sufficient water or other solvent as specified under individual monographs to produce 25 ml. To cylinder A add 2 ml of thioacetamide TS, mix well and allow to stand for 2 minutes, filter through filter membrane of 3 µm in porosity. To cylinder A add the prescribed volume of lead standard solution and dilute with water of other solvent as specified under individual monographs to produce 25 ml. Then add 2 ml of thioacetamide TS to cylinder B and 2 ml of water to cylinder A and compare the colour as described above.

If the substance being examined contains a ferric salt which interferes with the test, 0.5-1.0 g of ascorbic acid should be added to each cylinder.

Unless otherwise specified, evaporate the same quantity of the same reagents to dryness in a porcelain dish. Dissolve the residue in 2 ml of acetate buffer (pH 3.5) and 15 ml of water. Transfer the solution to a Nessler cylinder, add the specified quantity of lead standard solution and water to 25 ml. The solution is used as reference solution for the test solution which is prepared by using more than 1.0 ml of hydrochloric acid or equivalent amount of dilute hydrochloric acid, 2 ml of ammonia TS or by treating with other reagents.

Method 2

Unless otherwise specified, use the residue obtained from the Determination of Residue on Ignition, add 0.5 ml of nitric acid, evaporate to dryness, heat until nitrous oxide fumes are no longer evolved (or alternatively, ignite a quantity of the substance being examined in a crucible until thoroughly charred, cool, moisten the residue with 0.5-1.0 ml of sulfuric acid, ignite at a low temperature until sulfurous acid fumes are no longer evolved, add 0.5 ml of nitric acid, evaporate to dryness, heat until nitrous oxide fumes are no longer evolved and ignite at 500-600°C until the incineration is complete). Cool, add 2 ml of hydrochloric acid, evaporate to dryness on a water bath, add 15 ml of water, followed by ammonia TS dropwise until the solution is neutral to phenolphthalein IS, then add 2 ml of acetate BS (pH 3.5) and warm to effect dissolution. Transfer the resulting solution to Nessler cylinder B, dilute with water to 25 ml and proceed as described under method 1. The reference preparation should be prepared as follows. Place the same quantity of the same reagents used for the preparation of test solution in a porcelain dish and evaporate to dryness, dissolve in 2 ml of acetate BS (pH

3.5) and 15 ml of water, transfer to the Nessler cylinder A and add the specified volume of standard lead solution, dilute with water to 25 ml.

Method 3

Unless otherwise specified, dissolve a quantity of the substance being examined in 5 ml of sodium hydroxide TS and 20 ml of water. Transfer the solution to a Nessler cylinder, add 5 drops of sodium sulfide TS and mix well, the colour produced is not more intense than that of a reference preparation containing the specified volume of lead standard solution and treated in the same manner.

Method 4

Apparatus The filter holder is composed of tightly sealed upper and lower parts with screw thread, washer, filter membrane and nylon pad web (as Fig. 19).

Fig. 19

A is the upper cap part of the filter holder, the entrance may be fitted with a 50 ml syringe; B is joint; C is washer (external diameter is 10 mm, internal diameter is 6 mm); D is filter membrane with 10 mm in diameter and 3.0 μ m of porosity, soaked in water for more than 24 hours before use; E is nylon pad web (porosity diameter is not required) with 10 mm in diameter; F is the lower part of the filter holder, the exit is fitted with a suitable rubber tube.

Lead standard stain Measure accurately a quantity of lead standard solution to a small beaker, dilute to 10 ml with water or other solvent as specified under individual monographs, add 2 ml of acetate BS (pH 3.5) and 1.0 ml of thioacetamide TS, mix well, allow to stand for 10 minutes. Transfer to the above filter holder with a 50 ml syringe and filter it on applying an even pressure (filter rate is about 1 ml per minute), then place the filter membrane on a piece of filter paper and dry it.

Procedure Transfer 10 ml of the test preparation prepared as described under individual monographs and proceed as described under Lead standard stain, beginning with the words "add 2 ml of acetate BS (pH 3.5)". Any stain produced is not more intense than the standard stain.

If the test preparation is coloured or turbid, filter it previously with filter membrane. If the filter membrane is contaminated, replace it with another filter membrane and repeat the filtration until the filter membrane remains uncontaminated. Proceed as described under Lead standard stain, beginning at the words "add 2 ml of acetate BS (pH 3.5)", using 10 ml of filtrate, and compare the stain as described above.

VIII J Limit Test for Arsenic

Arsenic standard solution Dissolve 0.132 g of arsenic trioxide in 5 ml of 20% sodium hydroxide solution in a 1000 ml volumetric flask, neutralize with dilute sulfuric acid and add 10 ml in excess, dilute with water to volume and mix well, as a stock solution.

Transfer 10 ml of the stock solution, accurately measured, to a 1000 ml volumetric flask immediately before use, add 10 ml of dilute sulfuric acid, dilute with water to volume and mix well (each ml is equivalent to 1 μ g of As).

Method 1 (Gutzeit's method)

Apparatus (as Fig. 20). A is a 100 ml conical flask with standard ground joint; B is a standard hollow ground glass stopper connected to glass conduit C (external diameter 8.0 mm, internal diameter 6.0 mm), the total length of B and C is about 180 mm, D is a plastic screw, the upper part of which has an aperture 6.0 mm in diameter and the lower part of which has an aperture 8.0 mm in diameter; E is a plastic screw cap which has an aperture 6.0 mm in diameter. A wad of lead acetate cotton wool weighing about 60 mg is packed into tube C to a depth of about 60-80 mm. A disc of mercuric bromide test paper is placed between the contacting surfaces of D and E.

Fig. 20

Arsenic standard stain Place 2 ml of standard arsenic solution, accurately measured, in flask A, add 5 ml of hydrochloric acid and 21 ml of water. Then add 5 ml of potassium iodide TS and 5 drops of acid stannous chloride TS, allow to stand at room temperature for 10 minutes and add 2 g of zinc granules. Insert the stopper B and conduit C into the mouth of flask A and immerse the flask in a water bath at 25-40°C for 45 minutes. Remove the mercuric bromide test paper.

Use arsenic standard solution instead of the substance being examined and treat it in the same manner described under the individual monographs, prepare arsenic standard stain as described above, if the substance being examined needs to be destroyed organically before carrying out the limit test for arsenic.

Procedure Transfer the test preparation prepared as described under individual monographs to flask A and

proceed as described under Arsenic standard stain, beginning with the words "Then add 5 ml of potassium iodide TS..." Any stain produced is not more intense than the standard stain.

Method 2 (Silver diethyldithiocarbamate method)

Apparatus (as Fig. 21) A is a 100 ml conical flask with standard ground joint; B is a standard hollow ground glass stopper connected to glass conduit C (at one end, the external diameter is 8.0 mm and the internal diameter is 6.0 mm; the other end is in length of 180 mm, in external diameter of 4 mm and in internal diameter of 1.6 mm, the internal diameter of sharp end is 1 mm). D is a glass tube with flat bottom (length 180 mm, internal diameter 10 mm, and with a graduation at 5.0 ml). A wad of cotton wool previously moistened with lead acetate TS and dried weighing about 60 mg is packed into conduit C to a depth of about 80 mm, and measure accurately 5 ml of silver diethyldithiocarbamate TS in tube D.

Fig. 21

Standard arsenic reference solution Transfer 5 ml of arsenic standard solution as described under Method 1 to flask A, accurately measured, add 5 ml of hydrochloric acid and 21 ml of water. Then add 5 ml of potassium iodide TS and 5 drops of acid stannous chloride TS, allow to stand at room temperature for 10 minutes and add 2 g of zinc granules. Connect conduit C into flask A immediately, and allow the evolved arsine to enter tube D. Immerse the flask A in a water bath at 25-40°C for 45 minutes. Remove tube D, add chloroform to the graduation, mix well.

Use arsenic standard solution instead of the substance being examined and treat in the same manner described under the individual monographs, prepare arsenic standard stain as described above, if the substance being examined needs to be destroyed organically before carrying out the limit test for arsenic.

Procedure Transfer the test preparation prepared as described under individual monographs to flask A and proceed as described under standard arsenic reference solution, beginning with the words "Then add 5 ml of potassium iodide TS..."

Compare the above two solutions against a white background. Any colour produced by the test preparation is

reference solution. If necessary, determine the absorbance at the wavelength of 510 nm, using silver diethyldithiocarbamate TS as the blank (Appendix IV A).

Annotations (1) Make sure that a blank test produces no arsenic stain or only a barely visible stain.

(2) The preparation of standard stain and test stain must be carried out concomitantly.

(3) The zinc granules should be arsenic free and the size is such that they will pass through a No. 1 sieve. The quantity used should be increased and the reaction time should be extended up to 1 hour, if the granules are of larger size.

(4) Lead acetate cotton wool is prepared by immersing 1.0 g of absorbent cotton in 12 ml of a mixture of equal volumes of lead acetate TS and water. Drain off excess liquid and make the cotton wool fluffy, allow it to dry at a temperature below 100°C and preserve in a well closed glass container.

VIII K Limit Test for Ammonium

Unless otherwise specified, place a quantity of the substance being examined as prescribed under individual monographs in a distillation flask, add 200 ml of ammonia-free distilled water and 1 g of magnesium oxide, heat to distill, introduce the distillate to a 50 ml Nessler cylinder containing 1 drop of dilute hydrochloric acid TS and 5 ml of ammonia-free distilled water. When the volume of the distillate is about 40 ml, stop distillation, add 2 ml of alkaline mercuric potassium iodide TS, mix well, allow to stand for 15 minutes. Compare the colour produced with that of a reference solution containing 2 ml of ammonium chloride standard solution treated in the same manner.

Ammonium chloride standard solution Place 31.5 mg of ammonium chloride, accurately weighed, in a 1000 ml volumetric flask, dissolve it in water and dilute to volume, mix well (each ml is equivalent to 10 µg of NH₄).

VIII L Determination of Loss on Drying

Mix the substance being examined thoroughly, if it is in the form of large crystals, reduce them to a size of about 2 mm by crushing. Place about 1 g or the amount specified under individual monographs of the substance being examined in a tared, shallow weighing bottle, previously dried to constant weight at 105°C, unless otherwise directed.

The substance being examined should be evenly distributed to form a layer of not more than 5 mm in thickness, or not more than 10 mm in the case of bulky material. When the loaded bottle is placed in the drying chamber of desiccator, remove the stopper and put it beside the bottle, or leave it on the bottle in half open position. Upon the opening of the drying chamber or desiccator, the bottle should be closed promptly. If the substance is dried by heating, allow it to cool to room temperature in a desiccator before weighing.

If the substance melts at a lower temperature than the specified drying temperature, maintain the bottle with its content below the melting temperature until most of the water is removed, then dry it under the specified conditions.

If a vacuum desiccator or constant temperature vacuum desiccator is to be used, a pressure of 2.67 kPa (20 mmHg) or less should be maintained unless otherwise directed. The

chloride, silica gel or phosphorus pentoxide. Phosphorus pentoxide is often used in a constant temperature vacuum desiccator at 60°C, unless otherwise specified. The desiccants should be kept fully effective.

VIII M Determination of Water

Method 1 (Karl Fischer's Method)

A. Volumetric titration

This method is based on the quantitative reaction of water with a solution of sulfur dioxide and iodine in pyridine and methanol. The apparatus used should be dry and moistureproof. The determination of water is preferably carried out in a low humidity environment.

(1) *Preparation of Karl Fischer reagent* Place 110 g of iodine, previously dried in a desiccator over sulfuric acid for more than 48 hours, in a dry stoppered conical beaker, add 160 ml of anhydrous pyridine and cool, shake to effect complete dissolution. Add 300 ml of anhydrous methanol and weigh the conical beaker. Keep the conical beaker cold in an ice bath and keep the atmospheric moisture excluded from the system, pass dry sulfur dioxide into the conical beaker until the increase of weight is 72 g, add anhydrous methanol to produce 1000 ml. Stopper tightly and mix well, allow to stand for 24 hours protected from light.

This reagent should be preserved in tightly closed containers, protected from light and stored in a cool and dry place, standardized before use.

(2) *Standardization of Karl Fischer reagent* Standardize with a water determination apparatus directly or place about 30 mg of redistilled water, accurately weighed, in a dry stoppered flask, add 2-5 ml of anhydrous methanol. Titrate with Karl Fischer reagent until the colour changes from pale yellow to reddish brown. The end-point may also be determined electrometrically by dead-stop titration (Appendix VII A). Perform a blank titration and calculate the water equivalent of the reagent in mg of water per ml by the formula:

$$F = \frac{W}{A-B}$$

in which F is the water equivalent of the reagent, W is the weight of redistilled water in mg, A is the volume, in ml, of the reagent consumed in the titration of water and B is the volume, in ml, of the reagent consumed in the blank titration.

(3) *Procedure* Weigh accurately a quantity of the substance being examined which is anticipated to consume 1-5 ml of Karl Fischer reagent and determine with a water determination apparatus directly or place in a dry stoppered flask, add 2-5 ml of anhydrous methanol, titrate with Karl Fischer reagent with continuous shaking or stirring until the colour changes from pale yellow to reddish brown. The end-point may also be determined electrometrically by dead-stop titration (Appendix VII A). Perform a blank titration and calculate the percentage of water in the substance being examined by the formula:

$$\frac{(A-B)F}{W} \times 100$$

in which A and B are the volumes in ml of the reagent consumed in the titration of water in the substance being examined and in the blank titration respectively; F is the

weight of the substance being examined in mg.

B. Coulometric titration

This method is also based on the Karl Fischer reaction and using dead-stop titration (Appendix VII A) to determine the content of water. However, compared with volumetric titration, iodine is not added in the form of a volumetric solution from the titration tube but is produced in an iodide-containing solution by anodic oxidation. When all the water has been consumed an excess of iodine occurs, which can make the platinum electrodes polarize, thus indicating the endpoint. According to Faraday's law, the amount of iodine produced is directly proportional to the electric quantity passed through, so the total amount of water can be determined by measuring the total amount of electric quantity consumed. This method is predominantly used for substances with a very low water content (0.1% to 0.0001%). It is particularly suited to chemically inert substances like hydrocarbons, alcohols, and ethers. All the apparatus used must be dry and atmospheric moisture is excluded from the system. Procedure should be operated in a dry place.

Karl Fischer reagent Prepare or purchase the titration reagent according to the requirements of Karl Fischer's coulometric titrator. Calibration of the instrument is not necessary.

Procedure Moisture is eliminated from the system by pre-electrolysis, transfer quickly a quantity of test specimen estimated to contain 0.5-5 mg of water, accurately measured, into the anolyte solution. Perform coulometric titration to the electrometric endpoint. Read the water content of the specimen directly from the instrument's display, and calculate the percentage of water in the substance. One mg of water is equivalent to 10.72 Coulomb of electric quantity.

Method 2 (Toluene distillation method)

Apparatus As Fig. 22. The apparatus consists of a 500 ml round bottom flask (A), a graduated receiving tube (B) and a reflux condenser (C) approximately 40 cm in length. All parts of the apparatus should be cleaned and dried in an oven.

Fig. 22

Procedure Place a quantity of the substance being examined which is anticipated to yield about 1-4 ml of water and accurately weighed, in the flask A, add about 200 ml of toluene and dry and clean unglazed porcelain or a few glass beads if necessary. Assemble the apparatus and fill the receiving tube B with toluene through the condenser. Heat the flask gently, when toluene begins to boil, adjust the

second. When the volume of water in the receiving tube does not increase any more, rinse the inside of condenser with toluene and push down the toluene adhering to the wall with a brush or other suitable tools. Continue the distillation for 5 minutes, cool to room temperature and disconnect the apparatus. Push down any droplet of water adhering to the wall of the receiving tube with a copper wire wetted with toluene. Allow to stand until water is completely separated from toluene in the receiving tube (a small amount of methylene blue may be added to facilitate observation). Record the volume of water distilled and calculate the percentage of water in the substance being examined.

Annotations Toluene used in this procedure should be saturated with water and distilled.

VIII N Determination of Residue on Ignition

Place 1.0-2.0 g or the quantity specified under individual monographs of the substance being examined, accurately weighed, in a suitable crucible (If the substance being examined contains alkali metals or fluorine element, the platinum crucible should be used). Previously ignited to constant weight. Heat gently until it is thoroughly charred, cool and moisten the residue with 0.5-1 ml of sulfuric acid, unless otherwise directed. Heat gently until white fumes are no longer evolved and then ignite at 700-800°C until the incineration is complete. Cool in a desiccator and weigh accurately, ignite again at 700-800°C to constant weight. If the residue is to be used in the limit test for heavy metals, the ignition temperature should be controlled at 500-600°C.

VIII O Limit Test for Readily Carbonizable Substances

Use two colour matching tubes with same inner diameter, A and B. To tube A add 5 ml of the colour reference solution specified under individual monographs. To tube B add 5 ml of sulfuric acid (94.5%-95.5%) and then add the specified quantity of the substance being examined in small portions, shake the mixture thoroughly after each addition until solution is complete. Allow to stand for 15 minutes and compare the colour of the two solutions by viewing transversely against a white background, unless otherwise specified. The colour produced in tube B is not more intense than that of the solution in tube A.

Solid substances should be finely powdered before the test. When heating is necessary to effect dissolution of the substance being examined, mix it with sulfuric acid in a test tube, heat to dissolve, allow to cool, transfer the solution to a colour matching tube and compare the colour as described above.

VIII P Determination of Residual Solvents

Residual solvents in pharmaceuticals are defined as organic

manufacture of drug substances or excipients, or in the preparation of medicinal products, but not completely removed in manufacturing process. The limits of general residual solvents in pharmaceuticals are listed in table 1. Unless otherwise specified, the limits of Class 1, Class 2 and Class 3 residual solvents, should comply with the requirement of table 1; as to other solvents, based on knowledge of the manufacture process, appropriate limits should be set to ensure complying with the requirements of product specifications, good manufacturing practices (GMP) or other quality-based requirements. Carry out the method for gas chromatography (Appendix V E).

Chromatographic column

1. Capillary column

Unless otherwise specified, the capillary column with the similar polarity coating can be substituted each other.

(1) *non-polar column* Coated with 100% dimethylpolysiloxane.

(2) *polar column* Coated with polyethylene glycol (PEG-20 M).

(3) *moderate polar column* Coated with (35%) diphenyl-(65%) methylpolysiloxane, (50%) diphenyl-(50%) dimethylpolysiloxane, (35%) diphenyl-(65%) dimethylpolysiloxane, (14%) cyanopropylphenyl-(86%) dimethylpolysiloxane, (6%) cyanopropylphenyl-(94%) dimethylpolysiloxane.

(4) *lower polar column* Coated with (5%) phenyl-(95%) methylpolysiloxane, (5%) diphenyl-(95%) dimethylpolysiloxane.

2. Packed column

Use porous polymer beads of divinylbenzene-ethylvinylbenzene cross-linked with 0.25-0.18 mm in diameter or other suitable packing material as the stationary phase.

System suitability

(1) The number of theoretical plates of the capillary column is not less than 5000; the number of theoretical plates of the packed column is not less than 1000, calculated with reference to the peak due to the solvent being examined.

(2) In the chromatogram, the resolution between the peaks of the solvent being examined and its neighbouring substance is greater than 1.5.

(3) When internal standard method is used, carry out 5 replicate injections for each of the standard solutions, the relative standard deviation (RSD) of the peak area ratio of the solvent being examined to internal standard is not more than 5%; when external standard method is used, the RSD of the peak areas of the solvent being examined is not more than 10%.

Test solution preparation

1. Headspace injection

Unless otherwise specified, dissolve 0.1-1 g, accurately weighed, of the substance being examined in water, as to the water-insoluble substances, using N, N-dimethylformamide, dimethyl sulfoxide or other appropriate solvents. The principle of selection of the appropriate solvent is based on the solubility of the substance being examined and the residual solvents being controlled and the selected solvent should not interfere with the determination of the residual solvent being controlled. Prepare the test solution based on the limit of residual solvent specified in the monograph, the concentration should meet the requirement of quantitative determination.

2. Direct injection

Weigh accurately a quantity of the substance being examined,

test solution based on the limit of residual solvent specified in the monograph, the concentration should meet the requirement of quantitative determination.

Reference solution preparation

Weigh accurately a quantity of the organic solvent specified in the monograph, use the same method and solvent as that of test solution preparation to prepare the reference solution. For limit test, the concentration of the reference solution is based on the limits of residual solvents in the limit test. For quantitative determination to ensure accuracy of quantitative result, the concentration of reference solution is based on the actual content of residual solvent in the substance being examined. In general, it is better that the peak area of reference solution is not more than two times of the peak area of test solution. If necessary, the concentration of test solution or reference solution should be readjusted.

Procedure

Method 1 The method of isothermal temperature capillary column headspace injection.

When the number of organic solvents being examined is just a few and the difference of polarity of them is small, this method can be used.

Chromatographic conditions Usually maintain the temperature of column at 40-100°C; use nitrogen as the carrier gas, velocity of carrier gas is 1.0-2.0 ml/min; the equilibration temperature of headspace oven is 70-85°C when water is used as the solvent, the equilibration time of headspace vial is 30-60 minute; the injector temperature is 200°C or 250°C if flame ionization detector (FID) is used.

Procedure

Inject the reference solution and test solution, not less than two times respectively, measure the peak area of the solvent being examined.

If there are unknown organic solvents in the chromatogram, prescreen can be carried out according to table 2.

Method 2 The method of programmed temperature capillary column headspace injection.

When several organic solvents with different polarity are to be determined, this method can be used.

Chromatographic conditions If using non-polar chromatographic system, maintain the temperature of the column at 30°C for 7 min, then raise the temperature at a rate of 8°C per min to 120°C and maintain it at 120°C for 15 min. If using polar chromatographic system, maintain the temperature of the column at 60°C for 6 min, then raise the temperature at a rate of 8°C per min to 100°C and maintain it at 100°C for 20 min; nitrogen is used as the carrier gas, velocity of carrier gas is 1.0-2.0 ml/min; when water is used as the solvent, the headspace oven equilibration temperature is 70-85°C, the equilibration time of headspace vial is 30-60 minute; the injector temperature is 200°C or 250°C if flame ionization detector (FID) is used.

The temperature program can be adjusted based on the residual solvents specified in the monograph.

Procedure

Inject the reference solution and test solution not less than two times respectively, then measure the peak area of the solvent being examined.

If there are unknown organic solvents in the chromatogram, prescreen can be carried out according to table 3.

Method 3 Direct injection of solution.

Use packed column, or capillary column of appropriate polarity.

Procedure

Inject the reference solution and test solution two or three

being examined.

Calculation

(1) *limit test* Unless otherwise specified, determine based on the concentration of the test solution specified in the monograph. When internal standard method is used, the ratio of peak area of the residual solvent in the test solution to peak area of the internal standard is not more than the ratio of standard solution. When external standard method is used, the peak area of residual solvent being examined in test solution is not more than the corresponding peak area in standard solution.

(2) *quantitative determination* The content of residual solvents can be calculated by internal standard method or external standard method.

Annotations

(1) Unless otherwise specified, the selection of headspace conditions should as follows

A. The choice of headspace oven equilibration temperature depends on the boiling point of the residual solvents of the substance being examined. As to the residual solvents of high boiling point, the headspace oven equilibration temperature is also high; but at the same time attention should be paid to the thermal degradation ability of the substance to be examined, avoiding the interference of thermal degradation products.

B. The equilibration time of headspace is usually 30-45 min to ensure that the test solution has enough time to reach equilibrium. The equilibration time of headspace should not be too long, the hermeticity of the headspace vial may become worse, if excess 60 min, the accuracy of quantitation may decrease.

C. For reference solution and test solution the same headspace conditions should be used.

(2) Validation of the quantitative method

When headspace injection is used, the substance being examined and standard substance are in the matrix that are not completely the same, so the matrix effect should be taken into account. Standard addition method can eliminate the matrix effect, so usually standard addition method is adopted to validate accuracy of quantitation method. If the results of standard addition test and other quantify methods have discrepancy, the result of standard addition test is preferred.

(3) Elimination of the interference peak

The unknown impurity or the thermal degradation products in the substance being examined can interfere the examination of residual solvents. The interference effects include two kinds, the first kind results from the unknown impurity or the thermal degradation products in the substance being examined having the same retention time as the residual solvent being examined (co-elution); the second kind is caused by the thermal degradation product having the same structure as the residual solvent being examined (e.g. methoxyl produces methanol when thermal degradation occurs). When the residual solvent exceeds the limit, but it is not sure whether some unknown impurities or volatile heat-degradation compounds interfere the determination, experiments should be carried out to exclude the interference. As to the first kind interference effect, the general method adopted is to examine the same substance being examined using a chromatographic system with opposite polarity, then compare the results of the two different chromatographic systems. If the results are the same, then there is no co-elution interference; if the results are different, then there is co-elution interference. As to the second kind interference effect, the general method adopted is to examine the residual solvent-free reference substance.

The stainless steel pipeline and injection liner of ordinary gas chromatography instrument have strong sorption to nitrogenous alkaline substance such as amine, which result in the decrease of sensitivity, so the inert silicon steel or nickel steel pipeline should be used; when the method of direct injection of solution is used, the test solution should not be acidic, because the residual solvent being examined can react with acid that make it difficult to evaporate.

Usually use lower polar column or column that the packing materials have been treated with alkaline previously to examine nitrogenous alkaline substance. Better results may be obtained if the column specially designed for analysis of amines is used.

As to the nitrogenous alkaline substance that is not readily

detected by gas chromatography, such as N-methylpyrrolidone, other appropriate procedures can be used, such as ion chromatography.

(5) Selection of detector

Electron capture detector has high sensitivity for the halogen residual solvents, such as chloroform.

(6) Different laboratories may use different methods to examine the same substance. If the result is at brim edge of eligible or not eligible, the results of internal standard test and standard addition test are preferred.

(7) The following residual solvents are not readily detected by the headspace injection conditions, such as formamide, 2-ethoxyethanol, 2-methoxyethanol, ethylene glycol, N-methylpyrrolidone, etc.

Table 1 General residual solvents in pharmaceutical products and limits

solvents	limit/%	solvents	limit/%	solvents	limit/%	solvents	limit/%
Class 1 solvents (solvents to be avoided)		Class 2 solvents (solvents to be limited)		Class 3 solvents (solvents that should be limited by GMP or other quality-based requirements)		Class 3 solvents (solvents that should be limited by GMP or other qualitybased requirements)	
Benzene	0.0002	2-Ethoxyethanol	0.016	Acetic acid	0.5	Methylethyl ketone	0.5
Carbon tetrachloride	0.0004	Ethyleneglycol	0.062	Acetone	0.5	Methylisobutyl ketone	0.5

VII Q Thermal Analysis

Thermal analysis is a group of technique in which the physical-chemical properties of a substance being examined are precisely recorded as a function of temperature according to a controlled temperature program. And the physical variation, i.e. crystalline structure inversions, fusion, evaporation, dehydration or the chemical changes, i.e. decomposition, oxidation etc., and the accompanied variation of temperature, energy and weight are studied.

Absorption or release of energy accompanies phase change or chemical reaction when a substance is heated or cooled. According to the phase rule, temperature during phase inversion (i.e. melting and boiling point) keeps constant. A pure substance has a specific phase inversion temperature and enthalpy change (ΔH). These constants can be used for qualitative analysis, and the variation or variation extent of the measured values from them can indicate the purity of a substance being examined.

Thermal analysis is widely used in the studies of polymorphism, phase inversion, crystal water, crystalline solvent, and decomposition of a substance, and purity, consistency and stability of a drug.

1. Thermogravimetry

Thermogravimetry (TG) is a technique in which the weight of a substance being examined is determined as a function of temperature according to a controlled temperature program. The thermogravimetry curve is recorded as a graph with weight on the ordinate, and temperature (T) or time (t) on the abscissa. TG curve is usually in the shape of a stair, for the temperature during phase inversion (i.e. loss of crystal water or crystalline solvent, decomposition etc.) keeps constant, and the range in which the weight of the substance being examined keeps unchanged is called as plateau. It is easy to discriminate the absorbed water from the crystal water contained in a substance being examined, and the molecular ratio of crystal water can be calculated from the weight loss percentage between plateaus.

Usually, when heated, loss of absorbed water is a gradual process, while loss of crystal water occurs only at a specific temperature point or range (relevant with heating rate) where TG is in the stair shape due to the jump of weight loss.

Thermogravimetry can be used to measure the loss on drying of certain drugs.

Calorimetry

When heated simultaneously, temperature difference (ΔT) is produced between the substance being examined and the heat-inert reference material due to the energy effect resulted from certain physical or chemical changes of the former. As a function of temperature (or time) according to a controlled temperature program, differential thermal analysis (DTA) and differential scanning calorimetry (DSC) measure the temperature difference and the conveyed energy difference (dQ/dT), separately, between the substance being examined and the reference material. Power-compensated differential scanning calorimeter automatically calibrate the heating power conveyed to the substance being examined to compensate the energy effect, and keep the temperature constant between the substance being examined and the reference material. That means there is no extra energy transfer between the substance being examined and the reference material ($\Delta T=0$). This is why the quantitative accuracy of differential scanning calorimetry is better than that of differential thermal analysis.

The shape of DTA curve is similar to that of DSC, with temperature or time on the abscissa for both curves, but on the ordinate ΔT for the former, dQ/dT for the latter. On both curves, there are specific endothermic or exothermic peaks corresponding to a certain substance being examined.

DTA and DSC can be used to measure the following parameters.

1) **Inversion Temperature** DTA and DSC objectively record the temperature where the substance state inverse. For example, fusion curve indicates the initial and peak temperatures within fusion process. However, both temperatures may not be accordant with the melting point measured by the method of Appendix VI C. It is necessary to calibrate the temperature scale of the instrument precisely with a standard substance.

2) **Inversion Enthalpy** The area of endothermal or exothermic peak is directly proportional to the enthalpy change expressed as the following equation.

$$M \cdot \Delta H = K \cdot A$$

Where M is the mass;

ΔH is the inversion enthalpy of a unit mass;

A is the measured peak area;

K is the instrument constant.

The instrument constant K can be determined using a standard substance with a known ΔH , then the experimental inversion enthalpy of a substance being examined can be calculated from the above equation.

3) **Purity** Theoretically, a pure solid substance melts at a specific temperature point or infinity narrow temperature

enthalpy ΔH_f). Any broadening of melting range or lowering of melting point means purity decrease. Lowering of melting point induced by impurity can be expressed as the following Van't Hoff equation,

$$\frac{dT}{dX_2} = \frac{RT^2}{\Delta H_f} \cdot (k-1) \quad (1)$$

Where T is the thermodynamic temperature, K;
 X_2 is the concentration (molar fraction) of impurity;
 ΔH_f is the molar fusion enthalpy of pure substance;
 R is the gas constant;
 k is the distribution coefficient of impurity between the solid and liquid phases at fusion.

If no solid solution forms at fusion, k is equal to 0 and the equation (1) can be integrated to give:

$$X_2 = \frac{(T_0 - T_m) \Delta H_f}{RT_m^2} \quad (2)$$

Where T_0 is the melting point of pure substance, K;
 T_m is the measured melting point of the substance being examined, K.

ΔH_f , T_0 , and T_m can be experimentally measured, then the content of impurity can be calculated by the equation (2).

3. Procedure The thermal analysis techniques of thermogravimetry, differential thermal analysis and differential scanning calorimetry are given by each instrumental instruction in detail. To obtain an objective and reproducible thermogram as possible, it is appropriate to process a preliminary examination over a wide temperature range (from room temperature to a temperature 10-20°C higher than decomposition temperature or melting point) at a higher heating rate (10-20°C per minute), then replicate the examination deliberately over a narrow temperature range at a lower heating rate (e.g. 1°C per minute if necessary) to obtain a satisfactory result of thermal analysis.

A thermal analysis report should be attached with a complete description of the determination conditions, including instrument model, calibrated temperature value, sampling amount and granularity of the substance being examined, atmosphere pressure, direction and rate of temperature change and the sensitivity of instrument.

It is needed to point out that purity determination using Van't Hoff equation is based on the assumption that impurity does not lead to formation of solid solution. Application of the equation in accurately measuring the purity is limited, especially when the substance being examined is polymorphism or decomposes at fusion point.

VIII R Total Organic Carbon in Water for Pharmaceutical Use

Total organic carbon (TOC) determination is an indirect measure of organic substances present in water for pharmaceutical use. TOC determination can also be used to monitor the performance of various operations in the preparation of medicines.

The organic substances present in water for pharmaceutical use are generally from water source, water supply system including purification, storage and distribution, and the velum growth in water system. TOC can indicate the content of the organic substances in water for pharmaceutical use.

A variety of acceptable methods is available for determining TOC. Rather than prescribing a given method to be used, this general chapter describes the procedures used to qualify

tests. A standard solution is analysed at suitable intervals, depending on the frequency of measurements; the solution is prepared with a substance that is expected to be easily oxidisable (for example, sucrose) at a concentration adjusted to give an instrument response corresponding to the TOC limit to be measured. The suitability of the system is determined by analysis of a solution prepared with a substance expected to be oxidisable with difficulty (for example, 1,4-benzoquinone).

The various types of apparatus used to measure TOC in water for pharmaceutical use have in common the objective of completely oxidising molecules in the sample water to produce carbon dioxide followed by measurement of the amount of carbon dioxide produced, the result being used to calculate the carbon concentration in the water.

The apparatus used must discriminate between organic and inorganic carbon, the latter being present as carbonate. The discrimination may be effected either by measuring the inorganic carbon and subtracting it from the total carbon, or by purging inorganic carbon from the sample before oxidation. Purging may also entrain organic molecules, but such purgeable organic carbon is present in negligible quantities in water for pharmaceutical use.

Apparatus Use a calibrated instrument and verify the system suitability at suitable intervals using standard solutions as described below. The apparatus must have a limit of detection specified by the manufacturer of 0.05 mg or less of carbon per liter.

TOC water Use highly purified water complying with the following specifications:

- conductivity; not greater than $1.0 \mu\text{S} \cdot \text{cm}^{-1}$ at 25°;
- total organic carbon; not greater than 0.10 mg/L.

TOC water used, standard solution prepared and system suitability solution should share the same container.

Glassware preparation Use glassware that has been scrupulously cleansed by a method that will remove organic matter. Use TOC water for the final rinse of glassware.

Standard solution

Sucrose standard solution Unless otherwise specified, accurately weigh some sucrose, dried at 105° to a constant weight, and dissolve in TOC water to obtain a solution containing about 1.20 mg of sucrose per liter (0.50 mg of carbon per liter).

1,4-benzoquinone standard solution Unless otherwise specified, accurately weigh some 1,4-benzoquinone, and dissolve in TOC water to obtain a solution having a concentration of 0.75 mg of 1,4-benzoquinone per liter (0.50 mg of carbon per liter).

Test solution Using all due care to avoid contamination, collect water to be tested in an airtight container leaving minimal head space. Examine the water with minimum delay to reduce contamination from the container and its closure.

TOC water control Use TOC water obtained at the same time as that used to prepare the standard solution and the system suitability solution.

Control solutions In addition to the TOC water control, prepare suitable blank solutions or other solutions needed for establishing the base for calibration adjustments following the manufacturer's instructions; run the appropriate blanks to zero the instrument.

System suitability Run the following solutions and record the responses: TOC water (r_w); standard solution (r_s); system suitability solution (r_{ss}). Calculate the percentage response

$$\frac{r_{ss} - r_w}{r_s - r_w} \times 100$$

The system is suitable if the response efficiency is not less than 85% and not more than 115% of the theoretical response.

Procedure Run the test solution and record the *response* (r_u). The test solution complies with the test if r_u is not greater than

$$r_s - r_w.$$

The method can also be applied using on-line instrumentation that has been adequately calibrated and shown to have acceptable system suitability. The location of instrumentation must be chosen to ensure that the responses are representative of the water used.

Appendix IX

IX A Colour of Solution

The colour of solution and its difference from the specified colour can, to some extent, demonstrate the purity of drug. Colour of Solution is a method for testing the colour of a solution, by comparing the colour of solution of drug with that of the reference solutions specified, or, measuring the absorbance at the specified wavelength.

A solution which is termed "colourless" specified in an individual monograph means that the colour of solution of drug is the same as that of the solvent being used for the preparation of the solution, and a solution which is termed "almost colourless" means that the colour of solution of drug is less intense than that of a reference solution, prepared by diluting reference solution No. 1 with same volume of water.

Method 1

Unless otherwise specified, dissolve a quantity of the substance being examined specified in an individual monograph with water in a 25 ml Nessler cylinder, dilute with water to 10 ml. Place in another Nessler cylinder 10 ml of reference solution of specified tint and colour. View down vertically the cylinders against a white background, or view horizontally against a white background in diffused light. The colour in the cylinder containing the test solution is not more intense than that in the cylinder containing the reference solution. If the colour in the cylinder containing the test solution is, or is almost, the same as that in the cylinder containing the reference solution, or the tint between cylinders is not consistent, so that it is unable to estimate the result by naked eye, Method 3 (Colour Difference Meter Method) should be used, and the result should be accorded for justifying.

Potassium dichromate standard solution as reagents

Dissolve 0.4000 g of reference potassium dichromate, previously dried to constant weight at 120°C and accurately weighed, in water in a 500 ml volumetric flask and dilute with water to volume, shake thoroughly. Each ml of the solution contains 0.800 mg of $K_2Cr_2O_7$.

Cupric sulfate standard solution as reagents

Dissolve about 32.5 g of cupric sulfate in a quantity of hydrochloric acid solution (1→40) to produce 500 ml. Transfer 10 ml of the solution, accurately measured, to an iodine flask, add 50 ml of water, 4 ml of acetic acid and 2 g of potassium iodide. Titrate with sodium thiosulfate (0.1 mol/L) VS, add 2 ml of starch IS towards the end point of the titration and continue to titrate until the blue colour disappears. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 24.97 mg of $CuSO_4 \cdot 5H_2O$. Dilute the rest of cupric sulfate solution with hydrochloric acid solution (1→40) to contain 62.4 mg of $CuSO_4 \cdot 5H_2O$ per ml, based on the above assay result.

Cobaltous chloride standard solution as reagents

Dissolve about 32.5 g of cobaltous chloride in a quantity of hydrochloric acid solution (1→40) to produce 500 ml. Transfer 2 ml of the solution, accurately measured, to a flask, add 200 ml of water, mix well. Add ammonia TS until the solution turns from pink to green colour, add 10 ml of acetic acid-sodium acetate BS (pH 6.0), heat to 60°C and then add 5 drops of xylenol orange IS. Titrate with disodium edetate (0.05 mol/L) VS until the solution turns to yellow. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 11.90 mg of $CoCl_2 \cdot 6H_2O$. Dilute the rest of cobaltous chloride solution with hydrochloric acid solution (1→40) to contain 59.5 mg of $CoCl_2 \cdot 6H_2O$, based on the above assay result.

Preparation of stock reference solutions Prepare the following stock Reference Solutions, using the 3 Standard Solutions.

Preparation of stock reference solutions (expressed in ml)

Colour	Cobaltous chloride standard solution	Potassium dichromate standard solution	Cupric sulfate standard solution	Water
yellowish green(YG)	1.2	22.8	7.2	68.8
yellow(Y)	4.0	23.3	0	72.7
orange yellow(OY)	10.6	19.0	4.0	66.4
orange red(OR)	12.0	20.0	0	68.0
brownish red(BR)	22.5	12.5	20.0	45.0

Preparation of reference solutions Prepare the following reference solutions, using the Stock Reference Solutions.

Preparation of reference solutions (expressed in ml)

Number of reference solution	1	2	3	4	5	6	7	8	9	10
Stock Reference Solution	0.5	1.0	1.5	2.0	2.5	3.0	4.5	6.0	7.5	10.0
Water	9.5	9.0	8.5	8.0	7.5	7.0	5.5	4.0	2.5	0

Method 2

Unless otherwise specified, dissolve a quantity of the substance being examined specified in an individual monograph with water to produce a solution of 10 ml. filter if necessary. Measure the absorbance at the wavelength specified, it gives not more than the required value.

Method 3 (Colour Difference Meter Method)

This is a method describing and analyzing the colour of a solution quantitatively by direct measurement of its tristimulus values of transmittance using colour difference meter. Using this method for determination recognition when it is difficult to identify the colour difference between a test specimen and a reference solution visually. Colour difference between a test specimen and a reference solution is achieved by comparing their tristimulus values directly or by comparing them with those of water respectively.

According to the modern colour vision theory, there are three kinds of colour-sensitive pyramidal cells in retina of human eyes, which are sensitive to red, green and blue respectively. The colour vision procedure can be divided into two steps. Firstly, the three kinds of independent colour-sensitive pyramidal substances in retina absorb light radiation of various wavelengths of spectrum selectively and at the same time each by itself produces the reaction of white in the strong light or of black without stimulation outside. Then these three reactions combine again in the course of nerve stimulation transmission from the pyramidal receptors to the vision centre, resulting in three pairs of opposite neural reactions, i.e., red or green, yellow or blue, and white or black reaction. At last various senses of colours are formed in the vision centre of the pallium.

All colours in nature can be composed of a mixture of proper ratio of red, green and blue, the three primary colours, which are called the three kinds of receptor cells in human eyes. So a new concept, the tristimulus values, (X , Y , and Z), can be defined as three primary source stimulation values to match the colour being examined in the given three-colour system. Through extensive colour-matching experiments with human subjects having normal colour vision (who are called standard observers or standard eyes), distribution coefficients ($\bar{x}(\lambda)$, $\bar{y}(\lambda)$ and $\bar{z}(\lambda)$) have been measured for each visible wavelength (380-780 nm) which stimulates each pyramidal receptor to give the relative data. The curve of the combined distribution coefficients is called the spectral tristimulus values curve of the CIE 1931 standard colourimetric observer (as Fig. 23).

Fig. 23 The spectral tristimulus values curve of CIE 1931 standard colourimetric observer (the visual field being 10°)

The relationships between the distribution coefficient and the tristimulus values are given in following equations:

$$X = K \int S(\lambda) P(\lambda) \bar{x}(\lambda) d\lambda$$

$$Y = K \int S(\lambda) P(\lambda) \bar{y}(\lambda) d\lambda$$

$$Z = K \int S(\lambda) P(\lambda) \bar{z}(\lambda) d\lambda$$

$$Z = K \int S(\lambda) P(\lambda) \bar{z}(\lambda) d\lambda$$

Where K is the normalization coefficient;
 $S(\lambda)$ is the relative spectral power distribution of the illuminant;
 $P(\lambda)$ is either the spectral reflectance or spectral transmittance produced by the colour object;
 $\bar{x}(\lambda)$, $\bar{y}(\lambda)$ and $\bar{z}(\lambda)$ are the distribution coefficients of standard observers;
 $d\lambda$ is the wavelength interval, usually of 10 nm or 5 nm.

Once the tristimulus values of a colour have been determined, they may be used to calculate the coordinates of the colour in an idealized three-dimensional colour space. Many sets of colour equations named as the colour express system have been developed to define the space, such as the CIE 1931-XYZ colour express system, the CIE 1964 supplemental standard chroma system, the CIE 1976 $L^*a^*b^*$ colour space or the CIE Lab uniform colour space, the Hunter colour express system, etc.

In order to understand and compare conveniently, the CIE Lab uniform colour space is often used to describe colour and colour difference. It is constructed by a right-angle coordinate labelled by $L^*a^*b^*$ respectively. Every point in the three-dimensional-colour coordinate represents a colour and the geometrical distance between the point and the reference point illustrates the difference between the two colours (as Fig. 24 and Fig. 25). The same distance means the same colour difference. When the instrumental method is applied to compare the colour of a test preparation with that of a standard, the parameter needed to be compared is the difference, in the visually uniform colour space, between the colour of the blank and that of the test specimen or standard.

Fig. 24 The $L^*a^*b^*$ chromaticity diagram

Fig. 25 The $L^*a^*b^*$ colour space and the colour difference ΔE^*

In the CIE *Lab* uniform colour space, the relationships of among colour coordinates L^* , a^* and b^* , the tristimulus values X , Y and Z and the colour difference ΔE^* are defined by

$$\text{Luminosity Index } L^* = 116 \times (Y/Y_n)^{1/3} - 16$$

$$\text{Chromaticity Index } a^* = 500 \times [(X/X_n)^{1/3} - (Y/Y_n)^{1/3}]$$

$$\text{Chromaticity Index } b^* = 200 \times [(Y/Y_n)^{1/3} - (Z/Z_n)^{1/3}]$$

$$\text{Colour Difference } \Delta E^* = \sqrt{(\Delta L^*)^2 + (\Delta a^*)^2 + (\Delta b^*)^2}$$

Where X , Y and Z are the tristimulus values of the test specimen, X_n , Y_n and Z_n are the tristimulus values of the absolutely diffuse reflection material, and X/X_n , Y/Y_n and Z/Z_n should be more than 0.008856. ΔE^* , ΔL^* , both Δa^* and Δb^* are the colour difference, the luminosity index difference, and the chromaticity index differences of the test specimen and the standard respectively. The colour of the test specimen is brighter than that of the standard when ΔL^* is positive, and deeper or more saturated when Δa^* and Δb^* are both positive.

Briefly, the operating principle of colour difference meter is to simulate the sense of sight system of human eyes and turn the tristimulus values of spectral data into the mathematical expression of the colour through its inner analogy integrating optical system, then calculate L^* , a^* , b^* and ΔE^* . Fig. 26 is the working schematic diagram of a colour difference meter. Instrumental methods can provide accurate and precise measurements of colour and colour differences with the same spectral power distribution of the standard light source as that of the light source used in common colour observation (e.g., in daylight) and with the same photo-electrical response receptor as the colour vision of the observers (e.g., the visual field is 10° .) The provided data are more objective that do not drift with time, place and individuals.

Fig. 26 The photometry system diagram of the colour difference meter

- 1—Integrating sphere; 2—light source;
3—transmissive sample;
4—photo-electric tube for balance

1. General requirements of the instrument The instrument is commonly a photo-electric integrating colour difference meter. The illumination and observation condition is $0/d$ or $d/0$, the light source is D65, and the visual field is 10° . It can detect the tristimulus values X , Y and Z and calculate L^* , a^* , b^* , ΔE^* , the hue and the hue number of the test solution directly.

For the measurement of the spectral transmittance of clear liquids, the colour of solutions changes with the thickness of the layer measured. Unless otherwise specified, a cell of 1 cm should be used.

To ensure the reliability of the measurement, the instrument should be calibrated at regular intervals. Colourless materials such as water or air should be used as a standard and assigned a transmittance of 1.000 at all wavelengths during the calibration.

The tristimulus values of water or air are $X=94.81$, $Y=100.00$, and $Z=107.32$ under the conditions of the light source being D65 and the visual field being 10° at room temperature.

2. Determination Unless otherwise specified, the colour difference meter should be calibrated with water firstly. Then detect the solutions of the test specimen and the standard which are prepared as directed in the individual monograph. The colour difference ΔE^* between the solutions of the test specimen and water should not be more than that between the solutions of the standard and water. If there are two tints specified in the individual monograph, and the actual tint of the solution of the test specimen is between the two standard tints specified, and difficult to judge, the colour difference ΔE^* between the solutions of the test specimen and water should not be more than the mean value of the colour differences between the solution of the two standard tints and water $[\Delta E^* \leq (\Delta E_1^* + \Delta E_2^*)/2]$.

IX B Clarity of Solution

Clarity of Solution is a method for testing of clarity or opalescence of a solution. Place the solution of the substance being examined and reference suspension of appropriate concentration into separate matched, flat-bottomed test tubes, 15-16 mm in diameter, of colourless, transparent, neutral hard glass, accurately measured. Compare the contents of the test tubes after 5 minutes in preparation of the reference suspension against a black background by viewing under diffused light down the vertical axes of the tubes. Or otherwise place the tubes under the light source of the illuminating shade chamber of 1000 lx, view horizontally through the tubes.

A solution which is termed "clear" means that the clarity of solution of the substance being examined is the same as that of the solvent being used for the preparation of the solution, or its opalescence is not more pronounced than that of reference suspension No 0.5.

Preparation of opalescence reference standard stock solution

Dissolve 1.00 g of hydrazine sulfate, previously dried to constant weight at 105°C , in 100 ml volumetric flask with

with water to volume, shake thoroughly and allow to stand for 4-6 hours. Mix the solution with equal volume of 10% urotropine solution, shake thoroughly and allow to stand for 24 hours at 25°C , protected from light. The suspension is stable for 2 months in a cool place, protected from light. Shake thoroughly before use.

Preparation of opalescence reference standard solution Dilute 15.0 ml of Opalescence Reference Standard Stock Solution with water in 1000 ml volumetric flask and make up to volume, shake thoroughly. Transfer a quantity to a 1 cm cell, measure the absorbance at 550 nm (Appendix IV A), the absorbance is 0.12-0.15. The solution should be used within 48 hours of preparation. Shake thoroughly before use.

Preparation of reference suspension Prepare the following reference suspensions using the Opalescence Reference Standard Solution and water. This solution should be freshly prepared. Shake thoroughly before use.

Reference suspension No.	0.5	1	2	3	4
Opalescence reference standard solution/ml	2.50	5.0	10.0	30.0	50.0
Water/ml	97.50	95.0	90.0	70.0	50.0

IX C Test for Particulate Matter in Injections

The test for Particulate Matter is applied to determine the size and number of particulate matter in injections for intravenous injection that are in solutions. Prior to this test, the injection should comply with the visible particles test.

This test consists of light obscuration and microscopic test. Unless otherwise specified, light obscuration test is preferably used. If the test result using light obscuration test does not comply with the requirements or this test is not applicable for the sample, microscopic test should be followed to reach a conclusion on conformance to requirements.

Light obscuration test is not suitable for the preparations having increased viscosity, or the preparation which is apt to crystallization or the injections which will produce air bubbles when drawn into the sensor. If the viscosity of the preparation to be tested is sufficiently high so as to preclude its examination by either test method, a quantitative dilution with an appropriate diluent may be made to decrease viscosity, as necessary to allow the analysis to be performed.

Test environment Perform the test in an environment that does not contribute any significant amount of particulate matter. Test preparation should be carried in a laminar flow cabinet. The glassware and other required equipment should be clean and particle free. The water or other suitable solvent used in the test should be filtered through a filter with a porosity of not more than $1.0\ \mu\text{m}$.

Place a 50 ml volume of water or other suitable solvents for the test of particulate matter in a sample container, determined as directed under test procedure. For light obscuration test it should meet the requirements that not more than 10 particles of greater than $10\ \mu\text{m}$ in size and not more than 2 particles of greater than $25\ \mu\text{m}$ in size are observed in the combined 10 ml of solvent. For microscopic test it should meet the requirements that not more than 20 particles of greater than $10\ \mu\text{m}$ in size and not more than 5 particles of greater than $25\ \mu\text{m}$ in size are observed in the combined 50 ml of solvent. Otherwise, the water or other suitable solvents for the test of particulate matter, glassware and test environment are not suitable for particulate analysis. In this case, repeat the preparatory steps until conditions of analysis are suitable for the test.

1. Light obscuration particle count test

When particles in solution pass through a narrow testing area, the incident light at right angle with direction of fluid is weakened by obscuring of insoluble particles, therefore the output signal of sensor reduced. The variations of signal are proportional to the cross-sectional areas of particles. Light obscuration method for insoluble particles in injections are based on the principle mentioned above.

Test apparatus Usually consists of sample-feeding device, sensor and data processor.

The range of particular size determination is from 2 to $50\ \mu\text{m}$ and the concentration of particles for measurement is 0-5000 particulates per ml.

Instrument calibration The instrument should be calibrated every 6 months.

(1) *Sample volume* Transfer a volume of water for the test

to a container after the instrument equilibrated, and weigh. Withdraw through the sample-feeding device a certain volume of the water, and weigh the container again. Obtain the sample volume by calculating the difference of the two weights. Test for 3 times consecutively. Each volume obtained should be within $\pm 5\%$ of the volume specified, and the mean value should be within $\pm 3\%$ of the volume specified. The results should comply with the requirements mentioned above if it is calibrated by the other suitable methods.

(2) *Particle counting* Prepare a suspension containing 1000-1500 particles of standard particles having average diameters of $10\ \mu\text{m}$ or $25\ \mu\text{m}$ per ml and the relative standard deviation of the size distribution of the standard particles used is not more than 5%. Degas by ultrasonication (at 80-120 watts) for 30 seconds or by allowing to stand. Turn on the stirrer and agitate the sample gently to homogenize it. Withdraw and obtain the particle counts for three consecutive samples, disregarding the first count. The average of second and third counts should be within $\pm 20\%$ of the limits of number of particles.

(3) *Sensor resolution* Prepare a suspension containing 1000-1500 particles per ml of standard particles having average diameter of $10\ \mu\text{m}$ (standard deviation of mean diameter is not more than $1\ \mu\text{m}$) and the relative standard deviation of the size distribution of the standard particles used is not more than 5%. Degas by ultrasonication (at 80-120 watts) for 30 seconds or by allowing to stand. Turn on the stirrer and agitate the sample gently to homogenize it (taking care not to introduce air bubbles), determine the particles at $10\ \mu\text{m}$ and $12\ \mu\text{m}$ channel. The ratio of the difference count of two channels and the accumulative count of $10\ \mu\text{m}$ channel is not less than 68%. If the instrument calibration does not comply with the requirements, repeat the calibration steps after adjusting the instrument until it is well done.

Note Self-test can be conducted if the instrument is attached by the self-test software.

Procedure

(1) *Intravenous injection with a labelled volume of 25 ml or larger* Unless otherwise specified, wash the outside walls of the container of the injection being examined with water. Mix the contents by inverting the container 20 times and carefully open the container immediately. Pour a portion of specimen to wash the bottleneck and sample container, transfer the specimen in the sample container, degas by ultrasonication (at 80 to 120 watts) for 30 seconds or by allowing to stand, then place it on the sample-feeding device (or directly place the specimen on the sample-feeding device without stirring after degas). Turn on the stirrer or swirl gently by hand to homogenize the sample (avoid introducing air bubbles), withdraw a minimum of three aliquots, each not less than 5 ml in volume, record the data. Determine a minimum of another two specimens as the same way. Discard the data from the first portion of each specimen, calculate the average of consecutive counts.

(2) *Intravenous injection with a labelled volume of less than 25 ml* Unless otherwise specified, wash the outside walls of the container of the injection being examined with water. Mix the contents by inverting the container 20 times. Degas by ultrasonication (at 80 to 120 watts) for 30 seconds or by allowing to stand. Carefully open the container then place it on the sample-feeding device without stirring. Withdraw directly a suitable volume without introducing air bubbles, record the data. Determine a minimum of another two specimens as the same way. Discard the data from the

consecutive counts.

An appropriate method also can be used to combine the contents of 3 or more units to obtain a volume of not less than 20 ml into the sample container in the laminar flow cabinet. Degas by ultrasonication (at 80 to 120 watts) for 30 seconds or by allowing to stand, then place it on the sample-feeding device. Turn on the stirrer or swirl gently by hand to homogenize the sample (avoid introducing air bubbles), withdraw a minimum of three aliquots, each not less than 5 ml in volume into the light obscuration counter sensor, record the data. Discard the data from the first portion of each specimen, calculate the number of particles in each container by average the consecutive counts.

(3) *Sterile powder for intravenous injection or concentrated solution for injection* Unless otherwise specified, wash the outside walls of the container of the injection being examined with water. Carefully remove the cover, accurately add a quantity of water for particulate matter or appropriate solvent, replace the closure carefully and gently agitate the container to ensure the contents dissolved (for concentrated solution for injection, operate directly). Degas by ultrasonication (at 80 to 120 watts) for 30 seconds or by allowing to stand. Carefully open the container then place it on the sample-feeding device without stirring. Withdraw directly a suitable volume without introducing air bubbles, record the data. Determine a minimum of another two specimens as the same way. Discard the data from the first portion of each specimen, calculate the average of consecutive counts.

An appropriate method also can be used, wash the outside walls of 3 or more containers of the injection being examined with water in the laminar flow cabinet. Carefully remove the cover, accurately add a quantity of water for particulate matter or appropriate solvent respectively, gently agitate the container to ensure the contents dissolved (for concentrated solution for injection, operate directly). Combine the solution of each container to obtain a total volume of not less than 20 ml into the sample container. Degas by ultrasonication (at 80 to 120 watts) for 30 seconds or by allowing to stand, then place it on the sample-feeding device. Turn on the stirrer or swirl gently by hand to homogenize the sample (avoid introducing air bubbles), withdraw a minimum of three aliquots, each not less than 5 ml in volume, record the data. Discard the data from the first portion of each specimen, calculate the number of particles in each container by average the consecutive counts.

Evaluation

(1) *Intravenous injection with a labelled volume of 100 ml or larger* Unless otherwise specified, each ml of the injection contains not more than 25 particles that are greater than 10 μm and not more than 3 particles that are greater than 25 μm .

(2) *Intravenous injection with a labelled volume of less than 100 ml, sterile powder for intravenous injection and concentrated solution for injection* Unless otherwise specified, each container of the specimen contains not more than 6000 particles that are greater than 10 μm and not more than 600 particles that are greater than 25 μm .

2. Microscopic particle count test

Test apparatus Usually consists of laminar flow cabinet, microscope, microporous membrane filter, filtration apparatus and Petri dish.

Laminar flow cabinet HEPA-filter having a pore of 0.45 μm , the direction of airflow is from inside to outside. The wind speed and the particles in the cabinet should be

Microscope Use a suitable binocular microscope with big visual field, equipped with an objective micrometer with a calibrated ocular micrometer (0.05-0.1 mm per grid). The coordinate axis can move up and down, left and right, move scope should larger than 30 mm. The microscope is equipped with an illuminator which the incident angle of light and the strength of light can be adjusted. It can give a magnification of 100 \times during examination.

Microporous membrane The membrane is 25 mm or 13 mm in diameter with pores of 0.45 μm in effective diameter, it is white in colour and grids with partition of 3 mm has been printed on one side. It should be washed with water for particular matter until free from particular matter of an effective diameter greater than 25 μm , and not more than 5 particles greater than 10 μm are left on the membrane.

Preparation Before Examination When test environment meets the requirements, rinse the filter under the cabinet with water for particulate matter or other suitable solvent. Rinse the membrane with water for particulate matter or other suitable solvent, then place it on the filter holder with a blunt forceps, invert the fixed filter and wash the inner wall of the filter repeatedly with water for particulate matter or other suitable solvent. Allow to drain and place the filter on a suction flask.

Procedure

(1) *Intravenous injection with a labelled volume of 25 ml or larger* Unless otherwise specified, wash the outside walls of the container of the injection being examined with water. Under the cabinet mix the contents by inverting the container 20 times and carefully open the container immediately. Transfer 25 ml of specimen to the pretreated filter (25 mm in diameter of membrane) gently along the inner wall of the filter, allow to stand for 1 minute and filter under gentle suction. Release the vacuum and wash the inner walls of the filter with 25 ml of water for particulate matter, remove the washings by suction. Release the vacuum and remove the membrane with the forceps. Place the membrane on a Petri slide, using a very thin layer of glycerin, if necessary, to hold the membrane flat and in its place. Allow the membrane to dry and place the covered slide on the micrometer stage of the microscope. Examine the membrane under 100 \times magnification with the incident light at a suitable angle and adjust the microscope to see the grid clearly. Count the number of particles that are greater than 10 μm , and those greater than 25 μm in effective diameter.

(2) *Intravenous injection with a labelled volume of less than 25 ml* Unless otherwise specified, wash the outside walls of the container of the injection being examined with water. Mix the contents by inverting the container 20 times carefully under the cabinet. Carefully open the container immediately. Withdraw all solutions in each container directly with an appropriate method. Transfer the specimen to the pretreated filter (13 mm in diameter of membrane) gently along the inner wall of the filter, proceed as directed for procedure (1) above.

(3) *Sterile powder for intravenous injection or concentrated solution for injection* Unless otherwise specified, prepare specimen as directed under procedure (3) in light obscuration particle count test, proceed as directed for procedure (1) above.

Evaluation

(1) *Intravenous injection with a labelled volume of 100 ml or larger* Unless otherwise specified, each ml of the injection contains not more than 12 particles that are greater than 10 μm and not more than 2 particles that are greater

(2) *Intravenous injection with a labelled volume of less than 100 ml, Sterile powder for intravenous injection and concentrated solution for injection* Unless otherwise specified, each container of the specimen contains not more than 3000 particles that are greater than 10 μm and not more than 300 particles that are greater than 25 μm .

IX D Crystallinity

Solid substance may be classified as two forms: crystalline and noncrystalline. The following methods are used to test its crystallinity.

Method 1 (polarizing microscope method) Generally crystals have optical anisotropism except isometric crystal system. The transparent crystals exhibit the phenomena of birefringence when the light passes through them. Mount a few particles of the specimen on a clean glass slide, add a quantity of liquid paraffin. Examine the mixture under a polarizing microscope; the particles exhibit the phenomena of birefringence, extinction positions and optical crystalline characteristics specified in the individual monograph when the microscope stage is revolved.

Method 2 (X-ray powder diffraction) Crystalline materials present characteristic diffraction decorative pattern (sharply diffraction pattern), while noncrystalline materials, broad dispersion diffraction pattern. The test method is described under X-ray Powder Diffraction (Appendix IX F).

IX E Determination of Particle Size and Particle Distribution

The following procedures are used for the determination of particle size or particle distribution. The method 1 and method 2 are used for the determination of particle size or size limit in pharmaceutical preparation. The method 3 is used for the determination of particle distribution in drug substance or pharmaceutical preparation.

Method 1 (microscopy)

The particle size determined by this method is expressed as the length of particles observed under a microscope.

Standardization of ocular micrometer Standardization of ocular micrometer is carried out to ascertain the value of each unit of the ocular micrometer for each optical combination (objective, ocular, and tube length).

Place the stage micrometer on the stage of the microscope. Focus the illuminator and the scale of the stage micrometer. Adjust stage micrometer until the image is in the centre of the field of view. Take out the ocular. Unscrew the cover of the ocular, and insert the ocular micrometer within the tube of the ocular by placing it on the shelf which is about halfway between the upper and lower lenses of the ocular. The engraved surface must be faced upper. Screw the cover of the ocular, and place the ocular back to the tube of the ocular. The image of the stage micrometer and the scale of the ocular micrometer can be observed in the same field of view. Make the lines on the two micrometers parallel each other and the extreme left line (marking 0) on each scale coincide by adjusting the stage micrometer and rotating the ocular. Find the second lines which coincide, and count the

ratio. The value (μm) of each unit of the ocular micrometer for the objective, with which it is used, will be judged based on the ratio. As the value for each unit of the stage micrometer is 10 μm , the value of each unit of the ocular micrometer can be calculated by the following equation:

$$\frac{10 \times \text{the number of included units of the stage micrometer}}{\text{the number of included units of the ocular micrometer}}$$

When two objectives with different magnification are to be used, it is necessary to ascertain the value of each unit of the ocular micrometer for each objective with which it is used.

Procedure Thoroughly mix the substance being examined. For the substance with high viscosity, a suitable quantity of glycerin solution (1 \rightarrow 2) specified in the individual monograph may be added. Introduce 1-2 drops of the substance being examined onto a slide as specified in the appendix of the dosage form or in the individual monograph, cover a cover glass, and press gently to make the particles spread uniformly. Prevent formation of bubbles. For the substance being examined which is semisolid, it can be spread directly onto a slide. Immediately examine the slide under a microscope, in the whole field of view, using 50-100 \times magnification. No agglomeration occurs and none of the particles has a dimension of 50 μm or greater than it specified in the individual monograph. Examine the slide again under a microscope, in the field of view specified in the appendix of the dosage form or in the individual monograph, using 200-500 \times magnification. Record the total number of particles observed and the number of particles having the specified dimension. Calculate the percentage.

Method 2 (sieving)

Single sieve Place a quantity of the substance being examined, as specified in the individual monograph, upon the specified No. sieve with a close-fitting receiving pan and cover. Shake the sieve in a rotary horizontal direction for not less than 3 minutes, and gently tap on the sieve frequently in vertical direction. Weigh accurately the amount in the receiving pan, and calculate the percentage.

Two sieves Place the accurately weighed content of 5 single-dose units or of 1 multiple-dose unit upon the sieve specified in the appendix of the dosage form or in the individual monograph. Shake the sieve in a left-to-right horizontal direction by gently tapping on the sieve for 3 minutes. Weigh accurately the amount remaining on the smaller No. sieve and passing through the larger No. sieve. Calculate the percentage of the fraction.

Method 3 (Laser Diffraction)

Laser diffraction particle size analysis is based on the scientific phenomenon that particles in a laser beam scatter laser light at angles that inversely proportional to the size of the particles. There is a direct relationship between the distribution of the scattered light energy and the particle size distribution. Mie theory or Fraunhofer Approximation Theory is used to obtain the size distribution of the particles. The size range of this method is 0.02-3500 μm .

1. Instrument

Laser diffraction analyzer; The intensity of the laser source should be stable and the electronic background and optical background should be automatically eliminated.

"Standard reference material" with certain distribution and eigenvalues [$d(0.1)$, $d(0.5)$, $d(0.9)$] can be used for verification of the analyzer. Relative Standard Deviation (RSD) is generally used to express the size distribution of "standard reference material". For samples where the coefficient of variation of the particle size distribution is less than 50% (or ratio of diameter of largest to smallest particle

performed. The deviation of $d(0.5)$ of the "standard reference material" from the eigenvalue should be less than 3%, and the RSD of the five measurements should not exceed 3%. The deviation of the $d(0.1)$ and $d(0.9)$ of the "standard reference material" from the eigenvalue should be smaller than 5%, and the RSD of the measurements should not exceed 5%. As for the "standard reference material" with size below $10\text{ }\mu\text{m}$, the deviation of the measured $d(0.5)$ from the eigenvalue should be less than 6%, and the RSD of the paralleled tests should not exceed 6%; the deviation of the $d(0.1)$ and $d(0.9)$ from the eigenvalue should be less than 10%, and the RSD of the paralleled tests should not exceed 10%.

2. Procedure

Either wet dispersion unit or dry dispersion unit can be chosen according to the properties and solubility of the material for test. Wet method can be used for measurement of the suspended materials or the materials that are not soluble in the dispersion media. Dry method is used for measuring water-soluble materials or solid materials without any suitable dispersion media.

Wet method The lower size limit is usually 20 nm .

The suitable dispersion method should be chosen according to the properties of the material for test so that sample can be dispersed into stable suspended solution. Generally, such physical dispersion methods as ultrasonication and stirring can be used. When necessary, certain amount of chemical additive or surfactant can be added, so that the sample can be dispersed in a stable system. Thus, the sample can evenly and stably pass through the cell window, so as to get the accurate results.

Only when the electrical double layer potential (Zeta Potential) is in a certain range, can the dispersion system be in a stable state. Therefore, when the dispersion system of the material for test is prepared, attention should be paid to the measurement of Zeta Potential of the system, so as to assure the repeatability of the measurement.

Normally the amount of sample for test is displayed as obscuration. The optimal obscuration is between 8% and 20%. For the most advanced analyzer the lower limit can be down to 0.2%.

Dry method The lower size limit is usually 200 nm .

Generally, sample path should be obturated to prevent the sample from absorbing moisture. The velocity biasing should be eliminated from selecting dry powder feeder and sample cell. According to how easily the material can be dispersed, the air pressure applied for sample dispersion should be able to be adjusted, so that particles with different sizes can pass through the cell window evenly and stably at the same speed, thus assuring the accuracy of results.

For chemical drug substance, the ejective dispersion unit shall be used. A proper amount of metal balls can be added into the unit. The vibration feeding rate, the air pressure (usually $0.0\text{--}0.4\text{ MPa}$), and the gap of sample tray should be adjusted to control the dispersion and the amount of the sample that passes through the analyzer.

The amount of sample for dry measurement should reach 0.5%–5% in obscuration.

Annotations

(1) The setting of optical parameters is related to the size distribution of the sample. The refractive index and absorption index affect slightly to those particles with size above $10\text{ }\mu\text{m}$, and they affect considerably to those particles with size below $10\text{ }\mu\text{m}$. When measuring the size distribution of different drug substances and products, currently there is no mature theory available for guiding the setting of the optical parameters of the instrument, so that the setting can

be used to verify the instrument.

(2) For measurement of coloured material, emulsion, and particles smaller than $10\text{ }\mu\text{m}$, the Mie Theory should be the best general solution so as to reduce measuring errors. Fraunhofer Approximation Theory should not be used in this regard.

(3) When measuring the broad size distribution samples, it is recommended to use the whole size range analyzer with wide dynamic detector instead of analyzer with separate size range to reduce the measurement errors.

IX F X-Ray Powder Diffraction

Every crystal form of a compound produces its own characteristic X-ray diffraction pattern. These diffraction patterns can be derived either from a single crystal or from a powdered specimen (containing numerous crystals) of the material. The spacings between and the relative intensities of the diffracted maxima (spots or lines) can be used for qualitative and quantitative analysis of crystalline materials. Powder diffraction techniques are most commonly employed for routine identification and the determination of relative purity of crystalline materials. The principal use of single-crystal diffraction data is for the determination of molecular weight and analysis of crystal structure at the atomic level.

A solid substance can be classified as being crystalline, non-crystalline, or a mixture of the two forms. In crystalline materials, the molecular or atomic species are ordered periodically in a three dimensional array, called a lattice, within the solid particles. This lattice structure is lacking in non-crystalline material, which sometimes are referred to as glasses or amorphous solids.

The relatively random arrangement of molecules in non-crystalline substances makes them poor coherent scatterers of X-rays, resulting in broad, diffuse maxima in diffraction patterns. Their X-ray patterns are quite distinguishable from crystalline specimens, which give sharply defined diffraction patterns.

Many compounds are capable of crystallizing in more than one type of crystal lattice. At any particular temperature and pressure, only one crystalline form (polymorph) is thermodynamically stable. Since the rate of phase transformation of a metastable polymorph to the stable one can be quite slow, it is not uncommon to find several polymorphs of crystalline pharmaceutical compounds existing under normal handling conditions.

In addition to exhibiting polymorphism, many compounds form crystalline solvates in which the solvent molecule is an integral part of the crystal structure. Just as every polymorph has its own characteristic X-ray patterns, so does every solvate.

A collimated beam of monochromatic X-ray is diffracted in various directions when it impinges upon a rotating crystal or randomly oriented powdered crystal. The crystal acts as a three-dimensional diffraction grating to this radiation. The condition that diffraction can occur should conform to the Bragg equation:

$$d_{hkl} = \frac{n\lambda}{2 \sin \theta}$$

Where d_{hkl} denotes the interplanar spacings and θ is the angle of diffraction. The principal radiation sources utilized for X-ray diffraction are vacuum tubes with copper, molybdenum, iron, and chromium as anodes; copper X-rays are employed most commonly for organic substances. For each of these radiations there is an element that will filter off K_α radiation and permit the K_β radiation to pass (nickel is used in the

case of copper radiation). In this manner the radiation is practically monochromatized. The choice of radiation source to be used depends upon absorption characteristics of the material and not producing fluorescence by atoms present in the specimen.

Only a limited number of Bragg planes are in a position to diffract when monochromatized X-ray passes through a single crystal. But a beam passing through a very large number of small, randomly oriented crystals produces continuous cones of diffracted rays from each set of lattice planes. The diffraction patterns can be recorded by photographic films, radiation detectors, image board or planar detectors such as inductance coupling detectors etc. When film is used the Bragg angle can be measured easily from a film for determination, the diffraction intensities can be read by microphotometer. When radiation detector or planar detector is employed the angle, the intensities and d spacing all can be conveniently read by the powder diffractometer.

There are a varieties of factors that affect diffraction intensities. Generally the amplitude of a diffracted X-ray beam from any set of planes is dependent upon the following structural factors of the crystal and the experimental conditions. The former includes: ① position of each atom in the unit cell; ② the respective atomic scattering factors; and ③ the absorption of the X-radiation by the specimen and the polarizing factors. The latter includes: ① the intensity and wavelength of the incident radiation; ② the volume, the crystalline degree and the density of crystalline specimen; ③ the experiment temperature; and ④ the experimental arrangement utilized to record the intensity data.

Sample preparation and associated experimental techniques In general, the shapes of many crystalline particles tend to give a specimen that exhibits some degree of preferred orientation in the specimen holder. This is especially evident for needle-like or plate-like crystals. Preferred orientation in the specimen influences the relative intensities of various diffraction. In an attempt to improve randomness in the orientation of crystallites, the specimen may be ground carefully in a mortar to a fine powder.

In order to accurately measure the Bragg angle, a small amount of standard substance can be mixed into the specimen. Every d value of the standard substance is measured in the diffraction pattern and compared to literature values, so the diffraction data and the diffractometer can be calibrated.

In quantitative analysis of materials, a standard curve method is commonly used. The internal standard used should have approximately the same density as the specimen and similar absorption characteristics. More important, its diffraction pattern should not overlap to any extent with that of the material to be analyzed. As the X-radiation can be absorbed by the matrix, standard curve should be made in a quantity of matrix similar to that in which the substance will be analyzed. In favorable cases, the ratio of amount of the substance being analyzed to that of matrix is not more than 10%. Due to its poor quantification accuracy, the method is only used for some of specific quantification, such as the determination of the crystalline degree and the relative quantification for different polymorphs of a homogeneous compound.

Identification of crystalline materials can be accomplished by comparison of X-ray powder diffraction patterns obtained for known materials with those of the unknown. The diffraction angle (2θ), the intensity ratio and the d spacing are used in the comparison. Agreement between sample and reference should be within the calibrated precision of the diffractometer for diffraction angle, while relative intensities between sample and reference may vary up to 20%. For identification,

transformation may be induced by grinding pressure, resulting in change of diffraction pattern; (2) Sometimes the differences in the diffraction patterns of different polymorphs are relatively minor, and must be very carefully evaluated before a definitive conclusion is reached.

For most organic crystals, it is appropriate to record the diffraction pattern to include values for 2θ that range from near 0° to 40° . For inorganic salts, it may be necessary to extend the 2θ region scanned to well beyond 40° .

IX G Determination of Osmolality

The phenomenon that a solvent diffuses through a semi-permeable membrane from a solution of low concentration to a higher concentration solution is called osmosis. The pressure that is needed to prevent osmosis is called osmotic pressure. Biomembrane, such as cell membrane or capillary wall of the body, has the properties of a semi-permeable membrane, thus the osmotic pressure must be considered for injection and eye drops. The declaration of osmolar concentration on the label of intravenous replenishment liquid, nutrient (s), electrolyte (s) or osmotic diuretic agents, such as Monnitol Injection, are required to inform the clinical doctors.

The units of osmolar concentration are usually expressed as milliosmoles (mOs mol) of solute per kilogram of solution. The ideal milliosmole concentration may be determined according to the formula:

$$\begin{aligned} & \text{Milliosmole concentration (mOs mol/kg)} \\ &= \frac{\text{weight of solute (g/kg)}}{\text{molecular weight (g)}} \times n \times 1000 \end{aligned}$$

Where n is the number of ions or chemical species produced when the solute is dissolved. In ideal solutions, for example, $n=1$ for glucose, $n=2$ for sodium chloride or magnesium sulfate, $n=3$ for calcium chloride, $n=4$ for sodium citrate.

Deviation from ideal condition is usually slight in solutions within the physiological range and for more dilute solutions, but for highly concentrated solutions, the actual osmolarities may be appreciably lower than ideal values. For example, the ideal osmolality of 0.9% Sodium Chloride Injection is $2 \times 1000 \times 9/58.4 = 308$ mOs mol/kg, but in fact, its n is slightly less than 2, and the actual measured osmolality is 286 mOs mol/kg. The theoretical osmolality of a complex mixture, such as Protein Hydrolysate Injection, can not be readily calculated, so the actual measured value is usually used.

Apparatus It is difficult to directly measure osmolality, but more convenient to measure the freezing point, so osmolality is often determined by measuring the depression of freezing point. In ideally dilute solution, the depression of freezing point should conform to the following equation: $\Delta T_f = K_f \cdot m$, where ΔT_f is the depression value of freezing point, K_f is the depression constant of freezing point ($K_f=1.86$ when the solvent is water), m is the weight mole concentration. Osmolality is calculated by $P_o = K_o \cdot m$, where P_o is osmolality, K_o is the constant of osmolality, and m is the weight mole concentration. Due to the same meaning of concentration in the two formula mentioned above, osmolality can be determined by measuring the depression of freezing point. Osmometer is generally designed according to the principle of the depression of freezing point.

An osmometer consists of a test tube containing the solution

and a pair of resistor sensitive to temperature (thermistors). When measuring, immerse the sensor into the solution in the glass tube, lower the tube into the cooling system and the temperature of the cooling system is decreased until the solution is super-cooled. The measured freezing point is converted to a measurement value by instrument.

Procedure Determine the zero point by using a certain volume of water (prepared freshly), calibrate the osmometer using reference solutions whose osmolality range is close to that expected for the solution being examined, then measure the osmolality of the solution being examined. When the osmolality of the solution being examined is beyond the range limit of the osmometer, dilute it with appropriate solvent to a measurable range of osmolality. If the sample is a solid, dissolve it in an appropriate solvent and then determine.

Preparation of reference solution for calibration of osmometer Dissolve a quantity, accurately weighed, of sodium chloride (primary reference substance) previously dried for 40 to 50 minutes at 500-650°C and cooled to room temperature in a desiccator contain in silica gel, as described in the Table, as required, in 1 kg of water, mix well.

Reference solution for calibration of osmometer

Weights of sodium chloride in 1 kg of water(g)	Milliosmole concentration (mOsmol/kg)	The depression of freezing point (°C)
3.087	100	0.186
6.260	200	0.372
9.463	300	0.558
12.684	400	0.744
15.916	500	0.930
9.47	600	.6
22.380	700	1.302

Determination of milliosmole concentration ratio The ratio of milliosmole concentration of the test sample to that of 0.9% (W/V) sodium chloride solution is called milliosmole concentration ratio. Determine the milliosmole concentration of the test sample (O_T) and that of the reference solution (O_S) respectively, calculate the milliosmole concentration ratio by the following equation:

$$\text{milliosmole concentration ratio} = \frac{O_T}{O_S}$$

Preparation of reference solution for measurement of milliosmole concentration ratio Weigh accurately 0.900 g of sodium chloride (primary reference substance), previously dried for 40-50 minutes at 500-650°C and cooled to room temperature in a desiccator containing silica gel, into a 100 ml volumetric flask, dissolve in water and dilute to volume, mix well.

For the preparation of injections or eye drops containing sodium chloride, osmolality is often measured instead of the assay of sodium chloride if the function of sodium chloride is mainly to regulate the osmotic pressure.

IX H Test for Visible Particles in Injections

Visible particles are defined as insoluble substance that present in injections or eye drops and can be observed under the required conditions by visual test. Their size or length

Injections or eye drops should be produced according to the Good Manufacture Practice (GMP). All of the products should be detected respectively by suitable methods before released, and the unacceptable products are eliminated synchronously.

There are two methods for the test for visible particles-lamp test and light scattering method. Lamp test is commonly used, but light scattering method also may be used especially some products that unsuitable for lamp test, such as the containers are coloured transparent glass or the colour of the solutions being examined is too dark to observe, should be detected by light scattering method.

During the test is carrying out in laboratory, must prevent to introduce foreign visible particles. All procedures must be performed under hygienic class 100, preferably in a laminar-air-flow cabinet, if the containers of samples being examined are unsuitable for detected (opaque or unshaped), and need to transfer the contents into other appropriate glass containers.

1. Lamp test

This test is carried out in a darkroom.

Apparatus See the following figure (Fig. 27):

Fig. 27

A-a light source of daylight lamp with panel for obstructing from light; The intensity of illumination is adjustable between 1000-4000 lx.

B-a non-glare black background.

C-a non-glare white background and the bottom (supply with test for coloured particles).

D-a glare white background (inboard of light baffle).

Requests for inspector Inspector's visions of distant and near distance should be 4.9 or more than 4.9 (vision after correcting defects should be 5.0 or more than 5.0); Inspector is also not colour blindness.

Procedure Unless otherwise specified, take 20 containers being examined randomly. First remove any adherent labels from the containers, clean the outer surfaces, then gently swirl and invert each individual container in order to force the visible particles that present in solutions being examined floating (Caution: ensuring that air bubbles are not introduced). If necessary, transfer the solutions being examined into other clean and transparent appropriate glass containers. Hold the bottle-neck of the container at the edge of light baffle and gently invert the container, meanwhile observe the presence of any particles in it, and retain appropriate distance to inspectors' eyes (common distance is 25 cm) with visual method respectively under black background and white background.

The intensity of illumination should be 1000-1500 lx for the colourless injections or eye drops; The intensity of illumination should be 2000-3000 lx for the samples which with coloured glass or transparent plastic containers and coloured solutions being examined; For the suspensions for injections or eye drops only detect coloured mass, cilia etc.

Criteria

Solutions for injection i.v., concentrated solutions for injection and eye drops All of the 20 containers should be free from visible particles. If visible particle has been found in not more than 1 container, repeat the procedure for a further 20 containers, and none visible particles could be found.

Suspensions for injection or eye drops All of the 20 containers should be free from coloured mass, cilia etc.

Injections not used for i.v., Power for injections and Sterile raw material for injection Comply with the related requirements of the drug surveillance administration of State Council.

2. Light scattering method

When a beam of monochromatic colour laser pass through the solution being examined, the insoluble substances in the solution cause the light scattering. The scattering energy is related to the size of insoluble substance. This method is intended to measure the light scattering energies caused by insoluble substance in solutions and then compare the energies with liminal value which preseted to check out the visible particles.

The light scattering energies caused by insoluble substance can be analyzed base on the series of the images collected. Suppose the light scattering energies is E , it is processed opto-electrical signal change over, became a corresponding stereopicture with the height of pyramid is H and the diameter is D and a pick-up camera can catches it. The light scattering energies E is a monotonous function for D and H , i.e. $E=f(D, H)$. Meanwhile, suppose the intensity of the light scattering energies is q , the exposure time of take a photograph is T , there is furthermore $E=g(q, T)$. Reasoning can be obtained from the above that the relationship between D with q and D with T is $D=w(q, T)$, remain the relationship of monotonous function. After D has been determined, the light scattering energies can be calculated according to the curve of the function.

Apparatus and Principle The apparatus consists of the rotator for sample bottle, laser photosource, image collecting equipment, data processing system and terminal monitoring system. It also includes the automatic send and deliver devices for the bottle.

The samples are transferred to the rotator by the send device. The rotator must rotate the bottle rounding the perpendicular line in high speed for a while and then stopped sharply. The homogeneous laser beam from laser photosource should evenly illuminates through the solutions being examined. As soon as the turbulent flow in the solutions disappears, but the solution is still rotating due to inertia, the image collecting equipment takes images continuously at specific angle for light scattering energies that resulting from insoluble substances in the rotating solution. The numbers of image should be not less than 75. Data processing system then processes the series of the images. It will assess automatically the insoluble substance more than given size exists or not according to the predefined criteria, or it will display the images on the monitor in order to making decision manually. The results will be recorded at the same time. Then the deliver device will be instructed to differentiate the qualified and unqualified samples automatically.

Standardization for Instrument The instrument should have the automatic calibrating function. The calibration should be carried out using the reference particles before the test. Unless otherwise specified, calibrate the instrument using the reference particles with diameter 40 μm and 60 μm respectively. The curve equation resulting from the

parameter of the reference particle with diameter 50 μm for test criterion.

After the pinel parameter is set according to the 50 μm reference particle, detect the solutions containing the 60 μm reference particle three times, each result should be positive.

Procedure Unless otherwise specified, choice the corresponding test parameters from the menu provided in the instrument according to the strength of samples and adjust the parameters in compliance with the size of the containers. The test must carry out three times. If a container fails the test even one time, change the method to the lamp test for further confirmation except the container is coloured transparent vessel or the colour of the solution being examined is too dark to observe by visual test.

In general conditions, the left and right lines of sampling window should overlap with the edges of the container, the upper line should be a secant line with the curve surface of the solution in the container. Rotating time parameter should be settled longer than the time that the whirlpool in the solution reaches to the bottom of the bottle in order to force the solid substances floating and air bubble broken. Holding time parameter should be set as short as possible but not shorter than the time for the whirlpool calming down in order to avoid the interference of air bubbles meanwhile retain the solid substances in moving state when image collecting equipment start to work. The tightness parameter for holding bottle prefer to same with the diameter of the bottom of the bottle (mm), and it is adjustable based on the qualities of the bottle. If the bottle is not smooth and straight enough to avoid the vibration during rotating, air bubbles would be introduced. In this case the tightness parameter should be increased to decrease the vibration, meanwhile, the rotating time parameter should be increased so ensuring that the whirlpool in the solution reach to the bottom of the bottle.

Injections Unless otherwise specified, take 20 containers being examined randomly. First remove any adherent nontransparent labels from the containers, clean the outer surfaces, then put the samples onto the send device, start the instrument and record the results. All of the 20 containers should be free from visible particles. If it is confirmed that visible particle has been found in not more than 1 container, repeat the procedure for a further 20 containers, and none visible particles could be found.

Eye drops Unless otherwise specified, take 20 containers being examined randomly and transfer the solutions into other clean and diaphanous appropriate glass containers. Put the containers onto the send device, start the instrument and record the results. All of the 20 containers should be free from visible particles. If it is confirmed that visible particle has been found in not more than 1 container, repeat the procedure for a further 20 containers, and none visible particles could be found.

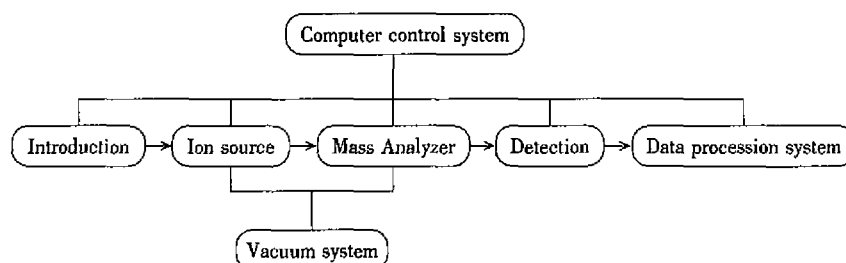

IX J Mass Spectrometry

Mass spectrometry is a method of analysis in which ions obtained by ionizing the analyte are separated according to their mass-to-charge ratios (m/z) and their spectral peak intensities are measured for analytical purpose. Mass is one of the intrinsic attributes of a substance, and different substances give different mass spectra. This attribute can be used for qualitative analysis (including molecular mass and relevant structural information). In addition, spectral peak

represented by a particular peak, and thus can be used for quantitative analysis.

A typical mass spectrometer comprises six parts: vacuum system-by which the vacuum status of each part of the mass and spectrometer is controlled; the sample introduction system-by which the sample is introduced into the suitable part of the ion source with the ionization technique as appropriate; the ion source-by which sample molecules are ionized and the ions produced are focused into an ion beam of certain energy level and in particular geometric shape; the mass analyzer-by which ions of different m/z ratios in the ion beam

origination from the ion source are separated according to factors such as spatial position, time sequence or orbital stability under the action of electromagnetic field (including magnetic field, combination of magnetic and electric fields, high-frequency electric field and high-frequency pulsed electric field etc.); the detector-by which post-separation ion signals are received, detected and recorded; data-processing system-by which the whole equipment is controlled by the computer system and data collection and procession is conducted. The diagrammatic sketch, which shows the operation principle, is as follows:

1. Vacuum System

The vacuum system is composed by mechanical pump and molecular pump. In order to get precise mass value, the collision between the ion and the remain gas molecular of test sample should be as little as possible. The method to realize this aim is letting the ion into the magnetic field under the high vacuum status, where the ion collector collects as many ions as possible and the vacuum extracts the gas molecular of the remaining test sample. To satisfy the test requirement, the pressure of the ion source should be reduced to 10^{-8} - 10^{-7} mmHg, while the pressure of the mass analyzer should be reduced to 10^{-7} - 10^{-8} mmHg.

2. Sample Introduction System and Interface Techniques

Introducing the sample into the mass spectrometer can be achieved by two means, direct introduction and through an interface.

(1) Direct Introduction

Under room temperature and normal pressure, a gaseous or liquid sample is introduced into the ion source by an adjustable spray device in the form of a neutral current. Volatile substances adhered to a solid or dissolved in a liquid can be enriched with the headspace analyzer, captured by the adsorption column, desorbed via temperature-programmed process, and delivered into the mass spectrometer through a capillary.

For solid samples, direct introduction by an insertion probe is usually adopted. The sample is introduced by heating it in a small crucible at the probe tip under the vacuum environment near the ion source, or desorption on a fast heating metallic filament in the ionization chamber, or by laser assisted desorption. Such introduction method, if coupled with electron impact ionization, chemical ionization and field ionization, is applicable to the analysis of materials with poor volatility or thermal stability.

(2) Interface

At present, the interface technique used for various couplings of liquid chromatography with mass spectrometry has undergone more rapid development over other sample introduction systems. This technique delivers chromatographic effluent into the mass spectrometry for ionization and subsequent spectrum analysis. Its major varieties include various types of spraying techniques (electrospray, thermal spray and ion spray), transmission device (particle beam) and particle-induced description (fast atom bombardment) etc.

Sample carried in the chromatographic mobile phase is ejected through a high-voltage (of several thousand volts) needle-shaped ejector and turned into charged droplets. Subsequent to the removal of solvent by drying air, the charged ions enter the mass analyzer directly through a capillary or pinhole. Conventional electrospray interface, suitable only for systems of mobile phase velocity from 1 to 5 $\mu\text{l}/\text{min}$, is used mainly for micro-column liquid chromatography. Since ions can carry multiple charges, the m/z ratios of macromolecular substances fall into the analytical ranges (m/z ratio less than 4000) of most quadrupole or magnetic mass analyzers. Thus, substances with high molecular mass up to several hundred thousand Daltons (Da) can be analyzed.

2) Thermal Spray Interface

Analyte carried in the mobile phase of a volatile buffer (such as ammonium acetate solution) is introduced through a duct of small diameter into the ion source and heated at the same time. Solvent is removed in the duct and the analyte enters the gaseous phase. Neutral molecules, via reaction with gaseous buffer ions (such as NH_4^+), are ionized by chemical ionization, and then delivered into the mass analyzer. The thermal spray interface is suitable for detecting various types of polarized compounds. Since the solvent requires a relatively higher temperature to evaporate, the analyte may be decomposed by heat.

3) Ion Spray Interface

On the basis of electrospray interface, spraying is assisted by gas to increase the mobile phase velocity to 1 ml/min. In electrospray and ion spray techniques, volatile buffer has to be used in mobile-phase system.

4) Particle Beam Interface

Chromatographic effluent is transformed into aerosol. Having its solvent removed in the solvent removal chamber, the neutral analyte molecules obtained are introduced into the ion source and ionized by means of electron impact ionization (EI) or chemical ionization (CI). The resulting spectra are thus classical EI or CI spectra, the former with a wealth of structure information. However, due to limitations with respect to polarity, thermal stability and molecular mass, particle beam interface is best suited for small organic molecules with masses less than 1000 Da.

5) Desorption Technique

In the coupling of microflow liquid chromatography with particle-induced desorption technique (fast atom bombardment), the chromatographic effluent is ionized by fast atom bombardment (FAB) and then analyzed by mass spectrometry.

the commonly used flow rate is 1 to 10 $\mu\text{l}/\text{min}$ and a trace of low-volatility liquid (such as glycerol) has to be added to the mobile phase. The liquid mixture flows through a capillary to a metal target set in the ion source. A liquid membrane is formed after solvent evaporation and is then bombarded by high-energy atoms or ions for ionization. The resulting spectra are similar to those resulted from fast atom bombardment or liquid secondary ion spectrum but the background from the sample matrix greatly reduced.

3. Ion Source

Function of an ion source determine the ionization efficiency and to a great extent the sensitivity of the mass spectrometer. There are two common types of ionization: one being the ionization of the sample in its gaseous phase at the ion source, and the other being the splashing of charged ions from solid surface or solution. In many cases, sample introduction and ionization take place simultaneously.

(1) Electron Impact (EI) Ionization

Upon entry into the ionization chamber, gaseous sample molecules are subject to bombardment by accelerated electron current emitted from tungsten or rhenium filament to produce positive ions. The pressure in the ionization chamber is maintained at the range between 10^{-4} and 10^{-6} mmHg. Energy gained from electron bombardment exceeds the ionization energy of the sample molecules, thus causing ionization or fragmentation of such molecules. EI spectra provide the most abundant structural information for organic compounds, and have a good reproducibility. The study on their fragmentation pattern is also the most comprehensive. A database of standard spectra of tens of thousand of organic compounds has been established for searching.

The drawback is that it is not suitable for samples with poor volatility and thermal stability.

(2) Chemical Ionization (CI)

Reagent gas with certain pressure is admitted to the source and ionized by a high energy electron beam or discharge. The ions resulted react further with reagent gas molecules, or have ion-molecule reaction with sample molecules. Sample molecules are then ionized through exchange of protons. Commonly used reaction gases include methane, iso-butane and ammonia. By chemical ionization, quasi-molecular ions are usually obtained. If proton affinity potential of the sample molecules is greater than that of the reagent gas, $[M+H]^+$ are produced; otherwise, $[M-H]^+$ are generated. Depending on the pressure of the reagent gas, CI ion source falls into three categories, namely atmospheric pressure, medium pressure (0.1-10 mmHg) and low pressure (10^{-6} mmHg). Atmospheric pressure CI ion source is suited to the coupling of chromatography with mass spectrometry, and the sensitivity is improved by two to three orders of magnitude over common CI ion source. Low pressure CI ion source can analyze less volatile samples at lower temperatures, and reagents with low volatility can be used but only in Fourier transform mass spectrometer.

(3) Fast Atom Bombardment (FAB)

The sample is dissolved in a matrix (usually solvents with high boiling points such as glycerol) to form a solution which is then applied to the metal surface for introducing into the FAB ion source. Neutral proton beam of an inert gas (such as xenon) is accelerated by strong electric field and aimed at the sample for bombardment. Associated ions existed in the matrix and the sample ions produced from FAB are both splashed into the gaseous phase and then delivered into the mass analyzer under the action of electric field. When an ion beam of an inert gas (such as caesium and argon) instead of the neutral atom beam is used for bombardment, a liquid secondary ion mass spectrometry will

FAB technique has the advantage of good ionization efficiency and is applicable to polar, poor volatility and thermal stability samples as well as those unsuited to EI or CI. When compared with EI, FAB can obtain stronger molecular ions or quasi-molecular ions; when compared with CI, FAB outperforms in giving more information about spectral peaks of fragment ions, which facilitates structural analysis. The limitation of FAB is the decreased sensitivity for non-polarized samples and the generation of more interference peaks from the matrix when the mass range is low (less than 400). FAB is a surface analysis technique, and care must be taken during sample preparation to optimize the condition of the surface. The adduction of sample molecules and alkaline metal ions, such as $[M+Na]^+$ and $[M+K]^+$, facilitates the formation of ions, as well as the ionization of biological molecules. Therefore, treatment of sample surface with sodium chloride solution may enhance the yield of adduct ions. Such yield can also be enhance by heating the sample in the course of analysis.

(4) Field Ionization (FI) and Field Desorption (FD)

FI ion source is formed by a pair of closely-spaced anode and cathode. By applying a high voltage between the two electrodes, a strong electric field up to 10^7 to 10^8 V/cm is formed around the cathode. Gaseous sample molecules near the cathode are ionized into positive molecular ions, and then accelerated to enter the mass analyzer. Liquid samples (solid samples dissolved with solvents first) can be ionized by FD. A metallic filament is immersed into the sample solution. Upon evaporation of the solvent, the filament, acting as the emitter, is delivered into the ion source. By a weak current applied to provide the energy for sample desorption, the sample molecules are dispersed into the high-field emission zone and ionized. FD is suited to nonvolatile and poor thermal stability samples. Both FI and FD can yield molecular ions easily.

(5) Atmospheric Pressure Ionization (API)

API is the most common ionization technique used in the coupling of liquid chromatograph with mass spectrometry. There are three types of common API ion source, namely atmospheric pressure electrospray ionization (APESI), atmospheric pressure chemical ionization (APCI) and atmospheric pressure photoionization (APPI). APESI, a process by which ions are produced from charged droplets following the removal of solvent, is suited to polar compounds which ionize easily in solutions. Given its capacity to handle multiple charges, it can analyze a wide range of molecular mass, and thus suited to small molecules as well as peptides, proteins and oligonucleotides. APCI, an ionization technique by which samples in gaseous and mobile phase are ionized by means of corona discharge under atmosphere pressure, is suited to considerably volatile samples, like non-polar compounds or compounds with low or medium polarity. Since ions with multiple charges are rarely formed, the analyzable range of molecular mass is subject to the mass range of the mass analyzer. Unlike APCI, APPI substitutes ultra-violet light for corona discharge to ionize gas-phase sample by photochemical action. APPI is suitable for non-polar compounds. In an API setting, the ion source is separated from the highly vacuum mass analyzer. The switch between different API ion sources is therefore very convenient.

(6) Matrix-assisted Laser Desorption Ionization (MALDI)

Sample dissolved in a suitable matrix is deposited on the metal support, and then exposed to ultraviolet or infrared pulsed laser radiation of high intensity to achieve ionization. This technique is mainly used for the analysis of macromolecules with mass up to 100000 Da. Its usage is limited to the ion source of the time-of-flight analyzer.

Plasma is composed of free electrons, ions and neutral atoms or molecules. It is largely a neutrally charged gas with an internal temperature as high as several thousand or even up to ten thousand degree Celsius. The sample, carried by a carrier gas through the centre of the plasma blaze, is evaporated and ionized quickly and introduced into the mass analyzer via an ion-led interface. Under extremely high temperature, the sample is completely evaporated and decomposed, resulting in a high percentage of ionization. It can therefore give relatively higher detection sensitivity for almost all elements. As the molecular structure of the compound will be damaged under such conditions, the use of ICP is limited to elemental analysis.

4. Mass Analyzer

A mass analyzer separates charged ions by their m/z ratios for recording mass and abundance of different ions. The two main technical parameters of a mass analyzer are the detectable range of m/z ratios (mass range) and the resolving power.

(1) Magnetic Sector Analyzer

Ions generated from the ion source are focused into an ion beam under a sector-type magnetic field and through a small slit. After exiting the ion source, the ions are subjected to a magnetic field perpendicular to their forward direction. Under the action of magnetic field, ions of different m/z ratios are deflected with various degree of deviation from their forward direction, resulting in the scattering of the ion beam. Given the difference in m/z ratios, these ions will have specific radius of curvature in their motion paths under the sector field. By varying the strength of the magnetic field, ions passing through the small slit sequentially are detected. Spatial separation of ions is then realized and their mass spectra obtained.

(2) Quadrupole Analyzer

A quadrupole analyzer gets its name from the four parallel metal rods it comprises. The ion beam is focused on the axis parallel to the rods. A direct current (DC) potential of fixed and a radio frequency (RF) potential are applied to the rods, making the two pairs of rods in opposite electrical potential. For given combination of DC and RF potential, ions of a particular m/z ratio travel steadily along the axis, while ions of other ratios are deflected to the sides and lost. By varying the combination of DC and RF potential maintaining a fixed slope, mass scanning can be achieved. A quadrupole analyzer exhibits a relatively higher sensitivity in selected ion analysis.

(3) Ion Trap Analyzer

It consists of a quadrupole-like ring electrode between two endcap electrodes. The endcap electrodes are held either at ground potential or at a DC voltage while RF voltage is applied to the ring electrode. With appropriate voltages, a potential energy trap (ion trap) is formed. The ion trap can capture ions within certain mass range, depending on the RF voltage level. Ions are stored in the trap and when a certain quantity is reached, the RF voltage of the ring electrode will be increased. Ions leaving the trap in descending order of their m/z ratios are detected by the electron multiplier. The current technology can already allow the ion trap analyzer to analyze ions of high m/z ratio, up to several thousand Da. The ion trap analyzer will decrease less sensitivity when a full-scan mode is used. Moreover, a single ion trap can achieve the function of multiple-stage mass spectrometry (MS^n) with a pre-set time sequence.

(4) Time of flight (TOF) Analyzer

Ions of same kinetic energy but different masses are separated according to their flight velocities. For a fixed distance of ion flight, ions of different masses vary in TOF. Ions of smaller

TOF of an ion is proportional to the square root of its m/z ratio. Ions are introduced into the mass spectrometer in discrete packets so that their flights start at the same point and TOF can be measured sequentially. Ion packets are either through a pulsed ionization process or through a gating system in which ions are produced continuously, but are introduced only at given times into the flight tube. Newly developed TOF analyzers, with its wider analyzable mass range and higher mass resolution, are particularly suitable for analysis of biological macromolecules like proteins.

(5) Fourier Transform Analyzer

Under a magnetic field of flux density, ions will move in circular orbits and their paths of movement are restricted by a resonant crossover electric field. When the crossover electric field frequency equals the cyclotron frequency, ions will be accelerated steadily, with the corresponding increases to their path radius and kinetic energy levels. As soon as the electric field disappears, the orbiting ions will create an alternate current on the electrodes and their masses can be obtained by analyzing the signal frequencies. Time and corresponding frequency spectrum are then imputed into the computer for Fourier transformation to produce the mass spectrum. The analyzer has the advantage of high resolution, with a precision as high as one milli-Dalton in the m/z ratio.

5. Tandem Mass Spectrometry (MS/MS) and Coupling Techniques

(1) MS/MS

Two or more mass spectrometers connecting together are called MS/MS. The simplest MS/MS consists of two mass spectrometers; ions will be pre-separated or modified with imparting energy at the first mass analyzer (MS_1) and delivered to the second one (MS_2) for result analysis. The most common type of MS/MS is triple quadrupole MS/MS, with the first quadrupole (Q_1) and the third quadrupole (Q_3) functioning as MS_1 and MS_2 respectively while Q_2 performing the function of bombarding various peaks produced by MS_1 to achieve fragmentation of the precursor ions before their entry into MS_2 for analysis. MS/MS formed by different mass analyzers are now available, such as Q-TOF and TOF-TOF tandems, expanding its application. Ion trap and Fourier transform analyzers can achieve time series MS_n scan at different time sequences.

One of the most basic functions of MS/MS is to determine the relationship between the precursor ions in MS_1 and the product ions in MS_2 . By the scan modes of MS_1 and MS_2 , such as product ion scan, precursor ion scan and neutral loss scan, the relationships between ions of different mass can be identified. Precursor ion fragmentation can be achieved by the following: collision-induced dissociation, surface induced dissociation and laser-induced dissociation. Dissociation without induction is known as metastable dissociation.

MS/MS has many advantages in mixture analysis. Coupling gas chromatography or liquid chromatography with mass spectrometry allows assay to be carried out even without chromatographic baseline separation of the substance. MS/MS can select precursor ions from the sample for analysis, without being interfered by other substances.

MS/MS can be widely used in the pharmaceutical field. Product ion scan can give qualitative information on the precursor ions of the drug's main ingredients, impurities and other substances contained, aiding the identification of unknown substances. It can also be used for identifying the sequence of peptides and amino acid of proteins.

In pharmacokinetical studies involving quantitative analysis of low-concentration samples in complex biological matrices, multiple reaction monitoring (MRM) mode can be used to reduce interference. In the analysis of specific ions of a drug, interfering signals from other compounds in the matrix

MS₂ on fragments of specific ions can reduce such interference. MRM can also perform quantitative analysis of several compounds at the same time. In the study of drug metabolism, neutral loss can be used to search for all the analyte all its ions containing the same functional group that is lost as a neutral fragment, such as the loss of neutral carbon dioxide in carboxylic acids, so that molecules with the common structural features can be identified. If the fragments lost are in the form of ions, the use of precursor ion scan can identify all the precursor ions losing such fragments.

(2) Coupling Techniques

Apart from acting as a sample introduction device for mass spectrometer, chromatography can perform preliminary sample separation and purification. Coupling chromatography with mass spectrometry can, therefore, carry out separation and analysis of complex systems. With the compound's retention time obtained by chromatography and its molecular mass and structural information by mass spectrometry, highly effective identification and assay of the compound in a complex system or mixture can be achieved. Among the coupling techniques available, gas chromatography/mass spectrometry (GC/MS) and high-performance Liquid chromatography/mass spectrometry (HPLC/MS) have been widely used in drug analysis.

1) GC/MS

GC effluent is already in the vapor state and can be admitted into MS directly. As working pressures of GC and MS differ by several orders of magnitude, various gas separators were used between them at the early stage coupling to address the difference in working pressure. With the application of capillary GC and high-speed vacuum pumps, however, GC effluent can now be delivered into MS directly.

2) HPLC/MS

As mentioned earlier before, HPLC/MS interface is mainly used for analysis of substances that cannot be analyzed by GC/MS, or are of poor thermal stability, strong polarity and high molecular mass, such as biological samples (drugs and their metabolites) and biological macromolecules (peptides, proteins, nucleic acids and polysaccharides).

3) Capillary electrophoresis/mass spectrometry (CE/MS)

CE is suitable for separation and analysis of ultra-trace sample (nL volume) and for special purposes (such as chiral enantiomer separation). CE effluent can be introduced into MS directly or can be added to the assisted mobile phase compatible with the mass spectrometer.

4) Supercritical fluid chromatography/mass spectrometry (SFC/MS)

SFC often uses supercritical fluid carbon dioxide as the mobile phase, suitable for separation of substances of low or medium polarity. Coupling SFC with MS can be achieved by the use of a separator between the chromatographic column and the ion source.

5) Inductively coupled plasma/mass spectrometry (ICP/MS)

Coupling ICP to MS with the former acting as the ion source is mainly used for elemental analysis and elemental morphology analysis.

6. data processing and application

Detectors commonly used are photomultipliers and electron multipliers. Signals collected are multiplied and digitalized for feeding into the computer for processing to obtain the mass spectrum.

In a spectrum, the quantity of ions is indicated by abundance, i.e. the number of ions of a given m/z ratio. As it is impossible to determine the "number" of a specific ion, relative abundance is generally used to represent its

base peak, while abundance of other ions is represented by a percentage relative to the base peak. A mass spectrum is produced by m/z ratios and relative intensities of ions within the detectable mass range of the mass spectrometer. In LC/MS and GC/MS, chromatographic retention times of common analytes together with the relative intensities of their ions obtained by MS form the total ion current chromatogram. One can also fix a specific m/z ratio and perform selected-ion monitoring (SIM) on the chromatographic effluent to obtain selected-ion chromatogram. Resolution, sensitivity and mass range are the most important parameters of a mass spectrometer.

1) Resolution

The ion separation capability of a mass spectrometer is called resolution, which is generally defined as the ratio between average peak mass and peak mass difference of two adjacent peaks of the same height with a 10% valley-to-peak height level. Mass spectrometers of low, medium and high resolution refer to resolution at 100 to 2000, 2000 to 10000 and over 10000 respectively.

$$R = \frac{M}{\Delta M}$$

Where, $M = \frac{M_1 + M_2}{2}$, $\Delta M = |M_1 - M_2|$

2) Sensitivity

The sensitivity is the measurement of the relationship between the intensity of the mass peak and the quantity of the test sample. In practice, the quantity of the test sample should be as less as better while the intensity of the mass peak should be as more intensive as better. Generally speaking, there are interaction between the resolution and the sensitivity.

3) Mass range

The mass range means the largest mass number of the ion, which can be measured precisely by the equipment. The obtainment of the largest mass number is directly related with the accelerating voltage. The accelerating voltage forms a inverse ratio with the m/z ratio. The reduction of the accelerating voltage will increase the largest mass number, but it also will reduce the resolution and the sensitivity at the same time.

7. Application

The main applications of mass spectrometry in the pharmaceutical field are qualitative assay, structural analysis and quantitative analysis of drugs.

The loss or gain of one electron by a neutral molecule results in the m/z ratio of molecular ions equaling the molecular mass number. The precise mass number of ions can be obtained by the use of high-resolution mass spectrometer or reference peak matching method, and the molecular formula of the compound can then be worked out. Cleavage of various chemical bonds of the molecular ions produces fragment ions, which aid in structural elucidation and identification.

When used for quantitative analysis, mass spectrometry has advantages in selectivity, precision and accuracy. External or internal standards may be used but the latter has higher precision than the former. The internal standard used in quantitative analysis can be either structural or stable isotope analogs, the former requires a lower cost but the latter yields higher precision and accuracy. When using isotopic substances are used as the internal standard, one has to make sure that the isotopic label are not exchangeable under the sampling separation and ionization condition. The use of FAB and LC/MS (thermal spray and electrospray) in quantitative analysis generally requires stable isotopes as the internal standard. The relative abundance of the analyte and

monitors specific ions of the analyte and the internal standard). When compared to a full scan, SIM exhibits increased selectivity and sensitivity because of the long integration time of ion current. By using the chromatographic peak area or peak height ratio of the analyte and the internal

standard, the calibration curve can be obtained. The analyte quantity can then be worked out based on the chromatographic peak area or peak height ratio of the analyte and the internal standard in the sample.

Appendix X

X A Determination of Disintegration

Disintegration is provided to determine whether the oral solid preparations disintegrate or disperse into fragments or particles within a prescribed time when placed in a liquid medium under the prescribed experimental conditions.

Disintegration is not required for the preparations which, except fragments of undissolved tablet coating or of capsule shell, remains on the screen of the test apparatus. Disintegration can be also considered to be achieved when the residue remained consists of a soft mass having no palpably, unmoistened core, or floats because of light weight.

Disintegration is not required for the preparations which comply with the requirements for Dissolution, Drug release or Disintegration for Suppositories and Vaginal Tablets.

1. Tablets

Apparatus The apparatus mainly consists of a basket-rack assembly with disks and a metallic device capable of raising and lowering the basket in the liquid medium at a constant rate between 30 and 32 cycles per minute through a distance of $55 \text{ mm} \pm 2 \text{ mm}$.

Basket-rack assembly The basket-rack assembly consists of six glass tubes, each $77.5 \text{ mm} \pm 2.5 \text{ mm}$ long, 21.5 mm in internal diameter with a wall of 2 mm in thickness. The tubes are held in a vertical position by two transparent plastic plates, each about 90 mm in diameter and 6 mm in thickness, with six holes, each about 26 mm in diameter. On the top of the upper plastic plate is a stainless-steel plate about 90 mm in diameter and 1 mm in thickness, with six holes each about 22 mm in diameter. Attached to the under surface of the lower plate is a disk of stainless-steel wire gauze about 90 mm in diameter, with apertures of 2.0 mm in internal diameter. A stainless-steel central shaft about 80 mm long is fixed with the upper plastic plate and stainless-steel plate. The stainless-steel plate, the two plastic plates and the wire gauze are fixed together by three screws (as Fig. 28).

Disks The disk is made of a smooth transparent plastic material having a specific gravity of $1.18-1.20$ with $20.7 \text{ mm} \pm 0.15 \text{ mm}$ in diameter, and $9.5 \text{ mm} \pm 0.15 \text{ mm}$ in thickness. It has five holes with 2 mm in diameter, one of the holes is located in the center and the others at an equal distance of 6 mm from the central hole. Equally spaced on the sides of the disk are four V-shaped notches. The dimensions of each notch are such that the upper openings are 9.5 mm wide and 2.55 mm deep and the lower openings are 1.6 mm wide and 1.6 mm deep (as Fig. 29).

Fig. 29

Procedure The basket is suspended in a water bath preferably using a 1000 ml of beaker, maintained at $37^\circ\text{C} \pm 1^\circ\text{C}$, the volume of the fluid in the vessel is adjusted appropriately so that at the highest point of the upward stroke the wire mesh remains at least 15 mm below the surface of the fluid and descends to a distance not less than 25 mm from the bottom of the vessel on the downward stroke.

Unless otherwise specified, place 1 tablet in each of the six tubes of the basket and operate the apparatus. All of the tablets should disintegrate completely within 15 minutes. If 1 tablet fails to disintegrate completely, repeat the test on 6 additional tablets. All of the tablets should comply with the requirement.

Film-coated tablets Carry out the test as described above. Replacing the water in the beaker with hydrochloric acid ($9 \rightarrow 1000$), all of the tablets should disintegrate within 30 minutes. If any one of the tablets has not disintegrated, repeat the test on additional six tablets; all the tablets should comply with the test.

Sugar-coated tablets Carry out the test as described above. All of the tablets should disintegrate within 60 minutes. If any one of the tablets has not disintegrated, repeat the test on additional six tablets; all the tablets should comply with the test.

Enteric-coated tablets Enteric-coated tablets are tested in the same way as described above using hydrochloric acid solution ($9 \rightarrow 1000$) as the immersion fluid and the tablets should disintegrate within 2 hours.

2 hours. Remove the basket, wash the tablets with a small quantity of water, add a disk to each tube. Repeat the operation using phosphate BS (pH 6.8) as the immersion fluid, all tablets should disintegrate completely within 1 hour. If 1 tablet fails to comply with the test, repeat the operation with additional 6 tablets. All the tablets should comply with the test.

Buccal tablets Unless otherwise specified, buccal tablets are tested in the same way as described above. All of the tablets should disintegrate or dissolve within 30 minutes. If any one of the tablets has not disintegrated, repeat the test on additional six tablets. All the tablets should comply with the test.

Sublingual tablets Unless otherwise specified, sublingual tablets are tested in the same way as described above. All of the tablets should disintegrate and dissolve within 5 minutes. If any one of the tablets has not disintegrated, repeat the test on additional six tablets. All the tablets should comply with the test.

Soluble tablets Unless otherwise specified, soluble tablets are tested in the same way as described above maintained the temperature at 15-25°C. All of the tablets should disintegrate and dissolve within 3 minutes. If any one of the tablets has not disintegrated, repeat the test on additional six tablets. All the tablets should comply with the test.

Colon-located enteric-coated tablets Unless otherwise specified, colon-located enteric-coated tablets are tested in the same apparatus as described under the individual monograph. All of the tablets should not release and disintegrate in the sulfuric acid solution (9→1000) and the phosphoric acid buffer solution with pH value less than 6.8, but release and disintegrate in the phosphoric acid buffer solution with pH value between 7.8 and 8.0 within 1 hour, and the tablet core also disintegrates. If any one of the tablets has not disintegrated, repeat the test on additional six tablets. All the tablets should comply with the test.

Effervescent tablets Effervescent tablets are tested in the following way. Place one tablet in a 250 ml beaker containing 200 ml of water maintained at 15-25°C, numerous gas bubbles are evolved. When the evolution of gas around the tablet or its fragments has ceased the tablets disintegrate, dissolve or disperse in the water so that no agglomerates of particles remain. Unless otherwise specified, the preparation being examined complies with the test if 6 tablets used in the test disintegrate in the manner prescribed within 5 minutes. If any one of the tablets has not disintegrated, repeat the test on additional six tablets. All the tablets should comply with the test.

2. Capsules

Unless otherwise specified, hard capsules or soft capsules are tested comply with the test as described above. If the capsules float on the surface of the water, a disk may be added. The hard capsules should disintegrate within 30 minutes and the soft capsules disintegrate within 1 hour. If one of the capsules has not disintegrated, repeat the test on further six capsules, all the capsules should comply with the test. For soft capsules, replacing the water in the beaker with simulated gastric fluid.

Unless otherwise specified, enteric capsules are tested in the same way as described above using hydrochloric acid solution (9→1000) as the immersion fluid and the capsule shells show no evidence of cracking, disintegrating in 2 hours. Remove the basket, wash the capsules with a small quantity of water, add a disk to each tube. Repeat the operation using simulated intestinal fluid as the immersion fluid, all capsules should disintegrate completely within 1 hour. If 1

with another 6 capsules. All the capsules should comply with the test.

3. Dripping pills

Carry out the test with the same apparatus as described as tablets using the stainless steel wire gauze with apertures of 0.425 mm in internal diameter. Carry out the test as described above using 6 dripping pills, unless otherwise specified. All of the dripping pills disperse completely within 30 minutes, and the coated-dripping pills should disperse completely within 60 minutes. If any one of the dripping pills has not dispersed completely, repeat the test on further six dripping pills, all the dripping pills should comply with the test.

Dripping pills made of gelatin matrix may be tested in simulated gastric fluid.

Annotation Simulated gastric fluid Add about 800 ml of water and 10 g of pepsin to 16.4 ml of dilute hydrochloric acid, mix well, dilute with water to produce 1000 ml.

Simulated intestinal fluid See Phosphate-Pancreatin BS (pH 6.8) (Appendix XV D).

X B Disintegration Test for Suppositories and Vaginal Tablets

The test for disintegration of suppositories and vaginal tablets determines whether a solid dosage form such as suppositories and vaginal tablets can disintegrate, soften, dissolve or disperse under the specified experimental conditions.

1. Suppositories

Apparatus The apparatus is composed of a transparent sleeve and a metal device (as Fig. 30).

Fig. 30

Transparent sleeve The transparent sleeve is made of glass or suitable plastic, with a height of 60 mm, an internal diameter of 52 mm and an appropriate wall thickness.

Metal device The metal device consists of two stainless steel metal discs and three metal hooks. Each of the disc has a diameter of 50 mm and contains 39 holes, each 4 mm in diameter (as Fig. 31). The discs are separated by a distance of 30 mm. The metal device is attached to the outer sleeve by means of the three equally-spaced hooks.

Procedure Take 3 suppositories being examined and allow to stand at room temperature for 1 hour. Place them on the lower discs of 3 metal devices respectively, then insert the devices into separate sleeves and fix them by means of the hooks. Unless otherwise specified, place each piece of the

Fig. 31

above apparatus in 3 vessels separately, each containing not less than 4 litres of water at $37.0^{\circ}\text{C} \pm 0.5^{\circ}\text{C}$ and fitted with a slow stirrer and a means of holding the apparatus vertically 90 mm below the surface of water, after each 10 minutes invert each apparatus without allowing it to emerge from the liquid.

Interpretation Unless otherwise specified, all of the fat-based suppositories should disintegrate, soften or have no solid core offering resistance to pressure within 30 minutes; all of the water-soluble suppositories should completely dissolve within 60 minutes. If one of the suppositories fails to comply with the requirements, repeat the test on 3 additional suppositories and all of them should comply with the requirements.

2. Vaginal tablets

Apparatus The apparatus is the same as that used for suppositories except that set the hook-end upside down in the vessel (as Fig. 32).

Fig. 32
1—Vaginal tablet; 2—Glass plate;
3—Water surface

Procedure Adjust the water surface level until the holes of the upper metal disc are just covered by a uniform layer of water. Put 3 vaginal tablets being examined on separate upper discs and cover the apparatus with a glass plate to maintain appropriate humidity.

Interpretation Unless otherwise specified, all of the vaginal tablets should dissolve or disintegrate into fragments and pass through the perforated plates or only remain a small amount of soft masses which have no solid core within 30 minutes. If one of the tablets fails to comply with the requirements, repeat the test on 3 additional tablets and all of them should comply with the requirements.

X C Dissolution Test

Dissolution test is used to determine the dissolution rate and

tablets, capsules or granules under the specified conditions. When dissolution test is specified in the monograph, it is understood that disintegration test can be exempted.

Method 1

Apparatus As Fig. 33.

Fig. 33

(1) The basket assembly consists of a basket and a shaft made of stainless steel (The materials should not adsorb, or interfere with the specimen being tested.). The basket (A) is made of stainless steel woven cloth with a nominal aperture of 0.40 mm; the stainless steel wire is 0.25 mm in diameter. The basket is cylindrical, $20.2 \text{ mm} \pm 1.0 \text{ mm}$ in internal diameter, with a metallic flanged rim at each end. The shaft (B) is $9.75 \text{ mm} \pm 0.35 \text{ mm}$ in diameter and is connected to the metallic lid of the basket. The lid has a vent hole, 2.0 mm in diameter and 3 retention springs with 3 tangs on 120° centers. The upper part of the lid has a diameter equal to the outside diameter of the basket and the lower part has a diameter equal to the inside diameter of the basket.

(2) The vessel is cylindrical, made of hard glass or other inert, transparent or brown materials, with a hemispherical bottom and a nominal capacity of 1000 ml, internal diameter $102 \text{ mm} \pm 4 \text{ mm}$, height $168 \text{ mm} \pm 8 \text{ mm}$. A fitted cover may be used to retard evaporation, the cover has a number of holes, the central one is used for the shaft to pass through, and the others are used for the insertion of thermometer and withdrawal of specimens. The vessel is placed in a constant temperature water bath.

(3) The shaft is connected with a motor with a speed regulator capable of maintaining the speed of rotation of the basket within $\pm 4\%$ of that specified in the individual monograph. When the motor is in operation, no part of the assembly, including the environment in which the assembly is placed, contributes any significant motion or vibration beyond that due to the smoothly rotating element. The shaft is positioned so that its axis is not more than 2 mm at any point from the vertical axis of the vessel. The wobble range is not greater than 1.0 mm during the rotation of the basket.

(4) The apparatus with six sets of assembly described above can be used to determine 6 specimens at the same time.

Assay Before test, adjust the apparatus so that the distance between the inside bottom of the vessel and the bottom of the basket is $25 \text{ mm} \pm 2 \text{ mm}$. Unless otherwise specified in the monograph, place 900 ml of de-aerated medium in each of 6 vessels, warm in a water bath to maintain a temperature at $37^{\circ}\text{C} \pm 0.5^{\circ}\text{C}$. Place 1 tablet (capsule or packet) in each of

speed to that specified in the monograph. Lower the baskets into the vessels, start the counting of time when the specimens immerse into the dissolution medium. Unless otherwise specified in the monograph, withdraw an aliquot of solution from a zone midway between the surface of the dissolution medium and the top of the rotating basket, 10 mm apart from the wall of the vessel within the time interval specified, or at each of the times stated (If two or more sampling times are specified, the sum of the volume of the samples withdrawn should be within $\pm 1\%$ of the volume of the dissolution medium. If the sum is greater than 1%, replace the aliquots withdrawn for analysis with equal volumes of fresh dissolution medium at 37°C immediately, or correct for the volume change in the calculation.). Filter immediately through a suitable membrane (The filter, made of inert material, has an appropriate pore size of not more than $0.8\ \mu\text{m}$ in diameter, should cause no significant absorption of the active ingredient from the dissolution solution and contain no materials extractable by the dissolution medium that would interfere with the prescribed analytical procedures). Complete taking and filtering a specimen within 30 seconds. Carry out the assay of active ingredient as directed in the monograph using the successive filtrate and calculate the amount of active ingredient dissolved from each tablet (capsule or packet).

Interpretation Unless otherwise specified in the monograph, the requirements are met if the quantities of active ingredient dissolved from tablets (capsules or packets) conform to one of the following states.

(1) The amount of active ingredient dissolved from each of 6 tablets (capsules or packets) is not less than the specified quantity (Q) calculated on the labelled content.

2. If 1-2 of 6 tablet (capsules or packets) fail the requirement, but not less than $Q-10\%$ and the average amount of active ingredient dissolved is not less than Q .

(3) If 1-2 of 6 tablets (capsules or packets) fail the requirement, and only 1 of tablets (capsules or packets) is less than $Q-10\%$ but not less than $Q-20\%$, and the average amount of active ingredient dissolved is not less than Q , repeat the test on 6 additional tablets (capsules or packets); if 1-3 of the second set of 6 tablets (capsules or packets) are less than Q , and only 1 of tablets (capsules or packets) is less than $Q-10\%$ but not less than $Q-20\%$, and the average amount of active ingredient dissolved is not less than Q .

The 10% and 20% values stated above interpretation are expressed as percentages of the labelled content.

Method 2

Apparatus As Fig. 34.

Fig. 34

Use the same assembly as that used in method 1, except that a paddle (A) is used instead of the basket. The paddle is made of stainless steel (as that used in method 1), the paddle blade and the lower part of shaft may be coated with a suitable inert material (such as Teflon). The shaft is positioned so that its axis is not more than 2 mm at any point from the vertical axis of the vessel. The wobble range of A, B is not greater than 0.5 mm during the rotation of the paddle.

Assay Before test, adjust the apparatus so that the distance between the lower edge of the blade and the inside bottom of the vessel is $25\text{ mm} \pm 2\text{ mm}$. Unless otherwise specified in the monograph, place 900 ml of de-aerated medium in each of 6 vessels, warm in a water bath to maintain a temperature of $37^\circ\text{C} \pm 0.5^\circ\text{C}$. Start the motor and adjust the rotational speed to that specified in the monograph. Place 1 tablet (capsule or packet) in each of 6 vessels (If tablet or capsule float, a sinker may be used, as Fig. 35). Start the counting of time when the specimens immerse into the dissolution medium. Unless otherwise specified in the monograph, withdraw an aliquot of the solution from a zone midway between the surface of the dissolution medium and the top of the blade, 10 mm apart from the wall of the vessel within the time interval specified, or at each of the times stated (If two or more sampling times are specified, as described in method 1). Filter immediately through a membrane (as that used in method 1). Complete taking and filtering a specimen within 30 seconds. Carry out the assay of active ingredient as directed in the monograph using the successive filtrate and calculate the amount of active ingredient dissolved from each tablet (capsule or packet).

Fig. 35

A: Acid-resistant wire clasp
B: Acid-resistant wire support

Interpretation Unless otherwise specified, proceed as directed for interpretation under method 1.

Method 3

Apparatus As Fig. 36.

Fig. 36

(1) The paddle, as Fig 37, is made of stainless steel (as that used in method 1); the upper part of the shaft is $9.75 \text{ mm} \pm 0.35 \text{ mm}$ in diameter and the lower part is $6.0 \text{ mm} \pm 0.2 \text{ mm}$ in diameter. The shaft is positioned so that its axis is not more than 2 mm at any point from the vertical axis of the vessel. The wobble rang A, B are not great than 0.5 mm during the rotation of the paddle.

Fig. 37

(2) The vessel is cylindrical, made of hard glass or other inert, transparent or brown materials, with a hemispherical bottom and a nominal capacity of 250 ml, internal diameter $62 \text{ mm} \pm 3 \text{ mm}$, height $126 \text{ mm} \pm 6 \text{ mm}$. The others used are the same assembly as that used in method 1 (2).

(3) The motor is connected with the shaft. The speed of the paddle is maintained within $\pm 1\%$ of that specified in the monograph. The others used are the same assembly as that used in method 2.

Assay Before test, adjust the apparatus so that the distance between the lower edge of the blade and the inside bottom of the vessel is $15 \text{ mm} \pm 2 \text{ mm}$. Unless otherwise specified in the monograph, place 100-250 ml of de-aerated medium in each vessels (a small, loose piece of anticorrosive materials such as metal filament may be attached to capsule that would otherwise float), and the rest of the procedure is the same as described in method 2. Withdraw an aliquot of the solution from a zone midway between the surface of the dissolution medium and the top of the blade, 6 mm apart from the wall of the vessel.

Interpretation Unless otherwise specified, proceed as directed for interpretation under method 1.

Dissolution conditions and attentions

(1) Apparatus Suitability Test Individually test 1 tablet of the dissolution calibrator, according to the operating conditions specified. The apparatus is suitable if the results obtained are within the acceptable range stated in the certificate for the calibrator in the apparatus test.

(2) Dissolution medium Use the dissolution medium specified in the monograph, freshly prepared and de-aerated before use [Dissolved gases can cause bubbles to form, which may change the results of the test. In such cases, dissolved gases should be removed prior to testing. Methods of de-aeration are as follows: Heat the medium, while stirring gently, to about 41°C , and continue stirring under vacuum for about 5 minutes; or continue boiling 15 minutes (about 5000 ml). Other validated de-aeration techniques for removal of dissolved gases may be used, such as ultrasonication or filtration]. If the dissolution medium is a buffered solution, adjust the solution so that its pH is within 0.05 unit of the pH specified in the monograph.

(3) Sampling time Specimens are to be withdrawn only at

the specified time of the monograph. Complete sampling specimens from 6 vessels within 1 minute.

(4) Where capsule shells interfere with analysis, remove the contents of not less than 6 capsules as completely as possible, and dissolve the empty capsule shells in the specified volume of dissolution medium. Perform the analysis as directed in the monograph. Make any necessary correction. Correction factors greater than 25% of the labelled content are unacceptable. If correction factors are not more than 2% of the labelled content, the interference of capsule shells is negligible.

(5) Unless otherwise specified in the monograph, withdraw samples at 45 minutes and the amount of active ingredient dissolved is not less than 70% of the labelled content.

(6) Unless otherwise specified in the monograph, place only 1 tablet (capsule or packet) in each of 6 vessels.

X D Drug Release Test

Drug release test is defined as the rate and degree at which a medicament is released from sustained-release preparation, controlled-release preparation, enteric-coated preparation or transdermal patches in the specified conditions when drug release test is specified in the monograph, it is understood that dissolution test or disintegration test can be exempt. The categories of sustained-release preparation, controlled-release preparation and enteric-coated preparation comply with Appendix XIX D.

Apparatus Unless otherwise specified, use the same assembly that used in dissolution test (Appendix X C).

Method 1 Used for sustained-release preparation or controlled-release preparation.

Assay Carry out the dissolution test accordingly with generally 3 sampling times. Withdraw an aliquot of the solution at the specified site where the specimens are taken after a specified time, and filter immediately through a membrane with pores of less than $0.8 \mu\text{m}$ in diameter. Complete sampling and filtering the specimen within 30 seconds. Replace the aliquots with fresh medium in equal volume immediately. Carry out the assay of active ingredient as directed in the monograph using the successive filtrate and calculate the amount of active ingredient released from each tablet (or capsules).

Interpretation Unless otherwise specified, the requirements are met if the quantities of active ingredient released from tablets (capsules) conform to one of following states.

(1) The amount of active ingredient released from each of 6 tablets (capsules) lies in the specified range, calculated on the labelled content at each test time.

(2) If 1-2 of tablets (capsules) fail the requirement, but not exceed 10% and the average amount of active ingredient released lies in the specified range at each test time.

(3) If 1-2 of tablets (capsules) fail the requirement, and only 1 of tablets (capsules) exceed 10%, but not exceed 20%, and the average amount of active ingredient released lies in the specified range at each test time, repeat the test on 6 additional tablets (capsules); if 1-3 of tablets (capsules) of the total of 12 tablets (capsules) exceed the specified range, and only 1 of tablets (capsules) exceeds 10%, but not exceed 20%, and the average amount of active ingredient released lies in the specified range at each test time.

The 10% and 20% values stated above interpretation are expressed as percentages of the labelled content. Exceeding

the specified range 10% means that the amount of active ingredient released from each tablet is not less than 10% of the lower limit of the specified range, and not more than 10% of the upper limit of the specified range at each time. The amount of active ingredient released at each time includes the amount of active ingredient release at terminal time.

Method 2 Used for enteric-coated preparation.

(1) **The amount released in acid** Unless otherwise specified, place 750 ml of 0.1 mol/L hydrochloric acid solution in each of 6 vessels, which are partially immersed in a suitable water bath that permits to keep the temperature inside the vessel at $37^{\circ}\text{C} \pm 0.5^{\circ}\text{C}$ during the test, adjust the rotational speed and maintain it stable. Carry out the method specified in monograph, place 1 tablet (capsule or packet) in each of 6 dry baskets or 6 vessels, start the motor to operate for 2 hours. Withdraw an aliquot of the solution at the specified site where the specimens are taken after a specified time, and filter immediately through a membrane with pores of less than $0.8\ \mu\text{m}$ in diameter. Complete sampling and filtering the specimen within 30 seconds. Carry out the assay of active ingredient as directed in the monograph using the successive filtrate and calculate the amount of active ingredient release from each tablet (or unit) in acid.

The amount released in buffer solution To the acid solution state above a ml of mol/L sodium phosphate [adjust to pH 6.8 ± 0.05 with 2 mol/L hydrochloric acid solution, if necessary]. Continue to operate the apparatus for 45 minutes, or for the time specified in the monograph, withdraw an aliquot of the solution at the specified site where the specimens are taken after a specified time, and filter immediately through a membrane with pores of less than $0.8\ \mu\text{m}$ in diameter. Complete sampling and filtering the specimen within 30 seconds. Carry out the assay of active ingredient as directed in the monograph using the successive filtrate and calculate the amount of active ingredient release from each tablet (or unit) in buffer solution.

(2) **The amount released in acid** Unless otherwise specified, place 900 ml of 0.1 mol/L hydrochloric acid solution in each of 6 vessels, proceed as directed under method (1) to measure the amount released in acid.

The amount released in buffer solution Drain the acid from each of 6 vessels, and add 900 ml of pH 6.8 phosphate buffer to each of 6 vessels, prepared by mixing 0.1 mol/L hydrochloric acid solution with 2 mol/L sodium phosphate solution (3 : 1), and adjusting with 2 mol/L hydrochloric acid solution or 2 mol/L sodium hydroxide solution to pH 6.8 ± 0.05 , if necessary. Or transferring each of 6 tablets (or units) to 6 other vessels containing 900 ml of phosphate buffer (pH 6.8) respectively, proceed as directed under (1) to measure the amount released in buffer solution.

Interpretation Unless otherwise specified, the requirements are met if the quantities of active ingredient released from tablets (capsules or packets) conform to one of the following states.

The amount released in acid (1) The amount of active ingredient release from each of 6 tablets (or capsules) is not more than 10%, calculated on the labelled content.

(2) If 1-2 of 6 tablets (or capsules) are more than 10%, but the average amount of active ingredient released is not more than 10%.

The amount released in buffer solution (1) The amount of active ingredient release from each of 6 tablets (or capsules) is not less than the specified quantity (Q) of the labelled content. Unless otherwise specified, the value of Q is 70% of the labelled content.

(2) If 1-2 of 6 tablets (or capsules) is less than Q, but not

less than $Q-10\%$, and the average amount of active ingredient released is not less than Q.

(3) If 1-2 of 6 tablets (or capsules) is less than Q, only 1 of tablets (capsules) is less than $Q-10\%$, but not less than $Q-20\%$, and the average amount of active ingredient released is not less than Q, repeat the test on 6 additional tablets (capsules); if 1-3 of tablets (capsules) of the total of 12 tablets (capsules) are less than Q, and only 1 of tablets (capsules) is less than $Q-10\%$, but not less than $Q-20\%$, and the average amount of active ingredient released is not less than Q.

The 10% and 20% values stated above interpretation are expressed as percentages of the labelled content.

Method 3 Used for transdermal patches.

Apparatus Use the paddle and vessel assembly (as Fig. 38) described in the dissolution test for tablets and capsules (Appendix X C, method 2), the disk assembly as Fig. 39.

Fig. 38 Paddle Over Disk

Fig. 39 Disk Assembly

Assay Place the prescribed volume of the dissolution medium in the vessel and equilibrate the medium to $32^{\circ}\text{C} \pm 0.5^{\circ}\text{C}$. Apply the patch in the disk ensuring that the release surface of the patch is as flat as possible and facing up. Place the disk at the bottom of the vessel and the release surface parallel to the bottom of the paddle blade. A distance of $25\ \text{mm} \pm 2\ \text{mm}$ between the paddle blade and the surface of the disk is maintained during the test. Immediately rotate the paddle and withdraw at determined intervals. Withdraw an aliquot of solution from a zone midway between the surface of the dissolution medium and the top of the blade, not less than 1 cm apart from the wall of the vessel. Replace the aliquots withdrawn for analysis with equal volumes of fresh dissolution medium.

Sampling method as same as Method 1.

Interpretation Unless otherwise specified, proceed as directed

for interpretation under method 1.

X E Test for Content Uniformity

Test for content uniformity is expressed as the contents of single ingredient of solid preparations, semi-solid preparations, and unhomogeneous liquid preparations small dosage or comply with the labelled amount. Unless otherwise specified, the labelled amount of each tablet, capsule or sterile powder for injection is not more than 10 mg or the content of the active ingredient is less than 5% of each weight; the labelled amount of each other preparation is less than 2 mg or the content of the active ingredient is less than 2% of each weight; and transdermal patches, are all carried on the test for content uniformity. The products whose effective concentration is relatively close to the concentration for the poison or side reaction or mixing technique is difficult and the labelled amount of each is not more than 25 mg, are also carried on the test for content uniformity. The component which complies with the above requirement is tested for compound preparations. When the test for content uniformity is specified in the monograph, it is understood that the test for weight variation (and of content) can be exempted.

Unless otherwise specified, take 10 tablets (unit) of the substance being examined, as specified in the individual monograph, determine separately the relative content X of each tablet which express 100 as the labelled amount, calculate its mean value \bar{X} , the standard deviation S^D and the absolute value A ($A = |100 - \bar{X}|$) which is the difference between the labelled amount and the mean value: if $A + 1.80 S \leq 15.0$, the substance being examined complies with the test for content uniformity; if $A + S > 15.0$, the substance being examined fails to comply with the test for content uniformity; if $A + 1.80 S > 15.0$ and $A + S \leq 15.0$, then repeat the determination using another 20 tablets. According to the results of first and repeated test, calculate the mean value \bar{X} of 30 tablets, standard deviation S and the absolute value A , the difference between the labelled amount and the mean value: if $A + 1.45 S \leq 15.0$, the substance being examined complies with the test for content uniformity; if $A + 1.45 S > 15.0$, the substance being examined fails to comply with the test for content uniformity.

The limit of the content uniformity should comply with the specifications under the individual monograph. Unless otherwise specified, the single ingredient of oral suspended solution, soft capsule filling with suspended substances, powder inhalation that holds capsules or blisters, and the single ingredient of suspensions for eye, ear and nose, solid or semi-solid preparations; the limit should be $\pm 20\%$; the limit for the transdermal patches and suppositories should be $\pm 25\%$.

If the limit of the test for content uniformity is $\pm 20\%$ or other percentage as specified in the monograph, the 15.0 in the above judge formula should be changed to 20.0 or other

corresponding value, but keep the coefficient in the formula unchanged.

If the method used for test for content uniformity is different to the assay method and the content of each tablet of content uniformity can not get from the response value (such as absorbance), take 10 tablets (units) of substance being examined, as specified in the test for content uniformity in the individual monograph. Use the response value Y from instrumental method (absorbance, peak area etc.) to calculate its mean value \bar{Y} . Determine the content X_A of each tablet which express 100 as the labelled amount by assay method. Calculate the X_A/\bar{Y} to get a proportional coefficient K ($K = X_A/\bar{Y}$). Every response value Y multiply by K to calculate the relative percentage content X ($X = KY$) of each tablet which express 100 as the labelled amount. Calculate \bar{X} , S and A by the method as described above and then identify the results.

X F Minimum Fill

The following tests and specifications apply to solid, semisolid, and liquid dosage forms packed in containers, except those preparations for which the tests for Weight Variation of Contents and Volume in Container are otherwise specified required or radio active pharmaceuticals.

Procedure

Gravimetric method (for containers labelled by weight)
Unless otherwise specified, select 5 containers (or 3 containers if the labelled quantity is more than 50 g), remove the cover and label. Thoroughly clean and dry the outside of the containers by suitable means, and weigh individually and accurately. Accurately remove the contents from each container, wash the container with a suitable solvent. Dry, and again weigh each empty container. Determine the net weight of contents in each container and the average net weight of contents. The results comply with the requirements. If one container fails the requirements, a further 5 (or 3) containers may be tested individually and all must comply.

Volumetric method (for containers labelled by volume)
Unless otherwise specified, select 5 containers (or 3 containers if the labelled quantity is more than 50 ml). Open the containers with caution to avoid any loss of the contents. Take up individually the contents of each container into a dry, previously standardized syringe, or pour into a dry, previously standardized graduated cylinder, if the labelled quantity is more than 50 ml. For viscous liquids, keep the containers upside down for 15 minutes to pour the contents as completely as possible. Measure the volume of the contents in each container, calculate the average volume of contents. The results comply with the requirements. If one container fails the requirements, a further 5 (or 3) containers may be tested and all must comply.

Labelled quantity	Solids, semisolids, liquids		Viscous liquids(volumetric method)	
	Average quantity	Quantity in each container	Average quantity	Quantity in each container
Less than 20 g(ml)	Not less than the labelled quantity	Not less than 93% of the labelled quantity	Not less than 90% of the labelled quantity	Not less than 85% of the labelled quantity
20-50 g(ml)	Not less than the labelled quantity	Not less than 95% of the labelled quantity	Not less than 95% of the labelled quantity	Not less than 90% of the labelled quantity

$$① S = \sqrt{\frac{\sum(X - \bar{X})^2}{n}}$$

continue

Labelled quantity	Solids, semisolids, liquids		Viscous liquids (volumetric method)	
	Average quantity	Quantity in each container	Average quantity	Quantity in each container
More than 50 g(ml)	Not less than the labelled quantity	Not less than 97% of the labelled quantity	Not less than 95% of the labelled quantity	Not less than 93% of the labelled quantity

In the cases of hygroscopic tablets, care must be taken to perform the test quickly enough to prevent moisture absorption (relative humidity is not more than 40%).

X G Test for Tablet Friability

This chapter provides guidelines for the friability determination of compressed, uncoated tablets. The test procedure presented in this chapter is generally applicable to most compressed tablets, and supplements other physical strength measurements, such as tablet crushing strength.

Apparatus Use a drum with an internal diameter of about 286 mm and a depth of 39 mm made of a transparent synthetic polymer with polished internal surfaces, and not subject to static build-up (as Fig. 40). One side of the drum is removable. The tablets are tumbled at each turn of the drum by a curved projection with an inside radius of $80 \text{ mm} \pm 1 \text{ mm}$ that extends from the middle of the drum to the outer wall. The drum is attached to the horizontal axis of a device that rotates at $25 \pm 1 \text{ rpm}$. Thus, at each turn the tablets roll or slide and fall onto the drum wall or onto each other.

Fig. 40 Tablet friability apparatus

Procedure For tablets weighing up to 0.65 g each, take a 6.5 g of sample; for tablets weighing over 0.65 g each, a 10-tablet sample is sufficient. Place the tablets on a No. 10 sieve and remove any loose dust with the aid of air pressure or a soft brush. Accurately weigh the tablet sample, and place the tablets in the drum. Rotate the drum 100 times, and remove the tablets. Remove any loose dust from the tablets as before and weigh.

Generally, the test is run once. If the results are doubtful or if the weight loss is greater than 1%, the test should be repeated twice and determine the mean of the three tests. A maximum weight loss of not more than 1% of the weight of the tablets being tested is considered acceptable and any tablets broken, chapped and smashed are not picked up.

If tablet size or shape causes irregular tumbling, adjust the drum so that its axis forms a 10° angle with the base and the tablets no longer bind together when lying next to each other, which prevents them from falling freely.

If tablet size or shape causes severe irregular tumbling in the drum, or tablets are produced by special procedure, this

X H Determination of Particle or Droplet Size Distribution of Inhalation Preparations

The particle or droplet size distribution in the spray discharged from inhalation preparations (including inhalation aerosol, dry powder inhalers and inhalation nebulizers), are important characteristics used in judging inhalation performance. While particle size measurement by microscopy, light obscuration, light scattering or light diffraction methods can be used to evaluate the number of particles in the emissions of inhalations in the manufacturing process, whenever possible this test should be replaced with a method to determine the aerodynamic size distribution of the drug aerosol leaving the inhalers for finished products. The particle or droplet size distribution measured by this test is the percentage of the inhalation output having an aerodynamic size less than or equal to that defined in the individual monograph over the amount of each emitted dose.

Apparatus The apparatus is shown figure 41, and the component units are described as follows.

Connect all the component units according to the figure and operate the apparatus at $20-25^\circ\text{C}$. Introduce 7 ml of solvent specified in the individual monograph as the propellant in the first impingement chamber D, and 30 ml of solvent specified in the individual monograph as the entrapping liquid in the second impingement chamber, H. Connect all the component units and ensure that the jet from the assembly G, just touches the bottom of the second impingement chamber. Clip the second impingement chamber and make all the component units tightly collected. Ensure that the assembly is vertical and adequately supported and that component C and E parallel each other. Connect a flowmeter inlet to the fitting F, and a pump to the flowmeter outlet. Place the rubber adapter on the assembly inlet. Insert the inhaler and ensure that the mouthpiece points along the horizontal axis of the throat B, while the container is upturned and in the same vertical plane as the assembly. Switch on the pump, adjust flow control valve to achieve a flow rate at 60 ± 5 liters per minute, switch off the pump, and remove the inhaler. Do not adjust the flow control valve during the operation.

Procedure

1. **Procedure for inhalation aerosols** Select one aerosol container and allow it to stand at $22^\circ\text{C} \pm 2^\circ\text{C}$ for at least 1 hour. Shake thoroughly and fire several discharges to waste. Insert the actuator into rubber adapter, switch on the pump, shake the container for 5 seconds, replace the container in its actuator, discharge once immediately. Remove the container from its actuator, shake for 5 seconds, relocate the container in its actuator and discharge again. Repeat the discharging for 10

Fig. 41 Devices for aerodynamic size distribution

- A: Rubber adapter for actuator mouthpiece.
 B: Throat, a modified 60 ml round-bottomed flask with 29/32 ground-glass inlet socket and 24/29 ground-glass outlet cone.
 C: Neck.
 D: First impingement chamber, a modified 100 ml round-bottomed flask with 24/29 ground-glass inlet socket and 14/23 ground-glass outlet socket.
 E: Coupling tube, a glass wall tube with 14 ground-glass outlet cone connected to D.
 F: Outlet fitting, connected to a flowmeter, the screw thread inlet connected to E sealed with a plastic screw cap (containing a ring).
 G: Jet assembly, a modified polypropylene filter holder with 4 jets (1.85 mm \pm 0.125 mm in diameter) arranged on a circular disc and with an integral jet spacer peg with 2 mm protrusion (2 mm in diameter).
 H: Second impingement chamber, a 250 ml conical flask with 24 ground-glass inlet socket.
 The dimension tolerance of the glassware is ± 1 mm.

discharging, remove the container, wait for 5 seconds and then switch off the pump. Dismantle the apparatus.

2. Procedure for powder inhalers

(1) Procedure for powder inhalers supplied in capsules Select one capsule, place it in the dry powder inhaler, squeeze the buttons on each side of the inhaler to pierce the two sides of the capsule, switch on the pump. Insert assembled inhaler with a suitable rubber adapter into the throat and ensure that the inhaler is tightly connected to the throat and lines up along the horizontal axis of the throat B. After 10 seconds remove the inhaler, place another capsule in the inhaler. Conduct the determination for 10 or 20 capsules. After the last discharging, switch off the pump and dismantle the apparatus.

(2) Procedure for powder inhalers supplied in blisters Pierce one blister in the inhaler unit. Switch on the pump. Insert the assembled inhaler with a suitable rubber adapter into the throat and ensure that the inhaler is tightly connected to the throat and lines up along the horizontal axis of the throat B. After 10 seconds remove the inhaler, pierce another blister in the inhaler. Conduct the determination for 10 or 20 blisters. After the last discharge, switch off the pump and dismantle the apparatus.

(3) Procedure for powder inhalers supplied in powder reservoir Load the inhaler with a dose by turning the grip or squeezing the inhaler. Switch on the pump. Insert the assembled inhaler with a suitable rubber adapter into the throat and ensure that the inhaler is tightly connected to the throat and line up along the horizontal axis of the throat B.

for 10 or 20 times as specified in the monograph. After the last discharging, switch off the pump and dismantle the apparatus.

3. Procedure for inhalation nebulizers

(1) Procedure for single-dose nebulizers Select one container, and put it into the devices. Switch on the pump of the apparatus and after 10 seconds actuating the nebulizer. Insert the assembled inhaler with a suitable rubber adapter into the throat and ensure that the inhaler is tightly connected to the throat and lines up along the horizontal axis of the throat B. After 60 seconds, stop nebulizing, wait for about 5 seconds and then switch off the pump of the apparatus. Conduct the determination for 10 or 20 containers as specified in the monograph. After the last discharging, switch off the pump and dismantle the apparatus.

(2) Procedure for multiple doses nebulizers Select one container, and put it into the devices. Switch on the pump of the apparatus and after 10 seconds actuating the nebulizer. Insert the assembled inhaler with a suitable rubber adapter into the throat and ensure that the inhaler is tightly connected to the throat and lines up along the horizontal axis of the throat B. After 60 seconds, stop nebulizing, wait for about 5 seconds and then switch off the pump of the apparatus. Conduct the determination for 10 or 20 doses as specified in the monograph. After the last discharging, switch off the pump and dismantle the apparatus.

Evaluation

Using the blank entrapping liquid, wash the filter, F interface, and the inner of the inlet tube to the lower conical flask and its out surface where it projects into the flask. Combine the washings into the second impingement chamber H and dilute with the same solvent to a volume. Determine the quantity of the active ingredient in this solution using the method described under the individual monograph. Calculate the amount of active ingredient collected in lower impingement chamber per discharge by dividing the determination value by 10 or 20, and express the result as a percentage of the labelled content. The percentage is referred as the particle or droplet size distribution of the emitted dose.

X J Determination of Patches Adhesion

Patches are the pharmaceutical preparations which are applied to the skin surface. It is necessary to control the adhesive force of the patches to skin as they could influence the safety and effectiveness of the product directly. Usually the adhesion between the pressure-sensitive adhesive of patches and the skin can be scaled by 3 indices, the tack testing, the maintaining adhesion and the peel strength. The tack exhibits the initial tendency to stick to skin when the pressure-sensitive adhesive contacts with skin softly and short-termly, the so-called handle stickiness. The maintaining adhesion exhibit the cohesive force of the pressure-sensitive adhesive. It is the ability of the pressure-sensitive adhesive resists creep damage induced by durable external shearing force. The peel strength is the cementation index of the pressure-sensitive adhesive.

1. Tack testing

Tack is measured by Bowl Incline Stopping. A series of fitting friction balls under the table roll past the adhesive surface of the inclined plate separately. The tack is evaluated by the biggest friction ball the adhesive surface could cling.

Table The number of friction balls and specification

The number	Diameter/mm	Weight /kg
1	0.794	0.002
2	1.588	0.016
3	2.381	0.055
4	3.175	0.132
5	3.969	0.257
6	4.763	0.440
7	5.556	0.702
8	5.953	0.86
9	6.350	1.03
10	7.144	1.50
11	7.938	2.06
12	8.731	2.66
13	9.525	3.55
14	10.319	4.43
15	11.113	5.64
16	11.509	6.20
17	11.906	6.93
18	12.303	7.5
19	12.700	8.42
20	13.494	10.1
21	14.288	12.0
22	15.081	14.1
23	15.875	16.5
24	16.669	19.1
25	17.463	21.9
26	18.256	25.0
27	19.050	28.4
28	19.844	32.4
29	20.638	36.2
30	22.225	45.2
31	23.019	50.0
32	23.8131	55.5
33	25.400	57.4
34	26.988	80.8
35	28.575	95.5
36	30.163	112.8
37	31.750	131.9
38	33.338	152
39	34.925	175
40	36.513	198.1
41	38.100	227.3
42	41.275	287.57
43	42.863	320.4
44	44.450	361
45	47.625	439.5
46	50.800	538.8

(1) Apparatus

The tack tester consists of inclined plate, base frame and ball meeting box (as Fig 42). A stainless steel plate with about 2 mm thickness is used as the inclined plate (angle of inclination is 45°), two horizontal lines with the interval scale of 10 mm were drawn on it. The top one is the mark of the ball's zero position and the bottom line is the mark of sample's stationary position. The base frame could be adjusted and keep horizon of the tester. The ball meeting box is used to meet the ball rolling down the plate, the inwall of the box is lined with soft abrasives. The number

description in the table above.

Fig. 42

(2) Procedure

Preliminary, patches should be taken out of the package and put non overlapping to each other under the room temperature for 2 hours.

1) *Preparation work* Clean the surface of inclined plate and friction ball. With the adhesive surface upward, fixed the patch to the inclined plate between the two lines by double faced adhesive tape, and keep flattening. Put the friction ball at the starting line with a tweezer, before the formal test preliminary test may be conducted several times, friction ball's right or left position should be adjusted so that the rolling track will misalign each time. Preselect a bigger friction ball, observe whether the friction ball rolling down could be stuck to the test section (stop moving for more than 5 seconds). From the big to the small, select friction balls of different numbers to carry out the test for several times, until the friction ball with the biggest number which could be stuck to the test section is found. Do the test again on the same sample with the friction ball of the biggest number and the neighboring two, then confirm the biggest one.

2) *Procedure* Take 3 samples, conduct the test with the friction ball of the biggest number to the samples separately. If one of them couldn't stop the friction ball, do the test again with the neighboring smaller one for a change. If it fails again, confirm the friction ball of the biggest number according to the method above.

3) *Interpretation* Comply with the ball number of the friction ball specified in the individual monograph. Among the numbers of the friction ball which is stuck to 3 samples, if 3 all are the same biggest one, or if 2 of them are the biggest one and the other is only the neighboring smaller one, the result is expressed as the biggest ball number; if one of them is the biggest one and the other two are only the neighboring smaller one, then the result is expressed as the ball number of the neighboring smaller one.

2. Measurement of patches' maintaining adhesive force

Apply the patches to the plate surface. Keep the plate verticality, hanging a poise with a standard mass along the length direction of the patches, record the time period the patches slip from starting to dropping out or the distance it slips down in a certain period of time.

(1) Apparatus

1) *Test frame* It consists of a base frame, which could be adjusted to keep horizontal, and a bracket, which is used to hang, and fix the test plate. Test frame keep the acting surface of the test plate to be hangd vertically.

2) *Test plate* Test plate is 1.5-2.0 mm in thick, 125 mm in wide, 125 mm in long. The test plate is made of stainless steel. Snag its surface sidewise softly with waterproof-abrasive paper whose viscosity is P280 as prescribed in GB/T7499-1994, when gentle trace appears on the plate

traces. The test plate should be used after snagging if it is used frequently or not used for a long time. Change the test plate if permanent pollution or scar is found.

3) *Press stick* Press stick is a steel axis coated by rubber.

4) *Loading board* The requirements for the material, dimension and surface are same as test plate.

(2) Procedure

Before the test, removed their bagging materials of the patches and place them non-overlapping to each other under the room temperature for 2 hours.

Dip the cleaning material in the detergent and scrub the test plate and loading board, then towel off carefully with a neat gauze. Repeat this operation more than 3 times, until the acting surface of the plate is clean by visual check. Do not touch the acting surface of the plate with your finger or other things after cleaning. Stick the sample to the middle between the test plate and loading board and the sample is parallel with the end of the plate. Rolling on the sample with press stick. When the sample sticks to the plate, put it under the room temperature for 20 minutes, fix it to the test frame. Record the starting time of the test.

Remove weight at the schedule time, measure the displacement of the sample downslide, or record the time the sample dropping out the plate.

(3) *Interpretation* The displacement or the dropping time should comply with the requirements specified in individual monograph.

The test result is the arithmetic mean of a set of samples' displacement or dropping time

3. Measurement of the peel strength

Conduct this test by 180° peel strength test method.

(1) Apparatus

1) *Testing machine* Sample's breakdown load should be 15%-85% of lacerating machine's full load. The indication error of force should be less than 1%. The machine peels continuously with a lowering speed of 300 mm/min±10 mm/min, usually accompanied by a plotting device record peeling

load automatically.

2) *Test plate* The stainless steel test plate is 1.5-2.0 mm in thick, 50 mm±1 mm in wide, 125 mm±1 mm in long.

3) *Melinex* The PET film is 0.025 mm in thick, about 110 mm in long, 20 mm in wide. The melinex should comply with the requirements of JB1256-77 (6020 PET).

(2) Procedure

Before the test, removed their bagging materials of the patches and place them non-overlapping to each other under the room temperature for 2 hours.

Fix the patches' backface to test plate with double faced adhesive tape and fix the sample to the incline plate with adhesive tape, fix sample with adhesive tape along its up side and down side if necessary, let the test sample be stuck on the plate flat.

Stick sample's adhesive layer to clean melinex, rolling on the sample back and forth with press stick to ensure that there is no air blister at the joining part. Before test, put the sample under the room temperature for 20-40 minutes after sticking. Fold the free end of the melinex 180°, grasp melinex's free end and the test plate to up side and down side separately of the testing machine. Keep the peeling surface and testing machine in line. The testing machine peels continuously with a lowering speed of 300 mm/min±10 mm/min, the peeling curve is drawn by an automatic recording device.

(3) Interpretation

Peel strength should comply with the requirements specified in individual monograph.

The 180° peel strength σ (kN/m) of the patch is calculated according to the following formula,

$$\sigma = \frac{S}{LB} \cdot c$$

In the formula: s is the area under the curve in the numeric area, mm²;

L is the length of the curve in the numeric area, mm;

B is the actual width of the sample, mm;

c is the load of record sheet's unit height, kN/m.

The test result is the arithmetic mean of the peel strength.

Appendix XI

XI A Microbiological Assay of Antibiotics

The activity (potency) of antibiotics may be demonstrated under suitable conditions by their inhibitory effect on microorganisms. The assay is designed on the basis of the principle of parallel line model.

Two general methods are employed, the agar diffusion method and the turbidimetric method.

If the calculated potency is less than 90% or more than 110% of the estimated potency, the assay should be repeated by changing the estimated potency.

Unless otherwise specified, the average percentage of fiducial limits is not more than 5%.

Method 1 Agar diffusion method

The agar diffusion method is a method to determine the potency of an antibiotic to be tested, and is based on comparing the dose response of the preparation being examined that inhibits the growth of a suitable susceptible microorganism and that of the standard preparation of that antibiotic are in the same degree of inhibition expressed by the sizes of the corresponding inhibition zones.

Preparation of Inoculum

Bacillus subtilis suspension Transfer the growth of *Bacillus subtilis* [CMCC(B)63501] from the nutrient agar slant onto a large slant surface, incubate at 35-37°C for 7 days, examine the growth stained by Gram's method microscopically, it contains not less than 85% of spores. Wash off the spores with sterile water and heat at 65°C for 30 minutes.

Bacillus Pumilus suspension Transfer the growth of *Bacillus pumilus* [CMCC(B)63202] from the nutrient agar slant onto a large slant surface, prepare the suspension as described under *Bacillus subtilis* suspension.

Staphylococcus aureus suspension Transfer the growth of *Staphylococcus aureus* [CMCC(B)26003] from the nutrient

agar slant onto a fresh slant surface, incubate at 35-37°C for 20-22 hours. Wash off the growth with sterile water or sterile solution of 0.9% sodium chloride immediately before use.

Micrococcus lutea suspension Transfer the growth of *Micrococcus lutea* [CMCC(B)28001] from the nutrient agar slant onto a large slant surface, incubate at 26-27°C for 24 hours. Wash off the growth with medium III or sterile solution of 0.9% sodium chloride immediately before use.

Escherichia coli suspension Transfer the growth of *Escherichia coli* [CMCC(B)44103] from the nutrient agar slant onto a fresh slant surface, incubate at 35-37°C for 20-22 hours. Wash off the growth with sterile water immediately before use.

Saccharomyces cerevisiae suspension Transfer the growth of *Saccharomyces cerevisiae* (ATTC9763) from medium V slant onto medium IV slant, incubate at 32-35°C for 24 hours. Wash off the growth with sterile water into a tube containing sterile glass beads, shake well.

Klebsiella Pneumoniae suspension Transfer the growth of *Klebsiella Pneumoniae* [CMCC(B)46117] from the nutrient agar slant onto a fresh slant surface, incubate at 35-37°C for 20-22 hours. Wash off the growth with sterile water immediately before use.

Bordetella Bronchiseptica suspension Transfer the growth of *Bordetella Bronchiseptica* [CMCC(B)58403] from the nutrient agar slant onto a fresh slant surface, incubate at 32-35°C for 24 hours. Wash off the growth with sterile water immediately before use.

Reference Preparation The reference substances should be handled as directed in the package inserts. Solutions of the reference substance are prepared using sterile buffers described in Table 1 and diluted immediately before use.

The reference substances, molecular formula and theoretical potency are shown in Table 2.

Test Preparation Dissolve an accurately weighed quantity of the substance being examined in the solvent prescribed under individual monographs and dilute to approximately the same concentration as that of the reference preparation.

Table 1 The Experimental Design of the Agar Diffusion Assay of Antibiotics

Antibiotics	Test Organism	Medium		Sterile buffer solution pH	Concentration Unit/ml	Incubate Condition	
		No.	pH			temp. /°C	time/h
Streptomycin	<i>Bacillus subtilis</i> [CMCC(B)63501]	I	7.8-8.0	7.8	0.6-1.6	35-37	14-16

Preparation of Inoculated Plates Fill Petri dishes with flat bottom, 90 mm diameter, 16-17 mm high with 20 ml of molten medium listed in the table 1. Place the dishes on a horizontal platform to produce layers of hardened culture medium in uniform thickness.

Then add to each plate 5 ml of the same medium which has previously been inoculated at 48-50°C (or 60°C for spores) with an inoculum of the test organism listed in the table 1. The concentration of the inoculum should be so selected that the sharpest zones of inhibition are obtained. The diameters of the inhibition zones produced by the high dose of the reference preparation are 18-22 mm for 2-dose assay, and 15-18 mm by middle dose for 3-dose assay respectively. Spread the medium evenly over the entire surface and allow to cool on a horizontal platform. Place 4 (2-dose assay) or 6 (3-dose assay) stainless steel cylinders (6.0 mm \pm 0.1 mm in internal diameter, 7.8 mm \pm 0.1 mm in external diameter and 10.0 mm \pm 0.1 mm in height) on the surface of each plate at equal distance, then cover them with circular clay lids.

Assay Procedures

2-dose assay Use not less than 4 inoculated plates prepared as above, fill two of the diagonal cylinders on each plate with the high and low doses of the reference preparation, fill the remaining cylinders with the high and low doses of the test preparation. The dose levels should be in the ratio of 2 : 1 or 4 : 1. Incubate the plate under the conditions prescribed in the table 1 measure the diameter (or area) of the inhibition zones. Carry out the statistical analysis of variance (Appendix XIV, method 2.2) and calculate the potency of the substance being examined.

3-dose assay Use not less than 6 inoculated plates prepared as above, fill three of the alternate cylinders on each plate with the high, middle and low doses of the reference preparation, fill the remaining cylinders with the high, middle and low doses of the test preparation. The dose levels should be in the ratio of 1 : 0.8. Incubate the plates under the conditions prescribed in the table 1 measure the diameter (or area) of the inhibition zones. Carry out the statistical analysis of variance (Appendix XIV, method 3.3) and calculate

the potency of the substance being examined.

Method 2 Turbidimetric method

The turbidimetric method is a method to determine the potency of an antibiotic, depends upon the preparation being examined that inhibits the growth of a microbial culture in a fluid medium and that of the standard preparation of that antibiotic are in the same degree of inhibition expressed by the turbidity of the microbial culture which can be measured photometrically.

Preparation of Inoculum

Staphylococcus aureus suspension Transfer the growth of *Staphylococcus aureus* [CMCC(B)26003] from the nutrient agar slant onto a fresh slant surface, incubate at 35-37°C for 20-22 hours. Wash off the growth with sterile water or sterile solution of 0.9% sodium chloride immediately before use.

Escherichia coli suspension Transfer the growth of *Escherichia coli* [CMCC(B)44103] from the nutrient agar slant onto a fresh slant surface, incubate at 35-37°C for 20-22 hours. Wash off the growth with sterile water immediately before use.

Candida albicans suspension Transfer the growth of *Candida albicans* [CMCC(F)98001] from the Martin agar modified medium slant onto 10 ml of medium IX, incubate at 35-37°C for 8 hours. Dilute to a suitable concentration with medium IX.

Reference preparation The reference substances should be handled as directed in the package inserts. Solutions of the reference substance are prepared using sterile buffers described in Table 3 and diluted immediately before use. The reference substances, molecular formula and theoretical potency are shown in Table 2.

Test preparation Dissolve an accurately weighed quantity of the substance being examined in the solvent prescribed under individual monographs and dilute to approximately the same concentration as that of the reference preparation.

Preparation of Inoculated Fluid Medium Add suitable quantity

Table 3 The Experimental Design of the Turbidimetric Assay of Antibiotics

Antibiotics	Test Organism	Medium		Sterile buffer solution pH	Concentration Unit/ml	Incubate Condition Temp. /°C
		No.	pH			
Gentamycin	<i>Staphylococcus aureus</i> [CMCC(B)26003]	III	7.0-7.2	7.8	0.15-1.0	35-37

of inoculum of the test organism listed in the table 3 to the fluid medium immediately before use, and swirling to attain a homogeneous suspension. The quantity of the inoculum should be so selected that the microbial culture should have absorbances between 0.3 to 0.7 absorbance unit after an incubation period of 3-4 hours at 35-37°C. The difference of absorbances of the microbial culture inhibited between adjacent doses of the reference preparation is at least 0.1 absorbance unit for the dose levels is in the ratio of 2 : 1. It is preferable to obtain the optimum dose-response relationship and measurable opacity occurs in the conditions

Use the inoculated medium immediately after its preparations.

Assay Procedures

Standard curve method (1-dose assay) Use glass or plastic test tubes that are relatively uniform in length, diameter, and thickness, sterilized before use. Unless otherwise specified, it may be necessary to select the median concentration from defined dose-response linearity as the median test level. Prepare dilutions representing 5 test levels which include one corresponding to the median concentration, of the Standard. The dose levels should be in the ratio of 1 : 2 : 4 : 8 : 16. Prepare a solution of a single

median test level of the antibiotic to be examined according to its estimated potency or labelled concentration. Add each dose to 3 replicate tubes at least. Distribute 1.0 ml of each solutions of Standard or the antibiotic to be examined into identical test tube and add to each tube 9.0 ml of inoculated medium, mix immediately. The tubes randomized block arrangement, place them under the appropriate incubation temperature and identical incubation time (incubate usually for 4 hours) in order to obtain a readily measurable opacity occurs in the conditions of the test. Measure the opacity online using suitable apparatus, or after incubation, stop the growth of the microorganisms by adding 0.5 ml of formaldehyde (1→3) to each tube and read its absorbance in a suitable spectrophotometer fitted with a 530 nm or 580 nm filter. Prepare at the same time 2 control tubes both containing 1.0 ml of the test diluent and 9.0 ml of the inoculated medium but no antibiotic. One incubates at the same condition as the test tube to observe the growth of microorganisms, the other adds immediately 0.5 ml of dilute formaldehyde (1→3) to be the blank of absorbance. Carry out the statistical analysis (Calculation and Statistical Analysis of Standard Curve Method) and calculate the potency of the substance being examined.

Calculation and Statistical Analysis of Standard Curve Method

1. Calculation of Standard Curve

Logarithm (lg) of each dose of Standard and corresponding absorbance are shown in table 4.

Table 4 Logarithm of each dose of Standard and corresponding absorbance

Group of Units	lg-dose of Standard	absorbance
1	x_1	y_1
2	x_2	y_2
3	x_3	y_3
4	x_4	y_4
...
n	x_n	y_n
Mean	\bar{x}	\bar{y}

Regression coefficient (i.e. Slope) b , intercept a and linear regression equation of Standard curve are calculated as follows:

$$\text{Regression coefficient } b = \frac{\sum (x_i - \bar{x})(y_i - \bar{y})}{\sum (x_i - \bar{x})^2} = \frac{\sum x_i y_i - \bar{x} \sum y_i}{\sum x_i^2 - \bar{x} \sum x_i} \quad (1)$$

$$\text{Intercept } a = \bar{y} - b\bar{x} \quad (2)$$

$$\text{Linear regression equation } Y = bX + a \quad (3)$$

2. Significance tests of regression coefficient

It used t -test to judge if the linear regression equation is established, i.e. if the relation between X and Y can be represented by a straight line. Calculate the value of t with the following equations:

$$\text{Estimated standard deviation: } S_{y,x} = \sqrt{\frac{\sum (y_i - Y)^2}{n - 2}} \quad (4)$$

$$\text{Standard error of regression coefficient: } S_b = \frac{S_{y,x}}{\sqrt{\sum (x_i - \bar{x})^2}} \quad (5)$$

$$t = \frac{b - 0}{S_b} \quad (6)$$

Where y_i is the true absorbance of Standard;
 Y is the estimated absorbance may be obtained from Linear regression equation;
 \bar{y} is the mean true absorbance of Standard;
 x_i is the logarithm of dose of Standard;
 \bar{x} is the mean logarithm of dose of Standard.

If the calculated value of t is larger than the tabulated value of $t_{0.05/(2n-4)}$ corresponding to $p = 0.05$ and $2n-4$ degrees of freedom, the regression is highly significant, i.e. the relation between X and Y can be represented by a straight line.

3. Estimation of potency and fiducial limits

(1) **Estimation of logarithm of dose of antibiotic** When the regression is highly significant, lg-dose of antibiotic may be estimated by the following equations:

$$\text{Logarithm of dose of antibiotic } X_0 = \frac{Y_0 - a}{b} \quad (7)$$

(2) **Estimation of fiducial limits of logarithm of dose of antibiotic** Fiducial limits of lg-dose of antibiotic for $p = 0.05$ are calculated as follows:

$$\text{Fiducial limits of } X_0 : FL = X_0 \pm t_{0.05(n-2)} \cdot \frac{S_{y,x}}{|b|} \cdot \sqrt{\frac{1}{m} + \frac{1}{n} + \frac{(X_0 - \bar{x})^2}{\sum x_i^2 - \bar{x} \sum x_i}} \quad (8)$$

Where n is the number of responses to S ;
 m is the number of responses to T ;
 X_0 is the logarithm of dose of T which is obtained from Linear regression equation;
 Y_0 is the mean absorbance of antibiotic.

(3) **Estimation of percentage of fiducial limits** Percentage of fiducial limits of lg-dose of antibiotic are calculated as follows:

$$\text{Percentage of fiducial limits } FL\% = \frac{\text{upper limit of } X_0 - \text{lower limit of } X_0}{2X_0} \times 100\% \quad (9)$$

Where X_0 is the dose of antibiotic.

Unless otherwise specified, the percentage of fiducial limits is not more than 5%.

(4) **Estimation of potency** The potency of antibiotic are obtained by multiplying the concentration (lg-dose transformed to concentration) and dilution multiple of antibiotic.

2-dose assay or 3-dose assay Use glass or plastic test tubes that are relatively uniform in length, diameter, and thickness, sterilized before use. Unless otherwise specified, it may be necessary to select the optimum high, (middle,) low doses of the reference preparation. Distribute 1.0 ml of each solutions of Standard or the antibiotic to be examined into identical test tube. For 2-dose assay the dose levels should be in the ration of 2 : 1 or 4 : 1, and for 3-dose assay the dose levels should be in the ration of 1 : 0.8. With the same operation as standard curve method (1-dos assay) test, add each dose to 4 replicate tubes at least. The tubes randomized block arrangement, place them under the appropriate incubation conditions. Carry out the statistical analysis of variance (Appendix XIV, method 2.2 and 3.3) and calculate the potency of the substance being examined.

Culture Media

Medium I : Peptone	5 g
Beef extract	3 g
Dipotassium hydrogen phosphate	3 g
Agar	15-20 g
Water	1000 ml

Mix the above ingredients with the exception of agar, adjust the pH value to 0.2-0.4 higher than the final pH of the

the pH of the solution so that it is 7.8-8.0 or 6.5-6.6 after sterilization. Sterilize the medium at 115 °C for 30 minutes.

Medium I:	Peptone	6 g
	Beef extract	1.5 g
	Yeast extract	6 g
	Glucose	1 g
	Agar	15-20 g
	Water	1000 ml

Mix the above ingredients with the exception of agar and glucose, adjust the pH value to 0.2-0.4 higher than the final pH of the solution. Add agar, heat to dissolution and filter, then mix thoroughly with glucose and adjust the pH of the solution so that it is 7.8-8.0 or 6.5-6.6 after sterilization. Sterilize the medium at 115°C for 30 minutes.

Medium III:	Peptone	5 g
	Beef extract	1.5 g
	Yeast extract	3 g
	Sodium chloride	3.5 g
	Dipotassium hydrogen phosphate	3.68 g
	Potassium dihydrogen phosphate	1.32 g
	Glucose	1 g
	Water	1000 ml

Mix the above ingredients with the exception of glucose, heat to dissolution and filter, then mix well with glucose and adjust the pH of the solution so that it is 7.0-7.2 after sterilization. Sterilize the medium at 115°C for 30 minutes.

Medium IV:	Peptone	10 g
	Sodium chloride	10 g
	Sodium citrate	10 g
	Glucose	10 g
	Agar	20-30 g
	Water	1000 ml

Mix the above ingredients with the exception of agar and glucose, adjust the pH value to 0.2-0.4 higher than the final pH of the solution. Heat it with agar at 109°C for 15 minutes and allow to stand at above 70°C for one hour, filter. Mix thoroughly with glucose and adjust the pH of the solution so that it is 6.0-6.2 after sterilization. Sterilize the medium at 115°C for 30 minutes.

Medium V:	Peptone	10 g
	Maltose	40 g
	Agar	15-20 g
	Water	1000 ml

Mix peptone with water, adjust the pH value to 0.2-0.4 higher than the final pH of the solution. Add agar, heat to dissolution and filter, then mix well with maltose and adjust the pH of the solution so that it is 7.2-7.4 after sterilization. Dispense the solution into suitable vessels and sterilize the medium at 115°C for 30 minutes. Allow it to set in a sloped form with butt on cooling.

Medium VI:	Peptone	8 g
	Beef extract	3 g
	Yeast extract	5 g
	Sodium chloride	45 g
	Dipotassium hydrogen phosphate	3.3 g
	Potassium dihydrogen phosphate	1 g
	Glucose	2.5 g
	Agar	15-20 g
	Water	1000 ml

Mix the above ingredients with the exception of agar and glucose, adjust the pH value to 0.2-0.4 higher than the final pH of the solution. Add agar, heat to dissolution and filter, then mix thoroughly with glucose and adjust the pH of the solution so that it is 7.2-7.4 after sterilization. Sterilize the medium at 115°C for 30 minutes.

Medium VII:	Peptone	5 g
	Beef extract	3 g

Dipotassium hydrogen phosphate	7 g
Potassium dihydrogen phosphate	3 g
Sodium citrate	2.5 g
Agar	15-20 g
Water	1000 ml

Mix the above ingredients with the exception of agar, adjust the pH value to 0.2-0.4 higher than the final pH of the solution. Add agar, heat to dissolution and filter, then mix thoroughly with glucose and adjust the pH of the solution so that it is 6.5-6.6 after sterilization. Sterilize the medium at 115°C for 30 minutes.

Medium VIII:	Yeast extract	1 g
	Ammonium sulfate	1 g
	Glucose	5 g
	Agar	15-20 g
	Phosphate BS (pH 6.0)	1000 ml

Mix the above ingredients heat to dissolution and filter. Sterilize the medium at 115°C for 30 minutes.

Medium IX:	Peptone	7.5 g
	Beef extract	1.0 g
	Yeast extract	2.0 g
	Sodium chloride	5.0 g
	Glucose	10.0 g
	Water	1000 ml

Mix the above ingredients with the exception of glucose, heat to dissolution and filter, then mix thoroughly with glucose and adjust the pH of the solution so that it is 6.5 after sterilization. Sterilize the medium at 115°C for 30 minutes.

Nutrient broth medium:	Peptone	10 g
	Sodium chloride	5 g
	Beef infusion*	1000 ml

Dissolve peptone and sodium chloride in the beef infusion, warming slightly until the substances are dissolved, adjust the pH value to slightly alkaline, heat to boil, filter if necessary, adjust the pH of the solution so that it is 7.2 ± 0.2 after sterilization. Sterilize the medium at 115°C for 30 minutes.

Nutrient agar medium:	Peptone	10 g
	Sodium chloride	5 g
	Agar	15-20 g
	Beef infusion*	1000 ml

Mix the above ingredients with the exception of agar, adjust the pH value to 0.2-0.4 higher than the final pH of the solution. Add agar, heat to dissolution and filter, adjust the pH of the solution so that it is 7.2-7.4 after sterilization. Dispense the solution into suitable vessels and sterilize the medium at 115°C for 30 minutes. Allow it to set in a sloped form with butt on cooling.

* Beef infusion can also be prepared by dissolving 3 g of beef extract powder in 1000 ml of water.

Modified Martin medium:	Peptone	5.0 g
	Yeast extract	2.0 g
	Glucose	20.0 g
	Dipotassium hydrogen phosphate	1.0 g
	Magnesium sulfate	0.5 g
	Agar	15-20 g
	Water	1000 ml

Mix the above ingredients in water except agar and glucose, warming slightly until the substances are dissolved, adjust pH value to about 6.8. Add agar, heat to boil and filter, then mix thoroughly with glucose and adjust the pH of the solution so that it is 6.4 ± 0.2 after sterilization. Dispense the solution into suitable vessels and sterilize the medium at 115°C for 30 minutes. Allow it to set in a sloped form with butt on cooling.

medium for Polymyxin B:	Peptone	6.0 g
	Beef extract	1.5 g
	Yeast extract	3.0 g
	Glucose	1.0 g
	Papaic digest of soybean	4.0 g
	Agar	15-20 g
	Water	1000 ml

Mix the above ingredients with the exception of agar, adjust the pH value to 0.2-0.4 higher than the final pH of the solution. Add agar, heat to dissolution and filter, adjust the pH of the solution so that it is 6.5-6.7 after sterilization. Sterilize the medium at 115°C for 30 minutes.

The culture medium can be replaced by the dry culture medium containing the same ingredients, preparation and sterilization are in accordance with the manufacture's instruction.

Sterile Buffer Solutions

Phosphate BS (pH 6.0) Dissolve 2 g of dipotassium hydrogen phosphate and 8 g of potassium dihydrogen phosphate in water to produce 1000 ml, filter, sterilize at 115°C for 30 minutes.

Phosphate BS (pH 7.0) Dissolve 9.39 g of disodium hydrogen phosphate and 3.5 g of potassium dihydrogen phosphate in water to produce 1000 ml, filter, sterilize at 115°C for 30 minutes.

Phosphate BS (pH 7.8) Dissolve 5.59 g of dipotassium hydrogen phosphate and 0.41 g of potassium dihydrogen phosphate in water to produce 1000 ml, filter, sterilize at 115°C for 30 minutes.

Phosphate BS (pH 10.5) Dissolve 35 g of dipotassium hydrogen phosphate in water, add 2 ml of 10 mol/L potassium hydroxide solution and sufficient water to produce 1000 ml, filter, sterilize at 115°C for 30 minutes.

XI B Preparation of Penicillinase and Determination of Its Activity

1. Culture medium

Peptone	15 g
Sodium chloride	4 g
Sodium citrate	5.88 g
Dipotassium hydrogen phosphate	4 g
Glycerine	50 g
0.1% Ferrous sulfate ($\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$) solution	0.5 ml
2% Magnesium sulfate ($\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$) solution	1 ml
Beef infusion	1000 ml

Mix the above ingredients, adjust to pH 7.0-7.2, dispense in 500 ml conical flasks, 80 ml for each flask, sterilize at 115°C for 30 minutes.

2. Preparation of penicillinase solution

Inoculate one slant culture of *Bacillus cereus* [CMCC(B)63301] to one of the culture media flasks, incubate on a rotatory shaker at 25°C for 18 hours. Inoculate 10 ml of this culture to each of the remaining culture media flasks and add 4500 Units of sterile penicillin solution, incubate at 25°C for 24 hours, again add 20000 Units of sterile penicillin solution and incubate for 24 hours, and once more add 20000 Units of sterile penicillin solution and further incubate for another 24 hours. Centrifuge, sterilize the supernatant liquid by filtration through a suitable filter medium after adjusting pH to about 8.5. Adjust the pH of the filtrate to 7.0 using aseptic technique, dispense the sterile filtrate to suitable containers and stored below 10°C.

3. Determination of the activity of penicillinase

Preparation of penicillin solution Dissolve an accurately weighed quantity of benzylpenicillin sodium (or potassium) in phosphate BS (pH 7.0) to produce a solution containing 10000 penicillin units per ml.

Preparation of dilute penicillinase solution Dilute the penicillinase solution with phosphate BS (pH 7.0) to produce a solution of about 8000 to 12000 penicillinase units per ml, warm to 37°C before use.

Procedure Measure accurately 50 ml of penicillin solution to a 100 ml volumetric flask, warm to 37°C, add accurately 25 ml of dilute penicillinase solution, previously warmed to 37°C, mix promptly and allow to stand at 37°C for exactly 1 hour. Add 3 ml, accurately measured, to 25 ml, accurately measured, of iodine (0.005 mol/L) VS immediately [measure accurately 10 ml of iodine (0.05 mol/L) VS to 100 ml volumetric flask, dilute to volume with sodium acetate BS (pH 4.5)], allow to stand in a dark place at room temperature for 15 minutes, titrate with sodium thiosulfate (0.01 mol/L) VS, using starch IS added towards the end of the titration and continue the titration to the disappearance of the blue colour.

Blank titration Allow 2 ml, measured accurately, of prewarmed penicillin solution to stand at 37°C for 1 hour, add accurately 25 ml of iodine (0.005 mol/L) VS, and then 1 ml of dilute penicillinase solution. Allow to stand in dark place at room temperature for 15 minutes, titrate with sodium thiosulfate (0.01 mol/L) VS, calculate the enzyme activity as follows:

$$E = (B - A) \times M \times F \times D \times 100$$

Where E is enzyme activity of penicillinase, (Units/ml)/hour;

B is volume of sodium thiosulfate VS consumed in blank titration, ml;

A is volume of sodium thiosulfate VS consumed in the titration of penicillinase, ml;

M is concentration of sodium thiosulfate VS, mol/L;

F is the penicillin units, equivalent to each ml of iodine (0.005 mol/L) VS, under the experimental condition described above;

D is dilution factor of penicillinase solution.

Annotation **Phosphate BS (pH 7.0)** To dipotassium hydrogen phosphate 7.36 g and potassium dihydrogen phosphate 3.14 g, add sufficient water to produce 1000 ml.

Sodium acetate BS (pH 4.5) To glacial acetic acid 13.86 ml, add sufficient water to produce 250 ml; to crystalline sodium acetate 27.30 g add sufficient water to produce 200 ml. Mix the two solutions.

XI C Test for Undue Toxicity

The undue toxicity of a substance being examined is determined by observing the death and survival of mice within a period of 48 hours after having received by injection (or other route of administration) a dose of the substance being examined.

Animal Healthy mice from normal breeding each weighing 17-20 g are used and can only be used once for the test.

Preparation of test solution Unless otherwise specified, dissolve the substance being examined in sodium chloride injection to produce a solution of the concentration specified

in individual monographs.

Procedure Administer to each of 5 mice 0.5 ml of the test solution by one of the following routes specified in the individual monograph.

Intravenous injection Inject the test solution into a tail vein of each mouse. Usually the injection should be completed within 4-5 seconds at a uniform rate, but for those preparations specified to inject slowly in the monographs, the injection time may be prolonged to 30 seconds.

Intraperitoneal injection Inject the test solution from the abdominal surface into the peritoneal cavity.

Subcutaneous injection Inject the test solution subcutaneously at one side of the dorsal surface or under the abdominal surface.

Oral administration Administer the test solution orally by means of a suitable cannula.

Evaluation of the results Unless otherwise specified, none of the mice received the test solution dies within 48 hours. If one or more mice die within 48 hours, repeat the test using another 10 mice each weighing 18-19 g; none of the second group of mice dies within 48 hours.

XI D Test for Pyrogens

The test for pyrogens is carried out in rabbits by measuring the rise of body temperature following the intravenous injection of a specified dose of the preparation being examined.

Test animal Use healthy, matured rabbits weighing 1.7-3.0 kg, male or non-pregnant female. Keep the rabbits under observation for 7 days before the selection test, loss of weight, loss of appetite or other abnormal signs should not appear. Within 3-7 days prior to pyrogen test, rabbits which have not previously been used in a pyrogen test should be subject to a selection test as prescribed under the *procedure* except injection. Record the body temperature of each rabbit 8 times successively at 30 min intervals, if the recorded body temperatures of a rabbit are all in the range of 38.0-39.6°C, and the difference between the highest and lowest temperature is not greater than 0.4°C, it is fit for the pyrogen test. Do not use a rabbit more than 10 times and more frequently than once every 48 hours. The selection test should be repeated if a rabbit is to be used again after a break of 3 weeks, or if it has a maximum temperature rise of 0.6°C or more in a previous pyrogen test. All rabbits which have been used in a pyrogen test in which the preparation being examined was adjudged to be pyrogenic should not be used again.

Test conditions House the rabbits in a living area of uniform temperature (a temperature which does not differ by more than 5°C from that of the laboratory where the test is to be conducted) 1-2 days before the test. Conduct the pyrogen test in a laboratory of 17-25°C and free from disturbances. During the test, the variation of room temperature should not be more than 3°C. Withhold food from the rabbits and place the animals in suitable boxes at least 1 hour before the test, until the test is completed. Measure the body temperature with a suitable temperature-sensing device with a precision of $\pm 0.1^\circ\text{C}$. Insert the thermometer or temperature sensing probe into the rectum of the rabbit to an uniform depth (about 6 cm) for not less than 1.5 minutes. Record the body temperature of each rabbit once at an interval of 30 minutes, usually measure twice. The difference between the

greater than 0.2°C, use the mean value of these two readings as the normal body temperature of each rabbit. In any one test, the normal body temperature of each rabbit must be within 38.0-39.6°C and must not differ from one another by more than 1°C.

Render the syringes, needles and glassware free from pyrogens by heating at 250°C for 30 minutes or by any other suitable method.

Procedure Warm the preparation being examined to about 38.0°C. Within 15 minutes after the determination of normal body temperature, inject a dose as specified in the monograph into the ear vein of each of 3 rabbits slowly. Record the temperature of each rabbit once at an interval of 30 minutes, measure 6 times after the injection. The temperature rise of each rabbit is calculated by subtracting its normal temperature from the highest temperature recorded. If one of the 3 rabbits shows a temperature rise of 0.6°C or more; or none of the 3 rabbits shows a temperature rise of 0.6°C or more, but the sum of the 3 temperature rises exceeds 1.4°C, repeat the test with 5 other rabbits using the same procedure.

Evaluation of the results If none of the 3 rabbits in the first test shows a temperature rise of 0.6°C or more, and the sum of the 3 temperature rises does not exceed 1.4°C; or if only one of the 3 rabbits in the second test shows a temperature rise of 0.6°C or more, and the sum of the 8 temperature rises does not exceed 3.5°C, the preparation being examined passes the test. If more than one rabbits in either test show a temperature rise of 0.6°C or more; or the sum of the 8 temperature rises exceed 3.5°C, the preparation being examined is considered to be pyrogenic.

When the temperature rise is negative, the result is counted as a zero response.

XI E Test for Bacterial Endotoxin

The test for bacterial endotoxins is used to detect or quantify endotoxins of gram-negative bacterial origin using TAL reagent. It is used to determine the limit concentration of bacterial endotoxin in a preparation being examined.

Two methods are used for this test; the gel-clot method and the photometric method. The latter includes a turbidimetric method and a chromogenic method. Proceed by any one of these two methods. In the event of doubt or dispute, the final decision is made based on the gel-clot method, unless otherwise indicated in the monograph.

The quantities of endotoxin are expressed in Endotoxin Units (EU).

The National Standard for Endotoxin (NSE) is prepared and purified from *Escherichia coli*. It is used only for calibration of the working standard for endotoxin (WSE) and for calibration and verifying the sensitivity of TAL reagents.

The working standard for endotoxin (WSE) of which the potency has been standardized against NSE in collaboration assay, is used for bacterial endotoxin test as positive control, for interference test and for sensitivity test of TAL reagent.

The water used in the gel-clot test for bacterial endotoxins is a sterile water for injection, of which quantities of bacterial endotoxins are less than 0.015 EU per ml. The quantities of bacterial endotoxins of water used in the photometric test are less than 0.005 EU per ml.

Depyrogenate all glassware and other heat-stable apparatus used in the test by heating in a hot-air oven at 250°C for at least 60 minutes (or by any other validated suitable method).

employing plastic apparatus, such as microtitre plates and pipette tips for automatic pipettors, use apparatus shown to be free of detectable endotoxin and of interfering effects for the test. Avoid microbial contamination during the test.

Preparation of the test solutions Prepare the test solutions by dissolving or diluting active substances or medicinal products using water for bacterial endotoxins test (water for BET). Some substances or preparations may be more appropriately dissolved or diluted in other aqueous solutions. If necessary, adjust the pH of the test solution (or dilution thereof) so that the pH of the mixture of the TAL reagents and test solution falls within the pH range specified by the TAL reagents manufacturer. This usually applies to a product with a pH in the range of 6.0 to 8.0. The pH may be adjusted by the use of acid, base or a suitable buffer, as recommended by the TAL reagents manufacturer. Acids and bases may be prepared from concentrates or solids with water for BET in containers free of detectable endotoxin. Buffers must be validated to be free of detectable endotoxin and interfering factors.

Establishment of endotoxin limits The endotoxin limit (L) for drugs or biological products is usually defined as follows:

$$L = K/M$$

Where L is the endotoxin limit for active substances administered parenterally, which is specified in units such as EU/ml, EU/mg, or EU/Unit of biological activity;

K is the threshold human pyrogenic dose of endotoxin per kg of body weight in a single hour period, which is expressed as EU/(kg · h). For injections, $K = 5$ EU/(kg · h); for injections of radio-pharmaceuticals, $K = 2.5$ EU/(kg · h); and for intrathecal injections, $K = 0.2$ EU/(kg · h);

M is equal to the maximum recommended human dose of product per kg of body weight in a single hour period, which is specified in units such as ml/(kg · h), mg/(kg · h), or U/(kg · h). Here the human average body weight is 60 kg; the injection period is calculated as 1 hour when the injection is completed within 1 hour.

The endotoxin limit calculated by human dose may be adjusted according to the situation of manufacture and clinical use if necessary. In that case, appropriate reasons for adjustment have to be submitted.

Determination of the Maximum Valid Dilution (MVD) The Maximum Valid Dilution (MVD) is the maximum allowable dilution of the substance being examined at which the endotoxin limit can be determined. Determine the MVD using the following formulae:

$$MVD = cL/\lambda$$

Where L is the endotoxin limit of the substance being examined

c is the concentration of the substance being examined, when L is expressed as EU/ml, c is 1.0 ml/ml; when L is expressed as EU/mg or EU/U, the unit of C is mg/ml or U/ml. Minimum valid dilution concentration, $c = \lambda/L$, may be calculated for drug substance or sterilized powders for injection when MVD is 1.

λ is the labelled sensitivity of TAL reagent in the gel-clot method (EU/ml) or the lowest point used in the standard curve of the turbidimetric or chromogenic method.

Gel-clot method (Method 1)

The gel-clot method detects or qualifies endotoxins based on

Test for confirmation of labelled TAL reagent sensitivity The labelled sensitivity of TAL reagent (EU/ml) is defined as the lowest concentration of endotoxin that is required to cause the TAL reagent to clot under the conditions specified in the following procedure. The test for confirmation of the labelled TAL reagent sensitivity is to be carried out when each new batch of TAL reagent is used or when there is any change in the experimental conditions which may affect the outcome of the test.

Dissolve NSE or CSE in water for BET according to the labelled sensitivity of TAL reagent (λ), mix for 15 minutes using a vortex mixer. Prepare four replicate series of two-fold dilutions of NSE or CSE using water for BET to produce 4 dilutions with concentration of 2.0 λ , 1.0 λ , 0.5 λ , 0.25 λ , mix each dilution for 30 seconds using a mixer. Use 18 tubes of 10 mm × 75 mm in size containing of 0.1 ml of TAL reagent or use 18 original ampoules of 0.1 ml of TAL reagent. Add 0.1 ml of each of 16 endotoxin standard solutions (four standard concentrations in quadruplicate) to each of 16 tubes, and 0.1 ml of water for BET to each of 2 tubes as negative control. Mix gently after each addition, cover the tubes tightly and incubate the tubes vertically at $37 \pm 1^\circ\text{C}$ for 60 ± 2 minutes.

Take each tube in turn directly from the incubator and invert it through about 180° in one smooth motion to test the integrity of the gel. If a firm gel has formed that remains in place upon inversion, record the result as positive. A result is negative if an intact gel is not formed. Handle the tubes with care to avoid vibration, or false negative may result.

The test is not valid unless all the four tubes of highest concentration (2.0 λ) give positive results, all the four tubes of lowest concentration (0.25 λ) give negative results and the two tubes of negative control give negative results. Calculate the geometric mean endpoint concentration, i.e. the measured sensitivity of the TAL reagent (λ_c), using the following expression:

$$\lambda_c = \lg^{-1} (\sum X/4)$$

Where X is the log endpoint concentration which is the last positive result in a series of decreasing concentrations of endotoxin.

If this λ_c is not less than 0.5 λ and not more than 2 λ , the labelled sensitivity (λ) is confirmed and is used in tests performed with this TAL reagent.

Test for interfering factors Prepare solutions A, B, C and D as shown in Table 1, and use the test solutions at a dilution less than the MVD, not containing any detectable endotoxins, operating as described under the *Test for confirmation of labelled TAL reagent sensitivity*.

The test is not valid unless all replicates of solutions A and D show no reaction and the result of solution C confirms the labelled TAL reagent sensitivity. The geometric mean endpoint concentrations of solutions B (E_s) and C (E_t) are determined using the following formulas.

$$E_s = \lg^{-1} (\sum X_s/4)$$

$$E_t = \lg^{-1} (\sum X_t/4)$$

Where X_s is the log endpoint concentration of the solution C. X_t is log endpoint concentration of the solution B.

If both E_s and E_t are not less than 0.5 λ and not more than 2 λ , the test solution does not contain interfering factors under the experimental conditions used. Otherwise, the solution interferes with the test. If the preparation being examined interferes with the test at a dilution less than the MVD, repeat the test for interfering factors using a greater dilution, not exceeding the MVD. The use of a more sensitive TAL reagent permits a greater dilution of the preparation being examined and this may contribute to the elimination of interference.

Table 1 Preparation of solutions in the test for interfering factors by using gel-clot method

Solution	Endotoxin Concentration/Solution to which endotoxin is added	Diluent	Dilution factor	Initial endotoxin concentration	Number of replicates
A	None/Test solution	—	—	—	2
B	2 λ /Test solution	Test solution	1	2 λ	4
			2	1 λ	4
			4	0.5 λ	4
			8	0.25 λ	4
C	2 λ /Water for BET	Water for BET	1	2 λ	4
			2	1 λ	4
			4	0.5 λ	4
			8	0.25 λ	4
D	None/Water for BET	—	—	—	2

Solution A: solution of the preparation being examined that is free of detectable endotoxins.

Solution B: test for interference.

Solution C: control of the labelled TAL reagent sensitivity.

Solution D: negative control (water for BET).

Interference may be overcome by suitable treatment, such as filtration, neutralization, dialysis or heat treatment. To establish that the treatment chosen effectively eliminates interference without loss of endotoxins, repeat the test for interfering factors using the preparation being examined to which the standard endotoxin has been added and which has then been submitted to the chosen treatment.

When establish a method of bacterial endotoxin test for a new drug, the test for interfering factors should be carried out.

When the source of the TAL reagent, or the formula or the

manufacture process of the substance being examined are changed, or there is any change in the experimental conditions which may affect the outcome of the test, the test for interfering factors should be performed again.

Procedure

(1) Gel-clot limit test

Prepare solutions A, B, C and D as shown in Table 2, and perform the test following the procedure in the *Test for confirmation of labelled TAL reagent sensitivity*.

Table 2 Preparation of solutions in gel-clot limit test

Solution	Endotoxin Concentration/Solution to which endotoxin is added	Number of replicates
A	None/Diluted test solution	2
B	2 λ /Diluted test solution	2
C	2 λ /Water for BET	2
D	None/Water for BET	2

Solution A: solution of the preparation being examined

Solution B: positive product control

Solution C: positive control

Solution D: negative control

Prepare solution A and solution B (positive product control) using a test solution at the dilution of the MVD, with which the *Test for interfering factors* was completed.

Invaluation of results The test is not valid unless both replicates of the two positive control solutions B and C are positive and those of negative control solution D are negative. The preparation being examined complies with the test when a negative result is found for both replicates of solution A. The preparation being examined does not comply with the test when a positive result is found for both replicates of solution A. Repeat the test by 4 replicates of solution A

when a positive result is found for one replicate of solution A and a negative result is found for the other. The preparation being examined complies with the test if a negative result is found for all replicates of solution A in the repeat test.

(2) Gel-clot semi-quantitative test

The test quantifies bacterial endotoxins in the test solution by titration to an endpoint. Prepare solutions A, B, C and D as shown in Table 3, and perform the test following the procedure in the *Test for confirmation of labelled TAL reagent sensitivity*.

Table 3 Preparation of solutions in the gel-clot semi-quantitative test

Solution	Endotoxin Concentration/Solution to which endotoxin is added	Diluent	Dilution factor	Initial endotoxin concentration	Number of replicates
A	None/Test solution	Water for BET	1	—	2
			2	—	2
			4	—	2
			8	—	2
B	2 λ /Test solution	Water for BET	1	2 λ	2
C	2 λ /Water for BET		2	1 λ	2

continue					
Solution	Endotoxin Concentration/Solution to which endotoxin is added	Diluent	Dilution factor	Initial endotoxin concentration	Number of replicates
D	None/Water for BET	—	4	0.5 λ	2
			8	0.25 λ	2
			—	—	2
			—	—	2
Solution A: test solution at the dilution, not exceeding the MVD, with which the test for interference factors was carried out. Subsequent dilution of the test solution must not exceed the MVD. Use water for BET to make two dilution series of 1, 1/2, 1/4, and 1/8, relative to the dilution with which the test for interfering factors was carried out.					respectively.
Solution B: solution A containing standard endotoxin at a concentration of 2 λ (positive product control).					
Solution C: two series of water for BET containing the standard endotoxin at concentrations of 2 λ, λ, 0.5 λ, and 0.25 λ,					
Solution D: negative control (water for BET).					

Invaluation of results The test is not valid unless the following 3 conditions are met: (1) both replicates of solution D (negative control) are negative; (2) both replicates of solution B (positive product control) are positive; and (3) the geometric mean endpoint concentration of solution C is in the range of 0.5 λ to 2 λ .

To determine the endotoxin concentration of solution A, calculate the endpoint concentration for each replicate series of dilutions by multiplying each endpoint dilution factor by λ . The endotoxin concentration in the test solution is the geometric mean endpoint concentration of the replicates ($E = \lg^{-1}(\sum X/2)$). If the test is conducted with a diluted test solution, calculate the concentration of endotoxin in the original solution by multiplying the result by the dilution factor. If none of the dilutions of the test solution is positive in a valid test, record the endotoxin concentration as less than λ (or, if a diluted sample was tested, as less than λ times the lowest dilution factor of the sample). If all dilutions are positive, the endotoxin concentration is recorded as equal to or greater than the greatest dilution factor multiplied by λ . The preparation being examined meets the requirements of the test if the concentration of endotoxin is less than that specified in the individual monograph. Otherwise, the preparation being examined does not meet the requirements of the test.

Photometric method (Method 2)

The photometric method includes a turbidimetric method and a chromogenic method.

The turbidimetric method measures the endotoxin concentrations of test solutions based on the measurement of the increase in turbidity during the gel formation of the TAL reagent. Depending on the test principle used, this method is classified as being the endpoint-turbidimetric test or the kinetic-turbidimetric test. The endpoint-turbidimetric test is based on the quantitative relationship between the concentration of endotoxins and the turbidity (absorbance or transmission) of the reaction mixture at the end of an incubation period. The kinetic-turbidimetric test is a method to measure either the onset time needed for the reaction mixture to reach a predetermined absorbance, or the rate of turbidity development.

The chromogenic method measures the chromophore released from a suitable chromogenic peptide by the reaction of

endotoxins with the TAL reagent. Depending on the test principle employed, this method is classified as being the endpoint-chromogenic test or the kinetic-chromogenic test. The endpoint-chromogenic test is based on the quantitative relationship between the concentration of endotoxins and the quantity of chromophore released at the end of an incubation period. The kinetic-chromogenic test is a method to measure either the onset time needed for the reaction mixture to reach a predetermined absorbance, or the rate of colour development. All photometric tests are usually carried out by special instrumentation at the incubation temperature of $37 \pm 1^\circ\text{C}$. The quantities and volume ratios of the substance being examined and the TAL reagent, incubation time etc. employed in the test are decided according to the related instructions of instruments and the TAL reagents.

To assure the precision or validity of the turbidimetric and chromogenic tests, preparatory tests are conducted to assure that the criteria for the standard curve are satisfied and that the test solution does not interfere with the test.

Assurance of criteria for the standard curve The test for assurance of criteria for the standard curve must be carried out when each new batch of TAL reagent is used or any changes are made to the experimental conditions that are likely to influence the result of the test.

Using the standard endotoxin solution, prepare at least three endotoxin concentrations (the dilution factor of adjacent concentrations is not greater than 10) to generate the standard curve within the range of endotoxin concentrations indicated by the TAL reagent manufacturer. The mixing time for every dilution is the same as that of gel-clot method. Perform the test using at least three replicates of each standard endotoxin solution, and duplicate of negative control solution at the same time. When both reaction times of the duplicate of negative control solution are greater than that of the lowest concentration, perform statistic analysis of linear regression for all the data.

The test is not valid unless the absolute value of the correlation coefficient, $|r|$, is greater than or equal to 0.980, otherwise repeat the test.

Test for interfering factors Select an endotoxin concentration (λ_m) at or near the middle of the endotoxin standard curve. Prepare solutions A, B, C and D as shown in Table 4.

Table 4 Preparation of solutions in the test for interfering factors by using photometric method

Solution	Endotoxin Concentration	Solution to which Endotoxin is Added	Number of Replicates
A	None	Test solution	not less than 2
B	Middle concentration (λ_m) of the standard curve	Test solution	not less than 2
C	At least 3 concentrations (lowest concentration, λ , is designated)	Water for BET	each not less than 2

continue

Solution	Endotoxin Concentration	Solution to which Endotoxin is Added	Number of Replicates
D	None	Water for BET	not less than 2
Solution A: test solution, that may be diluted not to exceed the MVD.			
Solution B: preparation to be examined at the same dilution as Solution A, containing added endotoxin at a concentration equal to or near the middle of the standard curve.			
Solution C: standard endotoxin solution at the concentrations used in the validation of the method described in <i>Assurance of criteria for the standard curve</i> .			
Solution D: water for (negative control) BET.			

Calculate the content of endotoxin contained in the solution A (C_1) and solution B (C_2) respectively, and calculate the recovery of the endotoxin added to solution B as follows:

$$R = [(C_2 - C_1) / \lambda_m] \times 100\%$$

If under the conditions of the test, the recovery of the endotoxin added to solution B is within 50% to 200%, the test solution is considered to be free of interfering factors. When the endotoxin recovery is out of the specified ranges, the interfering factors must be removed as described in the *Test for interfering factors under Gel-Clot Techniques*. The efficiency of the treatment is verified by repeating the test for interfering factors.

When the source of the TAL reagent, or the origin, formula and the manufacture process of the substance being examined are changed, or there is any change in the experimental conditions which may affect the outcome of the test, the *Test for interfering factors* should be performed again.

Procedure

Follow the procedure described in the *Test for interfering factors under Photometric method*.

Calculate the endotoxin concentration of each replicate of solution A using the standard curve generated by the series of positive controls, solution C.

The test is not valid unless the following 3 requirements are met:

- (1) the results obtained with the series of positive controls, solution C, comply with the requirements for validation defined in the *Assurance of criteria for the standard curve under Photometric method*;
- (2) the endotoxin recovery, calculated from the concentration found in solution B after subtracting the endotoxin concentration found in solution A, is within the range of 50% to 200%;
- (3) both reaction times of the solution D (negative control) are greater than that of the lowest concentration of the endotoxin standard curve.

Invaluation of results The preparation being examined complies with the test if the mean endotoxin concentration of the replicates of solution A, after correction for dilution and concentration, is less than the endotoxin limit for the product. Otherwise, the preparation being examined does not meet the requirements of the test.

Note In this chapter, the term "tube" includes all types of receptacles such as micro-titer plate wells.

XI F Test for Vasopressor Substance

The vasopressor substance of the preparation being examined (T) is determined by comparing its vasopressor activity on anesthetized rat with that of standard preparation of posterior pituitary (S) under the condition of the following method.

the same way as that described under the Preparation of Standard Solution for the Biological Assay of Oxytocin (Appendix XII F) to produce a solution containing 1.0 Unit of vasopressor activity in 1 ml, calculated on the basis of the stated potency for vasopressin. Store the solution at a temperature of 4-8°C. The solution may be used over a period of not exceeding three months if it is still remained clear. Dilute the solution with sodium chloride injection to produce a standard dilution of 0.1 Unit per ml immediately before the test.

Preparation of test solution Dissolve the preparation being examined in water (or sodium chloride injection) to produce a solution of suitable concentration specified in the monograph. Adjust the concentration of the solution so that of the volume of the solution being injected will be equal to that of the standard dilution.

Procedure A healthy male rat weighting over 300 g is anaesthetized with suitable anaesthetics (such as i.p. 1 g urethane per kg body weight). Tie the rat on back to a operating table and maintain the body temperature of the rat during the test. Dissect the trachea for cannulation when necessary. Insert the femoral (or carotid) vein a cannula filled with sodium chloride injection for intravenous injection. Inject through the venous cannula 50-100 Units of heparin per 100 g body weight. Insert a artery cannula (filled with suitable units of heparin solution) into one of the dissected carotid artery and connect the other end of the cannula with a suitable pressure measuring device by a column of saline solution for making continuous record of blood pressure.

At this stage, adjust the pressure of the device to a level corresponding to the normal blood pressure of the rat, and remove the artery clamp. Inject slowly a α -adrenoceptor blocking agent (such as phentolamine mesylate 0.1 mg for 100 g body weight) and repeat the same dose of injection after 5-10 minutes. Start the test only when the blood pressure of the rat remains stable. Injections should be made at a uniform rate and at a regular interval of 5-10 minutes depending on the time at which the blood pressure returns to its original level. Each injection is followed by a fixed volume of sodium chloride injection.

Inject intravenously in turn two doses of standard dilution (ml) with the dose ratio of about 1 : 0.6, and repeat the injection for 2-3 times. If the elevation response of blood pressure to the lower doses is corresponding to 1.33-3.33 kPa, and the mean response caused by higher doses is clearly greater than that of the mean response caused by lower doses, the sensitivity of the rat is suitable for the test. Let d_s represent a dose of standard dilution (ml) which lies between the range of lower and higher doses used in the sensitivity test, and d_T the dose of test preparation specified in the monograph, inject a series of four dose in the order of d_s , d_T , d_s , d_T , compare the elevation response of blood pressure caused by the third dose (d_T) to that caused by the first dose (d_s), and the response caused the second dose (d_T) to that caused by the fourth dose (d_s). The preparation complies with the test if the two responses caused by d_T are

another series of four doses of d_s and d_T and compare the responses in the same way. The preparation complies with the test if, in the two series of doses, none of the response of d_T is greater than that of d_s . The preparation fails the test if all the responses caused by d_T are greater than that of d_s . If it is not the case, repeat the test with another cat. The test preparation fails the test if in the repeated test one depressor response caused by d_T is greater than that caused by d_s .

XI G Test for Depressor Substances

The depressor substance of a preparation being examined (T) is determined by comparing its depressor effect on anesthetized cat (or dog) with that of the histamine reference standard (RS) under the condition of the following method.

Preparation of standard solution Dissolve an accurately weighed quantity of the histamine phosphate RS in water to produce a solution of 1 mg histamine base per ml. Immediately before the test, dilute the histamine solution with sodium chloride injection to produce a solution of 0.5 μ g of histamine base per ml.

Preparation of test solution Prepare a solution of preparation being tested to produce a solution with suitable concentration specified in the monograph so that the volume of the solution being injected will be equal to that of the standard solution.

Procedure A healthy cat weighing over 2 kg (or a dog weighing over 5 kg), male or non-pregnant female, is anesthetized with a suitable anesthetic such as one of the barbiturates. Care should be taken to maintain the body temperature of the animal during the test. Fix the cat on an operating table, introduce a short glass cannula into the trachea so as to be ready for artificial respiration when necessary. Insert a cannula filled with suitable anticoagulant solution into one of the carotid artery and connect the cannula to a suitable pressure measuring device for making a continuous record of blood pressure. Cannulate the femoral vein for intravenous injection. Adjust the pressure of the pressure measuring device to a level corresponding to the normal blood pressure of the animal (usually 13.3-16.0 kPa) and remove the artery clamp. The doses can be given only when the blood pressure of the animal is constant. Injections should be made at a uniform rate and at regular intervals of 3-5 minutes depending on the speed at which the blood pressure returns to a constant level. Each injection is followed by a fixed volume of normal saline solution.

Inject intravenously in turn 3 doses of standard solution corresponding to 0.05 μ g, 0.1 μ g and 0.15 μ g of histamine base per kg of the cat's weight. Repeat the injections for 2-3 times, if the depressor responses to the injections of 0.1 μ g/kg are approximately the same and correspond to a fall of blood pressure not less than 2.67 kPa and the responses to the graded doses are clearly discriminated, the sensitivity of the animal is suitable for the test.

Let d_s represents the dose of 0.1 μ g of the histamine base per kg of the cat's weight and d_T the dose of test preparation specified in individual monographs, inject a series of doses in the order of d_s , d_T , d_T , d_s , compare the depressor response caused by the third dose with that caused by the first dose, and the response caused by the second dose with that caused by the fourth dose. The preparation complies with the test if none of the depressor responses caused by d_T is greater than 1/2 of that caused by d_s . If one response

another series of d_s , d_T , d_T , d_s and compare their responses in the same way. The test preparation complies with the test if none of the depressor responses caused by d_T is greater than that caused by d_s . The test preparation fails the test if all responses caused by d_T are greater than that caused by d_s . If it is not the case, repeat the test with another cat. The test preparation fails the test if in the repeated test one depressor response caused by d_T is greater than that caused by d_s .

The animal can further be used for test of depressor substances if the sensitivity of the animal is still suitable for the test.

XI H Test for Sterility

Test for sterility is a method to detect whether raw materials, preparations, medical devices or other articles, which are required to be sterile according to the Pharmacopoeia, are aseptic. However, a result conforming with the requirements only indicates that no contaminating micro-organism has been found in the sample examined under the conditions of the test.

Test for sterility should be carried out in a class 100 laminar-air-flow cabinet located within a 10000-class clean-room, or an isolator. The whole process should be performed under strictly aseptic conditions to avoid any microbial contamination. The cleanliness of working areas including laminar flow cabinet, working bench, background room should be monitored regularly according to the current national standard such as the detecting method for airborne particles, airborne microbe and settling microbe in the clean room (area) of the pharmaceutical industry. The isolator should be validated according to the relevant requirements, the cleanliness of inner isolator space should also comply with aseptic requirements.

1. Culture media

(1) Media preparation

Media for the test may be prepared as described below, dehydrated media may be used provided that they have same ingredients and comply with the requirements. Media should be sterilized using a validated process. Store at a temperature between 2°C and 25°C and protect from light. If the prepared media are stored in unsealed containers, they can be used in 3 weeks. If stored in suitable sealed containers, the media can be used in 1 year.

1) Fluid thioglycollate medium (for culturing aerobic bacteria and anaerobic bacteria)

Pancreatic digest of casein	15.0 g
Glucose	5.0 g
L-Cystine	0.5 g
Sodium thioglycollate or (Thioglycollic acid)	0.5 g 0.3 ml
Yeast extract	5.0 g
Sodium chloride	2.5 g
0.1% Resazurin solution (freshly prepared)	1.0 ml
Agar	0.75 g
Water	1000 ml

Mix the above ingredients in water except glucose and resazurin solution, heat until dissolved, adjust pH to slightly alkaline, boil and filter, add glucose and resazurin solution, mix, adjust the pH so that after sterilization the solution will have a pH of 7.1 ± 0.2 . Dispense the medium in suitable containers which provide a ratio of surface to depth of medium such that no more than the upper half of the medium has undergone a colour change (pink colour) indicative of oxygen uptake at the end of the incubation

use, not more than the upper one-fifth of the medium has acquired a pink colour, otherwise, the medium can be restored only once by heating the containers in a water-bath until the pink colour disappears (no more than 20 minutes), cooled quickly, taken care to prevent the introduction of non-sterile air into the container.

Fluid Thioglycollate Medium is to be incubated at 30-35°C.

2) Modified Martin medium (for culturing fungi)

Peptone	5.0 g
Yeast extract	2.0 g
Glucose	20.0 g
Dipotassium hydrogen phosphate (K_2HPO_4)	1.0 g
Magnesium sulfate ($MgSO_4$)	0.5 g
Water	1000 ml

Mix the above ingredients in water except glucose, heat until dissolved, adjust pH to about 6.8, boil, add glucose, mix, filter, adjust the pH so that after sterilization the solution will have a pH of 6.4 ± 0.2 , dispense the media into containers and sterilize using a validated process.

Improved Martin medium is to be incubated at 23-28°C.

3) Selective medium

Before sterilization or inoculation, add proper quantity of suitable neutralizer or surface-active substance, such as p-aminobenzoic acid (used in test for sterility of sulfonamides), polysorbate 80 (used in test for sterility for water insoluble substances) or β -lactamase (used in test for sterility of β -lactam preparations) etc. to each of the media described above. The quantity of neutralizer or surface-active substance should be validated.

4) Nutrient broth medium

Peptone	10.0 g
Beef powder	3.0 g
Sodium chloride	5.0 g
Water	1000 ml

Mix the above ingredients in water, heat until dissolved, adjust pH to slightly alkaline, boil, filter, adjust the pH so that after sterilization the solution will have a pH of 7.2 ± 0.2 , dispense the media into containers and sterilize using a validated process.

5) Nutrient broth agar medium

Add 14.0 g agar to nutrient broth medium as described above, adjust the pH so that after sterilization, the solution will have a pH of 7.2 ± 0.2 , dispense the media into containers and sterilize using a validated process.

6) 0.5% glucose broth medium (used in test for sterility of antibiotic such as Streptomycin sulfate)

Peptone	10.0 g
Beef powder	3.0 g
Glucose	5.0 g
Sodium chloride	5.0 g
Water	1000 ml

Mix the above ingredients in water except glucose, heat until dissolved, adjust the pH to slightly alkaline, boil, add glucose, mix, filter, adjust the pH so that after sterilization, the solution will have a pH of 7.2 ± 0.2 , dispense the media into containers and sterilize using a validated process.

7) Modified Martin agar medium

Add 14.0 g agar to Improved Martin medium as described above, adjust the pH so that after sterilization the solution will have a pH of 6.4 ± 0.2 . Dispense the media into containers and sterilize using a validated process.

(2) Suitability Tests of Medium

The media used in the test for sterility, as described above, should comply with the following sterility and sensitivity tests, carried out before or in parallel with the test on the

(3) **Sterility** Incubate no less than 5 vessels of each batch of sterilized medium at the specified incubation temperature for 14 days. Growth of microorganisms should not occur.

(4) Test for sensitivity of medium

1) Test strains	<i>Staphylococcus aureus</i>	[CMCC (B) 26003]
	<i>Pseudomonas aeruginosa</i>	[CMCC (B) 10104]
	<i>Bacillus subtilis</i>	[CMCC (B) 63501]
	<i>Clostridium sporogenes</i>	[CMCC (B) 64941]
	<i>Candida albicans</i>	[CMCC (F) 98001]
	<i>Aspergillus niger</i>	[CMCC (F) 98003]

The viable microorganisms used in the test must not be more than five passages removed from the original master seed lot. The suitable seed-stock technique should be used so that the microorganism characters can be maintained.

2) **Preparation of inoculum** Inoculate freshly cultured *Staphylococcus aureus* or *Pseudomonas aeruginosa* or *Bacillus subtilis* into nutrient agar medium or nutrient broth medium and freshly cultured *Clostridium sporogenes* into fluid thioglycollate medium, incubate at 30-35°C for 18-24 hours. Inoculate freshly cultured *Candida albicans* into Modified Martin medium or Modified Martin agar medium, incubate at 23-28°C for 24-48 hours, prepare suspension, with the above cultures, containing less than 100 cfu microorganisms per ml with sterile 0.9% w/v sodium chloride solution. Inoculate freshly cultured *Aspergillus niger* into Modified Martin agar medium, incubate at 23-28°C for 5-7 days until good sporulation is obtained. Wash the *Aspergillus niger* spore culture and transfer it to sterile tube, prepare spore suspension containing less than 100 cfu per ml with sterile 0.9% w/v sodium chloride solution.

3) **Inoculation of medium** Take 9 containers of fluid thioglycollate medium (containing 12 ml medium per container), inoculate 2 containers of the medium with less than 100 cfu test microorganisms of *Staphylococcus aureus*, *Pseudomonas aeruginosa*, *Bacillus subtilis* and *Clostridium sporogenes* respectively, and the remaining uninoculated culture medium (one container) is used as blank control, then incubate for not more than 3 days. Take 5 containers of Modified Martin medium (containing 9 ml medium per container), inoculate 2 containers of the medium with less than 100 cfu test microorganisms of *Candida albicans* and *Aspergillus niger* respectively, and use the remaining uninoculated culture medium (one container) as blank control, incubate for not more than 5 days. Observe the test containers for growth of the microorganisms every day during the incubation.

4) **Evaluation of results** The blank control must be no growth of microorganisms. If a clearly visible growth of the microorganisms occurs in an inoculated culture medium, the medium meets the requirement of the test for sensitivity of medium.

2. Diluents and rinsing fluids

(1) 0.1% Peptone solution

Dissolve 1.0 g of peptone in 1000 ml of water, heat until dissolved, adjust the pH to 7.1 ± 0.2 , filter and dispense into containers. Sterilize using a validated process.

(2) pH 7.0 sodium chloride-peptone buffer

Mix 3.6 g KH_2PO_4 , 7.2 g Na_2HPO_4 , 4.3 g sodium chloride and 1.0 g peptone in 1000 ml of water. heat until dissolved, filter and dispense into containers. Sterilize using a validated process.

If necessary, Add suitable neutralizer or surface-active substance to each of the diluents or rinsing fluids described above before or after sterilization

In the course of establishing sterility testing method for product to be examined, the method must be verified to ensure that the adopted method is suitable for sterility test of the product. Whenever there is a change of drug composition or experimental conditions of the test, the testing method must be revalidated.

Validation test is to be conducted as described below under Test for sterility of the product being examined using exactly the same methods and the following instructions. The tests should be performed separately for each of the microorganism tested.

(1) **Tested strains and preparation of inoculum** Same as the test for sensitivity of medium described above.

(2) **Membrane filtration** Filter the specified quantity of the test specimen with Membrane filtration apparatus, rinse the membrane, add test microorganism with less than 100 cfu to the final portion of rinsing fluids, filter again. Transfer the membrane filter into fluid thioglycollate medium or Modified Martin medium, or add the medium to the filtration apparatus containing the membrane. Use another container containing the same volume of the medium, then add the same amount of test microorganisms as control. Incubate the containers at specified temperature for 3-5 days. Repeat the procedure for each of the test microorganism tested.

(3) **Direct Inoculation** Take 8 containers containing certain required volume of fluid thioglycollate medium for direct Inoculation, inoculate into 2 containers of each of medium with less than 100 cfu test microorganisms of *Staphylococcus aureus*, *Pseudomonas aeruginosa*, *Bacillus subtilis* and *Clostridium sporogenes* separately. Take 4 containers containing Modified Martin medium complying with the required volume for direct Inoculation, inoculate into 2 containers of each of the medium with less than 100 cfu test microorganisms of *Candida albicans* and *Aspergillus niger* separately. Add specified quantity of the product being tested to one of the inoculated containers of each test microorganism, the other inoculated container is for control. Incubate the containers at specified temperature for 3-5 days.

(4) **Invaluation of results** Compare with the control container, if clearly visible growth of each test microorganisms is obtained in the test containers containing the product to be tested, visually either the product possesses no antimicrobial activity under the conditions of the test or such activity has been satisfactorily eliminated. The test for sterility of the product being examined may then be carried out using the same method and conditions of the test. If the growth of test microorganisms is not obtained, or poor, or slow in any tested container, visually comparable to that in the control container without product, then the product with the specified quantity possesses antimicrobial activity under the conditions of the test.

In such a case, modify the conditions in order to eliminate the antimicrobial activity by using a large amount of rinsing fluid, or increase the volume of medium, or using suitable neutralizer or inactivator such as β -lactamase or p-aminobenzoic acid, or replacing the type of the membrane filter used etc. and repeat the validation test. The validation may also be performed simultaneously with the Test for sterility of the product being examined.

4. Test for sterility of the product being examined

(1) **Number of products to be tested** It is the number of the minimum package of the product to be examined for test for sterility once. Unless otherwise specified, test the number of products is specified in Table 1. The number of the products for positive control test is not included in table 1.

(2) **Quantity of product to be tested** It is the minimum

Unless otherwise specified, the minimum quantity of the product for each medium are defined in table 2 and table 3. When using the technique of direct inoculation, if the contents in a single container are sufficient to inoculate two containers of medium, they should be transferred to fluid thioglycollate medium and Modified Martin medium respectively. When using the technique of membrane filtration, the quantity of the products to be tested should not be less than the whole quantity used in direct inoculation, whenever permitted, the whole contents of each container should be filtered for testing.

(3) **Positive control** The microorganisms for positive control should be selected according to the nature of the product being examined. *Staphylococcus aureus* is used for the product possessing no antimicrobial activity or mainly anti-gram-positive-bacteria activity. *Encherichia coli* is used for the product mainly possessing anti-gram-negative-bacteria activity. *Clostridium sporogenes* is used for the product possessing anti-anaerobic bacteria activity. *Candida albicans* is used for the product possessing fungistatic activity. Preparation of the inoculums for positive control is the same as described under the Test for sensitivity of medium (*E. Coli* inoculums preparation is same as *Staphylococcus aureus* inoculums), number of test microorganism added should be less than 100 cfu, the quantity of the product used is the same as described under the Test for sterility of the product being examined for each container of medium. Incubate the positive control container for 48-72 hours, the growth of the test microorganisms should be well.

(4) **Negative control** In the course of the sterility test for examined product, a negative control should be performed with the same solvent and diluents as the test used. There must be no growth of microorganisms. If surface-active substances, neutralizers or inactivators etc. are used during the test, their efficacy and their absence of inhibition for growth and survival of microorganisms must be demonstrated.

The test for sterility is carried out by the membrane filtration method or direct Inoculation method. The membrane filtration method is used whenever the nature of the product permits. The same method and experimental conditions should be adopted in sterility test as that used in validation test. Before opening the product containers to be tested, the exterior surfaces of containers must be thoroughly cleansed with a suitable disinfectant. If the containers are packaged under vacuum, sterile air should be transmitted into the container aseptically with suitable equipments (eg. Needles with sterilizing filter) before the container is opened to release the contents.

(5) Sample preparation and medium inoculation

Unless otherwise specified, Carry out the test as described below.

1) Membrane filtration method

Sealed sterility testing system may be preferred used in the technique of membrane filtration. Other general membrane filter may also be adopted. The membrane used in the test for sterility has a nominal pore size which is not greater than $0.45 \mu\text{m}$ and a diameter about 50 mm. Selection of filtration membrane type should be performed according to the characters of product to be tested and solvent used. The filtration apparatus and membrane should be sterilized by appropriate means before use. Integrity of the membrane in the apparatus should be kept during the process filtration. When filtering aqueous solution, the membrane in the filter should be pre-wetted with a small quantity of rinsing fluids. When the samples tested are oily preparations, the filtration apparatus and membrane must be thoroughly dried before

always cover the whole surface of the membrane throughout the operation for maximal filtration efficiency. If necessary, wash the membrane by filtering through it with 100 ml of rinsing fluid for one single membrane each time, and the total volume used should not be too much to avoid any damage to the microorganisms held by the membrane, after filtering the sample solution.

① Aqueous solutions Transfer the specified quantity of samples tested directly into the membrane or membranes, or mix the samples into an aseptic vessels containing suitable quantity of the sterile diluent and transfer the mixture to the the membrane or membranes. Filter immediately. If the product being examined contain preservatives or have inherent antimicrobial activity, the membrane should be washed not less than three times by filtering through it with suitable quantity of the rinsing fluid. If sealed sterility testing system is used, transfer 100 ml of fluid thioglycollate medium and Modified Martin medium into the correspondence filter apparatus respectively after washing. If other general membrane filters are used, aseptically remove the membrane from the apparatus and cut it into three equal parts, and transfer each part to each of container containing 50 ml of suitable media, set one of the container as a positive control.

② Solid soluble in aqueous vehicle Transfer the specified quantity of specimens tested, dissolve with suitable sterile diluent or as directed in the label. Proceed with the test as directed above for Aqueous solutions.

③ β -lactam antibiotics Transfer the specified quantity of specimens and prepare samples as directed above for aqueous solutions or Solid soluble in aqueous vehicle, filter immediately, wash the membrane with suitable rinsing fluid. Then rinse the filter with rinsing fluids containing suitable quantity of sterile β -lactamase to inactivate any residual antibiotic activity on the membranes, if necessary, add a few sterile β -lactamase into the medium. Alternatively, the membranes can be inoculated directly to medium containing suitable quantity of sterile β -lactamase. Inoculate medium as directed above for Aqueous solutions.

④ Water insoluble substances Transfer the specified quantity of specimens and filter directly, or mix in a sterile diluent containing polysorbate 80 or other suitable emulsifying agent, and transfer it into the membrane or membranes. Filter immediately. Wash the membrane at least three times with rinsing fluid containing 0.1%-1% polysorbate 80. The membranes are inoculated to medium with or without containing polysorbate 80. Inoculate medium as directed above for Aqueous solutions.

⑤ Ointments and Viscous oils soluble in isopropyl myristate Mix specified quantity of specimens tested in suitable quantity of sterile isopropyl myristate, shake vigorously to completely dissolve the sample. If necessary, heat the mixture to not more than 44°C, Filter as rapidly as possible before the mixture cools down. In exceptional case when the mixture is unable to be filtered, more than 100 ml diluents should be added to the above mixture, shake sufficiently and extract the solution, then transfer the aqueous phase in underlayer into the membrane or membranes and filter immediately. Proceed washing membrane and inoculating medium as described above for water insoluble substances.

⑥ Sterile aerosol (or nebulization) products Transfer the specified quantity of product containers tested to a refrigeratory, and freeze for about 1 hour. Aseptically drill quickly a hole in the top end of each container and release the propellant, then open the container aseptically. Proceed as directed above for aqueous solutions or water insoluble substances, whichever applicable.

specimens tested, fit a sterile needle on the syringe (not included in the product package). If necessary, dissolve with suitable sterile diluent or with solvent specified by product label. Proceed with the test as directed above for Aqueous solutions or water insoluble substances, whichever applies. Needles included in the product package should also be tested for sterility using direct inoculation method.

⑧ Devices with pathways Take the specified quantity of devices tested, pass 50-100 ml rinsing fluids through each one to wash the inner surface of device. Collect the fluids in a sterile vessel. Proceed as directed above for Aqueous solutions. At the same time, Needles attached with package should be tested for sterility using direct inoculation method.

2) Direct Inoculation method

Direct Inoculation method is to directly transfer the specified quantity of product tested into fluid thioglycollate medium and Modified Martin medium respectively. In each container Incubated, the volume of samples tested is not more than 10% of the volume of the medium, and the volume of fluid thioglycollate medium should not be less than 15 ml, the volume of Modified Martin medium should not be less than 10 ml, unless otherwise specified. Use the same medium volume and height in the container as in Validation test. Inoculate the same number of containers for each medium as the number of products to be tested.

① Turbid aqueous solution Transfer the specified quantity of specimens tested into each culture medium.

② Solid articles Directly transfer specified quantity of specimens tested into each culture medium, or prepare a suspension of the product with suitable sterile diluent or as directed in the label, then transfer the specified quantity of specimens into each culture medium.

③ β -lactam antibiotics or sulfonamides Mix the specified quantity of specimens tested to the sterile dilution containing suitable quantity of sterile β -lactamase or p-aminobenzoic acid for neutralizing the antimicrobial activity. Inoculate the prepared suspension into each culture medium. Alternatively, Transfer directly the specified quantity of specimens into each culture medium containing sterile β -lactamase or p-aminobenzoic acid.

④ Water insoluble substances Transfer the specified quantity of specimens tested to a sterile container, add the dilution containing suitable quantity of polysorbate 80 or other emulsifying agent to the container and mix to emulsify the specimens. Inoculate the suspension prepared above into each culture medium. Alternatively, Transfer directly the specified quantity of specimens into each culture medium containing polysorbate 80 or other emulsifying agent.

⑤ Surgical dressing Take the specified quantity of packages. Aseptically open the package, and remove about 100 mg or 1 cm×3 cm dressings from different parts of each package into each culture medium containing sufficient volume to completely immerse the sample tested.

⑥ Catgut or sutures or other single-use material Take the specified quantity of the minimal package. Aseptically open the package and remove the entire material of each package into each culture medium containing sufficient volume to completely immerse the sample tested.

⑦ Sterile medical devices Take the specified quantity of packages, inoculate the whole device to each culture medium containing sufficient volume to immerse the device completely, if necessary, the devices tested should be disassembled or cut into pieces.

⑧ Radiopharmaceutical Open one container of product

medium and 7.5 ml Modified Martin medium separately.

(6) Incubation and observation

Incubate all medium containers above for 14 days at required temperature. Observe and record each medium container for evidence of microbial growth every day during incubation period. If the product being tested renders medium turbid so that the presence or absence of microbial growth can not be readily determined by visual examination, 14 days after the beginning of incubation, transfer suitable portions of the medium to fresh containers with the same kind of medium or slants, and incubate the fresh containers 2 days for bacteria and 3 days for fungi, then examine the fresh containers for evidence of microbial growth; or smear a small amount of the medium on a slide, stain and examine with microscope for the suspected microbial growth.

5. Evaluation of results

Except the positive control container, if no evidence of microbial growth is found in all of the test containers described above, the product to be examined complies with the test for sterility; if evidence of microbial growth is found in any one of the test containers, the product to be examined

does not comply with the test for sterility, unless it can be clearly demonstrated that the test was invalid for causes unrelated to the product to be examined. The test may be considered invalid only when one or more of the following conditions are fulfilled;

(1) The result of the microbiological monitoring of the sterility testing facility shows that it does not meet the requirements of the test for sterility.

(2) A review of the testing procedure used during the test in question reveals a fault.

(3) Microbial growth is found in the negative control container.

(4) After determination of the identification of the microorganisms isolated from the test, the growth of this species (or these species) may be ascribed unequivocally to faults in respect with the material or the technique used in conducting the sterility test procedure.

If the test is validated to be invalid, it should be repeated with the same number of the samples and procedure as in the original test. If no evidence of microbial growth is found in the test repeated, the product examined complies with the test for sterility; if microbial growth is found, the product examined does not comply with the test for sterility.

Table 1 Minimum number of product to be tested from each batch

Product to be tested	Number of items in the batch	Minimum number of items to be tested for each medium*
Parenteral preparations	Not more than 100	10% or 4 containers, whichever is the greater
	More than 100 and not more than 500	10 containers
	More than 500	2% or 20 containers, whichever is less
For large-volume parenteral preparations (more than 100 ml)		2% or 10 containers, whichever is less
Ophthalmic and other noninjectable preparations	Not more than 200 containers	5% or 2 containers, whichever is the greater
	More than 200	10 containers
	Up to 4	Each container
Bulk solid products	More than 4 containers, and not more than 50 containers	20% or 4 containers, whichever is greater
	More than 50 containers	2% or 10 containers, whichever is greater
Pharmacy bulk packages of Antibiotics (greater than 5 g)		6 containers
Medical Devices	Not more than 100 articles	10% or 4 articles, whichever is greater
	More than 100, and not more than 500 articles	10 articles
	More than 500 articles	2% or 20 articles, whichever is less

* If the content of one container are not sufficient to inoculate the two media, this number may be doubled.

Table 2 Minimum quantity of liquid product to be used for each medium

Quantity per container	Minimum quantity per container to be used for each medium
Not more than 1 ml	The whole contents of each container
more than 1 ml, and less than 5 ml	Half the contents of each container
Not less than 5 ml, and less than 20 ml	2 ml
Not less than 20 ml, and less than 50 ml	5 ml
Not less than 50 ml, and less than 100 ml	10 ml
Not less than 50 ml, and less than 100 ml (Intravenous)	Half the contents of each container
Not less than 100 ml, and not more than 500 ml	Half the contents of each container
More than 500 ml	500 ml

Table 3 Minimum Quantity of solid product to be tested for each medium

Quantity per container	Minimum quantity per container to be used for each medium
Less than 50 mg	The whole contents of each container
Not less than 50 mg and less than 300 mg	Half the contents of each container
Not less than 300 mg and less than 5 g	150 mg
Not less than 5 g	500 mg
Surgical dressing/cotton/gauze	100 mg or 1 cm×3 cm
Sutures and other single-use material	the whole device*
Devices with pathways for single-use	the whole device
Other medical devices	the whole device (cut into pieces or disassembled if necessary)*

* : If the device is bulky, the device may be submerged in more than 2000 ml of the medium.

XI J Microbial Limit Tests

Microbial limit tests provide tests for the estimation of the number of viable micro-organisms present in non-sterile pharmaceutical products of all kinds, including preparations, raw materials, excipients. The bacteria, fungi or yeasts count, as well as the specified bacteria, are tested.

Microbial limit tests should be carried out in a class 100 laminar-air-flow cabinet located within a 10000-class clean-room. The whole process should be performed under strictly aseptic conditions to avoid any microbial contamination. The cleanliness of working areas including laminar flow cabinet, working bench, background room should be monitored regularly according to the current national standard such as **The detecting method for airborne particles, airborne microbe and settling microbe in the clean room (area) of the pharmaceutical industry.**

Surfactants, neutralizing agents, or inactivators do not affect the growth of micro-organisms if they are used in the products to be examined.

Unless otherwise specified, incubate bacteria at 30-35°C, at 23-28°C for fungi or yeasts, and at 35-37°C for specified bacteria.

The test result is reported in the unit of 1 g, 1 ml, 10 g, 10 ml or 10 cm².

Quantity of products to be tested

It refers to the quantity of the product to be examined for one single test (in g, ml, or cm²).

Unless otherwise specified, use samples of 10 g or 10 ml of the product to be examined for testing. Use 100 cm² for pellicles. The quantity may be appropriately decreased for expensive drugs and small-package drugs. Increase the quantity by 10 g or 10 ml when *Salmonella* is tested.

Select the samples at random from at least 2 minimum containers, and at least 4 pieces for pellicles.

The quantity of sampling (from at least 2 minimum containers) is 3 times the quantity for testing.

Preparation of the sample

Samples are prepared appropriately depending on their physico-chemical properties and biological characteristics. If necessary, samples are warmed in a water bath not more than 45°C. The samples are inoculated to the culture media within one hour of preparation.

Unless specified otherwise, follow the methods below to prepare the samples.

1. Liquids

Take 10 ml of the product, dilute to 100 ml with sterile

this 1 : 10 solution as the test solution. Add an appropriate amount of sterile polysorbate 80 to an oil to make it dispense evenly. For aqueous preparations, the products may be mixed as the test solution.

2. Solids, semi-solids, and viscous products

Take 10 ml of the product, dilute to 100 ml with sterile sodium chloride-peptone buffer (pH 7.0), mix well with a homogenizer or other devices. Use this 1 : 10 solution as the test solution. If necessary, add an appropriate amount of polysorbate 80 and warm the sample in a water bath so that it dispense evenly.

3. Sample specified preparation

(1) Non-aqueous products

Method 1 Transfer 5 g (or 5 ml) of the product into a sterile beaker containing 5 g melt (not exceeding 45°C) Span 80, 3 g glyceryl monostearate, 10 g polysorbate 80, mix, slowly add sterile sodium chloride-peptone buffer (pH 7.0, 45°C) to 100 ml with agitating to make an emulsion. Use this 1 : 20 emulsion as the test solution.

Method 2 Transfer 10 g of the product to a suitable container with 20 ml sterile isopropyl myristate (prepared as described under Sterility test, the amount may be increased if necessary) and sterile glass beads, agitate thoroughly to dissolve the product. Then add 100 ml sterile sodium chloride-peptone buffer (pH 7.0, 45°C), agitate for 5-10 min for extraction. Allow it to stand until the two layers separate. Use the 1 : 10 aqueous layer as the test solution.

(2) Pellicles

Take 100 cm² of the pellicles, cut into pieces. Immerse into 100 ml of sterile sodium chloride-peptone buffer (pH 7.0), and agitate. Use the 1 : 10 diluent as the test solution.

(3) Enteric-coated and colonic-coated products

Transfer 10 g of the product, dilute to 100 ml with sterile phosphate buffer solution (pH 6.8 for enteric-coated and pH 7.6 for colonic-coated), warm in a 45°C water bath, and shake to dissolve. Use this 1 : 10 solution as the test solution.

(4) Aerosols and sprays

Chill a prescribed amount of the product in a refrigerator for approximately 1 hour. Take it out, dig a small hole rapidly and aseptically. Put it at room temperature and allow the propellant to escape. Transfer all the residue with a sterile syringe, add an appropriate amount of sterile sodium chloride-peptone buffer (pH 7.0, add an appropriate amount of sterile polysorbate 80 for water-insoluble ingredients), and mix well. Take a sample equivalent to 10 g or 10 ml, and dilute by 10 folds. Use this 1 : 10 solution as the test solution.

(5) Products containing antimicrobial agents

When the products to be examined possess antimicrobial

methods described below.

① Culture media dilution Transfer the prescribed amount of the product to an adequate volume of culture media. Thus the concentration of the product decreases until it possesses no antimicrobial activity. For the limit test of bacteria, fungi, and yeasts, distribute 2 ml of the diluted solution over Petri dishes. Add agar media, mix well, and allow it to solidify. Incubate the dishes under appropriate conditions. Count the average number of colonies obtained with 1 ml of the solution. Report the counts by the plate-count method. The amount of diluting culture media may increase when specified bacteria are tested.

② Enrichment of micro-organisms by centrifugation Centrifuge a specified quantity of the product at 3000 rpm for 20 minutes. If the product contains precipitates, centrifuge at 500 rpm for 5 minutes at first, and then collect the supernatant and centrifuge again as described above. Discard the supernatant and dilute the residue at the bottom (about 2 ml) to original specified quantity with diluting solution.

③ Membrane filtration See the membrane filtration method under Bacteria, fungi, and yeasts count.

④ Neutralization If the product to be examined contains antimicrobial agents like mercury, arsenic, or antiseptics, use suitable neutralizing agents or inactivators to eliminate its antimicrobial activity. The neutralizing agents or inactivators may be added in the diluting solutions or culture media.

Bacteria, fungi or yeasts count

Method validation

The bacteria, fungi or yeasts count method for microbial limit tests is validated before it is used for drugs. The count method is revalidated if changes in composition of the product or testing conditions may affect the result. Validation test is to be conducted as described under Bacteria, fungi or yeasts count using exactly the same methods and the following instructions. The tests should be performed separately for each of the micro-organism tested.

Test strains

The viable micro-organisms used in the test must not be more than five passages removed from the original master seed lot. The suitable seed-stock technique should be used so that the micro-organism characters can be maintained.

<i>Escherichia coli</i>	[CMCC (B) 44102]
<i>Staphylococcus aureus</i>	[CMCC (B) 26003]
<i>Bacillus subtilis</i>	[CMCC (B) 63501]
<i>Candida albicans</i>	[CMCC (F) 98001]
<i>Aspergillus niger</i>	[CMCC (F) 98003]

Preparation of Inoculum Inoculate freshly cultured of *Escherichia coli*, *Staphylococcus aureus*, or *Bacillus subtilis* to nutrient broth medium or nutrient agar medium, incubate for 18-24 hours; Inoculate freshly cultured of *Candida albicans* to modified Martin medium or modified Martin agar medium, and incubate for 24-48 hours; The above cultures are diluted to 50-100 colony-forming units (cfu) per ml with sterile solution of 0.9% sodium chloride. Inoculate freshly cultured of *Aspergillus niger* to modified Martin agar medium, and incubate for 5-7 days. Wash out the spores with 3-5 ml sterile solution of 0.9% sodium chloride. Transfer the spore suspension to a sterile test tube. Dilute the suspension to 50-100 cfu per ml with sterile solution of 0.9% sodium chloride.

Validation test Carry out at least 3 parallel tests, and calculate the recovery of micro-organisms for each test.

(1) Testing group When the plate count method is used, transfer 1 ml of the lowest possible serial dilution of the sample and 50-100 cfu testing micro-organisms to a Petri

dish, and pour the agar medium immediately. Use 2 Petri dishes for each microbial strain, and record the colony number by the plate count method. When the membrane filtration method is used, transfer specified quantity of the sample solution through a membrane, rinse appropriately, add 50-100 cfu testing micro-organisms in the last portion of rinsing solution. Record the colony number by membrane filtration method.

(2) Microbial group Determine the number of micro-organisms added in the test.

(3) Product control Transfer a prescribed quantity of the product, determine the number of bacteria, fungi or yeasts in sample.

(4) Diluting solution control Diluting solution control should be carry out when the sample of preparation used dispersant, emulsification, neutralization, centrifugation and filtration etc. Use diluting solution instead of sample and add the testing micro-organisms to 50-100 cfu per ml, preparation test solution and determine the number of micro-organisms as described above for testing group.

Evaluation of results

In each of the 3 parallel tests, the microbial recovery is not less than 70% (average colony number of the diluting solution control/average colony number of the testing group $\times 100\%$). If the microbial recovery of the testing group is not less than 70% [(average colony number of the testing group-average colony number of the product control)/average colony number of the microbial group $\times 100\%$], proceed the bacteria, fungi or yeasts count of the product to be examined as described above. If the microbial recovery in any of the tests is below 70%, eliminate the antimicrobial activities of the product by appropriate methods like culture media dilution, centrifugation, membrane filtration, or neutralization. The method needs re-validation.

The validation test is carried out in parallel with the bacteria, fungi, or yeasts count of the product to be examined.

Examination method

Examination method include plate count and membrane filtration method. Use validated plate count method or membrane filtration method to carry out the bacteria, fungi, or yeasts count of the product to be examined.

Dilute the homogenized solution to be test with pH 7.0 sterile solution of sodium chloride-peptone buffer solution to make serial dilutions of 1:10, 1:100, 1:1000, etc.

1. Plate count method

Use two to three successive serial dilutions as the testing solution. Transfer 1 ml of the sample to a sterile Petri dish (90 mm in diameter), add 15-20 ml Nutrient agar medium, or Sodium rose bengal agar medium, or Yeast extracts peptone glucose agar medium (melted at not exceeding 45°C), mix well, and allow the contents to solidify at room temperature. Invert the Petri dish and incubate under appropriate conditions. For each dilution, use at least 2 Petri dishes for each culture medium.

Negative control Transfer 1 ml of the dilution to a sterile Petri dish, promptly add the culture medium, and allow the contents to solidify at room temperature. Invert the Petri dish and incubate under appropriate conditions. Use at least 2 Petri dishes for each culture medium. No evident growth of micro-organisms occurs in either of the Petri dish.

Incubation and counting Unless otherwise prescribed, incubate the bacteria for 48 hours, count the number of colonies every day, report the number on the 48 hour; incubate the fungi and yeasts for 72 hours, count the number of colonies every day, report the number on the 72 hour; extend the incubation time to 5-7 days if necessary. Do not

count the number of colonies assemble. Following counting, calculate the number of colonies of each dilution of the product, report the result following the Microbial number report rule described below.

For liquid preparations containing honey and royal jelly, use Sodium rose bengal agar medium for fungi count and Yeast extracts peptone glucose agar medium for yeasts count. Sum the counts as the final result.

Microbial number report rule Select the dilution in which the average number of colonies of bacteria and yeasts is 30-300 cfu and of the fungi is 30-100 cfu.

If average microbial number of any dilution is less than 30, select the number of the lowest dilution. Calculate the number of cfu per g or per ml product to be tested.

When no microbial growth occurs in any of the dilutions, or it only occurs for the lowest dilution where the average microbial number of the cfu is less than 1, report the result with 1 multiplying by the lowest dilution folds.

2. Membrane filtration

Use membranes having a nominal pore size not greater than 0.45 μm , and a diameter of appropriately 50 mm. The type of filter material is chosen in such a way that the bacteria retaining efficiency is not affected by the component or solvent of the sample to be investigated. The filter unit and membrane are sterilized prior to use by appropriate means. Maintain the performance characteristic of the filter during the testing process. Moist the membrane with a minimum amount of rinsing solution before the test of aqueous products. Where the product to be examined is an oil, the membrane and filter unit are thoroughly dried before use. Let the product solution and rinsing solution cover the whole membrane to obtain its maximal performance. Rinse the membrane with 100 ml of rinsing solution each time if necessary. Do not use a large amount of rinsing solutions to avoid disturbance of the micro-organisms on the membrane. Take representing 1 g or 1 ml of the product, or 1 ml suitable dilution solution of the sample if product include large numbers of micro-organism, and dilute to 100 ml with diluting solution, mix well and filter. Rinse the membrane with pH 7.0 sterile sodium chloride-peptone buffer solution or other suitable rinsing solution, as described above for validation test. Transfer the membrane onto a Nutrient agar medium or Sodium rose bengal agar medium, or Yeast extracts peptone glucose agar medium plate, and incubate. Use at least one membrane for each medium.

Negative control Use 1 ml of the dilution, and carry out the test as described above. No evident growth of micro-organisms occurs in the negative control.

Incubation and counting Carry out the test as described above for plate count method. The number of micro-organisms on each membrane is not more than 100 cfu.

Microbial number report rule Multiply the average microbial number by dilution folds as the number of cfu per g or per ml product to be test. If no microbial growth occurs, report the result with less than 1 or 1 multiplying by the lowest dilution folds.

Test for specified micro-organisms

Method validation

The method for specified micro-organisms test is validated before it is used for microbial limit tests for drugs. The method is re-validated if changes in composition of the product or testing conditions may affect the result.

Validation micro-organisms used should be complied with requirements of the microbial limits of the product. Validation the method of coliform should be used *Escherichia coli*. Carry out the test as described under the Test for

specified micro-organisms exactly the same methods and the following instructions.

Test strains he strains comply with the requirements as described above for bacteria, fungi, or yeasts count.

Escherichia coli [CMCC (B) 44102]

Staphylococcus aureus [CMCC (B) 26003]

Salmonella paratyphi B [CMCC (B) 50094]

Pseudomonas aeruginosa [CMCC (B) 10104]

Clostridium sporogenes [CMCC (B) 64941]

Preparation of Inoculum Inoculate freshly cultured of *Escherichia coli*, *Staphylococcus aureus*, *Salmonella paratyphi B*, or *Pseudomonas aeruginosa* to nutrient broth medium or nutrient agar medium; inoculate freshly cultured of *Clostridium sporogenes* to fluid thioglycollate medium; incubate for 18-24 hours. Dilute the suspension to 10-100 cfu per ml with sterile solution of 0.9% sodium chloride.

Validation test

(1) **Testing group** Add a specified quantity of the product to be examined and 10-100 cfu testing micro-organisms to the culture medium, carry out the test by prescribed methods described below. When the membrane filtration method is used, filter an appropriate quantity of the product through a membrane, rinse appropriately, add the testing micro-organisms in the last portion of rinsing solution. Transfer the membrane to the culture medium for incubation.

(2) **Negative control** Negative control is set to verify the specificity of the testing method. The procedure is the same as described above for testing group. Use *Staphylococcus aureus* as the negative control microorganism for the test of *Escherichia coli*, coliform, or *Salmonella* species. Use *Escherichia coli* as the negative control microorganism for the test of *Pseudomonas aeruginosa*, *Staphylococcus aureus*, and *Clostridium* species. No control micro-organism is detected.

Evaluation of results

No control micro-organism is detected in the negative control. If the tested micro-organism is detected in the testing group, proceed the test with the product to be examined. If the tested micro-organism is not detected in the testing group, eliminate the antimicrobial activities of the product by appropriate methods like culture media dilution, centrifugation, membrane filtration, or neutralization. The method needs re-validation.

The validation test is carried out in parallel with the test for specified micro-organisms of the product to be examined.

Examination method

Carry out the test of the product to be examined as described above for validation test.

Positive control Add 10-100 cfu of the tested micro-organism to the positive control, carry out the test as the Test for specified micro-organisms. The tested micro-organism can be detected in the positive control.

Negative control Transfer 10 ml of diluting solution to a prescribed amount of culture media, and incubate as the Test for specified micro-organisms. No micro-organism growth occurs in the negative control.

(1) ***Escherichia coli*** Inoculate 10 ml of the test solution (equivalent to 1 g, 1 ml or 10 cm^2) to be examined to an appropriate amount of Bile salt lactose culture medium (not less than 100 ml) directly or after appropriate treatment, incubate for 18-24 hours (48 hours if necessary).

Inoculate 0.2 ml of the above culture to a tube containing 5 ml MUG medium, and incubate. Observe under 366 nm UV light at the time of 5 hours and 24 hours, respectively. Use blank MUG medium as the negative control. The result is MUG-positive if the cultures give fluorescent light, or MUG

negative if no fluorescent light is observed. Following observation, add several drops of indole test solution. The result is indole-positive if the liquid surface presents a rosy colour, or indole-negative if no colour change takes place. The negative control is MUG-negative and indole-negative. A MUG-positive and indole-positive result indicates the presence of *E. coli* in the product. A MUG-Negative and indole-Negative result indicates the absence of *E. coli* in the product. If the product is MUG-positive and indole-negative, or MUG-negative and indole-positive, inoculate the cultures on eosin methylene blue agar medium plate or MacConkey agar medium plate, and incubate for 18-24 hours.

If no growth of micro-organism occurs on the plate, or the appearance of the microbial colonies does not match the descriptions in Table 1, the product passes the test. Otherwise, confirm the result by suitable biochemical tests.

Table 1 Morphologic characteristics of *Escherichia coli* colonies

Culture medium	Characteristic colonial morphology
Eosin methylene blue agar medium	Purple black, light purple, bluish purple or pink, deep purple at the center of colony or no obvious dark center, circular, slight convex, regular margin, smooth surface, moist, metal gloss often appeared.
MacConkey agar medium	Brilliant pink or pale red, deep pink at center of the colony, circular, flat, regular margin, smooth surface, moist.

(2) **Coliform** Use 3 tubes each containing an appropriate amount of Bile salt lactose fermentation culture medium (not less than 10 ml), respectively add 1 ml of 1 : 10 (containing 0.1 g or 0.1 ml of the product), 1 : 100 (containing 0.01 g or 0.01 ml of the product), 1 : 1000 (containing 0.001 g or 0.001 ml of the product) dilutions. Add 1 ml of diluting solution to another tube as the negative control. Incubate for 18-24 hours.

The product passes the test if no microbial growth occurs, or no gas bubbles or acid forms. If the formation of acid and gas bubbles is observed, inoculate the cultures on Eosin methylene blue agar medium plate or MacConkey agar medium plate, and incubate for 18-24 hours.

If no growth of micro-organisms occurs on the plate, or the appearance of the microbial colonies does not match the descriptions in Table 2, or the colonies are not gram-negative bacilli, the product passes the test. If the morphology of the colonies matches the descriptions in Table 2, and they are gram-negative bacilli without spores, confirm the result by suitable biochemical tests.

Table 2 Morphologic characteristics of coliform colonies

Culture medium	Characteristic colonial morphology
Eosin methylene blue agar medium	Purple black, or purple red, circular, slight convex, regular margin, smooth surface, moist.
MacConkey agar medium	Brilliant pink or pale red, circular, flat, regular margin, smooth surface, moist.

Validation test Choose 4-5 suspect colonies from the plate, individually inoculate in tubes containing bile salt lactose culture medium, and incubate for 24-48 hours. The formation of acid and gas bubbles indicates the presence of coliform. Otherwise, absence coliform in the product.

According to the number of coliform-positive tubes, and Table 3, record the probable number of coliform 1 g or 1 ml

Table 3 Probable number of coliform

Result of each quantity of product			Probable number of coliform N(per g or ml)
0.1 g or 0.1 ml	0.01 g or 0.01 ml	0.001 g or 0.001 ml	
+	+	+	$N > 10^3$
+	+	-	$10^2 < N < 10^3$
+	-	-	$10 < N < 10^2$
-	-	-	$N < 10$

Note: + represents coliform is detected, and - not detected.

(3) ***Salmonella species*** Inoculate 10 g or 10 ml of the product to be examined to an appropriate amount (not less than 200 ml) of Nutrient broth culture medium directly or after appropriate treatment, mix well with a homogenizer or other devices, and incubate for 18-24 hours.

Inoculate 1 ml of the culture above to 10 ml Sodium tetrathionate brilliant green culture medium, incubate for 18-24 hours. Then streak the cultures on the surface of Bile salt sulfur milk agar culture medium (or *Salmonella* and *Shigella* agar medium) and MacConkey agar medium (or Eosin methylene blue agar) plates separately, incubate for 18-24 hours (or 40-48 hours if necessary). If no bacterial growth occurs on the plate, or the morphology of the colonies does not conform to the descriptions in Table 4, *Salmonella* is absence in the product to be tested.

If the morphology of the colonies conforms to or is similar to the description in Table 4, choose 2-3 colonies and transfer to Triple sugar iron agar culture medium slant with a inoculating needle, using surface and deep inoculation. Incubate for 18-24 hours. If red colour on the surface and yellow colour at the bottom, or yellow on the surface and black at the bottom is not observed, *Salmonella* is absence in the product to be tested. Otherwise, confirm the presence of *Salmonella* by carrying out suitable biochemical and Serum agglutination tests with the cultures on triple sugar iron agar culture medium slant.

Table 4 Morphologic characteristics of *Salmonella* colonies

Culture medium	Characteristic colonial morphology
Bile salt sulfur lactose agar	Colourless to pale orange, semitransparent, black at the center or whole black or no black
<i>Salmonella</i> and <i>Shigella</i> agar medium	Colourless to pale red, semitransparent or opaque, black brown in the center of the colonies occasionally
Eosin methylene blue agar medium	Colourless to pale orange colour, transparent or semitransparent, smooth moist circular colonies
MacConkey agar medium	Colourless to pale orange colour, transparent or semitransparent, dark in the center occasionally

(4) ***Pseudomonas aeruginosa*** Inoculate 10 ml of the test solution (equivalent to 1 g, 1 ml or 10 cm² of the product) to an appropriate amount (not less than 100 ml) of Bile salt lactose culture medium, incubate for 18-24 hours. Then streak the cultures on the surface of Cetyl trimethylammonium bromide agar culture plate, and incubate for 18-24 hours.

Pseudomonas aeruginosa colonies are typically flat, irregular, diffusing margin, moist surface, greyish white, occasionally surrounded by bluish green zone. If no bacterial growth occurs on the plate, or the morphology of the colonies does not conform to the above descriptions, *Pseudomonas aeruginosa* is absence in the product to be tested. If the growth colonies reveal the above characters,

culture slant, incubate for 18-24 hours. Use the slant cultures for Gram's staining, microscopical examination, and oxidase test.

Oxidase test Place a piece of clean filter paper in a Petri dish, spread the slant cultures on the filter paper with a sterile glass bar, add dropwise freshly prepared 1% *N*, *N*-dimethyl-*p*-phenylenediamine dihydrochloride test solution. The oxidase test is positive if the cultures appear pink and then turn into purplish red within 30 seconds. Otherwise, the test is negative.

If the slant cultures are not Gram-negative bacilli, or the oxidase test is negative, *Pseudomonas aeruginosa* is absence in the product to be tested. Otherwise, carry out the pyocyanin test.

Pyocyanin test Inoculate the slant cultures onto PDP agar culture slant, and incubate for 24 hours. Then add 3-5 ml of chloroform to the test tube, agitate the medium and shake thoroughly. Allow to stand for a while, then transfer the chloroform layer to a new tube, add about 1 ml of 1 mol/L hydrochloric acid solution, allow to stand for a moment following shaking, observe the phenomenon. If the solution appears pink, the pyocyanin test is positive; or otherwise, negative. Use un-inoculated PDP agar culture slant as the negative control. The negative control is pyocyanin-negative. If the bacteria in question are Gram-negative bacilli, and are oxidase test positive and pyocyanin test positive, *Pseudomonas aeruginosa* is presence in the product to be examined. If the bacteria in question are Gram-negative bacilli, and are oxidase test positive and pyocyanin test negative, proceed the test by carrying out suitable biochemical tests to confirm whether they are *Pseudomonas aeruginosa*.

(5) *Staphylococcus aureus* Inoculate 10 ml of the test solution (equivalent to 1 g, 1 ml or 10 cm² of the product) to an appropriate amount (not less than 100 ml) of Sodium tellurite broth culture medium (or Nutrient broth culture medium) directly or after appropriate treatment, incubate for 18-24 hours (48 hours if necessary). Then streak the cultures on the surface of Egg yolk high salt agar culture medium plate or Mannitol high salt agar culture medium plate, incubate for 24-72 hours. If no bacterial growth occurs on the plate, or the morphology of the colonies does not conform to the descriptions in Table 5, *Staphylococcus aureus* is absence in the product in question.

Table 5 Morphologic characteristics of *Staphylococcus aureus* colonies

Culture medium	Characteristic colonial morphology
Mannitol high salt agar culture medium	Golden yellow, circular convex, regular margin, yellow outer circle, colony diameter 0.7-1 mm.
Egg yolk high salt agar culture medium	Golden yellow, circular convex, regular margin, opaque outer circle due to lecithin degradation, colony diameter 1-2 mm.

If the morphology of the colonies conforms to or is similar to the description in Table 5, choose 2-3 colonies and inoculate onto Nutrient agar culture medium slant, and incubate for 18-24 hours. Take the obtained cultures for Gram's staining. And inoculate the cultures in Nutrient broth culture medium, and incubate for 18-24 hours, then carry out the coagulase test.

Coagulase test Use 3 sterile tubes, add 0.5 ml of (1 : 1) mixture of plasma and sterile water in each tube, then respectively add 0.5 ml of nutrient broth cultures of the suspect bacteria (or concentrated bacterial suspension prepared from the nutrient agar slant cultures), 0.5 ml of

concentrated bacterial suspension prepared from the nutrient agar slant cultures), and 0.5 ml of Nutrient broth culture medium or 0.9% sterile sodium chloride solution, which are testing tube, positive tube, and negative tube, respectively. Incubate the 3 tubes together. Examine the tubes at 3 hours and subsequently at suitable intervals up to 24 hours. The plasma in the negative tube maintains fluidity, and the plasma coagulates in the positive tube. If the plasma in the testing tube coagulates, the coagulase test is positive, or otherwise, negative. If the result of positive or negative tube does not conform to the above description, repeat the test.

If the suspect bacteria are not Gram-positive cocci, and the coagulase test is negative, *Staphylococcus aureus* is absence in the product to be tested.

(6) *Clostridium* Take two equal portions (10 ml, equivalent to 1 g or 1 ml of the product) of the sample solution. Heat one portion at 80°C for 10 minutes and cool rapidly. Do not heat the other portion. Inoculate the test solutions above to 100 ml of Chopped meat culture medium directly or after appropriate treatment separately. Incubate under anaerobic conditions for 72-96 hours. If no turbidity, gas bubbles, beef digestion, or bad smells form in the testing tube, *Clostridium* is absent in the product being examined. Otherwise, spread 0.2 ml of the cultures onto the surface of columbia agar culture medium plate to which gentamicin has been added, and incubate under anaerobic conditions for 48-72 hours. If no microbial growth occurs on the plate, *Clostridium* is absent in the product to be tested. If colonies are observed on the plate, select 2-3 colonies and carry out Gram's staining test and catalase test.

Catalase test Put the colonies from the plate above onto clean glass slices, add dropwise 3% hydrogen peroxide solution. If gas bubbles appear on the colony surface, the catalase test is positive, or otherwise, negative.

If the suspect colonies are Gram-positive *Clostridium*, with or without oval or round spores, and catalase test is negative, *Clostridium* is presence in the product being examined. Or otherwise, *Clostridium* is absence.

Evaluation of results.

If specified micro-organisms or other pathogenic micro-organisms are detected in one single test, the product does not pass the test. The test needs not repetition.

If any count of bacteria, of fungi, or of yeasts does not comply with the requirements, take samples at random from the same batch, and carry out two more independent repetitive tests. Report the average value from three determinations as the final result.

If fungi and yeasts are detected in eye preparations, the product being examined passes the test for fungi and yeasts count only if micro-organisms are not detected in two more repetitive tests.

If results of bacteria, fungi and yeasts count, as well as the test for specified micro-organisms meet the specified requirements for the product being examined, the product passes the test. If the result of bacteria, fungi and yeasts count, or the result for the test for specified micro-organisms does not comply with the specified requirements for the product being examined, the product does not pass the test.

Diluting solutions

The diluting solutions are sterilized by validated sterilization methods after preparation.

1. pH 7.0 sterile sodium chloride-peptone buffer solution
Prepare the solution as described under the Test for Sterility

2. pH 6.8 sterile phosphate buffer solution, pH 7.6 sterile phosphate buffer solution

Prepare the solution as described under Appendix XV D, filter, dispense in containers, and sterilize.

If necessary, add surfactants or neutralizing solutions before or after the sterilization.

3. 0.9% sterile sodium chloride solution

Transfer 9.0 g sodium chloride, dissolve in 1000 ml water, filter, dispense in containers, and sterilize.

Culture media

The media may be prepared as described below, or their dehydrated formulations may be used. The media should be Sterilized using a validated process.

1. Nutrient agar culture medium, nutrient broth culture medium, fluid thioglycollate medium, modified Martin medium, and modified Martin agar medium

Prepare the media as described under the Test for Sterility (Appendix XI H).

2. Sodium rose bengal agar medium

Peptone	5.0 g
Glucose	10.0 g
Potassium dihydrogen phosphate (KH_2PO_4)	1.0 g
Magnesium sulfate ($\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$)	0.5 g
Sodium tetrachloro-tetraiodo-fluorescein	0.0133 g
Agar	14.0 g
water	1000 ml

Mix the above ingredients in water except glucose and sodium tetrachloro-tetraiodo-fluorescein, heat until dissolved, filter, and then add glucose and sodium tetrachloro-tetraiodo-fluorescein. Dispense in containers and sterilize.

3. Yeast extracts peptone glucose agar medium (YPD)

peptone	10.0 g
Yeast extracts	5.0 g
Glucose	20.0 g
agar	14.0 g
water	1000 ml

Mix the above ingredients in water except glucose, heat until dissolved, filter, and then add glucose. Dispense in containers and sterilize.

4. Bile salts lactose medium (BL)

peptone	20.0 g
lactose	5.0 g
Sodium chloride	5.0 g
Dipotassium hydrogen phosphate (K_2HPO_4)	4.0 g
Potassium dihydrogen phosphate (KH_2PO_4)	1.3 g
Ox bile salts (or sodium desoxycholate 0.5 g)	2.0 g
water	1000 ml

Mix the above ingredients in water except lactose and ox bile salts (or sodium desoxycholate), heat until dissolved, adjust the pH so that after sterilization it is 7.4 ± 0.2 , boiling. Filter, add lactose and ox bile salts (or sodium desoxycholate), dispense in containers and sterilize.

5. Bile salts lactose fermentation medium

Add 0.04% bromocresol purple indicator to the un-sterilized bile salts lactose medium, dispense in suitable tubes containing inverted tubule, and sterilize.

6. Eosin methylene blue agar medium (EMB)

Nutrient agar medium	100 ml
2% eosin solution	2 ml
20% lactose solution	5 ml
0.5% methylene blue solution	1.3-1.6 ml

Melt the nutrient agar medium by heating, cool to 60°C , add aseptically the other three solutions, shake thoroughly, and pour into Petri dishes.

7. MacConkey agar medium (MacA)

Peptone	20.0 g
Sodium chloride	5.0 g
lactose	10.0 g
1% neutral red solution	3.0 ml
Ox bile salts	5.0 g
Agar	14.0 g
water	1000 ml

Mix peptone and sodium chloride in water, heat until dissolved, adjust the pH so that after sterilization it is 7.2 ± 0.2 . Add agar, heat to melt, then add the other ingredients. Shake thoroughly, dispense in containers, and sterilize. Cool to 60°C , and pour into the Petri dishes.

8. 4-methylumbelliferyl- β -D-glucuronide (MUG) culture medium

peptone	10.0 g
Manganese sulfate	0.5 mg
Zinc sulfate	0.5 mg
Magnesium sulfate	0.1 g
Sodium chloride	5.0 g
Calcium chloride	50 mg
Potassium dihydrogen phosphate (anhydrous)	0.9 g
Disodium hydrogen phosphate (anhydrous)	6.2 g
Sodium sulfite	40 mg
Sodium desoxycholate	1.0 g
MUG	75 mg
water	1000 ml

Mix the above ingredients in water except MUG, heat until dissolved, adjust the pH so that after sterilization it is 7.3 ± 0.1 , add MUG, dissolve, dispense 5 ml of the medium to each tube and sterilize.

9. Triple sugar iron agar medium (TSI)

Peptone	20.0 g
glucose	1.0 g
Beef extract powder	5.0 g
Sodium chloride	5.0 g
lactose	10.0 g
sucrose	10.0 g
Ferrous sulfate	0.2 g
Sodium thiosulfate	0.2 g
0.2% phenosulfonphthalein solution	12.5 ml
agar	12.0 g
water	1000 ml

Mix peptone, beef extracts powder, sodium chloride, ferrous sulfate and sodium thiosulfate, dissolve in water heat until dissolved, adjust the pH so that after sterilization it is 7.3 ± 0.1 . Add agar, heat to melt, then add the other ingredients. Shake thoroughly, dispense in containers, and sterilize. Make short slants (2-3 cm) after the media cool.

10. Sodium tetrathionate brilliant green medium (TTB)

Peptone	5.0 g
Calcium carbonate	10.0 g
Ox bile salts	1.0 g
Sodium thiosulfate	30.0 g
water	1000 ml

Dissolve the above ingredients in water heat until dissolved, and sterilize.

Just prior to use, add 0.2 ml iodine test solution and 0.1 ml brilliant green test solution to 10 ml of the medium, and shake thoroughly.

11. Salmonella and Shigella agar culture medium (SS)

peptone	5.0 g
Sodium citrate	8.5 g
0.1% Brilliant green solution	0.33 ml
Beef extract powder	5.0 g
Ammonium ferrous citrate	1.0 g
lactose	10.0 g
Sodium thiosulfate	8.5 g
Ox bile salts	8.5 g
1% neutral red solution	2.5 ml

agar	16.0 g
water	1000 ml

Mix the above ingredients in water except lactose, neutral red solution and agar, heat until dissolved, adjust the pH so that after sterilization it is 7.2 ± 0.1 . Filter, add agar and heat to melt. Then add the other ingredients, shake thoroughly, sterilize, cool to 60°C , and pour into Petri dishes.

12. Bile salts sulfur lactose agar culture medium (DHL)

peptone	20.0 g
Beef extracts	3.0 g
lactose	10.0 g
sucrose	10.0 g
Sodium desoxycholate	1.0 g
Sodium thiosulfate	2.3 g
Sodium citrate	1.0 g
Ammonium ferrous citrate	1.0 g
1% neutral red solution	3 ml
agar	16.0 g
water	1000 ml

Mix the above ingredients in water except sugars, indicators and agar, heat until dissolved, adjust the pH so that after sterilization it is 7.2 ± 0.1 . Add agar and heat to melt. Then add the other ingredients, shake thoroughly, sterilize, cool to 60°C , and pour into Petri dishes.

13. Cetrinide agar medium

peptone	10.0 g
Beef extracts powder	3.0 g
Sodium chloride	5.0 g
Cetyl trimethyl ammonium bromide	0.3 g
agar	14.0 g
water	1000 ml

Mix the above ingredients in water except agar, heat until dissolved, adjust the pH so that after sterilization it is 7.2 ± 0.1 . Add agar and heat it to melt, shake thoroughly. Dispense in containers, sterilize, cool to 60°C , and pour into Petri dishes.

14. Tellurite broth medium

Just prior to use, add 0.2 ml of freshly prepared 1% sodium (or potassium) tellurite solution, mix well.

15. Egg yolk high salts agar medium

peptone	6.0 g
Beef extracts	1.8 g
Sodium chloride	30.0 g
10% sodium chloride egg yolk solution	100 ml
agar	16.0-18.0 g
water	650 ml

Mix the above ingredients in water except 10% sodium chloride egg yolk solution, heat until dissolved, adjust the pH so that after sterilization it is 7.6 ± 0.1 . Sterilize and cool to 60°C . Add aseptically 10% sodium chloride egg yolk solution, shake thoroughly, and pour into Petri dishes.

16. Mannitol high salts agar medium

peptone	10.0 g
Beef extracts	1.0 g
mannitol	10.0 g
Sodium chloride	75.0 g
1% phenolsulfonphthalein solution	2.5 ml
agar	14.0 g
water	1000 ml

Mix the above ingredients in water except mannitol, phenolsulfonphthalein solution and agar, heat until dissolved, adjust the pH so that after sterilization it is 7.6 ± 0.1 , add agar and heat to melt. Filter and dispense in containers, sterilize and cool to 60°C , then pour into Petri dishes.

17. Lactose fermentation culture medium

peptone	20.0 g
Lactose	10.0 g
0.04% bromocresol purple indicator	25 ml
water	1000 ml

Mix the above ingredients in water except 0.04% bromocresol purple indicator, heat until dissolved, adjust the pH so that after sterilization it is 7.2 ± 0.2 , add the indicator, dispense in suitable tubes (3 ml per tube). Sterilize.

18. Pyocyanin culture medium

peptone	20.0 g
Magnesium chloride (anhydrous)	1.4 g
Potassium sulfate (anhydrous)	10.0 g
glycerol	10 ml
agar	14.0 g
water	1000 ml

Mix peptone, magnesium chloride and potassium sulfate, heat until dissolved, adjust the pH so that after sterilization it is 7.3 ± 0.1 , add glycerol and agar, heat to melt, shake thoroughly, dispense in suitable tubes and sterilize. Cool at room temperature to make slants.

19. Chopped meat culture medium

Preparation of the Beef bits. Use fresh beef, remove the fats and muscles, and boil for 10 minutes. Cut into pieces of 5 mm^3 , add three folds (w/w) of distilled water, immerse in $4\text{-}10^\circ\text{C}$ water for 18-20 hours, then boil for 1 hour, filter through gauze. The residue is washed twice with water. Then put the beef bits into an appropriate amount of sodium hydroxide solution so that the pH is around 8:4, agitate thoroughly. Immerse the beef overnight, and discard the upper water the next day, and wash 2-3 times with water. Spread the beef on a tray, sterilize, and dry at $80\text{-}100^\circ\text{C}$, remove the powders, put into bottles, and keep away from moisture.

Preparation of chopped meat culture medium. Put the beef bits in suitable containers, add an appropriate amount of Nutrient broth medium so that the beef bits constitute 1.5% of the volume, adjust the pH so that after sterilization it is 7.3 ± 0.1 , sterilize.

20. Columbia agar culture medium

Pancreatic digest of casein	10.0 g
Pepsin digest of beef	5.0 g
Pancreatic digest of heart	3.0 g
Yeast extracts powder	5.0 g
Corn flour	1.0 g
Sodium chloride	5.0 g
agar	15.0 g
water	1000 ml

Mix the above ingredients in water except agar, heat until dissolved, adjust the pH so that after sterilization it is 7.3 ± 0.2 , add agar and heat to melt. Filter, dispense in containers and sterilize. Cool to $45\text{-}50^\circ\text{C}$, add sterile gentamicin sulfate (equivalent to 20 mg gentamicin), mix well, and pour into Petri dishes.

Microbial contamination limits of Pharmaceutical Preparations

The microbial contamination limits of non-sterile preparations is drawn by fully considering the drug administration routes and potential harm to the patients. Unless otherwise prescribed, Microbial limit test follows the criterion below in the manufacturing, storage and distribution of preparations, as well as in the establishment of new preparations standards, evaluation of imported preparations, and the quality control of preparations, raw materials, and excipients.

1. Sterile preparations specified in General Notice or monographs, and other preparations labelled sterile

Comply with the test for Sterility.

2. Preparations for oral administration

Bacteria count Not more than 1000 per g, or 100 per ml.
 Fungi and yeasts count Not more than 100 per g or per ml.
E. coli. Absence in 1 g or 1 ml.

3. Preparations for local administration

(1) Local administration preparations for surgery, burn or serious injury
 Comply with the test for sterility.

(2) Preparations for eye administration

Bacteria count Not more than 10 per g or per ml.
 Fungi and yeasts count Absence in 1 g or 1 ml.

Staphylococcus aureus, *Pseudomonas aeruginosa* and *Escherichia coli* Absence in 1 g or 1 ml.

(3) Preparations administered via ear, nose or respiratory tract

Bacteria count Not more than 100 per g, per ml or per 10 cm².
 Fungi and yeasts count Not more than 10 per g, per ml or per 10 cm².

Staphylococcus aureus and *Pseudomonas aeruginosa*
 Absence in 1 g, 1 ml or 10 cm².

Escherichia coli. Absence in 1 g, 1 ml or 10 cm² for preparations for nose and respiratory tract administration.

(4) Preparations for vagina and urethra administration

Bacteria count Not more than 100 per g or per ml.
 Fungi and yeasts count Less than 10 per g or per ml.

Staphylococcus aureus and *Pseudomonas aeruginosa*
 Absence in 1 g or 1 ml.

(5) Preparations for rectal administration

Bacteria count Not more than 1000 per g, and not more than 100 per ml.
 Fungi and yeasts count Not more than 100 per g or per ml.

Staphylococcus aureus, *Pseudomonas aeruginosa* and *Escherichia coli* Absence in 1 g or 1 ml.

(6) Other preparations for local administration

Bacteria count Not more than 100 per g, per ml or per 10 cm².
 Fungi and yeasts count Not more than 100 per g, per ml or per 10 cm².

Staphylococcus aureus and *Pseudomonas aeruginosa*
 Absence in 1 g, 1 ml or 10 cm².

4. Oral preparations containing animal tissues (including

extracts)

Salmonella species are absence per 10 g or per 10 ml.

5. Preparations for more than one administration routes

Comply with the requirements for each administration route.

6. Raw materials and excipients

Refer to the limit for corresponding preparation.

XI K Test for Allergen

The general allergic reactions of a substance being examined are determined by injecting a dose of test solution into guinea pigs, after a fixed interval challenging intravenously into each sensitized animal a solution of the substance being examined and observing allergic reactions of each challenged animal.

Use healthy guinea pigs weighing 250-350 g, male or non-pregnant female. Breed in normal condition before and during test. Guinea pigs can only be used once for the test.

Preparation of test solution Unless otherwise prescribed, prepare a solution of a substance being examined with suitable concentration specified in the monograph.

Procedure Unless otherwise prescribed, inject intraperitoneally 0.5 ml of the test solution into each of 6 guinea pigs for 3 times successively, once every other day, then distribute sensitized animals into two groups with 3 guinea pigs in each group. Challenge intravenously into each guinea pig of one group 1 ml of the test solution on the fourteenth day and each of the other group on the twenty-first day after the first injection. Examine the Guinea pigs everyday and measure the weight of each animal before sensitization and challenge. Observe if allergic reactions such as hair pricking, short of breathing, twitching happen within 30 minutes after challenge.

Evaluation of the results None of the guinea pigs shows two or more types of allergic reactions within 30 minutes after challenge, such as hair pricking, sneezing, retching or continuous cough for three times and short of breathing; or one of the following allergic reactions: twitching, shock or dying. Otherwise, the substance being examined does not meet the requirements of the test.

Appendix XII

XII A Biological Assay of Vasopressin

The potency of the preparation of vasopressin being examined (T) is estimated by comparing its blood pressor activity on the rat with that of the Posterior Pituitary Standard (S) under the condition of following assay method.

Preparation of standard solution Transfer a suitable quantity of the Posterior Pituitary Standard, accurately and rapidly weighed to avoid the absorption of moisture, to a small glass vessel. Add accurately a small volume of 0.25% acetic acid and mix thoroughly. Place the total content of the vessel into a large test tube and add accurately 0.25% acetic acid to the test tube to produce a solution of 1 Unit of vasopressin per ml. Stopper the test tube lightly with a glass stopper and heat the tube, with continuous and gentle shaking, in a boiling water bath for 5 minutes. Cool the tube rapidly and filter. Distribute the filtrate into a suitable glass container and store it at 4-8°C. The solution may be used within 3 months if it remains clear.

On the day of the assay, dilute an accurately measured portion of the standard solution with sodium chloride injection to produce two dilutions of (S). The ratio (r) of the concentration between two dilutions should not be greater than 1 : 0.6. Adjust 2 dose levels such that the smaller dose produces a response of rise in blood pressure significantly and the larger dose does not produce a maximum response.

Preparation of test solution Prepared in the same way as described under Preparation of Standard Solution. The concentration of the test solution is calculated on the basis of the labelled or assumed potency (A_T) of the vasopressin being examined. The ratio (r) of the concentration between two dilutions of (T) should be the same as that of (S). The mean value of the responses given by each dose level of the test solution should be approximately the same as that of the standard solution.

Assay A healthy male rat weighing over 300 g is anaesthetized with suitable anaesthetics (such as i. p. 1 g of urethane per kg body weight). Tie the rat on back to an operating table and maintain the body temperature of the rat during the test. Dissect the trachea for cannulation when necessary. Insert the femoral (or jugular) vein a cannula filled with sodium chloride injection for intravenous injection. Inject through the venous cannula 50-100 Units of heparin per 100 g body weight. Insert a artery cannula (filled with 200-400 Units of heparin solution) into one of the dissected carotid artery and connect the other end of the cannula with a suitable pressure measuring device via a tube containing saline solution for making continuous record of blood pressure.

At this stage, adjust the pressure of the device to a level corresponding to the normal blood pressure of the rat, and remove artery clamp. Inject slowly a α -adrenoceptor blocking

body weight) and repeat the same dose of injection after 5-10 minutes. Start the test only when the blood pressure of the rat remains stable. Injections should be made at a uniform rate and at a regular interval of 10-15 minutes depending on the time at which the blood pressure returns to its original level. Each injection is followed by a fixed volume of sodium chloride injection (about 0.3-0.5 ml). Repeat 4-6 replicate of four doses (d_{S_1} , d_{S_2} , d_{T_1} , d_{T_2}), following random or random block design.

Measure all the responses and calculate the result of the assay by Statistical Method in Biological Assays; parallel line assay, random or randomized block design (Appendix XIV). The percentage of fiducial limits of error (FL%) should not be greater than 20%.

XII B Determination of Cytochrome C Activity

Reagents (1) *Phosphate BS* (0.2 mol/L) Dissolve 71.64 g of disodium hydrogen phosphate in water to produce 1000 ml as solution A; dissolve 27.60 g of sodium dihydrogen phosphate in water to produce 1000 ml as solution B. Mix 81 ml of solution A with 19 ml of solution B, adjust pH to 7.3.

(2) *Phosphate BS* (0.1 mol/L) Dilute 500 ml of phosphate BS (0.2 mol/L) with water to produce 1000 ml, adjust pH to 7.3.

(3) *Phosphate BS* (0.02 mol/L) Dilute 100 ml of phosphate BS (0.2 mol/L) with water to produce 1000 ml, adjust pH to 7.3.

(4) *Succinate solution* Dissolve 4.72 g each of succinic acid and potassium hydroxide in water to produce 100 ml, adjust the pH to 7.3.

(5) *Potassium cyanide solution* Dissolve 0.65 g of potassium cyanide in water to produce 100 ml, adjust pH with dilute sulfuric acid to 7.3.

(6) *Cytochrome C-free heart suspension* Remove the fat and connective tissue of two fresh pig or bovine hearts, strip and mince with a mincing machine. Transfer to a gauze bag, rinse with tap water for about two hours, stir frequently and squeeze to remove the haemochrome, squeeze dry, wash with water in portions, squeeze dry. Soak it in phosphate BS (0.1 mol/L) for about 1 hour, squeeze dry. Repeat the soaking process. Wash, with water in portions, squeeze dry. Transfer to a homogenizer, immerse in a quantity of phosphate BS (0.02 mol/L) and homogenize to a uniform paste. Centrifuge for 10 minutes. To the supernatant suspension add some ice, adjust pH to about 5.5 with dilute acetic acid rapidly and centrifuge for 15 minutes immediately. To the precipitate add an equal volume of phosphate BS (0.1 mol/L), triturate with a glass homogenizer to form a homogenate, store in a refrigerator. Dilute 1.0 ml with

Preparation of test solution Prepare a solution containing about 3 mg of cytochrome C per ml in water.

Procedure Transfer 5 ml of phosphate BS (0.2 mol/L), 1.0 ml of succinate solution and 0.5 ml of test solution (if the test solution is a reducing type, add 0.05 ml of 0.01 mol/L potassium ferricyanide solution) to a 25 ml Nessler cylinder with stopper, add 0.5 ml of cytochrome C-free heart suspension and 1.0 ml of potassium cyanide solution, dilute with water to produce 10 ml, mix well. Measure the absorbance using reagent as a blank until the absorbance value ceases to increase at the maximum wavelength found at intervals of 0.5 nm in the vicinity of 550 nm (Appendix IV A), this is the absorbance due to enzymatic reduction. Add about 5 mg of sodium hydrosulfite to each tube, mix well, allow the solutions to stand for about 10 minutes, measure the absorbance until the value ceases to increase at the same wavelength. This is the absorbance due to chemical reduction. Calculate according to the following expression.

$$\text{Cytochrome C Activity} = \frac{\text{Absorbance due to Enzymatic Reduction}}{\text{Absorbance due to Chemical Reduction}} \times 100\%$$

XII C Assay of Hyaluronidase

Reagents (1) *Acetic acid-potassium acetate BS* Dissolve 14 g of potassium acetate and 20.5 ml of glacial acetic acid in water to produce 1000 ml.

(2) *Phosphate BS* Dissolve 2.5 g of sodium dihydrogen phosphate, 1.0 g of anhydrous disodium hydrogen phosphate and 8.2 g of sodium chloride in water to produce 1000 ml.

(3) *Hydrolysed gelatin* Dissolve 50 g of gelatin in 1000 ml of water, heat at 121°C for 90 minutes and freeze dry.

(4) *Hydrolysed gelatin solution* To a mixture of 250 ml of phosphate BS and 250 ml of water add 330 mg of hydrolysed gelatin, mix well and store at 0-4°C. It is usable if no turbidity appears in the solution.

(5) *Serum stock solution* Dilute 1 volume of fresh bovine serum with 9 volumes of acetic acid-potassium acetate BS, adjust the pH to 3.1 with 4 mol/L hydrochloric acid solution and allow to stand for 18-24 hours before use. Store at 0-4°C and use within 30 days.

(6) *Dilute serum solution* Determine the content of total serum solids in serum stock solution as follows: Place an accurately weighed quantity of fresh bovine serum in a crucible containing clean sand, previously dried to constant weight at 105°C, evaporate to dryness on a water bath and dry to constant weight at 105°C. Calculate the content of total solids in the serum stock solution. On the day of the assay, dilute 1 volume of the serum stock solution containing about 8% of total solids with 3 volumes of acetic acid-potassium acetate BS; or dilute with 2 volumes of acetic acid-potassium acetate BS for that containing about 5% of total solids.

(7) *Potassium hyaluronate stock solution* Prepare a stock solution by dissolving potassium hyaluronate, previously dried over phosphorous pentoxide under reduced pressure for 48 hours, in water to produce a solution of 0.5 mg per ml. Store at a temperature below 0°C and use within 30 days.

volume of potassium hyaluronate stock solution with one volume of phosphate BS. Prepare on the day of the assay.

Preparation of standard solution To a quantity of hyaluronidase RS, accurately weighed, add cold hydrolysed gelatin solution to produce a solution of 1.5 Units per ml. Prepare on the day of the assay.

Preparation of test solution To a quantity of the substance being examined, accurately weighed, add cold hydrolysed gelatin solution to produce a solution of 1.5 Units per ml calculated on the basis of assumed potency. Prepare on the day of the assay.

Preparation of standard curve To 6 pairs of the same size test-tubes in turn add 0.00 ml, 0.10 ml, 0.20 ml, 0.30 ml, 0.40 ml and 0.50 ml of standard solution per pair, and then in turn add 0.50 ml, 0.40 ml, 0.30 ml, 0.20 ml, 0.10 ml and 0.00 ml of hydrolysed gelatin solution per pair respectively. At intervals of 30 seconds add to each tube successively 0.50 ml of dilute potassium hyaluronate solution, making the final volume in each tube 1.00 ml, mix well and place each tube in a water-bath maintained at 37°C ± 0.5°C. After exactly 30 minutes, remove each tube successively from the water-bath at intervals of 30 seconds and immediately add 4.0 ml of dilute serum solution. Shake and allow them to stand at room temperature for 30 minutes. Mix well and determine the absorbance of the resulting solutions at 640 nm (Appendix IV A). Repeat the operation described above, using a mixture of 0.50 ml of phosphate BS and 0.50 ml of hydrolysed gelatin solution, beginning at the words "place each tube in a water bath maintained at 37°C ± 0.5°C...". Plot a standard curve with absorbance as the ordinate and Units of standard solution as the abscissa.

Procedure To 3 pairs of the same size test-tubes in turn add 0.20, 0.30 and 0.40 ml of test solution per pair, and then in turn add 0.30 ml, 0.20 ml and 0.10 ml of hydrolysed gelatin solution per pair respectively. Carry out the operation described under the preparation of standard curve beginning at the words "At intervals of 30 seconds add to each tube successively 0.50 ml of dilute potassium hyaluronate solution", read the units from the standard curve, divide by the corresponding weights (mg) of substance being examined. The mean of the six values is the potency of the sample being examined.

XII D Biological Assay of Heparin

The potency of a preparation of heparin being examined (T) is estimated by comparing its clot delaying effect on fresh rabbit blood (or plasma) with that of Heparin Standard (S) under the condition of the following assay method.

Preparation of standard solution Dissolve an accurately weighed quantity of the Heparin Standard in sterile water to produce a solution of 100 Units per ml. Store the solution at a temperature of 4-8°C. The solution may be used within 3 months if it remains clear.

On the day of the assay, dilute an accurately measured portion of the above solution with 0.9% sodium chloride solution to produce 3 dose levels of standard solution in geometric progression (d_{s_3} , d_{s_2} , d_{s_1}), the ratio (r) of adjacent dose level should be equal. For an assay using fresh blood, the ratio (r) is about 1 : 0.7 and the highest dose may contain 2-5 Units of heparin per ml. The mean clotting time for the highest dose should not be more than 60

normal clotting time. For an assay using plasma, the ratio (r) is about $1 : 0.85$ and the highest dose (may contain $0.5-1.5$ Units of heparin per ml) should give a clotting time of not more than 30 minutes.

Preparation of test solution Prepare 3 dose levels of test solution (d_{T_3} , d_{T_2} , d_{T_1}), in the same way as described under Preparation of Standard Solution. The concentration of the test solution is calculated on the basis of the labelled or assumed potency (A_T) of the heparin being examined. The ratio (r) of adjacent dose levels should be the same as that of standard solution. The clotting time observed with each dose should be nearly the same as that observed with the corresponding doses of the standard solution.

Preparation of plasma Collect fresh blood from rabbit or pig in a vessel containing 8% sodium citrate solution. For 1 volume of sodium citrate solution 19 volumes of blood may be collected, shake gently while the blood is being collected. When the necessary amount of blood is collected, centrifuge promptly for 20 minutes, the centrifuging force is preferably not greater than 1500 folds of the gravity constant. Transfer portions of the pooled plasma into flasks and allow to freeze. On the day of the assay, thaw the plasma by putting the flasks in a constant temperature water bath at $37^\circ\text{C} \pm 0.5^\circ\text{C}$, filter the thawed plasma through a porous filter paper or two layers of gauze. Store the plasma in refrigerator. During the assay, keep the plasma at a temperature of $4-8^\circ\text{C}$.

Assay

Method 1 Use clean, dry test tubes of uniform size ($0.8\text{ cm} \times 3.8\text{ cm}$ or $1.0\text{ cm} \times 7.5\text{ cm}$). Add 0.1 ml of one of the 3 doses of standard solution, or one of the 3 doses of test solution to each tube, for each dose at least 3 tubes are used, followed by 0.9 ml of fresh rabbit blood and mix well, taking care to avoid the formation of air bubbles. The time elapsed between the addition of blood to the first and the last tube should be not more than 3 minutes. Place the tubes in a constant temperature water bath maintained at $37^\circ\text{C} \pm 0.5^\circ\text{C}$ and record the time of blood clotting for each tube.

Method 2 Add to each tube 0.5 ml (or 0.8 ml) of plasma, place the tubes in a constant temperature water bath at $37^\circ\text{C} \pm 0.5^\circ\text{C}$ for 5-10 minutes. Add to each tube 0.4 ml (or 0.1 ml) of one of the 3 doses of standard solution or one of the 3 doses of test solution, for each dose at least 3 tubes are used, followed by 0.1 ml of 1% calcium chloride solution, mix well, taking care to avoid the formation of air bubbles. Record the time of blood clotting for each tube. Carry out the statistical calculation for quantitative response based on the linear relationship of the logarithm of clotting time to the logarithm of heparin concentration (Appendix IV). The percentage of fiducial limits of error (FL%) should not be greater than 10% for method 1, and 5% for method 2.

III E Biological Assay of Chorionic Gonadotrophin

The potency of a preparation of chorionic gonadotrophin being examined (T) is estimated by comparing the uteri weight increasing effect produced on immature female mice with that produced by Chorionic Gonadotrophin Standard (S) under the condition of the following assay method.

Preparation of standard solution On the day of the assay dissolve the contents of the sealed container of Chorionic Gonadotrophin Standard in 0.9% sodium chloride

accurately measured portion of this solution with 0.5% carboxymethylcellulose sodium solution to produce 3 dose levels of (S) (d_{S_3} , d_{S_2} , d_{S_1}) in geometric progression, the ratio (r) of adjacent dose levels should be equal and not be greater than $1 : 0.5$ and the highest dose (may contain $0.3-0.8$ Units of chorionic gonadotrophin per ml) should not produce a maximum response of uteri weight gain, the lowest dose should produce a significant weight gain than the normal uterus. Store the dilute solution at $4-8^\circ\text{C}$ and use it within three days.

Preparation of test solution Prepare three dose levels of (T) (d_{T_3} , d_{T_2} , d_{T_1}) in the same way as described under Preparation of standard solution. The concentration of the test solution is calculated on the basis of the labelled or assumed potency (A_T) of the chorionic gonadotrophin being examined. The ratio (r) of adjacent dose levels should be the same as that of standard and the mean value of the responses produced by each dose level of (T) should be approximately the same as that of (S).

Assay Use healthy female mice of 17-23 days old, weighing 9-13 g, but in one assay the age difference between individual mouse should not be greater than 3 days and the weight difference not be greater than 3 g. Distribute the mice into 6 groups at random with at least 15 mice in each group. Inject subcutaneously into each of the six groups one of the three dose level of (S) or of (T) with equal volume (0.2 ml) for each mouse on three successive day at approximately the same time each day. Kill the mice about 24 hours after the third injection, remove the uterus of each mouse by cutting through the cervix. Free the uterus from extraneous tissue, gently squeeze out the uterine fluid on an absorbent paper and weigh immediately (precision 0.5 mg), express the weight of uterus in mg per 10 g of body weight. Carry out the statistical calculation for quantitative response assay (Appendix XIV), the percentage of fiducial limits of error (FL%) should not be greater than 25%.

III F Biological Assay of Oxytocin

The potency of a preparation of oxytocin being examined (T) is estimated by comparing the contraction effect produced on isolated rat uterus with that produced by Posterior Pituitary Standard or synthetic Oxytocin Standard (S) under the condition of the following assay method.

Preparation of standard solution Transfer a suitable quantity of the Posterior Pituitary Standard, weighed accurately and rapidly to avoid the absorption of moisture, to a small glass vessel. Add accurately a small volume of 0.25% acetic acid and mix thoroughly. Place the total content of the vessel into a large test tube and add accurately 0.25% acetic acid to the test tube to produce a solution of one of oxytocic unit per ml calculated on the basis of stated potency. Stopper the test tube lightly with a glass stopper and heat the tube with continuous and gentle shaking, in a boiling water bath for 5 minutes. Cool the tube rapidly and filter through a dry filter paper. Distribute the filtrate into a suitable glass container and store it at $4-8^\circ\text{C}$. The solution may be used within 3 months if it remains clear.

On the day of the assay, take an accurately measured portion of the standard solution or a quantity of synthetic Oxytocin Standard, add 0.9% sodium chloride solution to produce two dilutions of (S). The ratio (r) of the concentration between two dilutions should not be greater than $1 : 0.7$ and

ml. The concentration of two dilutions should be chosen as such that the higher dose should not produce maximum contraction (generally about 50-85 mm), the lower dose produces a response of contraction (generally about 20-50mm) and the contractions produced by higher and lower doses should be clearly discriminated.

Preparation of test solution On the day of the assay, prepare the solution and dilutions of oxytocin injection being examined by diluting the injection with 0.9% sodium chloride solution to produce two dilutions of (T). The concentration of the dilution of (T) is calculated on the basis of the labelled or assumed potency of the preparation being examined. The ratio (r) of the concentration between two dilutions of (T) should be the same as that of (S). The mean value of contractions produced by each dose level of (T) should be approximately the same as that of (S).

Preparation of lock solution for isolated rat uterus Prepare the solution by adding slowly 200 ml of 0.25% sodium bicarbonate to 800 ml of aqueous solution containing the following ingredients: sodium chloride 9 g, potassium chloride 0.42 g, calcium chloride (anhydrous) 0.06 g, glucose 0.5 g, mix well.

Assay Use healthy female rat of 3 months old weighing 160-240 g. On the day of the assay, confirm by vaginal smear that the rat is in proestrus. The proestrus stage of the rat can be produced by injecting intramuscularly some oestrogen hormone about 24 hours before the assay.

Kill the rat and remove the uterus freeing from extraneous tissue. Suspend one horn of the uterus in an isolated organ bath by fixing the lower end of the uterus horn to the bottom of the bath and connecting the upper end of the uterus horn to a recording lever for making a record of the contraction of the uterus. Fill the organ bath with equal volume of lock solution (about 30-50 ml) and maintain the bath at a constant temperature ($\pm 0.5^\circ\text{C}$) of about $32-35^\circ\text{C}$. Oxygenate the solution in the bath with small air bubbles or bubbles of a mixture of 95% oxygen and 5% carbon dioxide, 15 minutes later, add in turn into the bath the two standard dilutions and two test dilutions (d_{s_2} , d_{s_1} , d_{t_2} , d_{t_1}) in equal volume (0.3-0.8 ml). After each addition, when the contraction of uterus reaches its maximum and begin to relax, change and replace twice the bath solution with fresh lock solution. The second addition can be given only when the uterus is restored to its normal condition. The time interval between two additions should be equal (about 3-5 minutes). Repeat 4-6 replicate of four doses (d_{s_2} , d_{s_1} , d_{t_2} , d_{t_1}), following random or random block design.

Measure all the responses and calculate the result of the assay by the Statistical Method for Biological Assay; parallel line assay, random or randomized block design. The percentage of fiducial limits of error ($FL\%$) should not be greater than 10%.

XII G Biological Assay of Insulin

The potency of a preparation of insulin being examined (T) is estimated by comparing the hypoglycaemic effect it produces on mice with that produced by Insulin Standard (S) under the condition of the following assay method.

Preparation of standard solution Dissolve an accurately weighed quantity of Insulin Standard in 0.9% sodium chloride solution (acidified with hydrochloric acid to pH 2.5 and containing 0.2 g phenol in 100 ml) to produce a

temperature of $4-8^\circ\text{C}$. The solution may be used within 5 days.

On the day of the assay, dilute an accurately measured portion of this solution with 0.9% sodium chloride solution (pH 2.5) to produce two dilutions. The ratio (r) of the concentration of two dilutions is not greater than $1:0.5$. In general, the higher concentration may contain 0.06-0.12 Units of insulin per ml. Adjust the concentration of two dilutions to such that the smaller dose produces a positive depletion of blood sugar and the larger dose does not produce maximum depletion of blood sugar.

Preparation of test solution Prepare the solution and dilutions of (T) in the same way as that described under the preparation of standard solution. The concentration of the solution of (T) is calculated on the basis of the labelled or assumed potency (A_T) of preparation being examined. The ratio (r) of the concentration between two dilutions should be the same as that of two standard dilutions and the mean value of the blood sugar depletion produced by each concentration of (T) should be approximately the same as that of (S).

Assay Use healthy mice of same strain, same sex and approximately the same in age. In one assay, the difference of weight should not be greater than 3 g. Distribute the mice at random into four equal groups with at least 10 mice in each group. Mark the mice in each group for identification. Inject subcutaneously each of the four prepared dilutions of (S) (d_{s_2} , d_{s_1}) and (T) (d_{t_2} , d_{t_1}) into one group of mice, using the equal volume of 0.2-0.3 ml for each mouse. Exactly 40 minutes after each injection, take a suitable amount of blood sample from the orbital venous sinus of each mouse. Determine the glucose concentration of each blood sample by a suitable method such as that of Glucose Oxidase-Peroxidase method. Not less than 3 hours later, inject each of the dilution into the above four groups of mice following the twin cross-over design, and at the same time interval after injection, determine the blood glucose concentration of each mouse. Calculate the result of the assay by the Statistical Method for Biological Assay; parallel line assay, twin cross-over design (Appendix XIV). The percentage of fiducial limits of error ($FL\%$) should not be greater than 25%.

XII H Test for the Prolongation of Insulin Effect

The prolongation of the hypoglycaemia effect of protamine zinc insulin being examined (T) is tested by comparing the hypoglycaemia it produces on rabbits with that produced by Insulin Standard (S) under the condition of the following method.

Preparation of standard solution Dissolve an accurately weighed quantity of Insulin Standard in 0.9% sodium chloride solution (pH 2.5, acidified with hydrochloric acid) containing 0.2% of phenol to produce a solution of the same concentration Units per ml as that of the protamine zinc insulin injection being tested.

Preparation of test solution The protamine zinc insulin injection is used directly without further dilution.

Procedure Use healthy rabbits weighing 2.0-3.0 kg, male or nonpregnant female, and house the rabbits singly, 18-20 hours before the test, deprive the rabbits of food and feed

provide no food or water to the rabbits and handle them with care to avoid any excitement. Distribute the rabbits at random into two equal groups of approximately the same weight and sex in each group. Take a blood sample of not more than 1.5 ml from the marginal ear vein and determine the normal blood sugar level for every rabbit using a suitable blood sugar determination method.

Inject subcutaneously the rabbits in one group an accurate dose of about 1.2 Units of the standard solution of insulin (S) and the rabbit in other group the same volume of solution being examined (T) at the same site as that of the standard group. At 2 and 6 hours after injection of standard solution and at 6 and 9 hours after injection of test solution, take blood samples and determine the blood sugar level (mg of glucose per 100 ml of blood) for every rabbit at each bleeding time. Calculate the blood sugar levels as the percentage of its normal blood sugar level and expressed it as Percentage of Blood Sugar. If none of the blood sugar percentage for a rabbit was lowered below 90%, or if the rabbit died or convulsed in the course of the test, the data of that rabbit should be rejected. There should be at least six rabbits available in each group. Calculate the mean percentage of blood sugar for (S) and (T) group at each bleeding time.

Evaluation of result In the standard group, if the number of rabbit died or convulsed is more than 1 in five, or if the mean percentage of blood sugar at 2 hours bleeding time has not lowered to 65% or at 6 hours bleeding time has not returned to 95%, adjust the dose of (S) and repeat the test. The protamine zinc insulin being examined complies with the test for prolongation if its mean percentage of blood sugar has lowered to or below 75% either at 6 hours or at 9 hours bleeding time.

XII J Biological Assay of Protamine Sulfate

The potency of a preparation of protamine sulfate being examined (T) is determined by testing its capacity to neutralize the anticoagulant effect of Heparin Standard (S) in test tubes containing fresh rabbit blood or plasma under the condition of the following assay method.

Preparation of heparin standard solution Dissolve an accurately weighed quantity of Heparin Standard in 0.9% sodium chloride solution to produce a series of solution different in concentration of not more than 5 Units per ml in succession, e.g. 85, 90, 95, 100, 105, 110, 115, 120, 125 Units per ml.

Preparation of test solution Dissolve an accurately weighed quantity of Protamine Sulfate being examined (T) in 0.9% sodium chloride solution to produce a solution of 1 mg per ml, calculated on the dried basis or, if it is an injection, dilute with 0.9% sodium chloride solution to 1 mg per ml, calculated with reference to the labelled amount.

Preparation of plasma Carry out the preparation of plasma as described under the Biological Assay of Heparin (Appendix XII D).

Assay Use 8 dry clean test tubes of uniform size (0.8 cm × 3.8 cm). To the first and eighth tube add 0.2 ml each of 0.9% sodium chloride solution as the control tube. To each of the six remaining tubes add 0.1 ml of the solution being examined followed by 0.1 ml of one of the heparin standard solution in succession, mix thoroughly. To each of the eight tubes add 0.8 ml of fresh rabbit blood, mix immediately

bubbles. Record the time of blood clotting for each tube. Place the tubes in a constant temperature water bath maintained at $37^{\circ}\text{C} \pm 0.5^{\circ}\text{C}$. The time elapsed between the blood collection and placing the tubes in the bath should not be more than 2 minutes.

If, instead of fresh rabbit blood, plasma is used in an assay, add 0.7 ml of plasma to each of 8 tubes, mix well and allow the tubes to stand in the water bath for 5-10 minutes. Then to each tube add 0.1 ml of 1% calcium chloride solution, mix immediately after each adding taking care to avoid the formation of air bubbles and record the clotting time for each tube.

Evaluation of result The assay is valid if the difference of clotting time between two control tubes is not more than 1:1.35. Take the mean clotting time of the two control tubes as the normal clotting time.

In the series of six test tubes in order of increasing concentration of heparin, the last tube which shows the clotting time of not more than 150% of the normal clotting time is the terminal tube of the test.

Perform 5 assays in series, if the heparin concentration of five terminal tubes does not differ by more than 10 Units, take the mean value of the 5 assay results as the potency of protamine sulfate in Units per mg.

XII K Biological Assay of Digitalis

The potency of a preparation of digitalis being examined (T) is determined by comparing the minimum lethal dose it produces on pigeons with that produced by Digitalis Standard (S) under the condition of the following assay method.

Preparation of standard solution Transfer a suitable quantity of the Digitalis Standard, weighed accurately and rapidly to avoid the absorption of moisture, to a glass stoppered vessel. To each unit of digitalis, calculated with reference to the stated potency of the Standard, add 1 ml of 76% ethanol. Stopper the vessel tightly and shake continuously for 1 hour, filter through a dry filter; the solution contains 1 Unit of digitalis per ml. Store the solution at a temperature of 4-8°C. The solution may be used within 1 month if it remains clear.

On the day of the assay, dilute an accurately measured portion of the standard solution with 0.9% sodium chloride solution so that the mean lethal dose of the diluted solution will be 25-34 ml per kg of pigeon's body weight (usually 1 ml of the standard solution is to be diluted to 30 ml with 0.9% sodium chloride solution).

Preparation of test solution Weigh accurately a quantity of the digitalis being examined (if it is in the form of tablets, accurately weigh more than 20 tablets to determine the average weight, powder the tablets rapidly, weigh a quantity of the powdered tablet equivalent to not less than 20 tablets) and prepare the test solution as described under Preparation of Standard Solution. The concentration of the test solution is calculated on the basis of labelled or assumed potency (A_T) of digitalis being examined and the lethal dose of test solution (ml/kg) should be approximately the same as that of the standard solution.

Assay Use healthy pigeons weighing 250-400 g, but in one assay the weight difference between individual pigeon should not be greater than 100 g; 16-24 hours before assay, deprive the pigeons of food and give drinking water only. On the day of the assay, distribute pigeons at random into two equal

standard group, another is the test group. Secure the pigeon on a board, pluck a few feathers covering the alar vein and insert a fine needle connected with a microburette into the exposed vein. Infuse 0.5 ml of the standard solution or test solution into the vein, followed by a continuous infusion of 0.2 ml per minute until cardiac arrest occurs. Pigeons may have tremor, emesis or evacuation of stool before it is dying, but only the dilation of pupil and cessation of breath can be considered as the critical point of death. Record the total volume of standard solution or test solution infused for each pigeon and calculate the minimum lethal dose as ml (or Units) per kg of body weight. Multiply the minimum lethal dose by 10 and convert it into logarithm. Carry out the statistical calculation for direct assays (Appendix XIV), the percentage of fiducial limits of error ($FL\%$) should not be greater than 15%.

XII L Toxicity Test of Sodium Stibogluconate

The toxicity of sodium stibogluconate is determined by comparing the number of mice killed by injection of the preparation being tested (T) with that by Sodium Stibogluconate Standard (S) under the condition of following method.

Preparation of standard solution Dissolve an accurately weighed quantity of the Standard in water by warming at about 70°C for 15 minutes. Cool to room temperature and add water to make a suitable concentration. Warm the solution at 50°C for 30 minutes (water evaporation should be avoided), cool to room temperature. The concentration of the solution, calculated on pentavalent antimony, should be such that after intravenous injection into a group of mice, using 0.02 ml/g body weight, will cause a mortality of approximately 50% (20%-80% is suitable).

Preparation of test solution If the sample being tested is a powdered material, prepare the test solution in the same manner as that of standard solution. If the sample is sodium stibogluconate injection, prepare the test solution by diluting it with water and warm the solution at 50°C for 30 minutes (water evaporation should be avoided), cool to room temperature. In either case, the concentration of the solution of test preparation should be 83% as that of standard solution.

Procedure Use 40 or 20 healthy mice weighing 17-25 g with the difference of not exceeding 3 g in one test. Distribute the mice into two groups at random with 20 or 10 mice in each group. Inject intravenously one group the standard solution and the other the test solution using a volume of 0.02 ml per g body weight. The injection for each mouse should be completed within 4-5 seconds. Record the number of mice died within 15 minutes after injection.

Evaluation of result When two groups of twenty mice are used in a test: The sample complies with the test if the number of mice killed by the injection of the test solution is not greater than the number killed by standard solution; the sample fails the test if the number of mice killed by test solution is greater than the number killed by standard solution.

When two groups of ten mice are used in a test: the sample complies with the test if the number of mice killed by the test solution is at least two less than the number killed by standard solution. The sample fails the test if the number of

killed by standard solution. If it is not the case, repeat the test with another two groups of ten mice and evaluate the test result in the same way as that described above by comparing the total number of mice killed in the two series of ten mice of (S) and (T) group.

XII M Biological Assay of Follicle Stimulating Hormone

The potency of menotrophin being examined (T) with respect to its follicle stimulating hormone activity is estimated by comparing its effect in enlarging the ovaries of immature female rats with that of Menotrophin Standard (S) under the condition of following method of assay.

Preparation of solvent On the day of the assay dissolve a quantity of bovine serum albumin in 0.9% sodium chloride solution to produce a solution of 1 mg per ml, adjust to pH 7.2 ± 0.2 with 1 mol/L sodium hydroxide solution. Dissolve chorionic gonadotrophin (raw material or preparation for injection), accurately weighed, in above solution to produce a solution of 20 Units per ml calculated on the basis of the labelled. Use this solution as the solvent.

Preparation of standard solution On the day of the assay dissolve the contents of Menotrophin Standard with respect to its follicle stimulating hormone potency in above solvent to produce 3 dose levels of (S) (d_3 , d_2 , d_1) in geometric progression, the ratio (r) of adjacent dose levels should be equal and not be greater than $1 : 0.5$ and the highest dose (may contain 2-5 Units of follicle stimulating hormone per ml) should not produce a maximum response of ovaries weight gain, the smallest dose should produce a response of ovaries weight gain significantly. Store the solutions at a temperature of 4-8°C and use them within three days.

Preparation of test solution Prepare three dose levels of (T) (d_3 , d_2 , d_1) in the same way as described under Preparation of Standard Solution. The concentration of the test solution is calculated on the basis of the labelled or assumed potency (A_T) of the follicle stimulating hormone being examined. The ratio (r) of adjacent dose levels should be the same as that of standard and the mean value of the responses given by each dose level of (T) should be approximately the same as that of (S).

Assay Select healthy female rats of the same strain, 19-23 days old, weighing 36-50 g, but in an assay the age difference between individual rat should not be greater than 3 days and the weight difference not be greater than 10 g. Assign the rats at random to six groups of at least eight animals. Inject subcutaneously into each of six groups one of the three dose levels of the standard solution or test solution with equal volume (0.5 ml) for each rat on three successive days at approximately the same time each day. About 24 hours after the last injection, kill the rats and remove the ovaries. Free the ovaries from extraneous tissue and oviduct, remove any extraneous fluid on an absorbent paper and immediately weigh the ovaries (precision 0.2 mg) from each animal.

Calculate the result of the assay by Statistical Method in Biological Assays; parallel line assay, random design (Appendix XIV). The percentage fiducial limits of error ($FL\%$) should not be greater than 45%.

XII N Biological Assay of Luteinising Hormone

The potency of menotrophin being examined (T) with respect to its luteinising hormone activity is estimated by comparing its effect in increasing the weight of the seminal vesicles of immature male rats with that of Menotrophin Standard (S) under the condition of following method of assay.

Preparation of solvent On the day of the assay dissolve a quantity of bovine serum albumin in 0.9% sodium chloride solution to produce a solution of 1 mg per ml, adjust to pH 7.2 ± 0.2 with 1 mol/L sodium hydroxide solution. Use this solution as the solvent.

Preparation of standard solution On the day of the assay dissolve the contents of Menotrophin Standard with respect to its luteinising hormone potency in above solvent to produce 3 dose levels of (S) (d_{s_3} , d_{s_2} , d_{s_1}) in geometric progression, the ratio (r) of adjacent dose levels should be equal and not be greater than $1 : 0.5$ and the highest dose (may contain 8-10 Units of luteinising hormone per ml) should not produce a maximum response of seminal vesicle weight gain, the smallest dose should produce a response of seminal vesicles weight gain significantly. Store the solutions at a temperature of $4-8^\circ\text{C}$ and use them within four days.

Preparation of test solution Prepare three dose levels of (T) (d_{T_3} , d_{T_2} , d_{T_1}) in the same way as described under Preparation of Standard Solution. The concentration of the test solution is calculated on the basis of the labelled or assumed potency (A_T) of the luteinising hormone being examined. The ratio (r) of adjacent dose levels should be the same as that of standard and the mean value of the responses given by each dose level of (T) should be approximately the same as that of (S).

Assay Select healthy male rats of the same strain, 19-23 days old, weighing 36-50 g, but in an assay the age difference between individual rat should not be greater than 3 days and the weight difference not be greater than 10 g. Assign the rats at random to six groups of at least six animals. Inject subcutaneously into each of six groups one of the three dose levels of the standard solution or test solution with equal volume (0.5 ml) for each rat on four successive days at approximately the same time each day. About 24 hours after the last injection, kill the rats and remove the prostate gland. Free the seminal vesicles from extraneous tissue and anterior lobe of prostate gland, remove any extraneous fluid on an absorbent paper and immediately weigh the seminal vesicles (precision 0.2 mg) from each animal.

Calculate the result of the assay by Statistical Method in Biological Assays; parallel line assay, random design (Appendix XIV). The percentage of fiducial limits of error (FL%) should not be greater than 35%.

XII O Biological Assay of Calcitonin

The potency of the preparation of calcitonin being examined (T) is estimated by comparing the hypocalcemic effect it

under the condition of following assay method.

Preparation of solvent Dissolve 0.2 g of bovine serum albumin in 20 ml of water, mix well, warm in a water bath at 56°C for 1 hour, cool to room temperature, freeze at -10 to -20°C . On the day of the assay thaw in a water bath at $36^\circ\text{C} \pm 0.5^\circ\text{C}$. Transfer to a 200 ml volumetric flask, a solution containing 2 g of sodium acetate previously added, add 3.5 ml of hydrochloric acid. Dilute to approximate total volume with water, adjust to pH 3.5-4.5 with a solution of hydrochloric acid or sodium hydroxide. Dilute to volume with water.

Preparation of standard solution On the day of the assay dissolve the contents of Calcitonin Standard with respect to its labelled potency in above solvent to produce 2 levels of (S) (d_{s_2} , d_{s_1}) in geometric progression, the ratio (r) of adjacent dose levels should not be greater than $3 : 1$ and the solution of higher dose may contain 50-100 mIU per ml.

Preparation of test solution Prepare two dose levels of (T) (d_{T_2} , d_{T_1}) in the same way as described under Preparation of Standard Solution. The concentration of the test solution is calculated on the basis of the labelled or assumed potency (A_T) of the calcitonin being examined. The ratio (r) of adjacent dose levels should be the same as that of standard and the mean value of the responses given by each dose level of (T) should be approximately the same as that of (S).

Assay Select healthy rats of the same sex and of the same strain, weighing 40 to 250 g, but in an assay the weight difference between individual rat should not be greater than 20 g. Deprive the rats of food 16 hours before the test but allow access to unlimited quantities of water prepared by distillation. On the day of test assign the rats at random to four groups of at least five animals, two groups being allocated to the higher and lower dose levels of Standard and two to those of the preparation being examined. Weigh and number the rats. Inject subcutaneously into the abdomen or intravenously into tail vein of each rat of four groups one of the two dose levels of the standard solution or test solution according to body weight of each animal with the dose volume 0.4 ml per 100 g of body weight. Exactly one hour after injection, bleed each animal from ophthalmic venous plexus in the order of injection. Determine the calcium content of the plasma by suitable method, such as *o*-cresolphthalein complexation method.

Calculate the result of the assay by Statistical Method in Biological Assays; parallel line assay, random design (Appendix XIV). The percentage of fiducial limits of error (FL%) should not be greater than 45%.

XII P Biological Assay of Growth Hormone

Method 1

The potency of the preparation of growth hormone being examined (T) is estimated by comparing its effect in increasing the body mass of immature hypophysectomised rat with that of Growth Hormone Standard (S) under the condition of following assay method.

Preparation of standard solution On the day of the assay dissolve the contents of Growth Hormone Standard in 0.9% sodium chloride solution containing 0.1% bovine serum albumin to produce two solutions (higher and lower dose levels) of (S). The ratio (r) of the concentration between

may contain 0.1-0.2 IU per ml and the solution of lower dose may contain 0.025-0.05 IU per ml. Store the daily doses in tightly closed ampoules at a temperature below -15°C . Thaw the daily doses before use.

Preparation of test solution Prepare and store two solutions of the preparation being examined in the same way as described under Preparation of standard solution. The concentration of the test solution is calculated on the basis of the labelled or assumed potency (A_T) of the preparation being examined.

Assay Select healthy rats of the same sex and of the same strain 26 days to 28 days old, weighing 60 to 80 g. From 2 to 3 weeks before the test, weigh the rats and carry out hypophysectomy. After operation, keep the rats at a clean animal lab and allow them to recovery.

On the first day of the test, weigh the rats again and discard those which have gained or lost more than 10 per cent of their body mass. Assign the remaining rats at random into four equal groups of not fewer than eight. Weigh and number the rats. Inject subcutaneously into the neck of each rat of four groups one of the two dose levels of the standard solution or test solution with equal volume (0.5 ml) for each rat on six successive days at approximately the same time each day. Kill the rats 24 hours after the last injection, weigh the rats, cleave the sellar region and inspect macroscopically for traces of pituitary gland if necessary. Exclude from the test rats showing remnants of the organ. The difference in mass of each rat between the day of the first injection and the last weighing is taken as the response. The mean value of the responses given by each dose level of (T) should be approximately the same as that of (S) and the lower dose should produce a response of body weight gain significantly, the higher dose should not produce a maximum response of

body weight gain.

Calculate the result of the assay by Statistical Method in Biological Assays; parallel line assay, random design (Appendix XIV). The percentage of fiducial limits of error (FL%) should not be greater than 50%.

Method 2

The potency of the preparation of growth hormone being examined (T) is estimated by comparing its effect in increasing the width of the proximal epiphysis of the tibia in immature hypophysectomised rat with that of Growth Hormone Standard (S) under the condition of following method of assay.

Preparation of standard solution and preparation of test solution As described under the method 1.

Assay Carry out the assay as described under the method 1. Cut out the two tibiae from each of the rats after killing them and store them in 10% formaldehyde solution. Cleave the proximal part of the bone in the middle sagittal plane. Rinse the bone parts with water for 10 minutes, with acetone for 10 minutes and again with water for 3 minutes. Transfer to 2% silver nitrate solution. Allow to stand for two minutes and flush with water. Place each of the bone parts in water and expose them to strong light until the calcified parts have become dark brown. Fixate them in 10% sodium thiosulfate solution for 30 seconds, and then put them in 80% ethanol solution and ready for measuring. The width of the epiphysis is measured as the response using 1 mm thickness of slice under a microscope.

Calculate the result of the assay by Statistical Method in Biological Assays; parallel line assay, random design (Appendix XIV). The percentage of fiducial limits of error (FL%) should not be greater than 50%.

Appendix XIII The Test of Radiopharmaceutical Preparations

Radiopharmaceutical Preparations are the preparations containing one or more radionuclides for diagnostic and clinical usage. The production, testing and use of radiopharmaceutical preparations should comply with the requirements in the Drug Administration Law of the People's Republic of China and "The Regulations for the Administration of Radiopharmaceutical preparations" promulgated by the State Council of the People's Republic of China.

1. Terminologies and Definitions

Nuclide Refers to a species of atom characterised by its mass number, the number of protons and the nuclear energy state and its average life is long enough to be observable.

Isotope Refers to nuclides of the same element with same atomic number but different mass number.

Radioactive and radioactive nuclide Refers to the property of certain nuclides emitting spontaneously radiation of one or more particles or γ -ray, emitting of γ -ray after the generation of tracked electron capture or spontaneous fission. Radionuclide is a nuclide that is radioactive.

Decay Refers to a transformation process of radionuclide emitting spontaneously one or more particles or γ -ray and transforming into another nuclide or nuclide in another energy state. Each individual radionuclide obeys the exponential decay rule described in the expression:

$$N_t = N_0 e^{-\lambda t}$$

Where N_t is the number of atoms of nuclide at elapsed time t ;

N_0 is the number of atoms of nuclide when $t=0$;

λ is the decay constant of radionuclide;

t is the time elapsed;

e is the base of natural logarithm.

Half-life Refers to the time in which the amount of radionuclide decays to half of its initial value in the process of individual radioactive decay. It is usually expressed as $T_{1/2}$. Each nuclide has its specific half-life which is related to the decay constant as follows:

$$T_{1/2} = 0.693/\lambda$$

Radioactivity Refers to the number of nuclear transformation of nuclide per second. The official unit of radioactivity is becquerel (Bq). Other units commonly used are megabecquerel (MBq), gigabecquerel (GBq), kilobecquerel (kBq).

Specific activity Refers to the radioactivity per unit mass of the element or of the compound concerned.

Radioactive concentration Refers to the radioactivity in a unit volume of radiopharmaceutical preparation.

Radionuclidic purity Refers to the percentage of total radioactivity that is present in the form of radionuclide concerned.

Radiochemical purity Refers to the ratio, expressed as a percentage, of the radioactivity of the stated radionuclide

of the radionuclide present in the radiopharmaceutical preparation.

Carrier Refers to the stable nuclide or its compound added or present in the radionuclide or its compound concerned.

2. Test for Identification

Tests for Identification of radiopharmaceutical preparation may be classified into the tests for identity and of the nature of the radionuclide. The later may be identified by the method described under Radiochemical purity.

Identification of radionuclide depends upon the characteristic transformation and its nature of the radionuclide. The basic method employed is the accurate measurement of the half-life, mass absorption coefficient or the γ -spectrum of the radionuclide.

(1) **Gamma-ray spectrum method** The gamma-ray energy spectrum of radionuclide should be identical with the energy of main photon complies with the requirement specified under the nuclide concerned. The energy of photoelectric peak should be identical with the γ -ray transition energy given in the decay scheme of the radionuclide.

The γ -ray spectrum of the nuclide in a radiopharmaceutical preparation is recorded by multiple channel γ -spectrometer with Sodium (Thallium) iodide scintillating crystal, Germanium (Lithium) or high purity Germanium semiconductor as detector through the use of the calibration curve of energy and channel by means of a series of γ -ray emission standard specimens or sources of known energy. The identification of the nuclide may be made with reference to a decay scheme or a curve of energy spectrum of the same radionuclide.

(2) **Measurement of half-life** A suitable detection apparatus is chosen based upon the nature of the radionuclide. The radioactive source is prepared by an appropriate amount of radiopharmaceutical preparation being examined with reference to the measuring range of the detection apparatus and the half-life of the radionuclide. Keep the source and the detector of the apparatus in a fixed geometrical condition and measure the count rate successively at a time interval for a period of 3 half-lives of the radionuclide concerned. Draw a curve with time as abscissa and count rate as ordinate on a semilog paper. The half-life calculated from the graph should not differ by more than 5% from the half-life stated for the individual radionuclide.

The following should be considered in the measurement.

① It is necessary to ensure that the efficiency of the detection apparatus remains constant;

② The geometrical conditions of the detection assembly are kept to be constant;

③ Make any necessary correction for the dead time on the basis of the radioactivity of the radionuclide.

Note *geometric condition* The validity of relative calibration and measurement of radionuclides is dependent

the detector and its surroundings. The geometric condition must be coincident in the measurement.

Correction for dead time The minimum time interval that is required for the counter to resolve two consecutive signal pulses is known as the dead time. If the counting rate is high when measuring, the correction for dead time must be made.

$$f_r = m/n = 1 - m\tau \quad (m\tau \ll 1)$$

where f_r is the correction factor, τ the dead time, m the counting rate, n the true counting rate.

(3) **Mass absorption coefficient method** Generally used for a purified β -ray radionuclide with a long half-life. Take an example of ^{32}P . Prepare a membrane source with ^{32}P solution, mount on a suitable counter. Carry out count rate determinations individually and successively using 6 aluminium foils, different in thickness, chosen from a range of 20-50 mg/cm² and one foil of 800 mg/cm² at least as the absorber. The sample and absorbers should be placed as close as possible to the detector in order to minimize the scattering effects. The net β -ray count rate is obtained by subtracting the count rate found with the thickest absorber of 800 mg/cm² or more from the count rates found with various absorbers. Plot the logarithm of the net β -ray count rate against the total absorbers thickness, which is the sum of the thickness of aluminium absorbers, the thickness of the counter window and the air equivalent thickness (the distance, expressed in cm, of the sample from the counter window multiplied by 1.205 under a pressure of 76 cm of Hg column and 20°C). An approximately straight line is obtained. Select two of the absorbers of different thickness that are 20 mg/cm² or more apart, their total absorber thickness should fall on the linear part of the absorption curve. The absorption coefficient is calculated from the equation:

$$\mu = \frac{1}{t_2 - t_1} \ln \frac{N_{t_1}}{N_{t_2}}$$

Where t_1 and t_2 are the thinner and the thicker absorber expressed in mg/cm²; N_t represent the net β count rate with t_1 and t_2 absorbers, respectively.

The calculation result should be not more than 10% in comparison with the mass absorption coefficient of the same pure nuclide measured under identical conditions.

3. Testing for Purity

(1) **Determination of radionuclidic purity** Radionuclidic impurities may be present in pharmaceutical preparation. The requirement for limit of specific radionuclidic impurities must be considered with regards to the nature of radiation and its effects to human. Usually, the nuclidic purity may be specified by the percentage of the radioactivity of radionuclidic impurities at the time when the measurements are made or that of total radioactivity present in the form of labelled radioactivity of the main nuclide.

The determination of nuclidic purity is carried out with multiple channel gamma spectrometer, using Germanium (Lithium) or high purity Germanium semiconductor as detector. Keep the form and size of the reference standard source and of the sources of samples being examined to be constant and maintain the geometric conditions of the sources and the detector to be identical conditions under a suitable environmental condition for performing of the spectrometric measurements. The radionuclidic purity may be obtained from the curve plot against the accurately measured energy and the efficiency of the detection based upon the known nuclidic parameters and the calculated γ -spectrum peak area with reference to a series of γ -ray emission reference sources. Certain decay products of radionuclides are still radioactive. These are referred to as mother and daughter radionuclides,

excluded from the calculation of radionuclidic purity. The radionuclidic purity should be stated with the date and hour when the measurement is made.

(2) **Determination of radiochemical purity** The radiochemical impurities of radiopharmaceutical preparation may be produced from the decomposition of the preparation itself or in the process of production. Radiochemical purity determination includes the separation of different chemical components and the measurement of the corresponding radioactivities.

Method 1 Carry out the method of ascending paper chromatography (Appendix V A), using a suitable amount of sample or proceed as described in the individual monograph if necessary. Apply the carrier solution on the base line, allow it to dry and then apply the sample solution on the same position. After developing and removal of the paper, dry it in air, determine the distribution of radioactivity on the chromatogram with a suitable apparatus. Calculate the R_f value and radiochemical purity by the following expression.

In the identification of individual radiopharmaceuticals, the word "about" means that the measured R_f value should be within $\pm 10\%$ of the specified value.

$$\text{Radiochemical purity (\%)} = \frac{\text{Net counts of radioactivity of specified chemical identity}}{\text{Sum of net counts of radioactivity on the chromatogram}} \times 100\%$$

Method 2 Carry out the paper electrophoresis (wet method) or electrophoresis on cellulose acetate membrane (Appendix V F). Apply the carrier solution on the base line as described in the individual monograph and followed by the sample solution on the same position if necessary. The base line is 1.5 cm from the anode or cathode support of the electrophoresis apparatus. Remove the paper or membrane after the specified time interval, dry it in air, determine and calculate the radiochemical purity as described under method 1.

Method 3 Carry out the method of ascending paper chromatography (Appendix V A) described in the individual monograph, using multiple separating system. After developing and removing of the paper, dry it in air, determine the distribution of radioactivity on chromatograms applied in each separating system with a suitable apparatus. In case the radioactive chemical impurities B and C contained in radiopharmaceutical A, B and (A+C) may be separated in separating system 1; C and (A+B) being separated in system 2; the radiochemical purity of sample A is calculated by the following expression:

$$\begin{aligned} B\% &= \frac{\text{net radioactive counts of B peak}}{\text{Sum of net radioactive counts of paper tested with system 1}} \times 100\% \\ C\% &= \frac{\text{net radioactive counts of C peak}}{\text{Sum of net radioactive counts of paper tested with system 2}} \times 100\% \\ A\% &= 100\% - (B + C)\% \end{aligned}$$

In addition, other separating analytical methods, which can separate various radiochemical impurities, can also be used for measurement of radiochemical purity after being validated, such as HPLC, column chromatography and thin-layer chromatography, etc.

4. Test for Particulate Matter

The diameter and distribution of the particulate matter or particles should be tested for the radiopharmaceutical preparations which are produced as colloidal solution or suspension. Usually, particles of nm in diameter are

microscope.

Electronic microscopical measurement Mount the solution being examined or an appropriate amount of dilute solution on a copper wire gauze of 3 mm (300 pores) which is coated with film suitable for mounting the specimen. Allow it to dry, observe directly or by photographing. Select an area where the particulate matter is distributed uniformly and measure at random the diameters of more than 100 particles. Calculate the diameter and distribution of particulate matter or particles with reference to both electronic and optical magnifying powers.

Microscopical measurement Mount the solution being examined or an appropriate amount of dilute solution in a blood cell counter and place it on the microscope stage. Observe the homogeneity of the distribution of particulate matter at first with eye piece $\times 10$, objective lens ($\times 10$), then observe with objective lens ($\times 40$) at the selected representing field or by photographing. Measure at random diameters of over 100 particles. Calculate the percentage distribution and the diameters of the particles in the preparation being examined.

5. Determination of pH value

The pH value of the solutions of radiopharmaceutical preparations must be in the definite scope. It is determined by a pH meter or a precise pH test paper to be checked.

Method of pH test paper Drop a drop of the solutions of radiopharmaceutical preparations on a precise pH test paper, compare the colour with the standard colour plate.

Method of pH meter Carry out the Determination of pH value (Appendix VI H) in a defensive condition.

6. Measurement of radioactivity and radioactive concentration

In the field of pharmaceutical sciences specific apparatus has been developed for the measurement of radioactivity, using dose calibrator with well-type ionization chamber as the detector. The apparatus has been calibrated carefully for release with reference radiation sources comply with the requirements for such measurement with the total indeterminacy no greater than $\pm 5\%$ (fiducial probability 99.7%). The apparatus should be calibrated periodically to ensure the accuracy of measurement.

(1) Measurement of radioactivity and radioactive concentration of γ -ray emitting nuclides

1) It is essential to safeguard the apparatus being operated under normal working conditions. Preheat the apparatus sufficiently and set it under the conditions required for the measurement of the nuclide concerned to measure the background reading or zero point adjustment.

2) Place the preparation being examined, accurately measured, into a glass vial of about 22.3 mm in external

diameter and about 1 mm in thickness of the wall. Mount the vial into the ionization chamber under identical geometrical conditions as that for calibration.

3) Carry out the measurements for 10 times consecutively, calculate the average value and subtract from it the background reading correspondingly as the radioactivity of the sample A.

4) The radioactive concentration of the preparation being examined C is calculated by the following equation:

$$C = A/V$$

Where V is the volume of the preparation being examined.

(2) Measurement of the radioactivity and radioactive concentration of β -ray emitting nuclide

The dose calibrator must be calibrated with a standard source, using the same condition described under the measurement of the substance being examined, and then may be used directly for the measurement. The procedure and calculation of results are similar to that described under γ -ray emitting radio nuclides.

1) The dose calibrator must comply with the requirements of the measuring apparatus enforced by the Government and calibrated and certificated by the National Bureau of Technical Supervision.

2) The date and time of measurement should be printed and the results should be within 90.0%-110.0%, or the range specified in the individual monograph, of the labelled value of radioactivity.

3) The dose calibrator must be stable and reliable, with detection source of long half-life nuclide (e.g. ^{137}Cs).

7. Other Requirements for the Radiopharmaceutical Preparations

(1) **Containers** Solutions of radiopharmaceutical preparations should be stored in vials with rubber closure for multiple injections. The radiation dose rate on the surface of the containers complies with the requirement for protection against ionization radiation.

(2) **Expiry date** The designated expiry date brings with the date at which the radioactivity is expressed on the label. It is not recommended to use beyond the expiry date or in any case, an extraordinary condition is observed within the expiry date.

(3) **Label and insert** The label of radiopharmaceutical preparations should indicate the name of the preparation, the name of manufacturer, batch number and indication of radioactive. The insert should indicate the name of the preparation, the chemical state, the date of production, batch number, radioactive concentration with the date and hour when the measurement was made, content (ml), total radioactivity, expiry date, name of manufacturer and the indication of radioactive.

Appendix XIV Statistical Methods for Biological Assays

1. Introduction

Biological methods are used for the assay of certain pharmaceutical products whose potency cannot be adequately determined by chemical or physical means.

This chapter presents mainly the basic principles and general requirements to be observed, the assay design and statistical method to be adopted in a biological assay. The assay procedure, experimental condition and some other specifications are described under individual monographs.

Standard Preparation Ch. P. standard preparations (S) are available for biological assays, the potency of (S) is expressed in Unit which is equivalent to the corresponding International Unit.

Test Preparation Test preparation (T) or (U) is a pharmaceutical products whose potency is to be assayed. The pharmacological properties of (T) or (U) should be essentially similar to those of the standard preparation. A_T or A_U is the labelled or assumed potency of (T) or (U).

Ratio of Equally Effective Doses Biological assays are carried out by comparing the responses produced by the standard preparation (S) and the test preparation (T) when applied as stimuli to living matter at the same time and under the same condition. From the results of an assay, the doses of (S) and (T) producing equal response—the equally effective doses (d_S , d_T) can be calculated and the potency of (T) is estimated from the ratio of equally effective doses (R), i. e.

R is the ratio of d_S and d_T . $R = d_S/d_T$.

M is the difference between logarithm of d_S and d_T . $M = \lg d_S - \lg d_T = x_S - x_T$. $R = \text{antilog } M$.

P_T is the estimated potency of (T) obtained by multiplying the value of R or antilog M by assumed potency A_T .

$P_T = A_T \cdot R = A_T \cdot \text{antilog } M$. P_T is expressed as u/mg, u/ml etc.

Control of Biological Variation Biological assays are subject to random errors due to the inherent variability of biological responses. In order to control and minimize the biological variation and reduce the error of an assay, the following conditions must be noticed.

(1) The living matter used in an assay should be of the same species and same source, bred in a uniform environment or cultured under uniform condition.

(2) When the totality of individual unit appears to be reasonably homogeneous, allocate the individual unit to different doses by random process. If the individuals in subgroup, such as body weight, Petri dishes, sex, litter are likely to be more homogeneous than the totality of individual unit, allocation will be made by arranging the individuals in contiguous subgroups at random to different doses.

(3) When the assay design requires to segregate the variation between subgroups or blocks such as between litters or Petri dishes, the member in each subgroup is selected at random for each dose.

Error Variance The residual error of an assay is obtained by subtracting the variations allowed for in the design (e.g. variations between doses) from the total variation in response. Error variance (s^2) is the mean square of residual error which is obtained by dividing the sum of squares of residual error by its degrees of freedom.

The value of s^2 will affect the value of standard error of M (S_M) and the range of fiducial limits.

Validity Test For parallel line assay, it is required that the relation between the logarithm of doses and responses (or transformed responses) can be represented by a straight line in a certain range of doses, and the line for the test preparation must be parallel to that for the standard preparation. If the dose-response line of (S) or (T) is not significantly deviated from a straight line and the two lines are not significantly deviated from parallelism, the assay result is said to be statistically valid, the calculation methods described in this chapter can be used to estimate the potency of the test preparation and its fiducial limits.

Fiducial Limits of Error The required precision of a biological assay is expressed in terms of fiducial limits (FL). The fiducial limits for M are $M \pm t \cdot S_M$, where S_M is the standard error of M, t is a value depending on the degrees of freedom (f) of s^2 (Table 1).

Table 1 Degrees of freedom and the corresponding values of t (P=0.95)

f	t	f	t	f	t	f	t
3	3.18	8	2.31	14	2.15	30	2.04
4	2.78	9	2.26	16	2.12	40	2.02
5	2.57	10	2.23	18	2.10	60	2.00
6	2.45	11	2.20	20	2.09	120	1.98
7	2.37	12	2.18	25	2.06	∞	1.96

In Ch. P., the fiducial limits are calculated with reference to a probability of 0.95, i. e., the true potency would be expected to lie between the upper and lower fiducial limits ($P=0.95$). The precision of an assay is expressed in $FL\%$ which is the average distance between the upper and lower fiducial limits expressed as a percentage of the estimated P_T or R . The value of $FL\%$ is prescribed for each assay method in Ch. P., if the result of an assay does not comply with the required $FL\%$, the experiment should be repeated. $FL\%$ may be reduced as much as practicable by increasing the number of animals or Petri dishes; reducing the weight or age variation of animals; changing the doses etc.

The results of n repeated assays, including the one with a $FL\%$ in excess of that specified in the monograph, can be combined to obtain a single value.

2. Direct Assay

In a direct assay, the threshold dose of standard or test preparation which produces some fixed effect is being measured. The assay of digitalis with pigeons is an example of such an assay.

In an assay of digitalis, x_s and x_T are the logarithm of the minimum lethal dose of (S) and (T) for each pigeon, their mean value \bar{x}_s and \bar{x}_T are taken as the equally effective doses, n_s and n_T are the number of pigeons treated with standard and test preparation respectively.

(1) Calculation of potency

$$M = \bar{x}_s - \bar{x}_T \quad (1)$$

$$R = \text{antilog}(\bar{x}_s - \bar{x}_T) = \text{antilog } M \quad (2)$$

$$P_T = R \cdot A_T \quad (3)$$

(2) Error variance and fiducial limits

$$s^2 = \frac{\sum x_s^2 - \frac{(\sum x_s)^2}{n_s} + \sum x_T^2 - \frac{(\sum x_T)^2}{n_T}}{n_s + n_T - 2} \quad (4)$$

$$f = n_s + n_T - 2$$

$$S_M = \sqrt{s^2 \cdot \frac{n_s + n_T}{n_s \cdot n_T}} \quad (5)$$

$$FL \text{ of } R = \text{antilog} (M \pm t \cdot S_M) \quad (6)$$

$$FL \text{ of } P_T = A_T \cdot \text{antilog} (M \pm t \cdot S_M) \quad (7)$$

$$FL\% \text{ of } R(\text{or } P_T) = \frac{\text{Upper limit of } R(\text{or } P_T) - \text{Lower limit of } R(\text{or } P_T)}{2 R(\text{or } 2 P_T)} \times 100\% \quad (8)$$

When two or more test preparations (T, U...) are compared with the standard preparation simultaneously, the combined error variance (s^2) of (S), (T), (U)... is calculated as follows:

$$s^2 = \frac{\sum x_s^2 - \frac{(\sum x_s)^2}{n_s} + \sum x_T^2 - \frac{(\sum x_T)^2}{n_T} + \sum x_U^2 - \frac{(\sum x_U)^2}{n_U} + \dots}{n_s - 1 + n_T - 1 + n_U - 1 + \dots} \quad (9)$$

$$f = n_s - 1 + n_T - 1 + n_U - 1 + \dots$$

Example 1 Direct assay of digitalis using pigeons (MLD method)

The assay is carried out as described in the Biological Assay of Digitalis (Appendix XIII K). The substance being examined is digitalis powder, $A_T=10$ Units/g. The results of test are shown in table 1-1.

Table 1-1 An assay of digitalis powder

S		T	
$MLD_s (d_s)$	x_s	$MLD_T (d_T)$	x_T
Units/kg body wt.	$\lg(d_s \times 10)$	Units/kg body wt.	$\lg(d_T \times 10)$
1.15	1.061	1.11	1.045
1.01	1.004	1.23	1.090
1.10	1.041	1.06	1.025
1.14	1.057	1.31	1.117
1.06	1.025	0.94	0.973
0.95	0.978	1.36	1.134
$\sum x_s$	6.166	$\sum x_T$	6.384
\bar{x}_s	1.028	\bar{x}_T	1.064

$$M = 1.028 - 1.064 = -0.036$$

$$R = \text{antilog}(-0.036) = 0.9204$$

$$P_T = 10 \times 0.9204 = 9.20 \text{ Units/g}$$

$$s^2 = \frac{1.061^2 + 1.004^2 + \dots + 0.978^2 - \frac{6.166^2}{6} + 1.045^2 + 1.090^2 + \dots + 1.134^2 - \frac{6.384^2}{6}}{6+6-2}$$

$$= 0.002373$$

$$S_M = \sqrt{0.002373 \times \frac{6+6}{6 \times 6}} = 0.02812$$

$$f = 6+6-2 = 10 \quad t = 2.23$$

$$FL \text{ of } P_T = 10 \text{ antilog}(-0.036 \pm 2.23 \times 0.02812) = 7.97 - 10.6 \text{ Units/g}$$

$$FL\% \text{ of } P_T = \frac{10.6 - 7.97}{2 \times 9.20} \times 100 = 14.3\%$$

3. Parallel Line Assay Based on Quantitative Responses

When the magnitude of response which varies with the amount of dose is measurable, it is known as a quantitative response. Parallel line assay can be used only when the relation between the logarithm of dose and response (or transformed response) can be represented by a straight line over a certain range of doses, and the straight line for (T) must be parallel to that for (S).

In a parallel line assay, the dose structure of (S, T) may be (2, 2) or (3, 3) which are generally termed as (*k, k*) assay; the dose structure of (S, T, U) may be (2, 2, 2) or (3, 3, 3) which are generally termed as (*k, k, k*) assay. When the number of doses of (S) is not equal to that of (T), (*k, k'*) assay is resulted. Ordinarily the (*k, k*) structure is used for parallel line assay, but when the dose of (T) or (S) used is very different from the right dose, it is possible that the response of the largest or smallest dose may fall outside the linear zone. In such circumstances, the response to the largest or smallest dose should be omitted and (3, 2) or (2, 3) assay is resulted. Therefore, in (*k, k'*) assay, *k* is only one more or one less than *k'*.

Either in (*k, k*) assay, (*k, k, k*) assay or in (*k, k'*) assay, the preceding *k* always represents the number of doses of (S), the *k* or *k'* behind is the number of doses of (T) or (U). Therefore $K = k + k$ or $K = k + k'$ or $K = k + k + k$. In this chapter, the calculation used for parallel line assays is a simplified method, therefore, the following requirements should be observed:

- (1) The ratio of adjacent doses (*r*) of (S) and (T) in an assay must be constant, usually (1 : 0.8)-(1 : 0.5). $\lg r = L$.
- (2) The number of responses (*m*) to each dose must be equal.

(1) **Assay design** ① *Random design* In this type of assay design, no restriction on the variability of subgroups is applied. The test animals or other experimental units are allocated randomly to different doses, only the variation caused by dose levels can be segregated from the assay result.

② *Random block design* In this type of design, the test animals or other experimental units are further divided into blocks, such as litters of experimental animal or Petri dishes in a microbiological assay. Random block design requires that every dose is applied once in every block (litter or Petri dish) and is only suitable when the block is large enough to accommodate all doses. In this design, the error variance may be reduced by segregating the variation between blocks.

③ *Cross-over design* This design is useful when the single animal used in an experiment can be tested on two occasions separated at suitable time interval. The cross over design used in (2, 2) parallel line assay is known as twin crossover test, in which two doses of standard preparation and of a test preparation are used. Animals are divided randomly into four groups with equal number of animal in each group, and each animal in every group is marked for identification. In the first part of the test, each group receives one of the doses of (S) and (T). Animals which received one preparation in the first part of the test receive the other preparation in the second part of the test, and animals receiving small doses in one part of the test receive large doses in the other. Thus the precision of the experiment can be increased by eliminating the different effect between animals and the different responses at the two stages of the test. The arrangement of doses for twin cross-over design is shown in the following table

	group 1	group 2	group 3	group 4
1st test	d_{S_1}	d_{S_2}	d_{T_1}	d_{T_2}
2nd test	d_{T_2}	d_{T_1}	d_{S_2}	d_{S_1}

(2) Variance analysis and validity test

For random and random block design

① Enter the value of the measured responses or their transformations (*y*) into Table 2. *K* is the total number of doses and *m* is the number of *y* in each dose. In randomized block design, the variation between rows (*m*) represents the variation between blocks, *n* is the total number of responses, $n = mK$.

Table 2 The value of y in different dose groups

		Number of doses					Sum
		(1)	(2)	(3)	...	(K)	
Between blocks	1	$y_{1(1)}$	$y_{1(2)}$	$y_{1(3)}$...	$y_{1(k)}$	$\sum y_1$
	2	$y_{2(1)}$	$y_{2(2)}$	$y_{2(3)}$...	$y_{2(k)}$	$\sum y_2$
	3	$y_{3(1)}$	$y_{3(2)}$	$y_{3(3)}$...	$y_{3(k)}$	$\sum y_3$

	m	$y_{m(1)}$	$y_{m(2)}$	$y_{m(3)}$...	$y_{m(k)}$	$\sum y_m$
Sum		$\sum y_{(1)}$	$\sum y_{(2)}$	$\sum y_{(3)}$...	$\sum y_{(k)}$	$\sum y$

② *Replacement of missing value and rejection of aberrant value* When an accident leads to the loss of one or more responses, the number of responses (m) in each dose will not be equal. The balance may be restored by one of the following procedures:

For random design, the missing value can be replaced with the arithmetic mean of other responses to the same dose. If there are one or two surplus responses in one dose, reject the surplus response by random selection. For randomized block design, the missing value can be replaced with a value calculated from equation (10):

$$y = \frac{KC + mR - G}{(K-1)(m-1)} \quad (10)$$

Where C is The sum of responses in the dose group containing the missing value;

R is the sum of responses in the row containing the missing value;

G is the sum of all responses recorded in the assay;

K is the total number of doses;

m is the number of blocks used in the assay.

When there are enough blocks (litters or dishes) used in the design, it is preferable to omit the whole block in which the missing value lies.

Each replacement of a missing value causes a loss of 1 degree of freedom for error variance, and the number of missing values should not be more than 5% of the total number of responses.

When the largest or smallest response in one of the doses is questionable, the following aberrant value test should be applied.

Let y_a be the supposed aberrant value, arrange the responses in the dose in order of magnitude from y_a to y_m ($y_a, y_2, y_3, \dots, y_{m-2}, y_{m-1}, y_m$). If y_a is the largest value, the series is in descending order; if y_a is the smallest value, the series is in ascending order.

Calculate the value of J with the following equations:

When $m=3-7$,

$$J_1 = \frac{y_2 - y_a}{y_m - y_a} \quad (11)$$

When $m=8-13$,

$$J_2 = \frac{y_3 - y_a}{y_{m-1} - y_a} \quad (12)$$

When $m=14-20$,

$$J_3 = \frac{y_3 - y_a}{y_{m-2} - y_a} \quad (13)$$

If the calculated value of J exceeds the critical value shown in Table 3, y_a can be judged as an aberrant value and rejected.

Table 3 The value of J for aberrant value test

m	3	4	5	6	7		
J_1	0.98	0.85	0.73	0.64	0.59		
m	8	9	10	11	12	13	
J_2	0.78	0.73	0.68	0.64	0.61	0.58	
m	14	15	16	17	18	19	20
J_3	0.60	0.58	0.56	0.54	0.53	0.51	0.50

③ *Variance analysis* For randomized block design, the sum of squares of total variation is divided into components of 'between doses', 'between blocks' and 'residual error'. The values for sum of squares were obtained using the following equations.

$$\text{Total} = \sum y^2 - \frac{(\sum y)^2}{mK} \quad (14)$$

$$\text{Between doses} = \frac{\sum [\sum y_{(k)}]^2}{m} - \frac{(\sum y)^2}{mK} \quad (15)$$

$$f_{\text{between doses}} = K - 1$$

$$\text{Between blocks} = \frac{\sum (\sum y_m)^2}{K} - \frac{(\sum y)^2}{mK} \quad (16)$$

$$f_{\text{between blocks}} = m - 1$$

$$\text{Residual error} = \text{total} - \text{between doses} - \text{between blocks} \quad (17)$$

$$f_{\text{residual error}} = (K-1)(m-1)$$

The mean squares for each component are calculated by dividing the sum of squares of each component by its degrees of freedom. The mean square for residual error is the error variance (s^2) of the assay.

$$s^2 = \frac{\text{sum of squares for error}}{f \text{ for error}} \quad (18)$$

or

$$s^2 = \frac{Km \sum y^2 - K \cdot \sum [\sum y_{(k)}]^2 - m \cdot \sum [\sum y_m]^2 + (\sum y)^2}{Km(K-1)(m-1)} \quad (19)$$

$$f = (K-1)(m-1)$$

For random design, it is only necessary to calculate the sum of squares for total, between doses and residual error, using equations (14), (15) and (20).

$$\text{Residual error} = \text{total} - \text{between doses} \quad (20)$$

$$f_{\text{residual error}} = K(m-1)$$

and s^2 is obtained from equation (18) or (21).

$$s^2 = \frac{m \sum y^2 - \sum [\sum y_{(k)}]^2}{Km(m-1)} \quad (21)$$

$$f = K(m-1)$$

④ *Validity test* For (2.2) and (2.2.2) assays, the between doses component can be subdivided into terms of preparations, regression and parallelism; for ($k.k$) assays other than (2.2) assay and ($k.k.k$) assays other than (2.2.2) assay, additional terms of quadratic and difference of quadratics are required. For ($k.k$) and ($k.k'$) assays, calculate $m \cdot \sum C_i^2$ and $\sum [C_i \cdot \sum y_{(k)}]$ for each term, using the equations shown in Table 4. The sum of squares for each component is obtained from equation (22).

Table 4 Orthogonal coefficient for validity tests of ($k.k$) and ($k.k'$) assay

	Difference of Quadratics	-1	1	1	-1	1	-2	1		10 m	$T_3-2T_2+T_1-S_4+S_3+S_2-S_1$

Notes: For (2.3) or (3.4) assay, calculate $m \cdot \sum C_i^2$ and $\sum [C_i \cdot \sum y_{(k)}]$ by interchanging the orthogonal coefficient of (S) and (T) in (3.2) or (4.3) assay.

In Table 4 $S_1, S_2, \dots, T_1, T_2, \dots$ are the total responses for each dose of (S) and (T) corresponding to the term $\sum y_{(k)}$ in table 2. The subscript 1, 2, 3... are used to represent the respective dose level and 1 is always the smallest dose.

$$\text{Sum of squares for each component} = \frac{[\sum C_i \cdot \sum y_{(k)}]^2}{m \cdot \sum C_i^2} \quad (22)$$

$$f=1$$

For (k. k. k) assays, calculate the sum of squares of preparation by equation (23) and (24).

For (2.2.2) assay

$$\text{Sum of squares(preparations)} = \frac{(S_2+S_1)^2 + (T_2+T_1)^2 + (U_2+U_1)^2}{2m} - \frac{(\sum y)^2}{mK} \quad (23)$$

$$f=2$$

For (3.3.3) assay

$$\text{Sum of squares(preparations)} = \frac{(S_1+S_2+S_3)^2 + (T_1+T_2+T_3)^2 + (U_1+U_2+U_3)^2}{3m} - \frac{(\sum y)^2}{mK} \quad (24)$$

$$f=2$$

For calculation the sum of squares for components other than preparations, calculate $m \cdot \sum C_i^2$ and $\sum [C_i \cdot \sum y_{(k)}]$ by the equations shown in Table 5.

Table 5 Orthogonal coefficient for validity tests of (k. k. k) assay

	Difference of quadratics	-1	2	-1	1	-2	1				12 m	$T_3-2T_2+T_1-S_3+2S_2-S_1$
		-1	2	-1				1	-2	1	12 m	$U_3-2U_2+U_1-S_3+2S_2-S_1$
					-1	2	-1	1	-2	1	12 m	$U_3-2U_2+U_1-T_3+2T_2-T_1$

The sum of squares for regression and parallelism is obtained from equation (22). The sum of squares of quadratic and difference of quadratics is calculated from equation (25).

$$\text{Quadratic and difference of quadratics} = \frac{2 \sum [\sum (C_i \cdot \sum y_{(k)})]^2}{\sum (m \cdot \sum C_i^2)} \quad (25)$$

$$f=2$$

The mean square of each term is obtained by dividing the sum of squares of each term by its degrees of freedom.

Table 6 is a model of validity test for (3.3) assay, randomized block design.

Table 6 Validity test for (3, 3) assay, randomized block design

The upper values: *P* = 0.05

The lower values: *P* = 0.01

If the calculated *F* value is larger than the tabulated value at the level of probability of *P* = 0.05 or *P* = 0.01, the value being tested is said to be significant at the level of *P* = 0.05 or highly significant at the level of *P* = 0.01.

The assay result is said to be valid if the outcome of the test is as follows.

The regression term should be highly significant (*P* < 0.01).

The deviation from parallelism should not be significant (*P* > 0.05).

When 3 or more dose levels are used in (*k, k*) or (*k, k, k*) assay, the quadratic and difference in quadratics should not be significant (*P* > 0.05).

The significant level for the term of preparations is not used for assessing the validity of an assay, but a highly significant *F* ratio for preparations may indicate that the choice of assumed potency is not a good one. The estimated potency may serve as a guide for the choice of assumed potency when the assay is repeated.

For twin cross-over design

and every animal of each group is tested on two separated occasions, therefore $2 \times 4m$ value of responses are obtained. Enter the $2 \times 4m$ values into the form of Table 8.

Table 8 The value of y for twin cross-over test

	1 st group			2 nd group			3 rd group			4 th group			
	Test (1)	Test (2)	Σ (1)+(2)	Test (1)	Test (2)	Σ (1)+(2)	Test (1)	Test (2)	Σ (1)+(2)	Test (1)	Test (2)	Σ (1)+(2)	
	d_{S_1}	d_{T_2}		d_{S_2}	d_{T_1}		d_{T_1}	d_{S_2}		d_{T_2}	d_{S_1}		
y	$y_{S_1(1)}$ \vdots	$y_{T_2(2)}$ \vdots	$y_{(1)}+y_{(2)}$ \vdots	$y_{S_2(1)}$ \vdots	$y_{T_1(2)}$ \vdots	$y_{(1)}+y_{(2)}$ \vdots	$y_{T_1(1)}$ \vdots	$y_{S_2(2)}$ \vdots	$y_{(1)}+y_{(2)}$ \vdots	$y_{T_2(1)}$ \vdots	$y_{S_1(2)}$ \vdots	$y_{(1)}+y_{(2)}$ \vdots	Σ
Σy	$S_{1(1)}$	$T_{2(2)}$		$S_{2(1)}$	$T_{1(2)}$		$T_{1(1)}$	$S_{2(2)}$		$T_{2(1)}$	$S_{1(2)}$		S_1 S_2 T_1 T_2

(II) *Replacement of missing value* In twin cross-over test, each animal has two values of measured response, if one value of an animal is lost, the total two values of that animal will be considered to be missed. Replace the two missing value separately with the arithmetic mean of the other responses to the same dose of the test or reject the one surplus value of other doses in each test by random selection.

Each replacement of a missing value causes a loss of 1 degree of freedom for error variance. The number of missing value should not be more than 5% of the total number of responses and the missing value in one dose should not be more than 1.

(III) *Variance analysis* For twin cross-over design, the sum of square of total variation of $2 \times 4m$ responses can be divided into variation of between animals (inter-animal variation) and variation of intra-animal.

Sum of squares of

$$\text{Total} = \Sigma y^2 - \frac{(\Sigma y)^2}{2 \times 4m} \quad (26)$$

$$f_{(\text{Total})} = 2 \times 4m - 1$$

Sum of square of inter-animal variation is calculated by equation (27) using the value in the third column of each group in Table 8

$$\text{Inter-animal} = \frac{\Sigma [y_{(1)} + y_{(2)}]^2}{2} - \frac{(\Sigma y)^2}{2 \times 4m} \quad (27)$$

$$f_{(\text{inter-animal})} = 4m - 1$$

Subtract inter-animal variation from the total variation, the residue is the sum of square of intra-animal variation.

Calculate $m \cdot \Sigma C_i^2$ and $\Sigma (C_i \cdot \Sigma y)$ of each component by multiplying the sum of total response for each test of the four groups in Table 8 ($S_{1(1)}$, $S_{2(1)}$, $T_{1(1)}$, $T_{2(1)}$, $S_{1(2)}$, $S_{2(2)}$, $T_{1(2)}$, $T_{2(2)}$) by the orthogonal coefficient shown in Table 9.

Sum of square of each component in Table 9 is obtained by $\frac{[\Sigma (C_i \cdot \Sigma y)]^2}{m \cdot \Sigma C_i^2}$.

Table 9 Orthogonal coefficient for validity test of twin cross-over design

Source of variation	Test(1)				Test(2)				$m \cdot \Sigma C_i^2$	$\Sigma(C_i \cdot \Sigma y)$
	$S_{1(1)}$	$S_{2(1)}$	$T_{1(1)}$	$T_{2(1)}$	$S_{1(2)}$	$S_{2(2)}$	$T_{1(2)}$	$T_{2(2)}$

The degrees of freedom for each component is 1.

* mean the four components of intra-animal variation, the remaining three components are inter-animal variation.

Sum of square of error variance for intra-animal (error I) and inter-animal (error II) are calculated by equation (28) and equation (29)

$$\text{Error(I)} = \text{Total} - \text{Inter-animal} - \text{Preparation} - \text{Regression} - \text{Time} - \text{Time} \times \text{parallelism} \quad (28)$$

$$f_{\text{error(I)}} = f_{\text{Total}} - f_{\text{inter-animal}} - f_{\text{preparation}} - f_{\text{regression}} - f_{\text{time}} - f_{\text{time} \times \text{parallelism}}$$

$$= 4(m-1)$$

$$\text{Error(II)} = \text{Inter-animal} - \text{Parallelism} - \text{Time} \times \text{Preparation} - \text{Time} \times \text{regression} \quad (29)$$

$$f_{\text{error(II)}} = f_{\text{inter-animal}} - f_{\text{parallelism}} - f_{\text{time} \times \text{preparation}} - f_{\text{time} \times \text{regression}}$$

(IV) *Validity test* The result of validity test for twin cross-over design is shown in Table 10.

Table 10 Validity test for twin cross-over design

source of variation	f	sum of square	mean square	F	P
Parallelism	1	equation(22)	sum of square/ f	mean square/ s_{II}^2	
Time \times preparation	1	equation(22)	sum of square/ f	mean square/ s_{II}^2

Time \times parallelism	1	equation(22)	sum of square/ f	mean square/ s^2	
Error(I)	$4(m-1)$	equation(28)	sum of square/ $f(s^2)$	mean square/ s^2	
Total	$2 \times 4m-1$	equation(26)			

In table 10, the mean square for each component is obtained by dividing the sum of square of each component by its degrees of freedom. F ratio for three inter-animal components (In the upper part of Table 10) is the mean square for each component expressed as a ratio of mean square of Error (II) - (s_{II}^2) and the F ratio for three intra-animal components (The lower part of table 10) is the mean square for each component expressed as a ratio of mean square of error (I) s^2 . The significance of F value are assessed in the same way as that for other parallel line assays.

Assay results are said to be statistically valid if the outcome of these tests is as follows:

The terms of regression, parallelism and preparation are assessed in the same way as that of (2.2) assay. The three interaction components—time \times preparation, time \times regression, time \times parallelism—indicate the variation of these components (preparation, parallelism, regression) from the first test to the second test, if the F value of these components obtained are significantly high, care should be taken in interpreting the results of the assay, and if possible, the assay should be repeated.

(3) Estimation of potency and fiducial limits

For (k, k), (k, k') and (k, k, k) assays, calculate the values of V , W , D , A , B and g by use of the equations listed in Table 11, and calculate R , S_M , FL by use of equations (30)-(33).

$$R = D \cdot \text{antilog } \frac{IV}{W} \quad (30)$$

$$S_M = \frac{I}{W^2(1-g)} \sqrt{ms^2[(1-g)AW^2 + BV^2]} \quad (31)$$

$$FL \text{ of } R = \text{antilog } \left[\frac{\lg R}{1-g} \pm t \cdot S_M \right] \quad (32)$$

$$FL \text{ of } P_T = A_T \cdot \text{antilog } \left[\frac{\lg R}{1-g} \pm t \cdot S_M \right] \quad (33)$$

Calculate P_T by use of equation (3) and its $FL\%$ by use of equation (8).

For twin cross-over design, 2m values of measured responses for each dose of (S) and (T) are obtained. Calculate V, W, D, and g by use of equations for (2. 2) assay in table 11 using the sum of 2m responses for each dose (the values of S_1 , S_2 , T_1 , T_2 in table 8). Calculate S_M by equation (34)

$$S_M = \frac{I}{W^2(1-g)} \sqrt{2ms^2[(1-g)W^2 + V^2]} \quad (34)$$

$$g = \frac{s^2 \cdot t^2 \cdot 2m}{W^2}$$

Example 2 Parallel line assay of HCG by uterus weight method in mice, random design (3. 3. 3)

S is the standard preparation of HCG;

T is HCG bulk substance, $A_T = 2500$ Units/mg;

U is HCG for injection, $A_U = 500$ Units/ampoule.

The assay result is shown in Table 2-1.

Table 2-1 An assay of HCG

$r = 1 : 0.6$, $I = \lg r = 0.222$ (3. 3. 3) assay; $K = 9$, $m = 15$

① Sum of squares

$$K = 9, m = 15$$

$$\text{Total} = 9.31^2 + 17.50^2 + \dots + 23.80^2 + 21.80^2 + 36.00^2 - \frac{(3795.35)^2}{9 \times 15} = 29868.26$$

$$f = 9 \times 15 - 1 = 134$$

$$\text{Between doses} = \frac{238.68^2 + 447.63^2 + \dots + 582.10^2}{15} - \frac{(3795.35)^2}{9 \times 15} = 12336.55$$

$$f = 9 - 1 = 8$$

$$\text{Error} = 29868.26 - 12336.55 = 17531.71$$

$$f = 134 - 8 = 126$$

② Variance analysis and validity test

$$\begin{aligned}\text{Sum of squares (preparations)} &= \frac{(238.68+447.63+623.58)^2}{3 \times 15} + \frac{(274.92+498.60+582.10)^2}{3 \times 15} - \frac{(3795.35)^2}{9 \times 15} = 633.23 \\ f &= 2\end{aligned}$$

The results of variance analysis are shown in Table 2-2; the results of validity test are shown in Table 2-3.

Table 2-2 Variance analysis for HCG assay (3. 3. 3)

Source of variation	$\Sigma y_{(k)}$									$m \cdot \Sigma C_i^2$	$\Sigma[G \cdot \Sigma y_{(k)}]$	Sum of squares			
	S_1	S_2	S_3	T_1	T_2	T_3	U_1	U_2	U_3			$\frac{[\Sigma(C_i \cdot \Sigma y_{(k)})]^2}{m \cdot \Sigma C_i^2}$	$\frac{2\Sigma[\Sigma(C_i \cdot \Sigma y_{(k)})]^2}{\Sigma(m \cdot \Sigma C_i^2)}$		
	Orthogonal coefficient C_i

				-1	2	-1	1	-2	1	12×15	-87.72				

Table 2-3 Validity test of HCG assay (3. 3. 3)

Source of variation	Degree of freedom(f)	Sum of squares	Mean square	F	P
Preparations	2	633.23	316.6	2.28	>0.05
Regression	1	11319.64	11319.64	81.35	<0.01
Parallelism	2	119.08	59.54	<1	>0.05
Quadratic	1	193.62	193.62	1.39	>0.05
Difference of quadratics	2	71.00	35.50	<1	>0.05
Doses	8	12336.55	1542.07	11.08	<0.01
Error	126	17531.71	139.14(s^2)		
Total	134	29868.26			

Conclusion The regression was highly significant, the deviation from parallelism, the quadratic and difference of quadratics were not significant. Therefore, the assay result was satisfactory.

③ Potency and fiducial limits

$$\begin{aligned}r &= 1 : 0.6 & I &= 0.222 \\ s^2 &= 139.14 & f &= 126 & t &= 1.98 \\ V_T &= \frac{1}{3}(208.74+395.10+526.00-238.68-447.63-623.58) = -60.017 \\ W &= \frac{1}{6}(526.00-208.74+623.58-238.68+582.10-274.92) = 168.223 \\ g &= \frac{139.14 \times 1.98^2 \times 15}{6 \times (168.223)^2} = 0.048 \\ R_T &= \frac{0.375}{0.375} \cdot \text{antilog}\left(\frac{-60.017}{168.223}\right) \times 0.222 = 0.833 \\ P_T &= 2500 \times 0.833 = 2082.5 \text{ Units/mg} \\ S_{M_T} &= \frac{0.222}{(168.223)^2 (1-0.048)} \times \sqrt{15 \times 139.14 \left[(1-0.048) \frac{2}{3} \times 168.223^2 + \frac{1}{6} (-60.017)^2 \right]} \\ &= 0.05129 \\ FL \text{ of } R_T &= \text{antilog} \left[\frac{\lg 0.833}{(1-0.048)} \pm 1.98 \times 0.05129 \right] = 0.653-1.043 \\ FL \text{ of } P_T &= 2500(0.653-1.043) = 1632.5-2607.5 \text{ Units/mg} \\ FL\% \text{ of } P_T &= \frac{2607.5-1632.5}{2 \times 2082.5} \times 100 = 23.4\% \\ V_U &= \frac{1}{3}(274.92+498.60+582.10-238.68-447.63-623.58) = 15.243 \\ W &= 168.223 \quad g = 0.048 \\ R_U &= \frac{0.375}{0.400} \text{ antilog} \left(\frac{15.243}{168.223} \times 0.222 \right) = 0.982 \\ P_U &= 500 \times 0.982 = 491.0 \text{ Units/ampoule}\end{aligned}$$

$$S_{Mu} = \frac{0.222}{168.223^2(1-0.048)} \times \sqrt{15 \times 139.14 \left[(1-0.048) \frac{2}{3} \times 168.223^2 + \frac{1}{6} \times 15.243^2 \right]}$$

$$= 0.05051$$

$$FL \text{ of } R_U = \text{antilog} \left[\frac{\lg 0.982}{(1-0.048)} \pm 1.98 \times 0.05051 \right] = 0.779 - 1.235$$

$$FL \text{ of } P_U = 500(0.779 - 1.235) = 389.5 - 617.5 \text{ Units/ampoule}$$

$$FL\% \text{ of } P_U = \frac{617.5 - 389.5}{2 \times 491.0} \times 100 = 23.2\%$$

Calculate s^2 from equation(21)

$$s^2 = \frac{15(9.31^2 + 17.50^2 + \dots + 21.80^2 + 36.00^2) - (238.68^2 + 447.63^2 + \dots + 582.10^2)}{9 \times 15(15-1)}$$

$$= 139.14$$

Example 3 Parallel line assay of neomycin, randomized block design (3.3) assay

S is the standard preparation of neomycin;

T is neomycin bulk substance, $A_T = 670$ Units/mg.

The assay result is shown in Table 3-1.

Table 3-1 An assay of neomycin

Units/ml	d_{S_1} 8.0	d_{S_2} 10.0	d_{S_3} 12.5	d_{T_1} 8.0	d_{T_2} 10.0	d_{T_3} 12.5	Σy_m
y	16.05	16.20	16.50	15.80	16.35	16.60	97.50

	16.00	16.45	16.70	16.05	16.35	16.70	98.25
	15.95	16.35	16.60	16.00	16.25	16.60	97.75
	15.70	16.25	16.60	15.85	16.25	16.60	97.25
	15.55	16.20	16.55	15.70	16.20	16.60	96.80
	15.65	16.20	16.40	15.80	16.15	16.40	96.60
	15.90	16.10	16.45	15.80	16.10	16.50	96.85
	15.60	16.00	16.30	15.70	15.95	16.30	95.85
$\Sigma y_{(k)}$	142.60 S_1	146.20 S_2	148.75 S_3	142.90 T_1	146.05 T_2	149.00 T_3	875.50

① Sum of squares

$$K=6, m=9$$

$$\text{Total} = 16.05^2 + 16.20^2 + \dots + 16.50^2 + 16.30^2 - \frac{(875.5)^2}{9 \times 6} = 5.4709$$

$$f = 9 \times 6 - 1 = 53$$

$$\text{Between doses} = \frac{(142.60)^2 + (146.20)^2 + \dots + (146.05)^2 + (149.00)^2}{9} - \frac{(875.5)^2}{9 \times 6} = 4.1926$$

$$f = 6 - 1 = 5$$

$$\text{Between dishes} = \frac{(97.50)^2 + (98.65)^2 + \dots + (96.85)^2 + (95.85)^2}{6} - \frac{(875.5)^2}{9 \times 6} = 1.0018$$

$$f = 9 - 1 = 8$$

$$\text{Error} = 5.4709 - 4.1926 - 1.0018 = 0.2765$$

$$f = 53 - 5 - 8 = 40$$

② Variance analysis and validity test

The results of variance analysis are shown in Table 3-2; the results of validity test are shown in Table 3-3.

Table 3-2 Variance analysis for neomycin in assay (3.3)

Source of variation	$\Sigma y_{(k)}$						$m \cdot \Sigma C_i^2$	$\Sigma [C_i \cdot \Sigma y_{(k)}]$	$\frac{\text{Sum of squares } [\Sigma (C_i \cdot \Sigma y_{(k)})]^2}{m \cdot \Sigma C_i^2}$
	S_1 142.60	S_2 146.20	S_3 148.75	T_1 142.90	T_2 146.05	T_3 149.00			
	Orthogonal coefficient C_i								
Preparations	-1	-1	-1	+1	+1	+1	9×6	0.4000	0.002963
Regression	-1	0	+1	-1	0	+1	9×4	12.25	4.168
Parallelism	+1	0	-1	-1	0	+1	9×4	0.05000	0.00006944
Quadratic	+1	-2	+1	+1	-2	+1	9×12	1.250	0.01447
Difference of quadratics	-1	+2	-1	+1	-2	+1	9×12	0.8500	0.006690

Table 3-3 Validity test for neomycin assay (3.3)

Source of variation	Degrees of freedom(<i>f</i>)	Sum of squares	Mean square	<i>F</i>	<i>P</i>
Preparations	1	0.002963	0.002963	<1	>0.05
Regression	1	4.168	4.168	602.9	<0.01
Parallelism	1	0.00006944	0.00006944	<1	>0.05
Quadratic	1	0.01447	0.01447	2.1	>0.05
Difference of quadratics	1	0.006690	0.006690	<1	>0.05
Doses	5	4.1926	0.8385	121.3	<0.01
Dishes	8	1.0028	0.1252	18.1	<0.01
Error	40	0.2765	0.006912(<i>s</i> ²)		
Total	53	5.4709			

Conclusion The regression was highly significant, the deviation from parallelism, the quadratic and difference of quadratics were not significant. Therefore, the assay result was satisfactory. The difference between dishes was highly significant ($P < 0.01$), the precision of the assay would be increased by segregating the variation between dishes from the total.

③ Potency and fiducial limits

$$r=1:0.8 \quad I=0.0969 \quad s^2=0.006912 \quad f=40 \quad t=2.02 \quad (P=0.95)$$

$$V=\frac{1}{3}(142.90+146.05+149.00-142.6-146.2-148.75)=0.1333$$

$$W=\frac{1}{4}(149.0-142.9+148.75-142.6)=3.0625$$

$$g=\frac{2.02^2 \times 0.006912 \times 9}{4 \times 3.0625^2}=0.007$$

$$R=\frac{12.5}{12.5} \text{ antilog } \frac{0.1333}{3.0625} \times 0.0969=1.01$$

$$P_T=1.010 \times 670 \text{ Units/mg}=676.70 \text{ Units/mg}$$

$$S_M=\frac{0.0969}{3.0625^2(1-0.007)} \times \sqrt{9 \times 0.006912 \left[(1-0.007) \times \frac{2}{3} \times 3.0625^2 + \frac{1}{4} \times 0.1333^2 \right]}=0.006469$$

$$FL \text{ of } R=\text{antilog} \left[\frac{\lg 1.010}{(1-0.007)} \pm 2.02 \times 0.006469 \right]=0.980-1.041$$

$$FL \text{ of } P_T=670 \times 0.980-670 \times 1.041=656.60-697.47 \text{ Units/mg}$$

$$FL\% \text{ of } P_T=\frac{697.47-656.60}{2 \times 676.70} \times 100=3.0\%$$

$$s^2=\frac{6 \times 9(16.05^2+16.20^2+\dots+16.50^2+16.30^2)}{6 \times 9(6-1)(9-1)} - \frac{6(142.6^2+\dots+149.0^2)-9(97.5^2+\dots+95.85^2)+875.5^2}{6 \times 9(6-1)(9-1)}$$

$$=0.006912$$

$$f=(6-1)(9-1)=40$$

Example 4 Parallel line assay of oxytocin, randomized block design (2.2)

S is the standard preparation of oxytocin;
T is oxytocin injection, $A_T=10$ Units/ml.
 The assay result is shown in Table 4-1.

Table 4-1 An assay of oxytocin injection

Doses Units	d_{s_1} 0.0068 (0.34 ml)	d_{s_2} 0.009 (0.45 ml)	d_{T_1} 0.0080 (0.40 ml)	d_{T_2} 0.0106 (0.53 ml)	Σy_m
<i>y</i>	39.5	68.0	41.0	71.0	219.5
	37.0	62.5	36.0	53.0	188.5
	35.0	63.0	37.0	62.0	197.0
	31.5	58.0	34.5 (15.0)	60.0	184.0
	30.0	50.0	35.0	60.0	175.0
	$\Sigma y_{(k)}$				
	173.0 S_1	301.5 S_2	183.5 T_1	306.0 T_2	964.0

① Disposal of an aberrant value

In Table 4-1, the response value of 3rd column (d_{T_1}) 4th row (15) is rather small, and the aberrant value test is applied. Arrange the responses to d_{T_1} in ascending order: 15.0, 35.0, 36.0, 37.0, 41.0.

$$m=5 \quad y_a=15 \quad y_2=35 \quad y_m=41$$

$$J_1=\frac{y_2-y_a}{y_m-y_a}=\frac{35-15}{41-15}=0.77$$

In Table 3, when $m=5$, $J_1=0.73$, smaller than the calculated J_1 (0.77). Therefore, y_* can be rejected and the missing value replaced by a value calculated as follows:

$$\begin{aligned} C &= 149 & R &= 149.5 & G &= 929.5 \\ K &= 4 & m &= 5 \\ y &= \frac{4 \times 149 + 5 \times 149.5 - 929.5}{(4-1)(5-1)} = 34.5 \end{aligned}$$

② Sum of squares

$$\text{Total} = 39.5^2 + 37.0^2 + \dots + 60.0^2 + 60.0^2 - \frac{964.0^2}{5 \times 4} = 3600.20$$

$$f = 5 \times 4 - 1 = 19$$

$$\text{Between doses} = \frac{173.0^2 + 301.5^2 + 183.5^2 + 306.0^2}{5} - \frac{964.0^2}{5 \times 4} = 3163.10$$

$$f = 4 - 1 = 3$$

$$\text{Between blocks} = \frac{219.5^2 + 188.5^2 + \dots + 184.0^2 + 175.0^2}{4} - \frac{964.0^2}{5 \times 4} = 285.82$$

$$f = 5 - 1 = 4$$

$$\text{Error} = 3600.20 - 3163.10 - 285.82 = 151.28$$

The replacement of a missing value causes a loss of 1 degree of freedom, therefore, $f = 19 - 3 - 4 - 1 = 11$, $s^2 = 151.28/11 = 13.75$

③ Variance analysis and validity test

The results of variance analysis are shown in Table 4-2; the results of validity test are shown in Table 4-3.

Table 4-2 Variance analysis for an assay of oxytocin injection

Source of variation	$\Sigma y_{(k)}$				$m \cdot \Sigma C_i^2$	$\Sigma [C_i \cdot \Sigma y_{(k)}]$	$\frac{[\Sigma (C_i \cdot \Sigma y_{(k)})]^2}{m \cdot \Sigma C_i^2}$
	S_1	S_2	T_1	T_2			
	173.0	301.5	183.5	306.0			
	Orthogonal coefficient C_i						
Preparations	-1	-1	1	1	5×4	15.0	11.25
Regression	-1	1	-1	1	5×4	251.0	31150.05
Parallelism	1	-1	-1	1	5×4	-6.00	1.80

Table 4-3 Validity test for an assay of oxytocin injection

Source of variation	f	Sum of squares	Mean square	F	P
Preparations	1	11.25	11.25	<1	>0.05
Regression	1	3150.05	3150.05	229.06	<0.01
Parallelism	1	1.80	1.80	<1	>0.05
Doses	3	3163.10	1054.37	76.67	<0.01
Blocks	4	285.82	71.46	5.20	<0.05
Error	11	151.27	13.75 (s^2)		>0.01
Total	19	3600.20			

Conclusion The regression was highly significant, the deviation from parallelism was not significant. Therefore, the assay result was satisfactory.

④ Potency and fiducial limits

$$r = 1 : 0.75 \quad I = 0.125 \quad s^2 = 13.75$$

$$f = 11 \quad t = 2.20$$

$$V = \frac{1}{2} (183.5 + 306.0 - 173.0 - 301.5) = 7.5$$

$$W = \frac{1}{2} (306.0 - 183.5 + 301.5 - 173.0) = 125.5$$

$$g = \frac{13.75 \times 2.20^2 \times 5}{125.5^2} = 0.021$$

$$R = \frac{0.009}{0.0106} \text{ antilog } \frac{7.5}{125.5} \times 0.125 = 0.864$$

$$P_T = 10 \times 0.864 = 8.64 \text{ Units/ml}$$

$$S_M = \frac{0.125}{125.5^2(1-0.021)} \sqrt{5 \times 13.75[(1-0.021)125.5^2 + 7.5^2]} = 0.008362$$

$$FL \text{ of } R = \text{antilog} \left[\frac{\lg 0.864}{(1-0.021)} \pm 2.20 \times 0.008362 \right] = 0.826-0.899$$

$$FL \text{ of } P_T = 10 \times (0.826-0.899) = 8.26-8.99 \text{ Units/ml}$$

$$FL\% \text{ of } P_T = \frac{8.99-8.26}{2 \times 8.64} \times 100 = 4.2\%$$

Example 5 Parallel line assay of insulin—Blood sugar depression method in mice, twin cross-over design

S is the standard preparation of insulin

T is the test preparation of insulin, $A_T = 27$ Units/mg.

d_{S_1} : 25 mu/ml, 0.25 ml/mouse d_{T_1} : 25 mu/ml, 0.25 ml/mouse

d_{S_2} : 50 mu/ml, 0.25 ml/mouse d_{T_2} : 50 mu/ml, 0.25 ml/mouse

$r = 1 : 0.5$ $I = 0.301$

y is value of blood glucose (mg%).

The assay result is shown in Table 5-1

Table 5-1 The data of an assay of insulin

	Group 1			Group 2			Group 3			Group 4				
	Test(1)	Test(2)	Test (1)+(2)	Test(1)	Test(2)	Test (1)+(2)	Test(1)	Test(2)	Test (1)+(2)	Test(1)	Test(2)	Test (1)+(2)

Σy														7766.15

① Sum of square

$$\text{Total} = 103.99^2 + 113.21^2 + \dots + 89.58^2 + 110.93^2 - \frac{(7766.15)^2}{2 \times 4 \times 10} = 25865.8223$$

$$f_{\text{Total}} = 2 \times 4 \times 10 - 1 = 79$$

$$\text{inter-animal} = 191.00^2 + 217.82^2 + \dots + 151.41^2 + 206.49^2 - \frac{(7766.15)^2}{2 \times 4 \times 10} = 11320.6387$$

$$f_{\text{inter-animal}} = 4 \times 10 - 1 = 39$$

② Calculate $m \cdot \sum C_i^2$, $\sum (C_i \cdot \sum y_i)$ and sum of squares of each component of Table 5-1 by use of equations in Table 9, and equation (22) (18)

The sum of square of error (I) and error (II) are obtained by equation (28) (29).

$$\text{Error(I)} = 25865.8223 - 11320.6387 - 84.8102 - 9249.0855 - 1267.7893 - 369.4991 = 3573.9995$$

$$f = 4 \times (10 - 1) = 36$$

$$\text{Error(II)} = 11320.6387 - 71.2720 - 215.7917 - 137.8388 = 110895.7362$$

$$f = 4 \times (10 - 1) = 36$$

The result of variance analysis and validity test are shown in Table 5-2 and 5-3.

Table 5-2 Variance analysis for insulin, twin cross-over design

Source of variation	$\Sigma y_{(1)}$				$\Sigma y_{(2)}$				$m \cdot \Sigma C_i^2$	$\Sigma(C_i \cdot \Sigma y)$	Sum of square $\frac{[\Sigma(C_i \cdot \Sigma y)]^2}{m \cdot \Sigma C_i^2}$
	$S_{1(1)}$	$S_{2(1)}$	$T_{1(1)}$	$T_{2(1)}$	$S_{1(2)}$	$S_{2(2)}$	$T_{1(2)}$	$T_{2(2)}$

* mean the four components of intra-animal variation, the remaining three components are inter-animal variation.

Table 5-3 Validity test of insulin

Source of variation	f	Sum of square	Mean square	F	P
Parallelism	1	71.2720	71.2720	<1	>0.05
Time×Preparation	1	215.7917	215.7917	<1	>0.05
Time×regression	1	137.8388	137.8388	<1	>0.05
Error(II)	36	10895.7362	302.6593(s_{II}^2)		
Inter-animal	39	11320.6387	290.2728	2.92	
Preparation	1	84.8102	84.8102	<1	>0.05
Regression	1	9249.0855	9249.0855	93.16	<0.01
Time of test	1	1267.7893	1267.7893	12.77	<0.01
Time×Parallelism	1	369.4991	369.4991	3.72	>0.05
Error(I)	36	3573.9995	99.2778(s^2)		
Total	79	25865.8223			

Conclusion The regression was highly significant, the deviation from parallelism was not significant, the assay result was satisfactory. The variance between two tests was highly significant, thus the precision of the assay was increased by eliminating the effects of difference between animals at the two stages of the test.

③ Potency and fiducial limits

$$r=1:0.5 \quad I=0.301 \quad s^2=99.2778 \quad f=36 \quad t=2.03$$

$$V=\frac{1}{2}(1765.96+2158.30-1687.02-2154.87)=41.185$$

$$W=\frac{1}{2}(1765.96-2158.30+1687.02-2154.87)=-430.095$$

$$R=\frac{50}{50}\text{antilog}\left(\frac{41185}{-430.095} \times 0.301\right)=0.936$$

$$P_T=27 \times 0.936=25.27 \text{ Units/mg}$$

$$g=\frac{99.2778 \times 2.03^2 \times 2 \times 10}{(-430.095)^2}=0.044$$

$$S_M=\frac{0.301}{(-430.095)^2(1-0.044)} \sqrt{2 \times 10 \times 99.2778[(1-0.044)(-430.095)^2+41.185^2]} \\ =0.03204$$

$$FL \text{ of } R=\text{antilog}\left[\frac{\lg 0.936}{(1-0.044)} \pm 2.03 \times 0.03204\right]=0.803-1.084$$

$$FL \text{ of } P_T=27(0.803-1.084)=21.68-29.27 \text{ Units/mg}$$

$$FL\% \text{ of } P_T=\left(\frac{29.27-21.68}{2 \times 25.27} \times 100\right)\%=15.0\%$$

4. Combination of Potency Estimates

When the same test preparation has been assayed n times, it is necessary to combine the n estimated potencies to obtain a mean potency and its fiducial limits.

In the combination of n estimates, the following points should be observed:

(1) The n estimates were independent and each obtained from a separate assay of the same method, under the same experimental condition.

(2) The estimated log potency (M) should be corrected by assumed potency (A_T) before they are combined.

Calculated the mean of the combined log P_T by the following method.

Homogeneity of n estimates of log potency: The homogeneity of n log potencies is assessed by χ^2 test.

$$\chi^2 = \sum WM^2 - \frac{(\sum WM)^2}{\sum W} \quad (35)$$

$$f = n - 1$$

Where M is the logarithm of the potency estimates and W is the reciprocal of its S_M .

$$W = \frac{1}{S_M^2} \quad (36)$$

If the calculated value of χ^2 is smaller than the tabulated value of $\chi^2_{0.05}$ corresponding to $n-1$ degrees of freedom (shown in Table 12), the potencies are homogeneous, the weighted mean potency of n estimates and its FL are obtained by equation (37)-(41), where \bar{M} is the weighted mean potency of $\lg P_T$.

$$\bar{M} = \frac{\sum WM}{\sum W} \quad (37)$$

$$S_{\bar{M}} = \sqrt{\frac{1}{\sum W}} \quad (38)$$

$$FL \text{ of } \bar{M} = \bar{M} \pm t \cdot S_{\bar{M}} \quad (39)$$

$$\bar{P}_T = \text{antilog } \bar{M} \quad (40)$$

$$FL \text{ of } \bar{P}_T = \text{antilog } (\bar{M} \pm t \cdot S_{\bar{M}}) \quad (41)$$

For equation (39) and (41), the appropriate value of t (in Table 1) is that corresponding to the sum of the numbers of f for the s^2 in the n individual assays

If the calculated value of χ^2 is greater than the tabulated value of $\chi^2_{0.05}$ in Table 12, the potencies are heterogeneous. The combined mean potency and the FL of n estimates are obtained by equation (42) (43) and equation (39)-(41).

$$\bar{M} = \frac{\sum M}{n} \quad (42)$$

$$S_{\bar{M}} = \frac{S_M}{\sqrt{n}} = \sqrt{\frac{\sum M^2 - \frac{(\sum M)^2}{n}}{n(n-1)}} \quad (43)$$

$$f = n - 1$$

Table 12 The value of χ^2 ($P=0.05$)

f	χ^2	f	χ^2	f	χ^2
1	3.84	11	19.7	21	32.7
2	5.99	12	21.0	22	33.9
3	7.82	13	22.4	23	35.2
4	9.49	14	23.7	24	36.4
5	11.1	15	25.0	25	37.6
6	12.6	16	26.3	26	38.9
7	14.1	17	27.6	27	40.1
8	15.5	18	28.9	28	41.3
9	16.9	19	30.1	29	42.6
10	18.3	20	31.4	30	43.8

Example 6 Combination of 5 estimates of Heparin

The assay results are shown in Table 6-1

Table 6-1 The data of 5 assay results of Heparin

P_T (Units/mg)	$M(\lg P_T)$	S_M	$W\left(\frac{1}{S_M^2}\right)$	WM	WM^2
189.28	2.2771	0.0289	1197.30	2726.37	6208.22
180.13	2.2556	0.0144	4822.53	10877.70	24535.74
189.72	2.2781	0.0105	9070.29	20663.03	47072.44
185.27	2.2678	0.00633	24957.01	56597.51	128351.83
181.25	2.2583	0.0278	1293.93	2922.08	6598.94
Σ			41341.06	93786.69	212767.17

$$\chi^2 = 212767.17 - \frac{93786.69^2}{41341.06} = 1.86$$

$$f = 5 - 1 = 4$$

The calculated χ^2 (1.86) is smaller than the tabulated value ($\chi_{(4),0.05}^2 = 9.49$).

$$\bar{M} = \frac{93786.69}{41341.06} = 2.2686$$

$$\bar{P}_T = \text{antilog } 2.2686 = 185.61 \text{ Units/mg}$$

$$S_M = \sqrt{\frac{1}{41341.06}} = 0.00492$$

$$f = 5 \times 24 = 120, t = 1.96$$

$$FL \text{ of } \bar{P}_T = \text{antilog } (2.2686 \pm 1.96 \times 0.00492) \\ = 181.53 - 189.78 \text{ Units/mg}$$

$$FL\% = \left(\frac{189.78 - 181.53}{2 \times 185.61} \times 100 \right) \% = 2.2\%$$

Example 7 Combination of 6 estimates of Insulin

The assay results are shown in Table 7-1.

Table 7-1 The data of 6 assay results of Insulin

P_T (Units/mg)	$M(\lg P_T)$	M^2	S_M	$W\left(\frac{1}{S_M^2}\right)$	WM	WM^2
25.91	1.4135	1.9980	0.09603	108.44	153.28	216.66
23.15	1.3646	1.8621	0.006202	25997.79	35476.59	48411.35
27.48	1.4390	2.0707	0.02609	1469.10	2114.04	3042.10
28.39	1.4532	2.1118	0.03177	990.75	1439.76	2092.26
27.56	1.4403	2.0745	0.03560	789.04	1136.46	1636.84
25.79	1.4115	1.9923	0.03181	988.26	1394.93	1968.95
Σ	8.5221	12.1094		30343.38	41715.06	57368.16

$$\chi^2 = 57368.16 - \frac{41715.06^2}{30343.38} = 19.70$$

$$f = 6 - 1 = 5 \quad \chi_{(5),0.05}^2 = 11.1$$

The calculated χ^2 (19.70) is greater than the tabulated value (11.1), the 6 estimates are heterogeneous.

$$\bar{M} = \frac{8.5221}{6} = 1.4203$$

$$\bar{P}_T = \text{antilog } 1.4203 = 26.32 \text{ Units/mg}$$

$$S_M = \sqrt{\frac{1.4135^2 + 1.3646^2 + \dots + 1.4115^2 - \frac{8.5221^2}{6}}{6(6-1)}} = 0.013$$

$$f = 6 - 1 = 5 \quad t = 2.57$$

$$FL \text{ of } \bar{P}_T = \text{antilog } (1.4203 \pm 2.57 \times 0.013) = 24.37 - 28.43 \text{ Units/mg}$$

$$FL\% = \left(\frac{28.43 - 24.37}{2 \times 26.32} \times 100 \right) \% = 7.7\%$$

5. Glossary of Symbols

A_T	The assumed or labelled potency of test preparation (T)
C	Incomplete sum of response in a column containing the missing value
C_i	Orthogonal coefficient used in validity test
$d_{S_1}, d_{S_2} \dots$	Dose levels of the standard preparation (S)
$d_{T_1}, d_{T_2} \dots$	Dose levels of the test preparation (T)
F	The mean square of each variable expressed as a ratio of s^2
FL	Fiducial limits
$FL\%$	Percentage of fiducial limits
f	Degrees of freedom
G	Incomplete sum of response in an assay excluding the missing value
g	Index of regression significance
I	Logarithm of the ratio between adjacent doses (r)
K	Total number of doses of S and T
$k \cdot k'$	Number of doses of S or T
M	Logarithm of the potency ratio (R)
m	Number of responses to each dose
n	Total number of responses to S and T
n_S	Number of responses to S
n_T	Number of responses to T
P	Probability
P_T, P_U	Estimated potency of test preparation (T, U)
R	Estimated potency ratio before correction by assumed potency, $R = \text{antilog } M$
R	Incomplete sum of response in a row containing the missing value
r	Ratio of adjacent doses
S	Standard preparation
$S_1, S_2 \dots$	Sum of the responses to each dose of standard preparation
S_M	Standard error of M
s^2	Error variance
T	Test preparation
$T_1, T_2 \dots$	Sum of the responses of each dose of test preparation
U	Another symbol used to represent test preparation
$U_1, U_2 \dots$	Sum of the responses to each dose of U
x	Logarithm of dose
x_S	Logarithm of minimum effective dose of S
x_T	Logarithm of minimum effective dose of T
\bar{x}_S	Mean log minimum effective dose of S
\bar{x}_T	Mean log minimum effective dose of T
y	Individual response or transformed response
y_1, y_m	Observed response listed in order of magnitude
$\sum y_{(k)}$	Sum of the responses to each dose of S or T
$\sum y_{(m)}$	Sum of the responses to each block or row

A white crystalline powder; odourless; tasteless; when slowly heated, sublimes but does not decompose. Soluble in boiling water, sodium hydroxide solution or sodium carbonate solution; slightly soluble in water; practically insoluble in ethanol, chloroform or ether.

Ascorbic Acid [$C_6H_8O_6$ 176.13]

Complies with the requirements prescribed in the monograph of the Chinese Pharmacopoeia.

Auric Chloride [$HAuCl_4 \cdot 3H_2O$ 393.83]

Bright yellow or orange crystals.

Soluble in water, ethanol or ether; slightly soluble in chloroform.

Azo Violet [$C_{12}H_9N_3O_4$ 259.22]

A reddish-brown powder.

Soluble in acetic acid, sodium hydroxide solution or toluene.

Barbital [$C_8H_{12}N_2O_3$ 184.19]

White crystals or powder; taste, slightly bitter.

Soluble in hot water, ethanol, ether or alkaline solution.

Barbital Sodium [$C_8H_{11}N_2NaO_3$ 206.18]

White crystals or powder; taste, bitter.

Soluble in water; slightly soluble in ethanol; insoluble in ether.

Barium Chloride [$BaCl_2 \cdot 2H_2O$ 244.26]

White crystals or granules.

Freely soluble in water or methanol; practically insoluble in ethanol, acetone or ethyl acetate.

Barium Hydroxide [$Ba(OH)_2 \cdot 8H_2O$ 315.46]

White crystals; absorbs carbon dioxide easily to form barium carbonate.

Freely soluble in water; slightly soluble in ethanol.

Barium Nitrate [$Ba(NO_3)_2$ 261.34]

White crystals or crystalline powder; burns and detonates when being in contact, rubbing or bumping with organic substances.

Soluble in water; slightly soluble in ethanol.

Barium Perchlorate [$Ba(ClO_4)_2 \cdot 3H_2O$ 390.32]

Colourless crystals. Poisonous.

Soluble in water or methanol; slightly soluble in ethanol, ethyl acetate or acetone; practically insoluble in ether.

Beef Extract

A yellowish-brown to dark brown pasty substance; odour, characteristic of beef; taste sour.

Soluble in water.

Chloride Not more than 6% of the total solids, calculated as NaCl.

Nitrate Decolourize a solution of beef extract (1→10) by boiling with active charcoal, filter, add 1 drop of the filtrate to 3 drops of a solution of diphenylamine in sulfuric acid (1→100), no blue colour is developed.

Ethanol insoluble substance To 25 ml of a solution of beef extract (1→10) add 50 ml of ethanol, shake thoroughly and filter, wash the residue with dilute ethanol (2→3), dry it at 105°C for 2 hours, the residue is not more than 10% of the total solids.

Ethanol soluble nitrogen The nitrogen content of the filtrate obtained in the test for ethanol insoluble substance is not less than 6% of the ethanol soluble substance.

Total solids Mix 10 ml of a solution of beef extract (1→10) with clean sand or asbestos, dry at 105°C for 16 hours, the residue is not less than 0.75 g.

Residue on ignition Not more than 30% of the total solids (Appendix VIII N).

Beef Hemoglobin

Dark brown crystals or crystalline powder.

Soluble in water or dilute acid.

Purity One band should be obtained after developing by electrophoresis on cellulose acetate membrane.

Total Nitrogen Not less than 16.0% (Appendix VII D, Method 1).

Loss on drying When dried to constant weight at 105°C, loses not more than 10.5% of its weight.

Residue on ignition Not more than 1.0% (Appendix VIII N).

Benzalkonium Chloride A white or pale yellow powder or gelatinous flakes.

Very soluble in water, ethanol or acetone; slightly soluble in benzene; practically insoluble in ether.

Benzene [C_6H_6 78.11]

A colourless clear liquid; odour, characteristic; inflammable.

Miscible with ethanol, ether, acetone, carbon tetrachloride, carbon disulfide or acetic acid; slightly soluble in water.

Boiling point: 80.1°C.

Benzidine Acetate [$C_{14}H_{16}N_2O_2$ 244.29]

White or pale yellow crystals or powder.

Soluble in water, acetic acid or hydrochloric acid; very slightly soluble in ethanol.

Benzoic Acid [C_6H_5COOH 122.12]

Complies with the requirements prescribed in monograph of the Chinese Pharmacopoeia.

Benzoquinone [$C_6H_4O_2$ 108.10]

Yellow crystals; odour, characteristic; sublimable.

Soluble in ethanol or ether; slightly soluble in water.

Benzoyl-DL-argrinylnaphthylamine Hydrochloride

[$C_{23}H_{25}N_5O_2 \cdot HCl$ 439.94]

White crystals.

Soluble in water or ethanol.

Benzoyl Chloride [C_6H_5COCl 140.57]

A colourless, clear liquid; irritant; corrosive; fuming on exposure to moist air; its vapour is corrosive and lachrymatory. Miscible with ether, benzene, carbon disulfide or oil; decomposes in water or ethanol.

Bismuth Subnitrate [$4BiNO_3(OH)_2 \cdot BiO(OH)$ 1461.99]

A white powder; heavy; odourless; tasteless; slightly hygroscopic.

Soluble in hydrochloric acid, nitric acid, dilute sulfuric acid or acetic acid; practically insoluble in water or ethanol.

Bis(cyclohexanone)oxalyldihydrazone [$C_{14}H_{22}N_4O_2$ 278.36]

White crystals.

Soluble in hot methanol or ethanol; insoluble in water.

Borax [$Na_2B_4O_7 \cdot 10H_2O$ 381.37]

White crystals or granules; hard.

Soluble in water and glycerin; insoluble in ethanol or acid.

Boric Acid [H_3BO_3 61.83]

White transparent crystals or a crystalline powder; with pear-like luster.

Freely soluble in hot water, hot ethanol or hot glycerin; soluble in water or ethanol; slightly soluble in acetone or ether.

Brilliant Green [$C_{27}H_{33}N_2 \cdot HSO_4$ 482.64]

Lustrous golden crystals.

Soluble in water or ethanol, the colour of solution is green.

Bromine [Br_2 159.81]

A deep red liquid, odour, asphyxiating irritant; fuming; freely volatile.

Miscible with ethanol, chloroform, ether benzene or carbon disulfide; slightly soluble in water.

Bromocresol Green [$C_{21}H_{14}Br_4O_5S$ 698.02]

A pale yellow or brown powder.

Soluble in ethanol or dilute alkaline solution; insoluble in

water.

Bromocresol Purple [$C_{21}H_{16}Br_2O_5S$ 540.23]

A pale yellow or pale red crystalline powder.
Soluble in ethanol or dilute alkaline solution; insoluble in water.

Bromophenol Blue [$C_{19}H_{10}Br_4O_5S$ 669.97]

A yellow powder.
Soluble in ethanol, ether, benzene or dilute alkaline solution; slightly soluble in water.

Bromothymol Blue [$C_{27}H_{28}Br_2O_5S$ 624.39]

A white or pale red crystalline powder.
Freely soluble in ethanol, dilute alkaline solution or ammonia solution; slightly soluble in water.

2,3-Butanedione [$C_4H_6O_2$ 86.09]

A yellowish-green liquid; odour, characteristic.
Miscible with ethanol or ether; soluble in water.

Butanol (*n*-Butanol) [$CH_3(CH_2)_3OH$ 74.12]

A clear, colourless liquid; odour, characteristic; inflammable; highly refractive.
Miscible with ethanol, ether or benzene; soluble in water.
Boiling point: 117-118°C.

t-Butanol [$(CH_3)_3COH$ 74.12]

White crystals, or liquid when contain small amount of water; odour, camphor like; hygroscopic; inflammable.
Miscible with ethanol or ether; soluble in water.
Boiling point: 82.4°C.

Butanone [$CH_3COC_2H_5$ 72.11]

A colourless liquid; freely volatile; inflammable; azeotropic with water; acutely irritant to mucous membrane of nose and eyes.
Miscible with ethanol or ether.

Butyl Acetate [$CH_3COO(CH_2)_3CH_3$ 116.16]

A clear, colourless liquid.
Miscible with ethanol or ether; insoluble in water.

Butylated Hydroxytoluene [$C_{15}H_{24}O$ 220.4]

Colourless crystals or a white crystalline powder.
Melting point: about 70°C.

Cadmium Acetate [$Cd(C_2H_3O_2)_2 \cdot 2H_2O$ 266.53]

White crystals.
Freely soluble in water; soluble in ethanol; very slightly soluble in ether.

Cadmium Iodide [CdI_2 366.22]

White or pale yellow crystals or a crystalline powder.
Soluble in water, ethanol, ether, ammonia solution or acids.

Cadmium Nitrate [$Cd(NO_3)_2 \cdot 4H_2O$ 308.49]

White needle or prismatic crystals; hygroscopic. Hypergolic and detonable when mixed with organic substances.
Freely soluble in water, soluble in ethanol, acetone or ethyl acetate; practically insoluble in concentrated nitric acid.

Calcein [$C_{30}H_{24}N_2Na_2O_{13}$ 666.51]

A bright yellow powder.
Soluble in water; insoluble in dehydrated ethanol or ether.

Calcium Carbonate [$CaCO_3$ 100.09]

A white crystalline powder.
Soluble in acid; insoluble in water and ethanol.

Calcon Carboxylic Acid

Brown to black colour crystals or a brown powder.
Freely soluble in alkaline solution and ammonia solution; slightly soluble in water.

Calcium Chloride [$CaCl_2 \cdot 2H_2O$ 147.01]

White granules or lumps; hygroscopic.
Freely soluble in water or ethanol.

Calcium Hydroxide [$Ca(OH)_2$ 74.09]

A white crystalline powder; absorbs carbon dioxide easily to form calcium carbonate.
Slightly soluble in water.

Calcium Sulfate [$CaSO_4 \cdot 2H_2O$ 172.17]

A white crystalline powder.
Soluble in solutions of ammonium salts, sodium thiosulfate, sodium chloride or acids; insoluble in water or ethanol.

Calcon [$C_{20}H_{13}N_2NaO_5S$ 416.39]

A brown or brownish-black powder.
Soluble in water or ethanol.

Camphor Sulfonic Acid [$C_{10}H_{16}O_4S$ 232.30]

White column or crystals.
Slightly soluble in glycerin, glacial acetic acid or ethyl acetate; very slightly soluble in ethanol; practically insoluble in ether.

Carbon Disulfide [CS_2 76.14]

A clear, colourless liquid; the pure substance has an ether-like odour; the usual commercial grade has a foul smell; inflammable; decomposes on standing for a long time.
Freely soluble in ethanol or ether; insoluble in water. It can dissolve iodine, bromine, sulphur, fat, rubber etc.
Boiling point: 46.5°C.

Carbon Tetrachloride [CCl_4 153.82]

A clear, colourless liquid; odour, characteristic; heavy.
Miscible with ethanol, chloroform, ether or benzene; very slightly soluble in water.

Casein

A white or pale yellow granular powder; odourless.
Insoluble in water or other neutral solvent; freely soluble in solutions of alkali hydroxide.
Alkalinity Shake 1 g of the casein with 20 ml of water for 10 minutes and filter, the filtrate exhibits no alkaline reaction with litmus paper.
Nitrogen 15.2%-16.0%, calculated on the dried basis (Appendix VII D).
Fats Not more than 0.5% (Appendix VII H).
Water soluble matter Not more than 0.1%.
Residue on ignition Not more than 1% (Appendix VII N).
Loss on drying Not more than 10.0% (Appendix VII L).

Catechol [$C_6H_6O_2$ 110.11]

Colourless or pale grey crystals or a crystalline powder; volatilizes with steam.
Freely soluble in water, ethanol or benzene.

Catechol Violet [$C_{10}H_{14}O_7S$ 386.38]

A reddish-brown crystalline powder with metallic lustre.
Freely soluble in water or ethanol.

Ceric Ammonium Nitrate [$(NH_4)_2Ce(NO_3)_6$ 548.22]

Reddish-orange crystals; strong oxidizing agent.
Soluble in water or ethanol; insoluble in concentrated nitric acid.

Ceric Ammonium Sulfate [$(NH_4)_4Ce(SO_4)_4 \cdot 2H_2O$ 633]

A yellow or orange-yellow crystalline powder.
Soluble in solutions of acid; slightly soluble in water; insoluble in acetic acid.

Ceric Sulfate [$Ce(SO_4)_2$ 332.24]

Deep yellow crystals.
Soluble in hot acid solution; slightly soluble in water, decomposes with the formation of basic salt.

Cerous Nitrate [$Ce(NO_3)_3 \cdot 6H_2O$ 434.22]

White, transparent crystals.
Soluble in water, ethanol or acetone.

Cetrimonium Bromide [$C_{16}H_{33}N(CH_3)_3Br$ 364.45]

A white crystalline powder.

Soluble in water; slightly soluble in ethanol; insoluble in ether.

Chloral Hydrate [$C_2H_3Cl_3O_2$ 165.40]

White crystals; odour, pungent; irritant to skin; volatilizes gradually on exposure to air; turns to yellow after long time storage.

Soluble in ethanol, chloroform or ether; soluble in water with hydrolysis.

Chloramine T [$C_7H_7ClNNaO_2S \cdot 3H_2O$ 281.69]

A white crystalline powder; odour, faintly chlorine-like.

Soluble in water; insoluble in chloroform or benzene.

Chlorinated Lime (Bleaching powder)

Complies with the requirements prescribed in monograph of the Chinese Pharmacopoeia.

p-Chloroaniline [C_6H_5ClN 127.57]

White or deep yellow crystals.

Soluble in hot water, ethanol, acetaldehyde or acetone.

Chloroform [$CHCl_3$ 119.38]

A colourless, clear liquid; heavy; refractive; volatilizes easily.

Miscible with ethanol, ether, benzene or petroleum benzin; slightly soluble in water.

Chloroform, Alcohol Free [$CHCl_3$ 119.38]

Wash 500 ml of chloroform with three portions of water, each of 50 ml. Dry the chloroform layer over anhydrous sodium sulfate for 12 hours, filter with absorbent cotton and distill. This solution should be freshly prepared.

p-Chlorophenol [C_6H_5ClO 128.56]

White crystals; odour, phenolic.

Freely soluble in ethanol or ether; slightly soluble in water.

Chloroplatinic Acid [$H_2PtCl_6 \cdot 6H_2O$ 517.91]

Orange red crystals; highly deliquescent.

Freely soluble in water; soluble in chloroform, acetone or ether.

Cholesterol [$C_{27}H_{46}O$ 386.66]

Monohydrate of cholesterol is white or pale yellow laminar crystals; anhydrous cholesterol is obtained at 70-80°C; it turns to yellow on exposure to air.

Soluble in benzene, petroleum benzin or vegetable oil; slightly soluble in ethanol; practically insoluble in water.

Chrome Azurol S [$C_{23}H_{13}Cl_2Na_3O_9S$ 605.31]

A brown powder.

Soluble in water to form a brownish-yellow solution; shows lower solubility in ethanol than in water with reddish-brown colour.

Chromium Trioxide [CrO_3 99.99]

Dark red crystals; powerful oxidizing agent and corrosive; hygroscopic; may cause inflame in contact with organic substances.

Freely soluble in water; soluble in sulfuric acid.

Chromotropic Acid [$C_{10}H_8O_8S_2 \cdot 2H_2O$ 356.33]

White crystals.

Soluble in water.

Cinchonine [$C_{19}H_{22}N_2O$ 294.40]

White crystals or a powder; taste, slightly bitter; darkens on exposure to light.

Soluble in ethanol or chloroform; slightly soluble in ether; practically insoluble in water.

Citric Acid [$C_6H_8O_7 \cdot H_2O$ 210.14]

White crystals or granules; efflorescent; hygroscopic.

Freely soluble in water or ethanol.

Cobaltous Acetate [$Co(C_2H_3O_2)_2 \cdot 4H_2O$ 249.08]

Violet-red crystals.

Soluble in water, ethanol, dilute acid or amyl acetate.

Cobaltous Chloride [$CoCl_2 \cdot 6H_2O$ 237.93]

Red or purplish-red crystals.

Freely soluble in water or ethanol; soluble in acetone; slightly soluble in ether.

Cobaltous Nitrate [$Co(NO_3)_2 \cdot 6H_2O$ 291.03]

White crystals or crystalline granules.

Freely soluble in water or ethanol; slightly soluble in acetone or ammonia solution.

Concentrated Ammonia Solution (Strong ammonia solution)

[NH_4OH 35.05]

A colourless, clear liquid; corrosive; contains 25%-28% (g/g) of NH_3 . Miscible with ethanol or ether.

Congo Red [$C_{32}H_{22}N_6Na_2O_6S_2$ 696.68]

A reddish-brown powder.

Soluble in water or ethanol.

Coomassie Brilliant Blue G 250 [$C_{47}H_{48}N_3NaO_7S_2$

854.04]

A violet crystalline powder.

Soluble in hot water or ethanol; slightly soluble in water.

Coomassie Brilliant Blue R 250 [$C_{45}H_{44}N_3NaO_7S_2$

825.99]

A violet powder.

Soluble in hot water or ethanol; insoluble in water.

m-Cresol Purple [$C_{21}H_{18}O_5S$ 382.44]

A reddish-yellow or brownish-green powder.

Freely soluble in methanol, ethanol or sodium hydroxide solution; slightly soluble in water.

Cresol Red [$C_{21}H_{18}O_5S$ 382.44]

A deep red, reddish-brown or dark green powder.

Freely soluble in ethanol or dilute sodium hydroxide solution; slightly soluble in water.

Crystal Violet [$C_{25}H_{30}ClN_3$ 407.99]

A dull green powder with metallic luster.

Soluble in water, ethanol or chloroform; insoluble in ether.

Cupric Acetate [$Cu(C_2H_3O_2)_2 \cdot H_2O$ 199.65]

Dark green crystals.

Soluble in water or ethanol; slightly soluble in ether or glycerin.

Cupric Chloride [$CuCl_2 \cdot 2H_2O$ 170.48]

Pale Bluish-green crystals.

Soluble in water, ethanol or methanol; slightly soluble in acetone or ethyl acetate.

Cupric Nitrate [$Cu(NO_3)_2 \cdot 3H_2O$ 241.60]

Blue, columnar crystals; burns and detonates when heated, rubbed or bumped with pulverized carbon, sulphur or other combustible substances.

Soluble in water or ethanol.

Cupric Sulfate [$CuSO_4 \cdot 5H_2O$ 249.69]

Blue crystals, granules or crystalline powder.

Soluble in water; slightly soluble in ethanol.

Cupric Sulfate, Anhydrous [$CuSO_4$ 159.61]

Greyish-white or greenish-white crystals or an amorphous powder; hygroscopic.

Soluble in water; practically insoluble in ethanol.

Curcuma Powder (Turmeric Powder)

A powder of the rhizome of *Curcuma longa* L. (Fam. Gingeraceae), containing 5% volatile oil, yellow curcumin, starch and resin.

Cyclohexane [C_6H_{12} 84.16]

A colourless, clear liquid; inflammable.

Miscible with methanol, ethanol, acetone, ether, benzene or carbon tetrachloride; practically insoluble in water.

Boiling point; 80.7°C.

Cysteine Hydrochloride [$\text{CH}_2(\text{SH})\text{CH}(\text{NH}_2)\text{COOH} \cdot \text{HCl}$ 157.62]

White crystals.

Soluble in water or ethanol.

L-Cystine [$\text{C}_6\text{H}_{12}\text{N}_2\text{O}_4\text{S}_2$ 240.30]

White crystals.

Soluble in acid or alkali solution; practically insoluble in water or ethanol.

Dextrin

Complies with the requirements prescribed in monograph of the Chinese Pharmacopoeia.

p-Diaminobenzene (*p*-Phenylenediamine) [$\text{C}_6\text{H}_4(\text{NH}_2)_2$ 108.14]

White or pale red crystals; darkens on exposure to air; sublimes easily on heating.

Soluble in ethanol, chloroform or ether; slightly soluble in water.

Diaminobenzidine Hydrochloride [$\text{C}_{12}\text{H}_{14}\text{N}_4 \cdot 4\text{HCl} \cdot 2\text{H}_2\text{O}$ 396.14]

A white or grey powder.

Soluble in water, its aqueous solution is readily oxidized and discoloured.

2,3-Diaminonaphthalene (2,3-Naphthalene diamine)

[$\text{C}_{10}\text{H}_8\text{N}_2$ 158.20]

Foliceous crystals.

Soluble in ethanol or ether.

Diammonium Hydrogen Phosphate [$(\text{NH}_4)_2\text{HPO}_4$ 132.06]

White crystals or a crystalline powder.

It loses ammonia on exposure to air and turns into ammonium dihydrogen phosphate.

Soluble in water; insoluble in ethanol.

Dibutyl Phthalate [$\text{C}_{16}\text{H}_{22}\text{O}_4$ 278.35]

A colourless or pale yellow oily liquid.

Freely soluble in ethanol, acetone, ether or benzene; practically insoluble in water.

Dichloromethane [CH_2Cl_2 84.93]

A colourless liquid; odour, ether-like.

Miscible with ethanol, ether or dimethylformamide; sparingly soluble in water.

Boiling point; 40-41°C.

2,6-Dichloroindophenol Sodium [$\text{C}_{12}\text{H}_6\text{Cl}_2\text{NNaO}_2 \cdot 2\text{H}_2\text{O}$ 326.11]

Grass green, fluorescent crystals or a dark green powder.

Freely soluble in water or ethanol; insoluble in chloroform or ether.

2,6-Dichloroquinone Chlorimide [$\text{C}_6\text{H}_2\text{Cl}_3\text{NO}$ 210.45]

A greyish-yellow crystalline powder.

Freely soluble in chloroform or ether; soluble in hot ethanol or dilute sodium hydroxide solution; insoluble in water.

Diethylamine [$(\text{C}_2\text{H}_5)_2\text{NH}$ 73.14]

A colourless liquid; odour, ammonia-like; strongly alkaline; corrosive; freely volatile; inflammable.

Miscible with water or ethanol.

Digitonin [$\text{C}_{56}\text{H}_{92}\text{O}_{29}$ 1229.33]

White crystals.

Sparingly soluble in dehydrated ethanol; slightly soluble in ethanol; practically insoluble in water, chloroform or ether.

2,7-Dihydroxynaphthalene (2,7-Naphthalenediol)

[$\text{C}_{10}\text{H}_8\text{O}_2$ 160.17]

White needle or scale crystals; the colour of solution darkens quickly on exposure to air.

Soluble in hot water, ethanol or ether; slightly soluble in chloroform or benzene.

3,5-Dihydroxy Toluene [$\text{C}_7\text{H}_8\text{O}_2 \cdot \text{H}_2\text{O}$ 142.14]

White crystals; easily oxidized to red in air; odour, unpleasant; taste, sweet.

Soluble in water or ethanol; slightly soluble in benzene, chloroform or carbon disulfide.

p-Dimethylaminobenzaldehyde [$\text{C}_9\text{H}_{11}\text{NO}$ 149.19]

White or pale yellow crystals; odour, characteristic; gradually turns to red on exposure to light.

Soluble in ethanol, acetone, chloroform, ether or acetic acid; slightly soluble in water.

Dimethylformamide [$\text{HCON}(\text{CH}_3)_2$ 73.09]

A colourless liquid with slight ammonia odour.

Miscible with water, ethanol, chloroform or ether.

Dimethylglyoxime [$\text{CH}_3\text{C}(\text{NOH})\text{C}(\text{NOH})\text{CH}_3$ 116.12]

A white powder.

Soluble in ethanol or ether; insoluble in water.

N,N-Dimethyl-p-phenylenediamine Dihydrochloride

[$\text{C}_8\text{H}_{12}\text{N}_2 \cdot 2\text{HCl}$ 209.12]

A white or greyish-white crystalline powder; darkens gradually on exposure to air; hygroscopic.

Soluble in water or ethanol.

Dimethylsulfoxide [$(\text{CH}_3)_2\text{SO}$ 78.14]

A colourless, viscous liquid; very hygroscopic; taste, slightly bitter; violent reaction occurs in contact with chlorine at room temperature.

Soluble in water, ethanol, acetone, chloroform, ether or benzene.

Dimethyl Yellow [$\text{C}_{14}\text{H}_{15}\text{N}_3$ 225.29]

A golden yellow crystalline powder.

Soluble in ethanol, chloroform, ether, benzene, petroleum ether or sulfuric acid; insoluble in water.

2,4-Dinitroaniline [$\text{C}_6\text{H}_5\text{N}_2\text{O}_4$ 183.12]

Yellow or yellowish-green crystals.

Soluble in chloroform or ether; slightly soluble in ethanol; insoluble in water.

m-Dinitrobenzene [$\text{C}_6\text{H}_4(\text{NO}_2)_2$ 168.11]

A pale yellow crystal; inflammable.

Freely soluble in chloroform, ethyl acetate or benzene; soluble in ethanol; slightly soluble in water.

3,5-Dinitrobenzoic Acid [$\text{C}_7\text{H}_4\text{N}_2\text{O}_6$ 212.12]

White or pale yellow crystals; volatilizes with steam.

Freely soluble in ethanol or glacial acetic acid; slightly soluble in water, ether, benzene or carbon disulfide.

2,4-Dinitrochlorobenzene [$\text{C}_6\text{H}_3\text{ClN}_2\text{O}_4$ 202.55]

Yellow crystals. It may cause explosion when heated to high temperature.

Freely soluble in hot ethanol; soluble in ether, benzene or carbon disulfide; insoluble in water.

2,4-Dinitrophenol [$\text{C}_6\text{H}_4\text{N}_2\text{O}_5$ 184.11]

Yellow, rhombic crystals; sublimes on heating.

Soluble in ethanol, ether, chloroform or benzene; very slightly soluble in cold water.

2,4-Dinitrophenylhydrazine [$\text{C}_8\text{H}_8\text{H}_4\text{O}_4$ 198.14]

A red crystalline powder; stable in acid solution, unstable in alkaline solution.

Soluble in hot ethanol, ethyl acetate, aniline or dilute mineral acids; slightly soluble in water and ethanol.

Diethyl Phthalate [$\text{C}_{12}\text{H}_{16}\text{O}_4$ 390.56]

A colourless or pale yellow oily liquid; odour, slight characteristic.

Miscible with organic solvent; insoluble in water.

Diethyl Sodium Sulfosuccinate [$C_{20}H_{37}NaO_7S$ 444.57]

White, wax-like solids.

Soluble in water, methanol, acetone, benzene, or carbon tetrachloride. Easily hydrolyzes in alkaline solution.

Dioxane [$C_4H_8O_2$ 88.11]

A colourless liquid; odour, ether-like; inflammable; freely absorbs oxygen to form peroxide.

Miscible with water or most of organic solvents.

Boiling range: 100-103°C.

Diphenylamine [$(C_6H_5)_2NH$ 169.23]

White crystals; odour, aromatic; gradually discolours on exposure to light.

Soluble in ether, benzene, glacial acetic acid or carbon disulfide; insoluble in water.

Diphenylcarbazine [$C_6H_5NHNHCONHNHC_6H_5$ 242.28]

A white, crystalline powder; gradually turns to red in air.

Soluble in hot ethanol, acetone or glacial acetic acid; very slightly soluble in water.

Dipotassium Hydrogen Phosphate [K_2HPO_4 174.18]

White granules or a crystalline powder.

Freely soluble in water; slightly soluble in ethanol.

2,2'-Dipyridyl [$C_5H_4N \cdot C_5H_4N$ 156.19]

A white or pale red crystalline powder.

Freely soluble in ethanol, chloroform, benzene or petroleum benzin; slightly soluble in water.

Disodium Edetate [$C_{10}H_{14}N_2Na_2O_8 \cdot 2H_2O$ 372.24]

A white crystalline powder.

Soluble in water; very slightly soluble in ethanol.

Disodium Hydrogen Phosphate [$Na_2HPO_4 \cdot 12H_2O$ 358.14]

White crystals or a granular powder; efflorescent.

Soluble in water; insoluble in ethanol.

Disodium Hydrogen Phosphate, Anhydrous [Na_2HPO_4 141.96]

A white crystalline powder; hygroscopic; it can absorb 2-7 mol of water on exposure to air for a long time.

Freely soluble in water; insoluble in ethanol.

Distilled Water, Ammonia Free

To 1000 ml of distilled water add 1 ml of dilute sulfuric acid and 1 ml of potassium permanganate TS, distil.

To 50 ml of the distillate add 1 ml of alkaline mercuric potassium iodide TS, no colour is produced.

Eosin Sodium [$C_{20}H_6Br_4Na_2O_5$ 691.86]

A red powder.

Freely soluble in water; an aqueous solution exhibits a red fluorescence; slightly soluble in ethanol; insoluble in ether.

Eriochrome Black T [$C_{20}H_{12}N_3NaO_7S$ 461.39]

A brownish-black powder.

Soluble in water or ethanol.

Ethanol [C_2H_5OH 46.07]

A clear, colourless liquid; freely volatile; inflammable.

Miscible with water, ether or benzene.

Ethanol, Absolute [C_2H_5OH 46.07]

A clear, colourless liquid; odour, alcoholic; inflammable; hygroscopic, it contains not more than 0.3% of water.

Miscible with water, acetone or ether.

Boiling point: 78.5°C.

Ether [$C_2H_5OC_2H_5$ 74.12]

A clear, colourless liquid; taste, paralysing sweet and astringent; freely volatile; inflammable; anaesthetic; oxidized to peroxide on exposure to light or on long storage.

Boiling point: 34.6°C

Ether Dehydrated [$(C_2H_5)_2O$ 74.12]

As described under Ether, but its water content is less than that of Ether.

Ethoxychrysoidine Hydrochloride [$C_{14}H_{16}N_4O \cdot HCl$ 292.77]

A deep reddish-brown or blackish-brown powder.

Soluble in water or ethanol.

Ethyl Acetate [$CH_3COOC_2H_5$ 88.11]

A clear, colourless liquid.

Miscible with acetone, chloroform or ether; soluble in water.

Ethyl Cyanoacetate [$CH_2(CN)COC_2H_5$ 113.12]

A colourless liquid; odour, characteristic of ester; taste, slightly sweet.

Miscible with ethanol or ether; soluble in ammonia solution or alkaline solution; insoluble in water.

Ethyl p-Hydroxybenzoate [$C_9H_{10}O_3$ 166.17]

White crystals; odourless; tasteless.

Soluble in ethanol, ether; slightly soluble in water.

Ethylene glycol monoethyl ether [$C_3H_8O_2$ 76.10]

Colourless liquid; odour, pleasant; toxic.

Miscible with water, ethanol, ether, glycerin, acetone and dimethylformamide.

Boiling point: 124.3°C.

N-Ethylmaleimide [$C_6H_7NO_2$ 125.12]

White crystals.

Freely soluble in ethanol or ether; slightly soluble in water.

Ethyl Tetrabromophenolphthalein Potassium [$C_{22}H_{13}Br_4KO_4$ 700.06]

Deep green or purplish-blue crystalline powder.

Soluble in water, ethanol or ether.

Fast Blue BB Salt [$C_{17}H_{18}ClN_3O_3 \cdot \frac{1}{2}ZnCl_2$ 415.96]

A pale cream-red powder

Ferric Ammonium Sulfate [$FeNH_4(SO_4)_2 \cdot 12H_2O$ 482.20]

White to pale violet crystals.

Soluble in water; insoluble in ethanol.

Ferric Chloride [$FeCl_3 \cdot 6H_2O$ 270.30]

Brownish-yellow or orange-yellow crystal-like mass; highly hygroscopic.

Freely soluble in water, ethanol, acetone, ether or glycerin.

Ferrous Sulfate [$FeSO_4 \cdot 7H_2O$ 278.02]

Pale blue crystals or granules.

Soluble in water; insoluble in ethanol.

Fluorane [$C_{20}H_{12}O_3$ 300.31]**Fluorescein** [$C_{20}H_{12}O_5$ 332.11]

An orange or red powder.

Soluble in hot ethanol, glacial acetic acid; in sodium carbonate solution or sodium hydroxide solution; insoluble in water, chloroform or benzene.

Formaldehyde Solution [$HCHO$ 30.03]

A colourless liquid; odour, pungent; it becomes muddy with polymerization when cooled. Slowly oxidized to formic acid on exposure to air. It contains about 37% of $HCHO$.

Miscible with water or ethanol.

Formamide [$HCONH_2$ 45.04]

A colourless, slightly viscous liquid with faint odour of ammonia; hygroscopic; irritant.

Miscible with water or ethanol.

Formic Acid [$HCOOH$ 46.03]

A clear, colourless liquid; odour, pungent; corrosive to skin. It contains not less than 85% of $HCOOH$.

Miscible with water, ethanol, ether or glycerin.

Formic Acid, Anhydrous [$HCOOH$ 46.03]

A clear, colourless liquid; odour, pungent; highly corrosive; strongly acidic; it contains not less than 98% of $HCOOH$.

Miscible with water, ethanol or ether.

Fuchsin Basic

Dark green crystals with metallic lustre.
Soluble in water or ethanol; insoluble in ether.

Furfural [$C_5H_4O_2$ 96.09]

A colourless or pale yellow oily liquid; easily turns to brown on exposure to air or light.
Miscible with water, ethanol or ether.

Gallic Acid [$C_7H_5O_5 \cdot H_2O$ 188.14]

White or pale brown crystals or a powder.
Soluble in hot water, ethanol or ether; insoluble in chloroform or benzene.

Gelatin

Complies with the requirements prescribed in monograph of the Chinese Pharmacopoeia.

Glucose [$C_6H_{12}O_6 \cdot H_2O$ 198.17]

Complies with the requirements prescribed in monograph of the Chinese Pharmacopoeia.

Glycerin (Glycerol) [$C_3H_8O_3$ 92.09]

A clear, colourless, viscous liquid; odourless; taste, sweet; hygroscopic.
Miscible with water or ethanol.

Glycine [$C_2H_5NO_2$ 75.07]

A white crystalline powder.
Soluble in water or pyridine; slightly soluble in ethanol; practically insoluble in ether.

Heptane [C_7H_{16} 100.20]

A colourless, clear liquid, inflammable.
Miscible with ethanol, chloroform or ether; insoluble in water.
Boiling point: 98.4°C.

n-Hexane [C_6H_{14} 86.18]

A clear, colourless liquid; odour, characteristic; highly volatile; irritant to respiratory tract.
Miscible with ethanol or ether, insoluble in water.
Boiling point: 69°C.

Holmium Oxide [Ho_2O_3 377.86]

Yellow solid; slightly hygroscopic; dissolves in acid with formation of a yellow salt.
Freely soluble in water.

Hydrazine Sulfate [$(NH_2)_2 \cdot H_2SO_4$ 130.12]

White crystals or powder.
Freely soluble in hot water; slightly soluble in water or ethanol.

Hydrochloric Acid [HCl 36.46]

A colourless, clear liquid; odour, pungent and characteristic; corrosive; fuming on exposure to air. It contains 36%-38% (g/g) of HCl.
Miscible with water or ethanol.

Hydrofluoric Acid [HF 20.01]

A colourless, fuming liquid; odour, pungent; highly corrosive to metal or glass.
Miscible with water or ethanol.

Hydrogen Peroxide Solution (30%) [H_2O_2 34.01]

A colourless, clear liquid; strong oxidizing agent and corrosive.
Miscible with water or ethanol.

Hydroquinone [$C_6H_4(OH)_2$ 110.11]

White or almost white crystals; discoloured on exposure to light.
Freely soluble in hot water; soluble in water, ethanol or ether.

p-Hydroxydiphenyl [$C_{12}H_{10}O$ 170.21]

Almost white crystals.

Freely soluble in ethanol or ether; soluble in alkali solution; insoluble in water.

Hydroxylamine Hydrochloride [$NH_2OH \cdot HCl$ 69.49]

White crystals; decomposes easily when moistened, corrosive.
Soluble in water, ethanol or glycerin.

p-Hydroxyphenylglycine [$C_8H_9NO_3$ 167.16]

White lustrous flakes.
Freely soluble in hydrochloric acid solution (1→5); soluble in acid or alkaline solution; practically insoluble in water, ethanol, ether, acetone, chloroform, benzene, glacial acetic acid or acetate ester.

8-Hydroxyquinoline [C_9H_7NO 145.16]

A white or pale yellow crystalline powder. Odour, phenolic; darkens easily on exposure to light.
Freely soluble in ethanol, acetone, chloroform or mineral acid; Practically insoluble in water.

Hypophosphorous Acid [H_3PO_2 66.00]

White, transparent crystals; colourless oily liquid is formed when over cooled; odourless; hygroscopic. It is a strong reducing agent.
Soluble in water, ethanol or ether.

Imidazole [$C_3H_4N_2$ 68.08]

White, nearly transparent Crystals.
Freely soluble in water, ethanol or pyridine;
Slightly soluble in benzene; very slightly soluble in petroleum ether.

Indigo Carmine [$C_{16}H_8N_2Na_2O_8S_2$ 466.36]

Blue crystals or powder with metallic lustre.
Soluble in water; insoluble in ethanol.

Iodine [I_2 253.81]

Purplish-black scale crystals or masses with metallic lustre.
Soluble in ethanol, ether or solution of potassium iodide; very slightly soluble in water.

Iodine Monochloride [ICl 162.36]

A brownish-red, oily liquid or dark-red crystals; strongly irritant; with odour of chlorine and iodine; corrosive and oxidative.

Iodine Pentoxide [I_2O_5 333.81]

A white crystalline powder; readily decomposes on exposure to light; hygroscopic.
Freely soluble in water to form iodic acid; insoluble in dehydrated ethanol, chloroform, ether or carbon disulfide.

Iodine Trichloride [ICl_3 233.26]

Yellow or pale brown crystals; odour, strongly pungent; volatile at room temperature; readily decomposes in contact with water; hygroscopic; corrosive.
Soluble in water, ethanol, ether or benzene.

Isoamyl Acetate [$CH_3COOCH_2CH_2CH(CH_3)_2$ 130.19]

A clear, colourless liquid; odour, characteristic resembling that of banana.
Miscible with ethyl acetate, ethanol, amyl alcohol, ether, benzene or carbon disulfide; very slightly soluble in water.

Isoamylol [$(CH_3)_2CHCH_2CH_2OH$ 88.15]

Colourless liquid; odour, characteristic; inflammable, miscible with organic solution; slightly soluble in water.
Boiling point: 132°C.

Isobutanol [$(CH_3)_2CHCH_2OH$ 74.12]

A colourless, clear liquid; strongly refractive; inflammable.
Miscible with water, ethanol or ether.
Boiling range: 107.3-108.3°C.

Isobutyl Acetate [$CH_3COOCH_2CH(CH_3)_2$ 116.16]

A colourless liquid; inflammable.
Miscible with ethanol or ether; insoluble in water.

Diethyl Sodium Sulfosuccinate [$C_{20}H_{37}NaO_7S$ 444.57]

White, wax-like solids.

Soluble in water, methanol, acetone, benzene, or carbon tetrachloride. Easily hydrolyzes in alkaline solution.

Dioxane [$C_4H_8O_2$ 88.11]

A colourless liquid; odour, ether-like; inflammable; freely absorbs oxygen to form peroxide.

Miscible with water or most of organic solvents.

Boiling range: 100-103°C.

Diphenylamine [$(C_6H_5)_2NH$ 169.23]

White crystals; odour, aromatic; gradually discolours on exposure to light.

Soluble in ether, benzene, glacial acetic acid or carbon disulfide; insoluble in water.

Diphenylcarbazide [$C_{18}H_{15}NHNHCONHNHC_6H_5$ 242.28]

A white, crystalline powder; gradually turns to red in air.

Soluble in hot ethanol, acetone or glacial acetic acid; very slightly soluble in water.

Dipotassium Hydrogen Phosphate [K_2HPO_4 174.18]

White granules or a crystalline powder.

Freely soluble in water; slightly soluble in ethanol.

2,2'-Dipyridyl [$C_5H_4N \cdot C_5H_4N$ 156.19]

A white or pale red crystalline powder.

Freely soluble in ethanol, chloroform, benzene or petroleum benzin; slightly soluble in water.

Disodium Edetate [$C_{10}H_{14}N_2Na_2O_8 \cdot 2H_2O$ 372.24]

A white crystalline powder.

Soluble in water; very slightly soluble in ethanol.

Disodium Hydrogen Phosphate [$Na_2HPO_4 \cdot 12H_2O$ 358.14]

White crystals or a granular powder; efflorescent.

Soluble in water; insoluble in ethanol.

Disodium Hydrogen Phosphate, Anhydrous [Na_2HPO_4 141.96]

A white crystalline powder; hygroscopic; it can absorb 2-7 mol of water on exposure to air for a long time.

Freely soluble in water; insoluble in ethanol.

Distilled Water, Ammonia Free

To 1000 ml of distilled water add 1 ml of dilute sulfuric acid and 1 ml of potassium permanganate TS, distil.

To 50 ml of the distillate add 1 ml of alkaline mercuric potassium iodide TS, no colour is produced.

Eosin Sodium [$C_{20}H_6Br_4Na_2O_5$ 691.86]

A red powder.

Freely soluble in water; an aqueous solution exhibits a red fluorescence; slightly soluble in ethanol; insoluble in ether.

Eriochrome Black T [$C_{20}H_{12}N_3NaO_7S$ 461.39]

A brownish-black powder.

Soluble in water or ethanol.

Ethanol [C_2H_5OH 46.07]

A clear, colourless liquid; freely volatile; inflammable.

Miscible with water, ether or benzene.

Ethanol, Absolute [C_2H_5OH 46.07]

A clear, colourless liquid; odour, alcoholic; inflammable; hygroscopic, it contains not more than 0.3% of water.

Miscible with water, acetone or ether.

Boiling point: 78.5°C.

Ether [$C_2H_5OC_2H_5$ 74.12]

A clear, colourless liquid; taste, paralysing sweet and astringent; freely volatile; inflammable; anaesthetic; oxidized to peroxide on exposure to light or on long storage.

Boiling point: 34.6°C

Ether Dehydrated [$(C_2H_5)_2O$ 74.12]

As described under Ether, but its water content is less than that of Ether.

Ethoxychrysoidine Hydrochloride [$C_{14}H_{16}N_4O \cdot HCl$ 292.77]

A deep reddish-brown or blackish-brown powder.

Soluble in water or ethanol.

Ethyl Acetate [$CH_3COOC_2H_5$ 88.11]

A clear, colourless liquid.

Miscible with acetone, chloroform or ether; soluble in water.

Ethyl Cyanoacetate [$CH_2(CN)COC_2H_5$ 113.12]

A colourless liquid; odour, characteristic of ester; taste, slightly sweet.

Miscible with ethanol or ether; soluble in ammonia solution or alkaline solution; insoluble in water.

Ethyl p-Hydroxybenzoate [$C_9H_{10}O_3$ 166.17]

White crystals; odourless; tasteless.

Soluble in ethanol, ether; slightly soluble in water.

Ethylene glycol monoethyl ether [$C_5H_{10}O_2$ 76.10]

Colourless liquid; odour, pleasant; toxic.

Miscible with water, ethanol, ether, glycerin, acetone and dimethylformamide.

Boiling point: 124.3°C.

N-Ethylmaleimide [$C_6H_7NO_2$ 125.12]

White crystals.

Freely soluble in ethanol or ether; slightly soluble in water.

Ethyl Tetrabromophenolphthalein Potassium [$C_{22}H_{13}Br_4KO_4$ 700.06]

Deep green or purplish-blue crystalline powder.

Soluble in water, ethanol or ether.

Fast Blue BB Salt [$C_{17}H_{18}ClN_3O_3 \cdot \frac{1}{2}ZnCl_2$ 415.96]

A pale cream-red powder

Ferric Ammonium Sulfate [$FeNH_4(SO_4)_2 \cdot 12H_2O$ 482.20]

White to pale violet crystals.

Soluble in water; insoluble in ethanol.

Ferric Chloride [$FeCl_3 \cdot 6H_2O$ 270.30]

Brownish-yellow or orange-yellow crystal-like mass; highly hygroscopic.

Freely soluble in water, ethanol, acetone, ether or glycerin.

Ferrous Sulfate [$FeSO_4 \cdot 7H_2O$ 278.02]

Pale blue crystals or granules.

Soluble in water; insoluble in ethanol.

Fluorane [$C_20H_{12}O_3$ 300.31]**Fluorescein** [$C_{20}H_{12}O_5$ 332.11]

An orange or red powder.

Soluble in hot ethanol, glacial acetic acid; in sodium carbonate solution or sodium hydroxide solution; insoluble in water, chloroform or benzene.

Formaldehyde Solution [$HCHO$ 30.03]

A colourless liquid; odour, pungent; it becomes muddy with polymerization when cooled. Slowly oxidized to formic acid on exposure to air. It contains about 37% of $HCHO$.

Miscible with water or ethanol.

Formamide [$HCONH_2$ 45.04]

A colourless, slightly viscous liquid with faint odour of ammonia; hygroscopic; irritant.

Miscible with water or ethanol.

Formic Acid [$HCOOH$ 46.03]

A clear, colourless liquid; odour, pungent; corrosive to skin. It contains not less than 85% of $HCOOH$.

Miscible with water, ethanol, ether or glycerin.

Formic Acid, Anhydrous [$HCOOH$ 46.03]

A clear, colourless liquid; odour, pungent; highly corrosive; strongly acidic; it contains not less than 98% of $HCOOH$.

Miscible with water, ethanol or ether.

Fuchsin Basic

Dark green crystals with metallic lustre.
Soluble in water or ethanol; insoluble in ether.

Furfural [$C_5H_4O_2$ 96.09]

A colourless or pale yellow oily liquid; easily turns to brown on exposure to air or light.
Miscible with water, ethanol or ether.

Gallic Acid [$C_7H_6O_5 \cdot H_2O$ 188.14]

White or pale brown crystals or a powder.
Soluble in hot water, ethanol or ether; insoluble in chloroform or benzene.

Gelatin

Complies with the requirements prescribed in monograph of the Chinese Pharmacopoeia.

Glucose [$C_6H_{12}O_6 \cdot H_2O$ 198.17]

Complies with the requirements prescribed in monograph of the Chinese Pharmacopoeia.

Glycerin (Glycerol) [$C_3H_8O_3$ 92.09]

A clear, colourless, viscous liquid; odourless; taste, sweet; hygroscopic.
Miscible with water or ethanol.

Glycine [$C_2H_5NO_2$ 75.07]

A white crystalline powder.
Soluble in water or pyridine; slightly soluble in ethanol; practically insoluble in ether.

Heptane [C_7H_{16} 100.20]

A colourless, clear liquid, inflammable.
Miscible with ethanol, chloroform or ether; insoluble in water.
Boiling point: 98.4°C.

n-Hexane [C_6H_{14} 86.18]

A clear, colourless liquid; odour, characteristic; highly volatile; irritant to respiratory tract.
Miscible with ethanol or ether; insoluble in water.
Boiling point: 69°C.

Holmium Oxide [Ho_2O_3 377.86]

Yellow solid; slightly hygroscopic; dissolves in acid with formation of a yellow salt.
Freely soluble in water.

Hydrazine Sulfate [$(NH_2)_2 \cdot H_2SO_4$ 130.12]

White crystals or powder.
Freely soluble in hot water; slightly soluble in water or ethanol.

Hydrochloric Acid [HCl 36.46]

A colourless, clear liquid; odour, pungent and characteristic; corrosive; fuming on exposure to air. It contains 36%-38% (g/g) of HCl .
Miscible with water or ethanol.

Hydrofluoric Acid [HF 20.01]

A colourless, fuming liquid; odour, pungent; highly corrosive to metal or glass.
Miscible with water or ethanol.

Hydrogen Peroxide Solution (30%) [H_2O_2 34.01]

A colourless, clear liquid; strong oxidizing agent and corrosive.
Miscible with water or ethanol.

Hydroquinone [$C_6H_4(OH)_2$ 110.11]

White or almost white crystals; discoloured on exposure to light.
Freely soluble in hot water; soluble in water, ethanol or ether.

p-Hydroxydiphenyl [$C_{12}H_{10}O$ 170.21]

Almost white crystals.

Freely soluble in ethanol or ether; soluble in alkali solution; insoluble in water.

Hydroxylamine Hydrochloride [$NH_2OH \cdot HCl$ 69.49]

White crystals; decomposes easily when moistened, corrosive.
Soluble in water, ethanol or glycerin.

p-Hydroxyphenylglycine [$C_8H_9NO_3$ 167.16]

White lustrous flakes.
Freely soluble in hydrochloric acid solution (1→5); soluble in acid or alkaline solution; practically insoluble in water, ethanol, ether, acetone, chloroform, benzene, glacial acetic acid or acetate ester.

8-Hydroxyquinoline [C_8H_7NO 145.16]

A white or pale yellow crystalline powder. Odour, phenolic; darkens easily on exposure to light.
Freely soluble in ethanol, acetone, chloroform or mineral acid; Practically insoluble in water.

Hypophosphorous Acid [H_3PO_2 66.00]

White, transparent crystals; colourless oily liquid is formed when over cooled; odourless; hygroscopic. It is a strong reducing agent.
Soluble in water, ethanol or ether.

Imidazole [$C_3H_4N_2$ 68.08]

White, nearly transparent Crystals.
Freely soluble in water, ethanol or pyridine; Slightly soluble in benzene; very slightly soluble in petroleum ether.

Indigo Carmine [$C_{16}H_8N_2Na_2O_8S_2$ 466.36]

Blue crystals or powder with metallic lustre.
Soluble in water; insoluble in ethanol.

Iodine [I_2 253.81]

Purplish-black scale crystals or masses with metallic lustre.
Soluble in ethanol, ether or solution of potassium iodide; very slightly soluble in water.

Iodine Monochloride [ICl 162.36]

A brownish-red, oily liquid or dark-red crystals; strongly irritant; with odour of chlorine and iodine; corrosive and oxidative.

Iodine Pentoxide [I_2O_5 333.81]

A white crystalline powder; readily decomposes on exposure to light; hygroscopic.
Freely soluble in water to form iodic acid; insoluble in dehydrated ethanol, chloroform, ether or carbon disulfide.

Iodine Trichloride [ICl_3 233.26]

Yellow or pale brown crystals; odour, strongly pungent; volatile at room temperature; readily decomposes in contact with water; hygroscopic; corrosive.
Soluble in water, ethanol, ether or benzene.

Isoamyl Acetate [$CH_3COOCH_2CH_2CH(CH_3)_2$ 130.19]

A clear, colourless liquid; odour, characteristic resembling that of banana.
Miscible with ethyl acetate, ethanol, amyl alcohol, ether, benzene or carbon disulfide; very slightly soluble in water.

Isoamylol [$(CH_3)_2CHCH_2CH_2OH$ 88.15]

Colourless liquid; odour, characteristic; inflammable.
Miscible with organic solution; slightly soluble in water.
Boiling point: 132°C.

Isobutanol [$(CH_3)_2CHCH_2OH$ 74.12]

A colourless, clear liquid; strongly refractive; inflammable.
Miscible with water, ethanol or ether.
Boiling range: 107.3-108.3°C.

Isobutyl Acetate [$CH_3COOCH_2CH(CH_3)_2$ 116.16]

A colourless liquid; inflammable.
Miscible with ethanol or ether; insoluble in water.

Isoniazid [$C_6H_7N_3O$ 137.14]

Complies with the requirements prescribed in monograph of the Chinese Pharmacopoeia.

Isooctane

See Trimethylpentane.

Isopentanol [$(CH_3)_2CHCH_2CH_2OH$ 88.15]

A colourless liquid; odour, characteristic; inflammable. Miscible with organic solvent; slightly soluble in water.

Isopropanol [$(CH_3)_2CHOH$ 60.10]

A colourless, clear liquid; odour, characteristic; taste, slightly bitter.

Miscible with water, ethanol or ether.

Boiling range: 82.0-83.0°C.

Isopropyl Ether [$C_6H_{14}O$ 102.18]

A colourless, clear liquid; inflammable.

Miscible with ethanol, ether, chloroform or benzene; slightly soluble in water.

Kerosene, Refined

A colourless or pale yellow oily liquid; odour, characteristic. Miscible with chloroform, benzene or carbon disulfate; insoluble in water or ethanol.

Wash 300 ml of commercial kerosene with 20 ml of crude sulfuric acid in a 500 ml separator for 4-5 times, until the acid layer is pale black, separate the kerosene layer and wash with water. Then wash it with 20 ml of sodium hydroxide solution (1→5), wash it with water and dehydrate with anhydrous calcium chloride, transfer it into a distilling flask, distil under an air condenser, on a sand bath. Collect the distillate in the range of 160-250°C.

Kieselguhr

A white or almost white powder; strongly adsorptive powder and good filter medium.

Insoluble in water, acid or alkali solution.

Lactic Acid [$CH_3CH(OH)COOH$ 90.08]

Complies with the requirements prescribed in monograph of the Chinese Pharmacopoeia.

Lanthanum Nitrate [$La(NO_3)_3 \cdot 6H_2O$ 433.01]

White crystals.

Soluble in water, ethanol or acetone.

Lead Acetate [$Pb(C_2H_3O_2)_2 \cdot 3H_2O$ 379.34]

White crystals or a powder.

Freely soluble in water or glycerin; soluble in ethanol.

Lead Monoxide [PbO 223.20]

A yellow to brownish-yellow powder or crystals.

At 300-500°C, it converts into Pb_3O_4 , but at higher temperature reverts to PbO .

Soluble in hot solution of sodium hydroxide, acetic acid or dilute nitric acid.

Lead Nitrate [$Pb(NO_3)_2$ 331.21]

White crystals; burns and detonates when in contact, rubbed or bumped with organic substances.

Soluble in water; slightly soluble in ethanol.

Lithium Carbonate [Li_2CO_3 73.89]

A white powder or crystals; light.

Soluble in dilute acid; slightly soluble in water; insoluble in ethanol or acetone.

Lithium Chloride [$LiCl$ 42.39]

A white crystalline powder.

Soluble in water, ethanol, acetone, ether, isoamyl alcohol or sodium hydroxide solution.

Lithium Lactate [$LiC_3H_5O_3$ 96.01]

A white powder; odourless.

Soluble in water.

Lithium Sulfate [$Li_2SO_4 \cdot H_2O$ 127.96]

White crystals.

Soluble in water; practically insoluble in ethanol.

Litmus

A blue powder or mass.

Partly soluble in water or ethanol.

Magnesium Chloride [$MgCl_2 \cdot 6H_2O$ 203.30]

White crystals or a powder; hygroscopic.

Soluble in water or ethanol.

Magnesium Nitrate [$Mg(NO_3)_2 \cdot 6H_2O$ 256.42]

White crystals; hygroscopic. Its aqueous solution is neutral, decomposes at 330°C, burns when mixed with inflammable organic substances, inflammable and detonable. Soluble in ethanol, ammonia or water.

Magnesium Sulfate [$MgSO_4 \cdot 7H_2O$ 246.48]

White crystals or a powder; efflorescent.

Freely soluble in water; slowly soluble in glycerin; slightly soluble in ethanol.

Malachite Green [$2C_{23}H_{25}N_2 \cdot 3C_2H_2O_4$ 929.04]

Green flake crystals with metallic lustre.

Freely soluble in hot water or ethanol; very slightly soluble in water.

Malonic Acid [$C_3H_4O_4$ 104.06]

White transparent crystals; strongly irritant.

Soluble in water, methanol, ethanol, ether or pyridine.

Maltose [$C_{12}H_{22}O_{11}$ 342.30]

White crystals (β -type); odour, sweet.

Freely soluble in water; slightly soluble in ethanol; insoluble in ether.

Specific rotation $[\alpha]_D^{20}$: +125°-+137°.

Manganese Dioxide [MnO_2 86.94]

Black crystals or a powder. It can cause burning or explosion when heated or rubbed with organic substances or other reductive substances.

Insoluble in water, nitric acid or cold sulfuric acid; soluble in nitric acid or dilute sulfuric acid in presence of hydrogen peroxide or oxalic acid.

Manganese Sulfate [$MnSO_4 \cdot H_2O$ 169.02]

Pink crystals.

Soluble in water; insoluble in ethanol.

Mannitol [$C_6H_{14}O_6$ 182.17]

White crystals; odourless; taste, sweet.

Soluble in water; slightly soluble in ethanol; practically insoluble in ether.

Mercuric Acetate [$Hg(C_2H_3O_2)_2$ 318.68]

White crystals or a powder; odour, resembling acetic acid.

Soluble in water or ethanol.

Mercuric Bromide [$HgBr_2$ 360.40]

White crystals or a crystalline powder.

Freely soluble in hot ethanol, hydrochloric acid, hydrobromic acid or solution of potassium bromide; slightly soluble in chloroform or ether.

Mercuric Chloride [$HgCl_2$ 271.50]

White crystals or a crystalline powder, slightly volatile at room temperature. It decomposes to mercurous chloride on exposure to light.

Soluble in water, ethanol, acetone or ether.

Mercuric Iodide, Red [HgI_2 454.40]

A emerald red powder; odourless; heavy

Soluble in ether, sodium thiosulfate solution and potassium iodide solution; slightly soluble in dehydrated ethanol; insoluble in water.

Mercuric Nitrate [$Hg(NO_3)_2 \cdot H_2O$ 342.62]

A white or slightly yellow crystalline powder, with an odour of nitric acid; hygroscopic.

Freely soluble in water or dilute acid; a precipitate of basic salt is formed in a large amount of water or boiling water.

Mercurous Nitrate [$\text{HgNO}_3 \cdot \text{H}_2\text{O}$ 280.61]

White crystals; usually with an odour of nitric acid.

Freely soluble in water or dilute nitric acid.

A precipitate of basic salt is formed in a large amount of water.

Mercury [Hg 200.59]

A silver-white lustrous, liquid metal; heavy; slightly volatile at room temperature; produces amalgam with metals other than iron.

Soluble in dilute nitric acid; insoluble in water.

Metaphthalein [$\text{C}_{32}\text{H}_{32}\text{N}_2\text{O}_{12}$ 636.58]

A pale yellow or pale brown powder.

Sensitivity To 10 mg add 1 ml of concentrated ammonia solution, dilute with water to 100 ml and mix well. Mix 5 ml of this solution with 95 ml of water, 4 ml of concentrated ammonia solution, 50 ml of ethanol and 0.1 ml of 0.1 mol/L barium chloride solution. The mixture turns to bluish-purple colour and should be colourless with adding 0.15 ml of 0.1 mol/L EDTA solution.

Methanol [CH_3OH 32.04]

A clear, colourless liquid; volatile; inflammable. It contains 0.1% of water.

Miscible with water, ethanol or ether.

Boiling range: 64-65°C.

Methanol, Anhydrous [CH_3OH 32.04]

A clear, colourless liquid; volatile; burns with a bluish flame without fume. It contains not more than 0.05% of water.

Miscible with water, ethanol or ether.

Boiling point: 64.7°C.

Methyl Acetate [$\text{CH}_3\text{COOCH}_3$ 74.08]

A clear, colourless liquid.

Miscible with water, ethanol or ether.

Methylamine Hydrochloride [$\text{CH}_3\text{NH}_2 \cdot \text{HCl}$ 67.52]

White or almost white crystals; hygroscopic.

Soluble in water or dehydrated ethanol.

N, N'-Methylene Bisacrylamide [$\text{C}_7\text{H}_{10}\text{N}_2\text{O}_2$ 154.17]

A white crystalline powder; hydrolyses in aqueous solution with formation of ammonia and acrylic acid.

Sparingly soluble in water.

Methylene Blue [$\text{C}_{16}\text{H}_{18}\text{ClN}_3\text{S} \cdot 3\text{H}_2\text{O}$ 373.90]

Deep emerald green crystals or a dark brown powder; with bronze lustre.

Freely soluble in hot water.

Methyl Isobutyl Ketone [$\text{CH}_3\text{COCH}_2\text{CH}(\text{CH}_3)_2$ 100.16]

A colourless liquid; inflammable.

Miscible with ethanol, ether or benzene; slightly soluble in water.

p-Methylaminophenol Sulfate [$\text{C}_6\text{H}_7\text{N}_2\text{O}_2 \cdot \text{H}_2\text{SO}_4$ 344.39]

White crystals; turns grey on exposure to light.

Soluble in water; insoluble in ethanol or ether.

Methyl p-Hydroxybenzoate [$\text{C}_8\text{H}_8\text{O}_3$ 152.14]

Colourless crystals or white crystalline powder; odourless or slightly irritant.

Soluble in ethanol, ether or acetone; slightly soluble in benzene or carbon tetrachloride; practically insoluble in water.

Methyl Orange [$\text{C}_{14}\text{H}_{14}\text{N}_3\text{NaO}_3\text{S}$ 327.34]

Orange crystals or a powder.

Freely soluble in hot water; practically insoluble in ethanol.

Methyl Red [$\text{C}_{15}\text{H}_{15}\text{N}_3\text{O}_2$ 269.30]

Purplish-red crystals.

Soluble in ethanol or acetic acid; insoluble in water.

Morphine, Anhydrous [$\text{C}_{17}\text{H}_{19}\text{NO}_3$ 285.34]

Rhombic, short columnar prism crystals (crystallized from anisole); decomposes at 254°C.

α -Naphthol (1-Naphthol) [$\text{C}_{10}\text{H}_7\text{OH}$ 144.17]

White, pale pink crystals or powder; odour, phenolic; darkens gradually on exposure to light.

Freely soluble in ethanol, chloroform, ether, benzene or alkali solution; slight soluble in water.

β -Naphthol (2-Naphthol) [$\text{C}_{10}\text{H}_7\text{OH}$ 144.17]

White or pale yellow crystals or a powder; odour, characteristic; discoloured easily on exposure to light.

Freely soluble in ethanol, ether, glycerin or sodium hydroxide solution; soluble in hot water; slightly soluble in water.

α -Naphtholbenzein [$\text{C}_{27}\text{H}_{20}\text{O}_3$ 392.45]

A reddish-brown powder.

Soluble in ethanol, ether, benzene or glacial acetic acid; insoluble in water.

α -Naphthylamine Hydrochloride [$\text{C}_{10}\text{H}_9\text{N} \cdot \text{HCl}$ 179.65]

A white crystalline powder; discoloured on exposure to air.

Soluble in water, ethanol or ether.

N-Naphthylethylenediamine Dihydrochloride [$\text{C}_{12}\text{H}_{14}\text{N}_2 \cdot 2\text{HCl}$ 259.18]

White or faintly red crystals.

Freely soluble in hot water, ethanol or dilute hydrochloric acid; slightly soluble in water, dehydrated ethanol or acetone.

Neutral Red [$\text{C}_{15}\text{H}_{17}\text{N}_4\text{Cl}$ 288.78]

A dark green or brownish-black powder.

Soluble in water or ethanol.

Nickel Ammonium Sulfate [$\text{NiSO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$ 394.99]

Bluish-green crystals.

Soluble in water; insoluble in ethanol.

Nickel Nitrate [$\text{Ni}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$ 290.79]

Green crystals. Its aqueous solution is acidic.

Freely soluble in water; soluble in ethanol or ethylene glycol; slightly soluble in acetone.

Nickel Sulfate [$\text{NiSO}_4 \cdot 7\text{H}_2\text{O}$ 280.86]

Green, transparent crystals.

Soluble in water or ethanol.

Nicotinyl L-tyrosyl-hydrazide [$\text{C}_{15}\text{H}_{16}\text{N}_4\text{O}_3$ 300.32]

White crystals.

Soluble in hot ethanol.

Ninhydrine [$\text{C}_9\text{H}_6\text{O}_4$ 178.14]

A white or pale yellow crystalline powder; hygroscopic; discoloured gradually on exposure to light and air.

Soluble in water or ethanol; slightly soluble in chloroform or ether.

Nitric Acid [HNO_3 63.01]

A colourless, clear liquid; fumes on exposure to air; odour, suffocating irritant; turns to brown with formation of nitrogen tetroxide on exposure to light.

It contains 69%-71% (g/g) of HNO_3 .

Miscible with water.

Nitric Acid, Fuming [HNO_3 63.01]

A clear, colourless or slightly yellowish-brown liquid; highly oxidative and corrosive; A reddish-yellow fog of nitrogen dioxide and nitrogen tetroxide is produced on contact

with air.

Miscible with water.

***p*-Nitroaniline** [$C_6H_5N_2O_2$ 138.13]

Yellow crystals or powder.

Freely soluble in methanol; soluble in ethanol or ether; insoluble in water.

Nitrobenzene [$C_6H_5NO_2$ 123.11]

A colourless or pale yellow oily liquid; odour, bitter almond-like.

Freely soluble in ethanol, ether, benzene or oil; very slightly soluble in water.

Nitromethane [CH_3NO_2 61.04]

A colourless, oily liquid; inflammable; its vapour forms explosive mixture with air.

Miscible with water, ethanol or alkali solution.

***p*-Nitrophenol** [$C_6H_5NO_3$ 139.11]

White or pale yellow crystals; sublimable; inflammable.

Freely soluble in ethanol, chloroform, ether or sodium hydroxide solution; slightly soluble in water.

***p*-Nitrophenyl-azo-resorcinol** [$C_{12}H_9N_3O_4$ 259.22]

A reddish-brown powder.

Slightly soluble in boiling ethanol, acetone, ethyl acetate and toluene; insoluble in water. Soluble in dilute alkali solution.

***n*-Octanol** [$CH_3(CH_2)_7OH$ 130.23]

A colourless liquid; odour, characteristically aromatic.

Miscible with ethanol, ether chloroform; insoluble in water.

Olive Oil

A pale yellow or slightly green liquid.

Orange IV [$C_{18}H_{14}N_3NaO_3S$ 375.38]

A yellow powder.

Soluble in water or ethanol.

Oxalic Acid [$H_2C_2O_4 \cdot 2H_2O$ 126.07]

White, transparent crystals or crystalline granules; efflorescent.

Freely soluble in water or ethanol; insoluble in chloroform or benzene.

Palladium Chloride [$PdCl_2$ 177.33]

Red, needle crystals; hygroscopic.

Soluble in water, ethanol, acetone or hydrobromic acid.

Pancreatic Digest of Casein

Yellow granules. Casein hydrolyzed with pancreatin decolourized and purified with active carbon. It is used as culture medium of bacteria, especially in test for sterility.

Pancreatin

Complies with the requirements prescribed in monograph of the Chinese Pharmacopoeia.

***n*-Pentanol** [$C_5H_{12}O$ 88.15]

A clear, colourless liquid; odour, characteristic and pungent. Its vapour can form explosive mixture with air.

Miscible with ethanol or ether; slightly soluble in water.

Boiling point: 138.1°C.

Pepsin

White to yellowish flakes or granules; taste, slightly sour and salty; hygroscopic.

Freely soluble in water; practically insoluble in ethanol, chloroform or ether.

Peptone

A yellow or pale yellow powder; odourless; taste, slightly bitter.

Soluble in water; insoluble in ethanol or ether.

Perchloric Acid [$HClO_4$ 100.46]

A colourless, clear liquid; strong oxidant; very hygroscopic; volatile and corrosive.

Miscible with water.

Petroleum Ether

A clear colourless liquid; odour, characteristic; inflammable; low boiling fractions of petroleum ether is highly volatile.

Miscible with anhydrous ethanol, ether or benzene; insoluble in water.

Boiling range: 30-60°C; 60-90°C; 90-120°C.

***o*-Phenanthroline** [$C_{12}H_8N_2 \cdot H_2O$ 198.22]

White or pale yellow crystals or a crystalline powder; darkens after long standing.

Soluble in ethanol or acetone; slightly soluble in water; insoluble in ether.

Phenol [C_6H_5O 94.11]

Complies with the requirements prescribed in monograph of the Chinese Pharmacopoeia.

Phenol, Liquefied

To 90 g of phenol add a little water, heat slowly on a water bath until liquefied, cool, add sufficient water to produce 100 ml.

Phenoxyethanol [$C_6H_5OCH_2CH_2OH$ 138.17]

A colourless, clear liquid; odour, aromatic.

Freely soluble in ethanol, ether or sodium hydroxide solution; slightly soluble in water.

Phenylhydrazine [$C_6H_5N_2$ 108.14]

A yellow oily liquid, turns to scale crystals at a temperature below 23°C; turns to brown on exposure to air and light; corrosive; inflammable.

Miscible with ethanol, ether, chloroform or benzene; soluble in dilute acid; slightly soluble in water or petroleum benzine.

Phenylhydrazine Hydrochloride [$C_6H_5N_2 \cdot HCl$ 144.60]

White or white transparent crystals; inflammable.

Freely soluble in water; soluble in ethanol, practically insoluble in ether.

Phloroglucinol [$C_6H_3(OH)_3 \cdot 2H_2O$ 162.14]

A white or pale yellow crystalline powder; taste, sweet. It turns to pale red on exposure to light.

Freely soluble in water.

Phenolphthalein [$C_{20}H_{14}O_4$ 318.33]

A white powder.

Soluble in ethanol; insoluble in water.

Phenolsulfonphthalein (Phenol red) [$C_{19}H_{14}O_5S$ 354.38]

A deep red crystalline powder.

Soluble in ethanol, solution of sodium hydroxide or sodium carbonate; insoluble in water, chloroform or ether.

Phosphorus Pentoxide [P_2O_5 141.94]

A white powder, odour alliaceous; corrosive; highly hygroscopic.

Phosphomolybdic Acid [$P_2O_5 \cdot 20MoO_3 \cdot 51H_2O$ 3939.49]

Bright yellow crystals.

Soluble in water, ethanol or ether.

Phosphoric Acid [H_3PO_4 98.00]

A clear, colourless, viscous liquid; corrosive.

Soluble in water.

Phosphotungstic Acid [$P_2O_5 \cdot 20WO_3 \cdot 28H_2O$ 5283.34]

White or pale yellow crystals.

Soluble in water, ethanol or ether.

***o*-Phthalaldehyde** [$C_8H_6O_2$ 134.13]

Pale yellow needle crystals.

Soluble in water, ethanol or ether; slightly soluble in

petroleum benzin.

Picrolonic Acid [$C_{10}H_8N_4O_5$ 264.21]

Yellow flake crystals.

Soluble in ethanol; slightly soluble in water.

Polyethylene Glycol 1500

A white or cream waxy solid; odour, characteristic; melts on heating.

Soluble in water or ethanol.

Polyethylene Glycol Adipate

$HO[CH_2CH_2OCO(CH_2)_4COO]_nH$

White powder or crystals.

Soluble in chloroform; insoluble in water, ethanol or ether.

Polysorbate 80

A pale red, oily liquid; odour, fat-like.

Soluble in water or most of organic solvents; insoluble in paraffin oil or vegetable oil.

Potassium Acetate [$KC_2H_3O_2$ 98.14]

White crystals or powder; hygroscopic.

Freely soluble in water or ethanol.

Potassium Alum [$AlK(SO_4)_2 \cdot 12H_2O$ 474.39]

White, transparent crystals or powder; odourless; taste, slightly sweet and astringent.

Freely soluble in glycerin or water; insoluble in ethanol or acetone.

Potassium Biphthalate [$KHC_8H_4(COO)_2$ 204.22]

A white crystalline powder.

Soluble in water; slightly soluble in ethanol.

Potassium Bisulfate [$KHSO_4$ 136.17]

White crystals; its aqueous solution is strongly acidic.

Soluble in water.

Potassium Bitartrate [$KHC_4H_4O_6$ 188.18]

A white, crystalline powder; taste, sour.

Freely soluble in hot water; insoluble in water or ethanol.

Potassium Bromate [$KBrO_3$ 167.00]

White crystals or powder.

Soluble in water; insoluble in ethanol.

Potassium Bromide [KBr 119.00]

A white crystalline powder.

Soluble in water, boiling ethanol or glycerin; slightly soluble in ethanol.

Potassium Carbonate [$K_2CO_3 \cdot 1\frac{1}{2}H_2O$ 165.23]

White crystals or granules.

Soluble in water; insoluble in ethanol.

Potassium Carbonate, Anhydrous [K_2CO_3 138.21]

White crystals or powder; hygroscopic.

Soluble in water; its aqueous solution is strongly alkaline; insoluble in ethanol.

Potassium Chlorate [$KClO_3$ 122.55]

White, transparent crystals or a powder.

Freely soluble in boiling water; soluble in water or glycerin; practically insoluble in ethanol.

Potassium Chloride [KCl 74.55]

White crystals or a crystalline powder.

Freely soluble in water or glycerin; slightly soluble in ethanol; insoluble in acetone or ether.

Potassium Chromate [K_2CrO_4 194.19]

Pale yellow crystals.

Soluble in water; insoluble in ethanol.

Potassium Cyanide [KCN 65.12]

White granules or clinkers.

Soluble in water; slightly soluble in ethanol.

Potassium Dichromate [$K_2Cr_2O_7$ 294.18]

Lustrous orange-red crystals; taste, bitter; strongly oxidative.

Soluble in water; insoluble in ethanol.

Potassium dihydrogen Phosphate [KH_2PO_4 136.09]

White crystals or a crystalline powder.

Soluble in water; insoluble in ethanol.

Potassium Ferricyanide [$K_3Fe(CN)_6$ 329.25]

Red crystals; decompose easily on exposure to light, air and acid.

Soluble in water; slightly soluble in ethanol.

Potassium Ferrocyanide [$K_4Fe(CN)_6 \cdot 3H_2O$ 422.39]

Yellow crystals or granules. Its aqueous solution readily deteriorates.

Soluble in water; insoluble in ethanol.

Potassium Hyaluronate

A white, loose, flocky mass or flake.

Freely soluble in water.

Loss on drying When dried to constant weight in vacuum over phosphorous pentoxide, loses not more than 10% of its weight.

Residue on ignition 14%-18% calculated on the dried basis.

Viscosity Kinematic viscosity of 0.15% aqueous solution, 5-6 mm²/s.

pH value 6.0-7.0, using 0.15% aqueous solution.

Total nitrogen 3%-4% calculated on the dried basis.

Potassium hydroxide [KOH 56.11]

White granules or sticks; absorbs carbon dioxide easily to form potassium carbonate; hygroscopic.

Soluble in water or ethanol.

Potassium Iodate [KIO_3 214.00]

White crystals or a crystalline powder.

Soluble in water or dilute sulfuric acid; insoluble in ethanol.

Potassium Iodide [KI 166.00]

White crystals or powder.

Soluble in water, ethanol, acetone or glycerin; insoluble in ether.

Potassium Naphthoquinone sulfonate [$C_{10}H_6KO_3S$ 276.31]

Golden yellow crystals.

Soluble in 50% ethanol; slightly soluble in water.

Potassium Nitrate [KNO_3 101.10]

White crystals or powder; burns and detonates when in contact, rubbed or bumped with organic substances.

Soluble in water; slightly soluble in ethanol.

Potassium Periodate [KIO_4 230.00]

A white, crystalline powder.

Soluble in hot water; slightly soluble in water.

Potassium Permanganate [$KMnO_4$ 158.03]

Dark purple crystals with metallic luster; strong oxidant; decomposes in ethanol, concentrated acids or other organic solvents with liberation of oxygen.

Soluble in water.

Potassium Sodium Tartrate [$KNaC_4H_4O_6 \cdot 4H_2O$ 282.22]

White, transparent crystals or a crystalline powder.

Soluble in water; insoluble in ethanol.

Potassium Sulfate [K_2SO_4 174.26]

White crystals or a crystalline powder.

Soluble in water or glycerin; insoluble in ethanol.

Potassium Tetroxalate (Potassium trihydrogen oxalate)

[$KH_3(C_2O_4)_2 \cdot 2H_2O$ 254.19]

White crystals or a crystalline powder.

Soluble in water; slightly soluble in ethanol.

Potassium Thiocyanate [KSCN 97.18]

White crystals.
soluble in water or ethanol.

Potato Starch [(C₆H₁₀O₅)_n]

A white, amorphous powder; odourless; tasteless; highly hygroscopic.
Insoluble in water and ethanol; forms slightly blue collosol in hot water.

Procaine Hydrochloride [C₁₃H₂₀N₂O₂ • HCl 272.78]

Complies with the requirements prescribed in monograph of the Chinese Pharmacopoeia.

Propanol [CH₃CH₂CH₂OH 60.10]

A clear, colourless liquid; inflammable.
Miscible with water, ethanol or ether.
Boiling point: 97.2°C.

Propylene Glycol [CH₃CH(OH)CH₂OH 76.10]

A colourless, viscous liquid; taste, slightly acid.
Miscible with water, acetone or chloroform.

Propyl *p*-Hydroxybenzoate [C₁₀H₁₂O₃ 180.20]

White crystals.
Freely soluble in ethanol or ether; Slightly soluble in boiling water; practically insoluble in water.

Protocatechuic Acid [C₇H₆O₄ 154.12]

White or faintly brown crystals; discoloured on exposure to air.
Soluble in ethanol or ether, slightly soluble in water.
Purified Water, Ammonia Free Distill 1000 ml of purified water with 1 ml of diluted sulphuric acid and 1 ml of potassium permanganate TS.

Pyridine [C₅H₅N 79.10]

A colourless, clear liquid; odour, disagreeable; taste, peppery; hygroscopic; inflammable.
Miscible with water, ethanol, ether or petroleum ether.

Pyridine, Anhydrous [C₅H₅N 79.10]

To 200 ml of pyridine reagent add 40 ml of benzene, mix well and distil on a sand bath. Collect the distillate at 115-116°C, tightly closed, spare.

Pyrogallol [C₆H₃(OH)₃ 126.11]

White lustrous crystals.
Soluble in water, ethanol or ether; slightly soluble in chloroform, benzene or carbon disulfide.

Quinaldine Red [C₂₁H₂₃IN₂ 430.33]

A deep red powder.
Soluble in ethanol; slightly soluble in water.

Quinalizarin [C₁₄H₈O₆ 272.21]

Red or dark red crystals or a powder with green metallic lustre.
Soluble in acetic acid with yellow colour; in sulfuric acid with bluish-violet colour; in aqueous alkaline solution with reddish-violet colour; insoluble in water.

Quinine Sulfate [(C₂₀H₂₄N₂O₂)₂ • H₂SO₄ • 2H₂O 782.96]

White, fine needle crystals; odourless; taste, very bitter; gradually discoloured on exposure to light; its aqueous solution yields neutral reactions.
Freely soluble in a mixture of chloroform-dehydrated ethanol (2 : 1); slightly soluble in water, ethanol, chloroform or ether.

Red Mercuric Iodide [HgI₂ 454.40]

A bright red powder; heavy; odourless.
Soluble in ether, sodium thiosulfate solution or potassium iodide solution; Slightly soluble in dehydrated ethanol; insoluble in water.

Resazurin [C₁₂H₇NO₄ 229.19]

Deep red crystals with green lustre.

Soluble in dilute sodium hydroxide solution; slightly soluble in ethanol or glacial acetic acid; insoluble in water or ether.

(*p*-Nitrophenyl-azo)-resorcinol [C₁₂H₉N₃O₄ 259.22]

A reddish-brown powder.
Slightly soluble in boiling ethanol, acetone, acetate ester or toluene; insoluble in water; soluble in dilute alkaline solution.

Resorcinol [C₆H₄(OH)₂ 110.11]

White transparent crystals; turns to pale red on exposure to light, air or in contact with iron.
Soluble in water, ethanol or ether.

Rhodamine B [C₂₈H₃₁ClN₂O₃ 479.02]

Green lustrous crystals or a reddish-violet powder.
Freely soluble in water with a bluish-red colour; its diluted solution is strongly fluorescent; freely soluble in ethanol; slightly soluble in hydrochloric acid or sodium hydroxide solution.

Salicylic Acid [C₇H₆O₃ 138.12]

White crystals or powder; taste, sweet followed by acid; gradually discolours on exposure to light; sublimes at 76°C.
Soluble in ethanol and ether; slightly soluble in water.

Salicylaldehyde [C₆H₄(OH)CHO 122.12]

A colourless or pale brown oily liquid; bitter almond-like odour.
Soluble in ethanol, ether and benzene; slightly soluble in water.

Sarcosylsin [C₁₃H₁₈Cl₂N₂O₂ 305.20]

Needle crystals.
Soluble in ethanol, propylene glycol or ethylene glycol, practically insoluble in water.

Selenious Acid [H₂SeO₃ 128.97]

White crystals; hygroscopic; reduced to selenium by most of the reducing agents.
Freely soluble in water or ethanol; insoluble in ammonia solution.

Semicarbazide Hydrochloride [NH₂CONHNH₂HCl 111.53]

White crystals.
Freely soluble in water; insoluble in ethanol and ether.

Silicic Acid [mSiO₂ • nH₂O]

A white, translucent, or milky white granules or pellets; hygroscopic; usually contains about 3%-7% of water; moisture absorbing capacity about 40%.

Silicotungstic Acid [SiO₂ • 12WO₃ • 26H₂O 3310.66]

White or pale yellow crystals; hygroscopic.
Freely soluble in water or ethanol.

Silver Diethyldithiocarbamate [(C₂H₅)₂NCS₂Ag 256.14]

Pale yellow crystals.
Freely soluble in pyridine; soluble in chloroform; insoluble in water, ethanol, acetone or benzene.

Silver Nitrate [AgNO₃ 169.87]

White, transparent, flaky crystals.
Freely soluble in ammonia solution; soluble in water or ethanol; slightly soluble in ether or glycerin.

Silver Oxide [Ag₂O 231.74]

A brownish-black powder; heavy; slowly decomposes on exposure to light; inflammable.
Freely soluble in dilute nitric acid or ammonia solution; practically insoluble in water or ethanol.

Soda Lime

A mixture of sodium hydroxide and calcium oxide, pink small granules with the addition of special indicator; the colour fades gradually on absorption of carbon dioxide.

Sodium Acetate [NaC₂H₃O₂ • 3H₂O 136.08]

White transparent crystals or white granules; efflorescent.
Soluble in water.

Sodium Acetate, Anhydrous $[\text{NaC}_2\text{H}_3\text{O}_2 \quad 82.03]$

A white powder; hygroscopic.
Freely soluble in water; soluble in ethanol.

Sodium Alizarinsulfonate $[\text{C}_{14}\text{H}_7\text{NaO}_7\text{S} \cdot \text{H}_2\text{O} \quad 360.28]$

An orange or yellowish-brown powder.
Freely soluble in water; slightly soluble in ethanol;
insoluble in chloroform or benzene.

Sodium Ammonium Phosphate $[\text{Na}(\text{NH}_4)_2\text{PO}_4 \cdot 4\text{H}_2\text{O} \quad 226.10]$

White crystals or granules; efflorescent and loss part of ammonia.

Soluble in water; insoluble in ethanol.

Sodium Bicarbonate $[\text{NaHCO}_3 \quad 84.01]$

A white crystalline powder.
Soluble in water; insoluble in ethanol.

Sodium Bisulfite $[\text{NaHSO}_3 \quad 104.06]$

A white crystalline powder; odour, resembling sulfur dioxide; oxidized to form sulfate on exposure to air.
Soluble in water; slightly soluble in ethanol.

Sodium Bitartrate $[\text{NaHC}_4\text{H}_4\text{O}_6 \cdot 2\text{H}_2\text{O} \quad 190.09]$

A white, crystalline powder.
Soluble in water; insoluble in ethanol.

Sodium Borohydride $[\text{NaBH}_4 \quad 37.83]$

A white crystalline powder; hygroscopic.
Soluble in water, ammonia solution, ethylenediamine or pyridine; insoluble in ether.

Sodium Bromide $[\text{NaBr} \quad 102.89]$

White crystals or a powder.
Soluble in water; slightly soluble in ethanol.

Sodium Carbonate $[\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O} \quad 286.14]$

White transparent crystals.
Soluble in water or glycerin; insoluble in ethanol.

Sodium Carbonate, Anhydrous $[\text{Na}_2\text{CO}_3 \quad 105.99]$

White powder or granules; absorbs one mol of water on exposure to air.
Soluble in water; to produce strongly alkaline solution; insoluble in ethanol.

Sodium Carbonate, Monohydrate $[\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O} \quad 124.00]$

White prismatic crystals; hygroscopic; loses water of crystallization at 100°C .
Freely soluble in water; insoluble in ethanol.

Sodium Carboxymethylcellulose

A white powder or small granules; hygroscopic; easily disperses and swells in hot water; the viscosity of a 1% solution is 0.005-2.0 Pa · s.

Sodium Chloride $[\text{NaCl} \quad 58.44]$

White crystals or a crystalline powder; hygroscopic.
Soluble in water and in glycerin; very slightly soluble in ethanol or hydrochloric acid.

Sodium Chromotropate $[\text{C}_{10}\text{H}_5\text{Na}_2\text{O}_8\text{S}_2 \cdot 2\text{H}_2\text{O} \quad 400.29]$

A white or grey powder.
Soluble in water with a pale brown colour.

Sodium Citrate $[\text{C}_6\text{H}_5\text{Na}_3\text{O}_7 \cdot 2\text{H}_2\text{O} \quad 294.10]$

White crystals or a powder.
Freely soluble in water; insoluble in ethanol.

Sodium Cobaltinitrite $[\text{Na}_3\text{Co}(\text{NO}_2)_6 \quad 403.94]$

A yellow or yellowish-brown crystalline powder; readily decomposes.
Very soluble in water; slightly soluble in ethanol.

Sodium Deoxycholate $[\text{C}_{24}\text{H}_{39}\text{NaO}_4 \quad 414.56]$

A white crystalline powder; odour, characteristic, resembling that of bile; taste, very bitter; hygroscopic.
Freely soluble in water; slight soluble in anhydrous ethanol; insoluble in ether.

Sodium Diethyldithiocarbamate $[(\text{C}_2\text{H}_5)_2\text{NCS}_2\text{Na} \cdot 3\text{H}_2\text{O} \quad 225.31]$

White crystals; its aqueous solution is alkaline and gradually decomposes to produce a turbidity due to the liberation of carbon disulfide in contact with acid.
Freely soluble in water; soluble in ethanol.

Sodium dihydrogen Phosphate $[\text{NaH}_2\text{PO}_4 \cdot \text{H}_2\text{O} \quad 137.99]$

White crystals or granules.
Freely soluble in water; practically insoluble in ethanol.

Sodium Ferricyanide, Ammoniated

$[\text{Na}_3[\text{Fe}(\text{CN})_5\text{NH}_3] \cdot 3\text{H}_2\text{O} \quad 325.98]$

Yellow crystals.
Soluble in water.

Sodium Fluoride $[\text{NaF} \quad 41.99]$

A white powder or cubic crystals.
Soluble in water; its aqueous solution is corrosive to glass; insoluble in ethanol.

Sodium Formate $[\text{HCOONa} \cdot 2\text{H}_2\text{O} \quad 104.04]$

White crystals; odour, faint formic acid; hygroscopic.
Soluble in water or glycerin; slightly soluble in ethanol.

Sodium Heptanesulfonate $[\text{C}_7\text{H}_{15}\text{NaO}_3\text{S}_3 \cdot \text{H}_2\text{O} \quad 220.27]$

Sodium Hexanesulfonate $[\text{C}_6\text{H}_{13}\text{NaO}_3\text{S} \quad 188.18]$

A white powder.
Soluble in water.

Sodium Hydrosulfite $[\text{Na}_2\text{S}_2\text{O}_4 \quad 174.11]$

A white or almost white powder; odour, characteristic; hygroscopic; decomposes and burns on exposure to air or heat.
Freely soluble in water; insoluble in ethanol.

Sodium Hydroxide $[\text{NaOH} \quad 40.00]$

White granules or flakes; easily absorbs carbon dioxide and water; hygroscopic.
Freely soluble in water, ethanol or glycerin.

Sodium Hypochlorite Solution $[\text{NaOCl} \quad 74.44]$

A clear, pale yellowish-green liquid; corrosive; strongly oxidative and alkaline.
Miscible with water.

Sodium Iodide $[\text{NaI} \quad 149.89]$

White crystals or a powder.
Soluble in water, ethanol or glycerin.

Sodium Laurylsulfate $[\text{CH}_3(\text{CH}_2)_{10}\text{CH}_2\text{OSO}_3\text{Na} \quad 288.38]$

White or pale yellow crystals or a powder; odour, characteristic; decomposes on exposure to moist and warm air. It is a mixture of 85% sodium laurylsulfate and other sodium alkyl sulfates.

Freely soluble in water, its 10% aqueous solution is not clear at low temperature; soluble in hot ethanol.

Sodium Molybdate $[\text{Na}_2\text{MoO}_4 \cdot 2\text{H}_2\text{O} \quad 241.95]$

A white crystalline powder; loses water of crystallization at 100°C .
Soluble in water.

Sodium β -Naphthalenesulfonate $[\text{C}_{10}\text{H}_7\text{NaO}_3\text{S} \quad 230.22]$

White crystals or powder.
Soluble in water; insoluble in ethanol.

Sodium 1,2-Naphthoquinone-4-sulfonate $[\text{C}_{10}\text{H}_5\text{NaO}_3\text{S} \quad 260.20]$

White crystals.
Freely soluble in water; slightly soluble in ethanol.

Sodium Nitrate $[\text{NaNO}_3 \quad 84.99]$

Colourless, transparent crystals or white granules; burns and detonates in contact, rubbed or bumped with organic substances.

Soluble in water; slightly soluble in ethanol.

Sodium Nitrite [NaNO_2 69.00]

White or pale yellow crystals or granules; hygroscopic; burns and detonates in contact with organic substances, evolving noxious and irritant gas of nitrogen oxide and nitrogen peroxide.

Soluble in water; slightly soluble in ethanol or ether.

Sodium Nitroprusside [$\text{Na}_2\text{Fe}(\text{NO})(\text{CN})_5 \cdot 2\text{H}_2\text{O}$ 297.95]

Transparent, dark red crystals; its aqueous solution decomposes gradually and turns to green.

Soluble in water; slightly soluble in ethanol.

Sodium 1-Nitroso-2-naphthol-3,6-disulfonate

[$\text{C}_{10}\text{H}_5\text{NNa}_2\text{O}_6\text{S}_2$ 377.26]

Golden yellow crystals or a crystalline powder.

Soluble in water; slightly soluble in ethanol.

Sodium Octanesulfonate [$\text{C}_8\text{H}_{17}\text{NaO}_3\text{S}$ 216.28]

Sodium Oxalate [$\text{Na}_2\text{C}_2\text{O}_4$ 134.00]

A white crystalline powder.

Soluble in water; insoluble in ethanol.

Sodium Pentanesulfonate [$\text{C}_5\text{H}_{11}\text{NaO}_3\text{S} \cdot \text{H}_2\text{O}$ 192.21]

White crystals.

Soluble in water.

Sodium Periodate [NaIO_4 213.89]

A white, crystalline powder.

Soluble in water, hydrochloric acid, nitric acid, sulfuric acid or acetic acid; insoluble in ethanol.

Sodium Phosphate [$\text{Na}_2\text{HPO}_4 \cdot 12\text{H}_2\text{O}$ 380.12]

Colourless or white granules.

Freely soluble in water; slightly soluble in ethanol.

Sodium Pyrosulfite [$\text{Na}_2\text{S}_2\text{O}_5$ 190.11]

White crystals or a powder with slight odour of sulfur dioxide; hygroscopic.

Soluble in water or glycerin; slightly soluble in ethanol.

Sodium Salicylate [$\text{C}_7\text{H}_5\text{NaO}_3$ 160.10]

White scales or powder; odourless, turns to pink on exposure to light for a long time.

Freely soluble in water and glycerin; soluble in ethanol; practically insoluble in chloroform, ether or benzene.

Sodium Selenite [Na_2SeO_3 172.94]

White crystals or a crystalline powder; efflorescent; readily reduced by reducing agent.

Freely soluble in water; insoluble in ethanol.

Sodium Sulfate, Anhydrous [Na_2SO_4 142.04]

A white crystalline powder; hygroscopic.

Soluble in water; insoluble in ethanol.

Sodium Sulfide [$\text{Na}_2\text{S} \cdot 9\text{H}_2\text{O}$ 240.18]

White crystals; its aqueous solution is alkaline.

Soluble in water; Slightly soluble in ethanol; insoluble in ether.

Sodium Sulfite [$\text{Na}_2\text{SO}_3 \cdot 7\text{H}_2\text{O}$ 252.15]

White, transparent crystals; odour, resembling sulfurous acid; efflorescent; oxidized to form sodium sulfate on exposure to air.

Soluble in water; very slightly soluble in ethanol.

Sodium Sulfite, Anhydrous [Na_2SO_3 126.04]

White small crystals or powder.

Soluble in water and glycerin; very slightly soluble in ethanol.

Sodium Taurocholate [$\text{C}_{26}\text{H}_{44}\text{NNaO}_7\text{S}$ 537.69]

White crystals; taste, sweet followed by bitter.

Freely soluble in water; soluble in ethanol.

Sodium Tellurite [Na_2TeO_3 221.58]

A white powder.

Freely soluble in hot water; slightly soluble in water.

Sodium Tetraphenylborate [$(\text{C}_6\text{H}_5)_4\text{BNa}$ 342.22]

White crystals; odourless.

Freely soluble in water, methanol, anhydrous ethanol or acetone.

Sodium Thioglycollate [$\text{CH}_2(\text{SH})\text{COONa}$ 114.10]

White crystals; odour, slight; hygroscopic.

Freely soluble in water; slightly soluble in ethanol.

Sodium Thiosulfate [$\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$ 248.19]

Colourless, transparent crystals or white granules.

Soluble in water with endothermic reaction; slightly soluble in ethanol.

Sodium Tungstate [$\text{Na}_2\text{WO}_4 \cdot 2\text{H}_2\text{O}$ 329.86]

A white crystalline powder; efflorescent.

Soluble in water; insoluble in ethanol.

Soluble Starch

A white powder; odourless; tasteless.

Soluble in boiling water; insoluble in water, ethanol or ether.

Solvent Blue 19

It is a mixture of 1-amino-4-anilinoanthraquinone and 1-methylamino-4-anilinoanthraquinone.

Stannous Chloride [$\text{SnCl}_2 \cdot 2\text{H}_2\text{O}$ 225.65]

White crystals.

Soluble in water, ethanol or sodium hydroxide solution.

Strontium Chloride [$\text{SrCl}_2 \cdot 6\text{H}_2\text{O}$ 266.64]

Colourless crystals or granules; odourless; volatilizes on exposure to air; hygroscopic on exposure to moist air.

Freely soluble in water; soluble in ethanol.

Strontium Hydroxide [$\text{Sr}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$ 265.76]

Colourless or white crystals; deliquescent; absorbs carbon dioxide from air to form carbonate. It loses seven molecules of water in dry air.

Soluble in hot water or acid; slightly soluble in water.

Succinic Acid [$\text{H}_2\text{C}_4\text{H}_4\text{O}_4$ 118.09]

White crystals.

Soluble in hot water; slightly soluble in ethanol, acetone or ether; insoluble in benzene, carbon disulfide, carbon tetrachloride or petroleum benzin.

Sudan IV [$\text{C}_{24}\text{H}_{20}\text{N}_4\text{O}$ 380.45]

A dark brown powder.

Soluble in ethanol, ether, chloroform, benzene or phenol; slightly soluble in acetone; insoluble in water.

Sulfamic Acid [$\text{NH}_2 \cdot \text{SO}_3\text{H}$ 97.09]

White crystals.

Soluble in water, hydrolyses easily with formation of ammonium bisulfate; slightly soluble in methanol or ethanol; insoluble in ether or acetone.

Sulfanilamide [$\text{C}_6\text{H}_5\text{N}_2\text{O}_2\text{S}$ 172.21]

White foliar or needle crystals or a powder.

Soluble in boiling water, ethanol, acetone, glycerin, hydrochloric acid or solution of caustic alkali; slightly soluble in water; insoluble in chloroform, ether or benzene.

Sulfanilic Acid [$\text{C}_6\text{H}_7\text{NO}_3\text{S}$ 173.19]

A white or almost white powder, discoloured on exposure to light.

Freely soluble in solution of ammonia, sodium hydroxide or sodium carbonate; soluble in hot water; slightly soluble in water.

Sulfosalicylic Acid [$C_7H_6O_5S \cdot 2H_2O$ 254.22]

White crystals or a crystalline powder; instantly turns to red with trace of iron; decompose to phenol or salicylic acid at high temperature.

Freely soluble in water or ethanol; soluble in ether.

Sulfuric Acid [H_2SO_4 98.08]

A clear, colourless, viscous liquid; generates much heat when mixed with water or alcohol. It contains 95%-98% (g/g) of H_2SO_4 .

Miscible with water or ethanol.

Relative density: about 1.84.

Sulfuric Acid, Nitrogen Free

Introduce sulfuric acid to a porcelain evaporating dish heated on a sand bath until the vapor of sulfur trioxide is evolved (about 2 hours), and continue to heat for more 15 minutes; then allow to cool in an empty desiccator.

Tannic Acid [$C_{76}H_{52}O_{46}$ 1701.22]

A pale yellow or pale brown loose powder; odour, characteristic; gradually darkens on exposure to air or light. Soluble in water or ethanol.

Tartaric Acid [$H_2C_4H_4O_6$ 150.09]

White, transparent crystals or a white crystalline powder. Soluble in water, methanol, ethanol, propanol or glycerin; slightly soluble in ether; insoluble in chloroform.

Tertiary Butanol [$(CH_3)_3COH$ 74.12]

White crystals; it is a liquid when containing a little of water; odour, camphor-like; hygroscopic; inflammable.

Miscible with ethanol or ether; soluble in water.

Boiling point: 82.4°C.

Tetrabromophenolphthalein Potassium Ethyl Ester

[$C_{22}H_{13}Br_4KO_4$ 700.06]

A dark green or bluish-violet crystalline powder.

Soluble in water, ethanol or ether.

Tetrabutylammonium Iodide [$(C_4H_9)_4NI$ 369.37]

A white or pale yellow powder.

Freely soluble in ethanol; soluble in water; slightly soluble in chloroform.

n-Tetradecane [$CH_3(CH_2)_{12}CH_3$ 198.39]

A clear, colourless liquid.

Miscible with ethanol or ether; insoluble in water.

Tetraethylammonium Hydroxide [$C_8H_{21}NO$ 147.26]

The free base only exists in solution or as a hydrate. Usually it is used as a solution of 10%, 25% or 60%. The aqueous solution is colourless, strongly corrosive; very strongly alkaline; freely absorbs carbon dioxide from air.

Tetraheptylammonium Bromide [$C_{28}H_{50}BrN$ 490.71]

Chromatographic pure.

melting point: 89-91°C.

Tetrahydrofuran [C_4H_8O 72.11]

A colourless liquid; odour, ether-like; inflammable; easily forms peroxide during storage.

Miscible with water, ethanol, acetone or ether.

Boiling point: 66°C.

Tetramethylammonium Hydroxide [$N(CH_3)_4OH$ 91.15]

A colourless, clear liquid; absorbs carbon dioxide easily; corrosive.

Soluble in water or ethanol.

Tetramethylethylenediamine [$C_6H_{16}N_2$ 116.21]

A clear, colourless liquid.

Miscible with water and ethanol.

Tetrazolium Blue [$C_{40}H_{32}Cl_2N_8O_2$ 727.65]

Colourless or yellow crystals.

Freely soluble in methanol, ethanol or chloroform; slightly soluble in water.

Thallous Chloride [Tld 239.85]

A white crystalline powder; poisonous.

Turns to purple on exposure to air or light.

Soluble in boiled water or 260 times cold water; insoluble in ethanol. Its solubility in water is decreased when mixed with hydrochloric acid.

Thallous Nitrate [$TiNO_3$ 266.40]

White or colourless crystals; poisonous; decompose at 450°C soluble in hot water; soluble in cold water; insoluble in alcohol.

Thioacetamide [CH_3CSNH_2 75.13]

Colourless or white flaky crystals.

Soluble in water, ethanol or benzene; slightly soluble in ether.

Thioglycollic Acid [$CH_2(SH)COOH$ 92.12]

A clear, colourless liquid; odour, irritant.

Miscible with water, ethanol, ether or benzene.

Thiourea [NH_2CSNH_2 76.12]

White rhombic crystals or needle crystals; taste, bitter.

Soluble in water or ethanol; slightly soluble in ether.

Thorin [$C_{15}H_{11}AsN_2Na_2O_{10}S_2$ 576.30]

Red crystals.

Freely soluble in water; insoluble in organic solvent.

Thymol [$C_{10}H_{14}O$ 150.22]

White crystals.

Very slightly soluble in water.

Thymol Blue [$C_{27}H_{30}O_5S$ 466.60]

A brownish-green crystalline powder.

Soluble in ethanol; insoluble in water.

Thymolphthalein [$C_{28}H_{30}O_4$ 430.54]

A white powder.

Soluble in ethanol; insoluble in water.

Titanium Dioxide [TiO_2 79.88]

A white powder.

Soluble in hydrofluoric acid or hot concentrated sulfuric acid; insoluble in water, hydrochloric acid, nitric acid or dilute sulfuric acid.

Titan Yellow [$C_{28}H_{19}N_5Na_2O_6S_4$ 695.73]

A pale yellow or brown powder.

Soluble in water, ethanol, sulfuric acid or sodium hydroxide solution.

Toluene [$C_6H_5CH_3$ 92.14]

A clear, colourless liquid; odour, benzene-like; inflammable.

Miscible with ethanol or ether.

Boiling point: 110.6°C.

p-Toluenesulfonic Acid [$CH_3C_6H_4SO_3H \cdot H_2O$ 190.22]

White crystals.

Freely soluble in water; soluble in ethanol or ether.

o-Toluidine [C_7H_9N 107.06]

A pale yellow liquid; turns to brownish-red gradually on exposure to light and air.

Soluble in ethanol, ether or dilute acid; slightly soluble in water.

Toluidine Blue [$C_{15}H_{16}ClN_3S$ 305.83]

A dark green powder, with bronze lustre.

Freely soluble in water; slightly soluble in ethanol; very slightly soluble in chloroform; practically insoluble in ether.

p-Tosyl-L-Arginine Methyl Ester Hydrochloride

[$C_{14}H_{22}N_4O_4S \cdot HCl$ 378.88]

White crystals.

Soluble in water or methanol.

Tragacanth

A white or faint yellow powder; odourless.

Soluble in alkali solution or hydrogen peroxide solution; insoluble in ethanol.

Trichloroacetic Acid [CCl_3COOH 163.39]

Colourless crystals; odour, characteristic; hygroscopic; corrosive; its aqueous solution is strongly acidic.

Freely soluble in ethanol or ether; soluble in water.

Triethanolamine [$\text{N}(\text{CH}_2\text{CH}_2\text{OH})_3$ 149.19]

A colourless or pale yellow, viscous liquid. Turns to brown on standing for a long time; absorbs water and carbon dioxide on exposure to air; it is strongly alkaline.

Miscible with water or ethanol.

Triethylamine [$(\text{C}_2\text{H}_5)_3\text{N}$ 101.19]

A colourless liquid; odour, strong ammonia.

Miscible with ethanol or ether; slightly soluble in water.

Boiling point: 89.5°C.

Triethylenediamine [$\text{C}_6\text{H}_{12}\text{N}_2 \cdot 6\text{H}_2\text{O}$ 220.27]

White or slightly yellow crystals; odour, characteristic; hygroscopic.

Freely soluble in water, methanol or ether.

Trifluoroacetic Acid [CF_3COOH 114.02]

A colourless, fuming liquid; hygroscopic; strongly corrosive.

Freely soluble in water, ethanol, acetone or ether.

Trimethylpentane [$(\text{CH}_3)_3\text{CCH}_2\text{CH}(\text{CH}_3)_2$ 114.23]

A clear, colourless liquid; inflammable. It can form explosive mixture with air.

Soluble in acetone, chloroform, ether or benzene; insoluble in water.

Boiling point: 99.2°C.

Trinitrophenol [$\text{C}_6\text{H}_3\text{N}_3\text{O}_7$ 229.11]

Pale yellow crystals; odourless; taste, bitter; violet explosion occurs at high temperature or when bumped or rubbed in dryness.

Soluble in hot water, ethanol or benzene.

Trioctyl Phosphate [$(\text{C}_8\text{H}_{17})_3 \cdot \text{PO}_4$ 434.64]

A colourless or pale yellow oily liquid.

Soluble in ethanol, acetone or ether.

Triphenyltetrazolium Chloride [$\text{C}_{19}\text{H}_{15}\text{ClN}_4$ 334.81]

White crystals; darkens gradually on exposure to light.

Soluble in water, ethanol or acetone; insoluble in ether.

Trometamol [$\text{C}_4\text{H}_{11}\text{NO}_3$ 121.14]

White crystals with strong alkalinity.

Soluble in water; insoluble in ether.

Trypsin

A white, almost white or pale yellow powder.

Soluble in water; insoluble in ethanol.

Tyrosine [$\text{C}_9\text{H}_9\text{NO}_3$ 181.19]

White crystals.

Soluble in water; insoluble in ethanol or ether.

Uranyl Acetate [$\text{UO}_2(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 2\text{H}_2\text{O}$ 424.15]

A yellow crystalline powder.

Soluble in water; slightly soluble in ethanol.

Urea [NH_2CONH_2 60.06]

White crystals or powder; odour, ammoniacal.

Soluble in water, ethanol or benzene; practically insoluble in chloroform or ether.

Urotropine [$\text{C}_6\text{H}_{12}\text{N}_4$ 140.19]

White crystals; odourless.

Soluble in water, ethanol or chloroform; slightly soluble in ether.

Valine [$\text{C}_6\text{H}_{11}\text{NO}_2$ 117.15]

White crystals; sublimable.

Soluble in water; insoluble in ethanol or ether.

Vanadium Pentoxide [V_2O_5 181.88]

An orange yellow crystalline powder or reddish-brown needle crystals.

Soluble in acid solution or alkali solution; slightly soluble in water; insoluble in ethanol.

Vanillin [$\text{CH}_3\text{O} \cdot \text{C}_6\text{H}_5(\text{OH})\text{CHO}$ 152.15]

White crystals; odour, fragrant.

Freely soluble in ethanol, chloroform, ether, glacial acetic acid or pyridine, soluble in oil or sodium hydroxide solution.

Water, Nitrate-free and Nitrite-free

Purified water, ammonia free, or deionized water.

Xanthidrol [$\text{C}_{13}\text{H}_{10}\text{O}_2$ 198.22]

A pale yellow crystalline powder.

Soluble in ethanol, chloroform or ether; insoluble in water.

Xylene [$\text{C}_6\text{H}_4(\text{CH}_3)_2$ 106.17]

A clear, colourless liquid; odour, characteristic; inflammable. It is a mixture of the three isomers of *o*-, *m*- and *p*-xylene.

Miscible with ethanol, chloroform or ether; insoluble in water.

Boiling point: 137-140°C.

Xylene Cyanol Blue FF [$\text{C}_{25}\text{H}_{27}\text{N}_2\text{NaO}_6\text{S}_2$ 538.62]

A brown or bluish-black powder.

Freely soluble in ethanol; soluble in water.

Xylenol Orange [$\text{C}_{31}\text{H}_{29}\text{N}_2\text{Na}_4\text{O}_{13}\text{S}$ 760.59]

A reddish-brown crystalline powder; hygroscopic.

Freely soluble in water; insoluble in ethanol.

Yeast Extract

A reddish-yellow to brown powder; odour, characteristic, but no rancid smell.

Soluble in water to yield a weak acidic reaction.

Chloride Not more than 5%, calculated as NaCl (Appendix VIII A).

Nitrogen 7.2%-9.5%, calculated on the dried basis (Appendix VII D).

Loss on drying Not more than 5.0% (Appendix VIII L).

Residue on ignition Not more than 15% (Appendix VIII N).

Coagulable Protein No sediment is produced when its aqueous solution (1→20) is filtered and boiled.

Yellow Mercuric Oxide [HgO 216.59]

A yellow or orange powder; heavy; darkens gradually on exposure to light.

Freely soluble in dilute sulfuric acid, dilute hydrochloric acid or dilute nitric acid; insoluble in water, ethanol, acetone or ether.

Zinc [Zn 65.39]

Greyish-white granules with metallic lustre.

Soluble in dilute acid with liberation of hydrogen; soluble slowly in ammonia solution or sodium hydroxide solution.

Zinc Acetate [$\text{Zn}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 2\text{H}_2\text{O}$ 219.51]

White crystals.

Freely soluble in water or boiling ethanol; slightly soluble in ethanol.

Zinc Chloride [ZnCl_2 136.30]

A white crystalline powder or clinkers.

Freely soluble in water; soluble in ethanol, acetone or ether.

Zincon [$\text{C}_{20}\text{H}_{15}\text{N}_4\text{NaO}_6\text{S}$ 462.42]

A brown, crystalline powder.

Soluble in ethanol or sodium hydroxide solution; insoluble in water.

Zinc Oxide [ZnO 81.39]

A white or pale yellow powder.

Soluble in dilute acid, concentrated alkali solution or ammonia solution; insoluble in water or ethanol.

Zinc Sulfate [$\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$ 287.56]

White crystals, granules or powder.

Freely soluble in water; soluble in glycerin; slightly soluble in ethanol.

Zirconium Nitrate [$\text{Zr}(\text{NO}_3)_4 \cdot 5\text{H}_2\text{O}$ 429.32]

White crystals; hygroscopic; decomposes at 100°C.

Freely soluble in water; soluble in ethanol.

Zirconyl Chloride [$\text{ZrOCl}_2 \cdot 8\text{H}_2\text{O}$ 322.25]

White crystals.

Freely soluble in water or ethanol.

XV B Test Solutions

Acetic Acid, Dilute

Dilute 60 ml of glacial acetic acid with water to 1000 ml.

N-Acetyl-L-tyrosine Ethyl Ester TS

Dissolve 24.0 mg of N-Acetyl-L-tyrosine ethyl ester in 0.2 ml of ethanol, add 2 ml of phosphate buffer solution (mix 38.9 ml of 0.067 mol/L potassium dihydrogen phosphate with 61.6 ml of 0.067 mol/L sodium dihydrogen phosphate, pH=7.0) and 1 ml of the indicator solution (mix equal quantities of 0.1% alcoholic methyl red solution and 0.05% alcoholic methylene blue solution), dilute with water to 10 ml.

Acid Ferric Ammonium Sulfate TS

Dissolve 20 g of ferric ammonium sulfate in 9.4 ml of sulfuric acid, dilute with water to 100 ml.

Acid Stannous Chloride TS

Dissolve 20 g of stannous chloride in hydrochloric acid to make 50 ml and filter.

The solution should be used within three months.

Acid Zirconium Alizarin TS

Dissolve 70 mg of sodium alizarinsulfonate in 50 ml of water, and then add the solution slowly to 50 ml of 0.6% zirconyl chloride ($\text{ZrOCl}_2 \cdot 8\text{H}_2\text{O}$) solution. Dilute with a mixed acid solution which contains 123 ml of hydrochloric acid and 40 ml of sulfuric acid per 1000 ml to 1000 ml. Allow to stand for 1 hour.

Alizarin Fluoro Blue TS

Add 12.5 ml of sodium hydroxide solution (1.2→100) to 0.19 g of alizarin fluoro blue, add 800 ml of water and 0.25 g of sodium acetate crystals, adjust to about pH 5.4 with dilute hydrochloric acid and dilute with water to make 1000 ml, mix well.

Alkaline Cupric Citrate TS

(1) Dissolve 17.3 g of crystalline cupric sulfate and 115.0 g of citric acid in 200 ml of warm water.

(2) Dissolve 185.3 g of anhydrous sodium carbonate (dried at 180°C for 2 hours) in water to make 500 ml.

Add 50 ml of solution (2) to 20 ml of solution (1) with constant shaking before use, cool and then dilute with water to 100 ml.

Alkaline Cupric Tartrate TS

(1) Dissolve 6.93 g of crystalline cupric sulfate in water to make 100 ml.

(2) Dissolve 34.6 g of crystalline potassium sodium tartrate and 10 g of sodium hydroxide in water to make 100 ml.

Mix solution (1) with solution (2) before use.

Alkaline Mercuric Potassium Iodide TS

Dissolve 10 g of potassium iodide in 10 ml of water, add slowly with stirring a saturated solution of mercuric chloride until a red precipitate remains undissolved. Add 30 g of potassium hydroxide and allow to dissolve, then add 1 ml or more of the saturated solution of mercuric chloride. Dilute with water to 200 ml. Allow the precipitate to settle and use the supernatant liquid.

Add 2 ml of this solution to 50 ml of water which contains 0.05 mg of ammonia, a yellowish-brown colour is formed immediately.

Alkaline β-Naphthol TS

Dissolve 0.25 g of β-naphthol in 10 ml of sodium hydroxide solution (1→10). This solution should be freshly prepared.

Alkaline Pyrogallol TS

Dissolve 0.5 g of pyrogallol in 2 ml of water. Add 8 ml of water which contains 12 g of potassium hydroxide, mix well.

This solution should be freshly prepared.

Alkaline Sodium Hydrosulfite TS

Dissolve 50 g of sodium hydrosulfite in 250 ml of water. Dissolve 28.57 g of potassium hydroxide in water to make 40 ml. Mix these two solutions. This solution should be freshly prepared.

Alkaline Sodium Nitroprusside TS

Dissolve 1 g of sodium nitroprusside and 1 g of sodium carbonate in water to make 100 ml.

Alkaline Tetrazolium Blue TS

Mix 10 ml of 0.2% methanol solution of tetrazolium blue with 30 ml of 12% methanol solution of sodium hydroxide before use.

Alkaline Trinitrophenol TS

To 20 ml of 1% trinitrophenol solution, add 10 ml of 5% sodium hydroxide solution, then dilute with water to 100 ml.

This solution must be freshly prepared.

1-Amino-2-naphthol-4-sulfonic acid TS

Mix thoroughly 5 g of sodium sulfite anhydrous with 94.3 g of sodium bisulfite and 0.7 g of 1-amino-2-naphthol-4-sulfonic acid. Dissolve 1.5 g of the mixture in 10 ml of water before use, filter if necessary.

Ammonia TS

Dilute 400 ml of concentrated ammonia solution with water to make 1000 ml.

Ammonia Concentrated TS

Use concentrated ammonia solution directly.

Ammoniated Ammonium Chloride TS

Dilute concentrated ammonia TS with equal volume of water, add ammonium chloride to make a saturated solution.

Ammoniated Cupric Chloride TS

Dissolve 22.5 g of cupric chloride in 200 ml of water, add 100 ml of concentrated ammonia TS and mix well.

Ammoniated Cupric Sulfate TS

Add ammonia TS dropwise to cupric sulfate TS until the freshly formed precipitate is almost dissolved, allow to settle and decant the clear solution. The solution should be freshly prepared.

Ammoniated Nickel Nitrate TS

Dissolve 2.9 g of nickel nitrate in 100 ml of water, add 40 ml of ammonia TS, shake and then filter.

Ammoniated Silver Nitrate TS

Dissolve 1 g of silver nitrate in 20 ml of water, add ammonia TS dropwise with stirring until the precipitate is almost completely dissolved, filter.

Preserve the solution in amber coloured glass bottle, protected from light.

Ammoniated Sodium Ferricyanide TS

Dissolve 1 g of ammoniated sodium ferricyanide $[\text{Na}_2\text{Fe}(\text{CN})_5\text{NH}_3 \cdot \text{H}_2\text{O}]$ in water to make 100 ml.

Ammonium Acetate TS

Dissolve 10 g of ammonium acetate in water to make 100 ml.

Ammonium Carbonate TS

Dissolve 20 g of ammonium carbonate with 20 ml of ammonia TS in water to make 100 ml.

Ammonium Chloride TS

Dissolve 10.5 g of ammonium chloride in water to make 100 ml.

Ammonium Magnesium Chloride TS

Dissolve 5.5 g of magnesium chloride and 7 g of ammonium chloride in 65 ml of water and then add 35 ml of ammonia TS. Allow to stand in glass bottle for several days, filter. The solution should be filtered, if turbidity occurs.

Ammonium Mercuric Thiocyanate TS

Dissolve 5 g of ammonium thiocyanate and 4.5 g of mercuric chloride in water to make 100 ml.

Ammonium Molybdate TS

Dissolve 10 g of ammonium molybdate in water to make 100 ml.

Ammonium Molybdate in Sulfuric Acid TS

Dissolve 0.1 g of ammonium molybdate in 10 ml of sulfuric acid.

Ammonium Molybdate-Sulfuric Acid TS

Dissolve 2.5 g of ammonium molybdate in a mixture of 15 ml of sulfuric acid and water to make 100 ml. This solution should be used within two weeks.

Ammonium Oxalate

Dissolve 3.5 g of ammonium oxalate in water to make 100 ml.

Ammonium Polysulfide TS

Add sulfur to ammonium sulfide TS and make a saturated solution.

Ammonium Reineckate TS

Dissolve 0.5 g of ammonium reineckate in 20 ml of water, shake for 1 hour, filter. This solution should be freshly prepared and used within 48 hours.

Ammonium Sulfide TS

To a solution of 60 ml of ammonia TS saturated with hydrogen sulfide add 40 ml of ammonia TS. Preserve in amber coloured glass bottle, protected from light. This solution is unsuitable for use if a copious precipitate of sulfur is present.

Ammonium Thiocyanate TS

Dissolve 8 g of ammonium thiocyanate in water to make 100 ml.

Anthrone TS

Dissolve 0.7 g of anthrone in 50 ml of sulfuric acid and dilute with sulfuric acid solution (70→100) to 500 ml.

Auric Chloride TS

Dissolve 1 g of auric chloride in 35 ml of water.

Barium Chloride TS

Dissolve 5 g of fine powder of barium chloride in water to make 100 ml.

Barium Hydroxide TS

Dissolve barium hydroxide in freshly boiled and cooled water

to make a saturated solution. This solution should be freshly prepared.

Barium Nitrate TS

Dissolve 6.5 g of barium nitrate in water to make 100 ml.

Bromine TS

To 2-3 ml of bromine in a glass bottle which is stoppered and lubricated with vaseline add 100 ml of water to make a saturated solution by shaking. This solution should be protected from light.

Bromine-Potassium Bromide TS

Dissolve 30 g of bromine and 30 g of potassium bromide in water to make 100 ml.

Cadmium Iodide TS

Dissolve 5 g of cadmium iodide in water to make 100 ml.

Calcium Chloride TS

Dissolve 7.5 g of calcium chloride in water to make 100 ml.

Calcium Hydroxide TS

To 1000 ml of water in a stoppered glass bottle add 3 g of calcium hydroxide, allow to stand for 1 hour with frequent shaking vigorously, use the supernatant liquid as the test solution.

Calcium Sulfate TS

Use the saturated solution of calcium sulfate directly.

Ceric Ammonium Nitrate TS

Dissolve 25 g of ceric ammonium nitrate in dilute nitric acid to make 100 ml.

Cerous Nitrate TS

Dissolve 0.22 g of cerous nitrate in 50 ml of water, add 0.1 ml of nitric acid and 50 mg of hydroxylamine hydrochloride, dilute with water to make 1000 ml and mix well.

Chloral Hydrate TS

Dissolve 50 g of chloral hydrate in a mixture of 15 ml of water and 10 ml of glycerin.

Chlorine TS

Use the saturated solution of chlorine in water. This solution should be freshly prepared.

Chromotropic Acid TS

Dissolve 50 mg of sodium chromotropate in 100 ml of a cold mixture of sulfuric acid and water (9 : 4). This solution should be freshly prepared before use.

Citric-Acetic Anhydride TS

Dissolve 2 g of citric acid in 100 ml of acetic anhydride.

Cobaltous Acetate TS

Dissolve 0.1 g of cobaltous acetate in methanol to make 100 ml.

Cobaltous Chloride TS

Dissolve 2 g of cobaltous chloride in 1 ml of hydrochloric acid, add water to make 100 ml.

Copper-Pyridine TS

Dissolve 4 g of cupric sulfate in 90 ml of water and add 30 ml of pyridine. This solution should be freshly prepared.

Cupric Acetate TS

Dissolve 0.1 g of cupric acetate in 5 ml of water which contains a few drops of acetic acid. Dilute with water to 100 ml and filter.

Cupric Acetate Concentrated TS

Dissolve 13.3 g of cupric acetate in a mixture of 195 ml of water and 5 ml of acetic acid.

Cupric Sulfate TS

Dissolve 12.5 g of cupric sulfate in water to make 100 ml.

Cupric Iodotartrate TS

Dissolve successively 7.5 g of cupric sulfate, 25 g of potassium sodium tartrate, 25 g of anhydrous sodium carbonate, 20 g of sodium bicarbonate and 5 g of potassium iodide in 800 ml of water. Dissolve 0.535 g of potassium iodate in water and add this solution to the mixture mentioned above.

Dilute with water to 1000 ml.

Cyanogen Bromide TS

Add 0.1 mol/L ammonium thiocyanate solution dropwise to bromine TS until it is colourless.

This solution should be freshly prepared. It is poisonous.

Diaminonaphthylene TS

Dissolve 0.1 g of 2, 3-diaminonaphthylene and 0.5 g of hydroxylamine hydrochloride in 100 ml of 0.1 mol/L hydrochloric acid solution, heat if necessary, cool and filter. This solution should be freshly prepared and protected from light.

Diazotized Sulfanilic Acid TS

Dissolve 1.57 g of sulfanilic acid in 80 ml of water and 10 ml of dilute hydrochloric acid by heating on a water bath. Cool to 15°C and add 6.5 ml of sodium nitrite solution (1→10) with stirring and dilute with water to 100 ml.

This solution should be freshly prepared.

Diazotized Dinitroaniline TS

Dissolve 50 mg of 2,4-dinitroaniline in 1.5 ml of hydrochloric acid, add 1.5 ml of water, cool in ice bath, then add 5 ml of 10% sodium nitrite solution dropwise with shaking.

Diazotized *p*-Nitroaniline TS

Dissolve 0.4 g of *p*-nitroaniline in a mixture of 20 ml of dilute hydrochloric acid and 40 ml of water, cool to 15°C and add 10% sodium nitrite solution until 1 drop of the solution turns blue to starch potassium iodide TP.

This solution should be freshly prepared.

2,6-Dichlorophenol Indophenol Sodium TS

Dissolve 0.1 g of 2,6-dichlorophenol indophenol sodium in 100 ml of water and filter.

2,6-Dichloroquinone-Chlorimide TS

Dissolve 1 g of 2,6-dichloroquinone-chlorimide in 200 ml of ethanol.

***p*-Dimethylaminobenzaldehyde TS**

Dissolve 0.125 g of *p*-dimethylaminobenzaldehyde in a cooled mixture of 65 ml of nitrogen-free sulfuric acid and 35 ml of water, add 0.05 ml of ferric chloride TS and mix well.

This solution should be used within 7 days.

Dimethylglyoxime TS

Dissolve 1 g of 2, 3-dimethylglyoxime in 100 ml of ethanol.

Dinitrobenzene TS

Dissolve 2 g of *m*-dinitrobenzene in ethanol to make 100 ml.

Dinitrobenzoic Acid TS

Dissolve 1 g of 3,5-dinitrobenzoic acid in ethanol to make 100 ml.

Dinitrophenylhydrazine TS

Dissolve 1.5 g of 2,4-dinitrophenylhydrazine in 20 ml of sulfuric acid solution (1→2), dilute with water to 100 ml and filter.

Dinitrophenylhydrazine Dilute TS

Dissolve 0.15 g of 2,4-dinitrophenylhydrazine in 100 ml of aldehyde free ethanol which contains 0.15 ml of sulfuric acid.

Diethyl Sodium Sulfosuccinate TS

Dissolve 0.9 g of diethyl sodium sulfosuccinate in 50 ml of water with gentle heating. Cool to room temperature, dilute with water to 200 ml.

Diphenylamine TS

Dissolve 1 g of diphenylamine in 100 ml of sulfuric acid.

Dipyridyl TS

Dissolve 0.2 g of 2,2'-dipyridyl, 1 g of sodium acetate crystal and 5.5 ml of glacial acetic acid in water to make 100 ml.

Disodium Hydrogen Phosphate TS

Dissolve 12 g of crystalline disodium hydrogen phosphate in water to make 100 ml.

Ethanol, Dilute TS

Dilute 529 ml of ethanol with water to 1000 ml.

It contains 49.5%-50.5% (ml/ml) of C₂H₅OH at 20°C.

Ethanolic Ammonia TS

Add concentrated ammonia solution to dehydrated ethanol.

It contains 9-11 g of NH₃ per 100 ml.

Preserve in rubber stoppered bottle.

Ethanolic *p*-Dimethylaminobenzaldehyde TS

Dissolve 1 g of *p*-dimethylaminobenzaldehyde in 9.0 ml of ethanol and 2.3 ml of hydrochloric acid, dilute with ethanol to 100 ml.

Ethanolic Hydroxylamine Hydrochloride TS

Mix one portion of hydroxylamine hydrochloride solution (34.8 → 100), one portion of sodium acetate-sodium hydroxide TS with four portions of ethanol.

Ethanolic Mercuric Bromide TS

Dissolve 2.5 g of mercuric bromide in 50 ml of ethanol by gentle heat.

Preserve in glass-stoppered bottle, protected from light.

Ethanolic Potassium Hydroxide TS

Use alcoholic potassium hydroxide (0.5 mol/L) VS.

Ethanolic Silver Nitrate TS

Dissolve 4 g of silver nitrate in 10 ml of water, dilute with ethanol to 100 ml.

Ferric Chloride TS

Dissolve 9 g of ferric chloride in water to make 100 ml.

Ferric Salicylate TS

(1) Dissolve 0.1 g of ferric ammonium sulfate in 2 ml of dilute sulfuric acid and add water to make 100 ml;

(2) Dissolve 1.15 g of sodium salicylate in water to make 100 ml;

(3) Dissolve 13.6 g of sodium acetate in water to make 100 ml.

(4) Mix 1 ml of ferric ammonium sulfate solution, 0.5 ml of sodium salicylate solution, 0.8 ml of sodium acetate solution with 0.2 ml of dilute acetic acid before use, add water to make 5 ml and mix well.

Ferrous Sulfate TS

Dissolve 8 g of ferrous sulfate crystals in 100 ml of freshly boiled and cooled water.

This solution should be freshly prepared.

Folin TS

Heat 10 g of sodium tungstate under reflux, 2.5 g of sodium molybdate, 70 ml of water, 5 ml of 85% phosphoric acid solution and 10 ml of hydrochloric acid in a 200 ml flask gently for about 10 hours, cool, add 15 g of lithium sulfate, 5 ml of water and 1 drop of bromine VS. Boil the mixture for about 15 minutes, or until the excess bromine is expelled. Cool, dilute with water to 100 ml and filter. The filtrate is kept in amber coloured glass bottle in a refrigerator.

Dilute 2.5 ml of the stock solution with water to 10 ml before use, shake thoroughly.

Formaldehyde TS

Use "Formaldehyde Solution" directly.

Formaldehyde-Sulfuric Acid TS

Add 1 drop of formaldehyde TS to 1 ml of sulfuric acid and mix well.

This solution should be freshly prepared before use.

Fuchsin-Pyrogallol TS

Dissolve 0.1 g of fuchsin basic in 50 ml of boiling water, cool, add 2 ml of a saturated solution of sodium bisulfite, and allow to stand for 3 hours. Add 0.9 ml of hydrochloric acid and allow to stand overnight. Add 0.1 g of pyrogallol, shake until dissolution is effected, dilute with water to 100 ml.

Fuchsin-Sulfurous Acid TS

Dissolve 0.2 g of fuchsin basic in 100 ml of hot water, add 20 ml of sodium sulfite solution (1 → 10) and 2 ml of hydrochloric acid, then dilute with water to 200 ml, add 0.1 g of activated carbon, stir and filter promptly. Allow to stand for at least 1 hour.

This solution should be freshly prepared.

Furfural TS

Dilute 1 ml of furfural with water to 100 ml.

This solution should be freshly prepared.

Glycerin-acetic Acid TS

Mix 1 volume of glycerin, 1 volume of 50% acetic acid solution and 1 volume of water.

Hemoglobin TS

Dissolve 1 g of bovine hemoglobin in hydrochloric acid solution (dilute 65 ml of 1 mol/L hydrochloric acid solution with water to 1000 ml) to make 100 ml and mix.

Preserve in refrigerator and use within 2 days.

Hydrochloric Acid Dilute TS

Dilute 234 ml of hydrochloric acid with water to 1000 ml.

It contains 9.5%-10.5% of HCl.

Hydrogen Peroxide TS

Dilute 30% concentrated hydrogen peroxide solution with water to a 3% solution.

Hydrogen Sulfide TS

Use the saturated solution of hydrogen sulfide.

Preserve in amber coloured glass bottle and protected from the light. It is unsuitable to be used if it does not possess an odour of H_2S , or if it does not produce a copious precipitate of sulfur when added to an equal volume of ferric chloride TS.

p-Hydroxydiphenyl TS

Dissolve 1.5 g of p-hydroxydiphenyl in 10 ml of 5% sodium hydroxide solution and dilute with water to 100 ml.

This solution may be kept several months in amber coloured glass bottle.

Hydroxylamine Hydrochloride TS

Dissolve 3.5 g of hydroxylamine hydrochloride in 60% ethanol to make 100 ml.

Hydroxylamine Sodium Acetate TS

Dissolve 0.2 g of hydroxylamine hydrochloride and 0.2 g of anhydrous sodium acetate in 100 ml of methanol.

This solution should be freshly prepared.

Iodine Potassium Iodide TS

Dissolve 0.5 g of iodine and 1.5 g of potassium iodide in 25 ml of water.

Iodine TS

Use iodine (0.05 mol/L) VS directly.

Iodine Monochloride TS

Dissolve 0.14 g of potassium iodide and 90 mg of potassium iodate in 125 ml of water, add 125 ml of hydrochloric acid. Preserve in well-closed glass bottle and store in a cool place.

Indigo Carmine TS

Dissolve indigo carmine in a mixture of 12 ml of sulfuric acid and 80 ml of water to make a solution which contains 0.09-0.11 g of $\text{C}_{16}\text{H}_8\text{N}_2\text{O}_2(\text{SO}_3\text{Na})_2$ per 100 ml.

Isoniazid TS

Dissolve 0.25 g of isoniazid in 0.31 ml of hydrochloric acid and sufficient methanol (or dehydrated ethanol) to make 500 ml.

Lead Acetate TS

Dissolve 10 g of lead acetate in freshly boiled and cooled water, add acetic acid dropwise to make the solution clear, and then dilute with freshly boiled and cooled water to 100 ml.

Lead Subacetate TS

Add 14 ml of water to 14 g of lead monoxide, triturate until a paste is formed. Transfer it to a glass bottle with 10 ml of water, add 70 ml of a solution which contains 22 g of lead acetate, shake vigorously for 5 minutes. Allow the mixture to stand for 7 days with frequent shaking, filter, add freshly boiled and cooled water to make 100 ml.

Lead Subacetate, Dilute TS

Dilute 4 ml of lead subacetate TS with freshly boiled and cooled water to 100 ml.

Magnesium Sulfate TS

Dissolve 12 g of magnesium sulfate crystals ($\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$) in water to make 100 ml.

Magnesium Sulfate, Dilute TS

Dissolve 2.3 g of magnesium sulfate in water to make 100 ml.

Mercuric Acetate TS

Dissolve 5 g of mercuric acetate, finely powdered, in warm glacial acetic acid to make 100 ml.

Preserve this solution in a well-closed amber coloured glass bottle.

Mercuric Chloride TS

Dissolve 6.5 g of mercuric chloride in water to make 100 ml.

Mercuric Nitrate TS

Dissolve 40 g of yellow mercuric oxide in a mixture of 32 ml of nitric acid and 15 ml of water.

Preserve in stoppered glass bottle and protected from light.

Mercuric Potassium Iodide TS

Dissolve 1.36 g of mercuric chloride in 60 ml of water and dissolve 5 g of potassium iodide in 10 ml of water, mix these two solutions and dilute with water to 100 ml.

Mercuric Sulfate TS

Mix 5 g of yellow mercuric oxide with 40 ml of water, add 20 ml of sulfuric acid slowly with stirring, then add another 40 ml of water and mix well.

Mercurous Nitrate TS

Dissolve 15 g of mercurous nitrate in a mixture of 90 ml of water and 10 ml of dilute nitric acid.

This solution should be kept in an amber coloured glass bottle with the addition of one drop of mercury.

p-Methylaminophenol TS

Dissolve 0.2 g of p-methylaminophenol sulfate in 100 ml of water. Add 20 g of sodium pyrosulfite and allow it to dissolve.

Preserve in a stoppered amber coloured glass bottle and use within two weeks.

Molybdenum Phosphotungstate TS

Boil 70 ml of water under reflux, 5 ml of phosphoric acid 10 g of sodium tungstate and 2.4 g of phosphomolybdic acid for 2 hours. Cool, dilute with water to 100 ml and shake thoroughly.

Preserve in a glass bottle, protected from light.

Ninhydrin TS

Dissolve 2 g of Ninhydrin in ethanol to make 100 ml.

Nitric Acid Dilute TS

Dilute 105 ml of nitric acid with water to 1000 ml.

It contains 9.5%-10.5% of HNO_3 .

Oxalic Acid TS

Dissolve 6.3 g of oxalic acid in water to make 100 ml.

Platinic Chloride TS

Dissolve 2.6 g of platinic chloride in water to make 20 ml.

Phenol Red TS

Dissolve 100 mg of phenol red in 100 ml of ethanol (filter if necessary).

Phenoldisulfonic Acid TS

To 3 g of freshly distilled phenol add 20 ml of sulfuric acid and heat in water bath for 6 hours. Transfer the product to a glass-stoppered bottle while it is not solidified. Before use heat gently in a water bath until it is molten.

Phenylhydrazine Sulfate TS

Dissolve 60 mg of phenylhydrazine hydrochloride in 100 ml of sulfuric acid solution (1→2).

Phloroglucinol TS

Dissolve 0.5 g of phloroglucinol in ethanol to make 25 ml.

Preserved in glass-stoppered bottle, protected from light.

Phosphotungstic Acid TS

Dissolve 1 g of phosphotungstic acid in water to make 100 ml.

Phthalaldehyde TS

Dissolve 1.0 g of phthalaldehyde in 5 ml of methanol and 95 ml of 0.4 mol/L boric acid solution (adjust to pH 10.4 with 45% sodium hydroxide solution) with shaking. Add 2 ml of thioglycolic acid and adjust to pH 10.4 with 45% sodium hydroxide solution.

Potassium Acetate TS

Dissolve 10 g of potassium acetate in water to make 100 ml.

Potassium Carbonate TS

Dissolve 7 g of anhydrous potassium carbonate in water to make 100 ml.

Potassium chromate TS

Dissolve 5 g of potassium chromate in water to make 100 ml.

Potassium Cyanide TS

Dissolve 10 g of potassium cyanide in water to make 100 ml.

Potassium Dichromate TS

Dissolve 7.5 g of potassium dichromate in water to make 100 ml.

Potassium Ferricyanide TS

Dissolve 1 g of potassium ferricyanide in 10 ml of water. This solution should be freshly prepared.

Potassium Ferrocyanide TS

Dissolve 1 g of potassium ferrocyanide in 10 ml of water. This solution should be freshly prepared.

Potassium Ferricyanide Dilute TS

To 10 ml of 1% potassium ferricyanide solution add 0.5 ml of 5% ferric chloride solution and 40 ml of water, shake thoroughly.

Potassium Hydroxide TS

Dissolve 6.5 g of potassium hydroxide in water to make 100 ml.

Potassium Iodide TS

Dissolve 16.5 g of potassium iodide in water to make 100 ml. This solution should be freshly prepared.

Potassium Iodobismuthate, Dilute TS

Dissolve 0.85 g of bismuth subnitrate in a mixture of 10 ml of glacial acetic acid and 40 ml of water. Before use, add 5 ml of potassium iodide solution (4→10) and 20 ml of glacial acetic acid to 5 ml of the solution mentioned above, dilute with water to 100 ml.

Potassium Iodobismuthate TS

Dissolve 0.85 g of bismuth subnitrate in a mixture of 10 ml of glacial acetic acid and 40 ml of water, and then add 20 ml of potassium iodide solution (4→10) and mix well.

Potassium Iodoplatinate TS

Dissolve 20 mg chloroplatinic in 2 ml of water, add 25 ml of 4% potassium iodide solution, shake to dissolve if a precipitate is produced, then add water to make 50 ml and shake thoroughly.

Potassium Iodoplatinate, Concentrated TS

Dissolve 0.15 g of chloroplatinic acid and 3 g of potassium iodide in water to make 60 ml.

Potassium permanganate TS

Use potassium permanganate (0.02 mol/L) VS directly.

Potassium Sulfate TS

Dissolve 1 g of potassium sulfate in water to make 100 ml.

Resorcinol TS

Dissolve 1 g of resorcinol in hydrochloric acid to make 100 ml.

Semicarbazide Hydrochloride TS

Triturate 2.5 g of semicarbazide hydrochloride with 3.3 g of sodium acetate, transfer the mixture to a conical flask with 30 ml of methanol, allow to stand for 30 minutes at a temperature below 4°C, filter and add methanol to make 100 ml.

Silicotungstic Acid TS

Dissolve 10 g of silicotungstic acid in water to make 100 ml.

Silver Diethyldithiocarbamate TS

To 0.25 g of silver diethyldithiocarbamate add a suitable amount of chloroform and 1.8 ml of triethylamine, dilute with chloroform to 100 ml and dissolve it by stirring. Allow the solution to stand overnight, and then filter with absorbent cotton wool.

Preserve in amber coloured glass bottle and store in a cool place.

Silver Nitrate TS

Use silver nitrate (0.1 mol/L) VS directly.

Sodium Acetate TS

Dissolve 13.6 g of crystalline sodium acetate in water to make 100 ml.

Sodium Acetate-Sodium Hydroxide TS

Dissolve 10.3 g of sodium acetate and 86.5 g of sodium hydroxide in water to make 1000 ml.

Sodium Bicarbonate TS

Dissolve 5 g of sodium bicarbonate in water to make 100 ml.

Sodium Bisulfite TS

Dissolve 10 g of sodium bisulfite in water to make 30 ml. This solution should be freshly prepared.

Sodium Bitartrate TS

Dissolve 1 g of sodium bitartrate in water to make 10 ml. This solution should be freshly prepared.

Sodium Carbonate TS

Dissolve 12.5 g of sodium carbonate monohydrate or 10.5 g of anhydrous sodium carbonate in water to make 100 ml.

Sodium Cobaltinitrite TS

Dissolve 10 g of sodium cobaltinitrite in water to make 50 ml.

and filter.

Sodium Diethyldithiocarbamate TS

Dissolve 0.1 g of sodium diethyldithiocarbamate in 100 ml of water and filter.

Sodium Fluoride TS

Dissolve 0.5 g of sodium fluoride in 100 ml of 0.1 mol/L hydrochloric acid solution.

This solution should be freshly prepared.

Sodium Hydroxide TS

Dissolve 4.3 g of sodium hydroxide in water to make 100 ml.

Sodium Hypobromite TS

Add 5 ml of bromine to a solution of 20 g of sodium hydroxide in 75 ml of water. Dilute with water to 100 ml and mix well.

This solution should be freshly prepared.

Sodium Hypochlorite TS

Prepare a homogeneous suspension by adding 100 ml of water to 20 g of chlorinated lime and add 100 ml of 14% sodium carbonate solution with stirring. Filter with wet filter paper and add a few drops of sodium carbonate TS to 5 ml of the filtrate. If a turbidity is produced, add sufficient 14% sodium carbonate solution to the bulk filtrate until the lime is completely precipitated, filter again, the final filtrate contains not less than 4% of NaClO.

Preserve in amber coloured glass bottle, protected from light.

Sodium Nitrite TS

Dissolve 1 g of sodium nitrite in water to make 100 ml.

Sodium Nitroprusside TS

Dissolve 1 g of sodium nitroprusside in water to make 20 ml.

This solution must be freshly prepared.

Sodium Nitroprusside Acetaldehyde TS

Mix 10 ml of 1% sodium nitroprusside solution with 1 ml of acetaldehyde.

Sodium Periodate TS

Dissolve 1.2 g of sodium periodate in 100 ml of water.

Sodium Sulfite TS

Dissolve 20 g of anhydrous sodium sulfite in 100 ml of water.

This solution should be freshly prepared.

Sodium Sulfide TS

Dissolve 1 g of sodium sulfide in water to make 10 ml.

This solution should be freshly prepared.

Sodium Thiosulfate TS

Use sodium thiosulfate (0.1 mol/L) VS directly.

Stannous Chloride TS

Dissolve 1.5 g of stannous chloride in 10 ml of water and a small amount of hydrochloric acid.

This solution should be freshly prepared.

Sulfanilamide TS

Dissolve 50 mg of sulfanilamide in 10 ml of 2 mol/L hydrochloric acid solution.

Sulfanilic- α -Naphthylamine TS

Dissolve 0.5 g of anhydrous sulfanilic acid in 150 ml of acetic acid. Dissolve 0.1 g of α -naphthylamine hydrochloride in 150 ml of acetic acid. Mix these two solutions.

This solution will show pink colour after standing for a long time, add zinc powder to decolourize it before use.

Sulfuric Acid, dilute, TS

Dilute 57 ml of sulfuric acid with water to 1000 ml.

It contains 9.5%-10.5% of H₂SO₄.

Tannic Acid TS

Dissolve 1 g of tannic acid in 1 ml of alcohol and dilute with

water to 100 ml.

This solution should be freshly prepared.

Tetramethylammonium hydroxide TS

Dilute 1 ml of 10% tetramethylammonium hydroxide solution with dehydrated ethanol to make 10 ml.

Thioacetamide TS

Dissolve 4 g of thioacetamide in water to make 100 ml. Store in refrigerator. Add 1.0 ml of thioacetamide solution to 5.0 ml of a mixture consisting of 15 ml of 1 mol/L sodium hydroxide solution, 5.0 ml of water and 20 ml of glycerin before use, heat for 20 seconds in a water bath, cool and use immediately.

Titanium Sulfate TS

Dissolve 0.1 g of titanium dioxide in 100 ml of sulfuric acid by heating, allow to cool.

***p*-Tosyl-L-Arginine Methyl Ester Hydrochloride TS**

Dissolve 98.5 mg of *p*-tosyl-L-arginine methyl ester hydrochloride in 5 ml of trometamol buffer solution (pH 8.1), add 0.25 ml of indicator solution (mix 0.1% alcoholic methyl red solution with an equal volume of 0.05% alcoholic methylene blue solution) and dilute with water to 25 ml.

Trichloroacetic Acid TS

Dissolve 6 g of trichloroacetic acid in 25 ml of chloroform, add 0.5 ml of 30% hydrogen peroxide solution and mix well.

Trinitrophenol TS

A saturated solution of trinitrophenol in water.

Trinitrophenol Lithium TS

Dissolve 0.25 g of lithium carbonate and 0.5 g of trinitrophenol in 80 ml of boiling water, cool and dilute with water to 100 ml.

Triphenyl Tetrazolium Chloride TS

Dissolve 1 g of triphenyl tetrazolium chloride in dehydrated ethanol to make 200 ml.

Vanadium Pentoxide TS

Dissolve vanadium pentoxide in phosphoric acid with shaking vigorously for 2 hours to produce a saturated solution. Filter with a sinter-glass funnel, dilute 1 volume of filtrate with 3 volume of water and mix well.

Vanillin TS

Dissolve 0.1 g of vanillin in 10 ml of hydrochloric acid.

Xanthidrol-Methanol TS

Dissolve 85% xanthidrol solution in 100 ml of methanol.

Zinc Chloride-Iodine TS

Dissolve 20 g of zinc chloride and 2 g of potassium iodide in 10 ml of water, then saturated with iodine.

Preserve in amber coloured glass bottle.

Zinc Uranyl Acetate TS

Dissolve 10 g of uranyl acetate in 5 ml of glacial acetic acid and 50 ml of water by heating. Dissolve 30 g of zinc acetate in 3 ml of glacial acetic acid and 30 ml of water with gentle heating. Mix the two solutions, cool and filter.

Zirconium Alizarin TS

Dissolve 5 mg of zirconium nitrate in a mixture of 5 ml of water and 1 ml of hydrochloric acid. Dissolve 1 mg of sodium alizarinsulfonate in 5 ml of water. Mix these two solutions.

XV C Test Papers

Ammoniated-Silver Nitrate TP

Immerse a strip of filter paper in ammoniated-silver nitrate TS until thoroughly wetted.

Benzidine-Cupric Acetate TP

To 9 ml of a saturated solution of benzidine acetate add 7 ml of water and 16 ml of 0.3% cupric acetate solution, immerse a strip of filter paper in the mixture until thoroughly wetted. Remove the paper and allow to dry.

Blue Litmus TP

Immerse a strip of filter paper in litmus IS until thoroughly wetted. Remove the paper and allow to dry.

Sensitivity Introduce 0.5 ml of 0.1 mol/L hydrochloric acid in a beaker. Add 100 ml of freshly boiled and cooled water and mix. Drop a strip of blue litmus TP 10-12 mm in width in the solution and stir continuously. The colour of the paper changes within 45 seconds.

Cadmium Acetate TP

Dissolve 3 g of cadmium acetate in 100 ml of ethanol, add ammonia TS until the majority of the precipitate is dissolved. Filter and immerse a strip of filter paper in the filtrate. Remove the paper before use and allow to dry.

Congo Red TP

Immerse a strip of filter paper in congo red IS until thoroughly wetted, remove the paper and allow to dry.

Curcuma TP (Turmeric TP)

Immerse a strip of filter paper in curcuma IS until thoroughly wetted. Lay the paper on a glass plate and dry at 100°C.

Lead Acetate TP

Immerse a strip of filter paper in lead acetate TS until thoroughly wetted. Remove the paper and allow to dry at 100°C.

Mercuric Bromide TP

Immerse a strip of filter paper in alcoholic mercuric bromide TS for 1 hour. Remove the paper and allow to dry in a dark place.

Mercuric Chloride TP

Immerse a strip of filter paper in a saturated solution of mercuric chloride for 1 hour, then remove the strip and allow to dry at 60°C in a dark place.

Mercuric Nitrate TP

To 45 ml of a saturated solution of mercuric nitrate add 1 ml of nitric acid. Immerse a strip of filter paper in the solution until thoroughly wetted. Remove the paper and allow to dry.

Red Litmus TP

Immerse a strip of filter paper in litmus IS, add a small amount of hydrochloric acid until a red colour is obtained. Remove the paper and allow to dry.

Sensitivity Introduce 0.5 ml of 0.1 mol/L sodium hydroxide solution to a beaker, add 100 ml of freshly boiled and cooled water and mix. Drop a strip of red litmus TP 10-12 mm in width in the solution and stir continuously. The colour of the paper changes within 30 seconds.

Starch-Iodide TP

Immerse a strip in 100 ml of freshly prepared starch IS, which contains 0.5 g of potassium iodide, until thoroughly wetted. Remove the paper and allow to dry.

XV D Buffer Solutions

Acetate BS (pH 3.5)

Dissolve 25 g of ammonium acetate in 25 ml of water, add 38 ml of 7 mol/L hydrochloric acid solution. Adopt the potentiometric method to adjust accurately to pH 3.5 with 2 mol/L hydrochloric acid solution or 5 mol/L ammonia solution and dilute with water to 100 ml.

Ammonium Acetate BS (pH 4.5)

Dissolve 7.7 g of ammonium acetate in 50 ml of water. Add 6 ml of glacial acetic acid and dilute with water to 100 ml.

Ammonium Acetate BS (pH 6.0)

Dissolve 100 g of ammonium acetate in 300 ml of water, add 7 ml of glacial acetic acid and mix well.

Ammonium Acetate-Ethanol BS (pH 3.7)

Mix 15.0 ml of 5 mol/L acetic acid solution with 60 ml of ethanol and 20 ml of water, and adjust to pH 3.7 with 10 mol/L ammonium hydroxide solution, dilute with water to 1000 ml.

Ammonia-Ammonium Chloride BS (pH 8.0)

Dissolve 1.07 g of ammonium chloride in water to make 100 ml. Add dilute ammonia solution (1→30) and adjust to pH 8.0.

Ammonia-Ammonium Chloride BS (pH 10.0)

Dissolve 5.4 g of ammonium chloride in 20 ml of water, add 35 ml of concentrated ammonia solution. Dilute with water to 100 ml.

Barbital BS (pH 7.4)

Dissolve 4.42 g of sodium barbital in 400 ml of water, adjust to pH 7.4 with 2 mol/L hydrochloric acid.

Barbital BS (pH 8.6)

Dissolve 5.52 g of barbital and 30.9 g of sodium barbital in water to make 2000 ml.

Barbital-Sodium Chloride BS (pH 7.8)

Dissolve 5.05 g of sodium barbital and 3.7 g of sodium chloride in water, heat to dissolve 0.5 g of gelatin in water, combine the two solution, adjust to pH 7.8 with 0.2 mol/L hydrochloric acid solution, make up to 500 ml with water.

Borate-Potassium Chloride BS (pH 9.0)

Dissolve 3.09 g of boric acid in 500 ml of 0.1 mol/L potassium chloride solution, and add 210 ml of 0.1 mol/L sodium hydroxide solution.

Borax-Calcium Chloride BS (pH 8.0)

Dissolve 0.572 g of borax and 2.94 g of calcium chloride in about 800 ml of water, and adjust to pH 8.0 with about 2.5 ml of 1 mol/L hydrochloric acid solution. Dilute with water to 1000 ml.

Borax-Sodium Carbonate BS (pH 10.8-11.2)

Dissolve 5.30 g of anhydrous sodium carbonate in water to make 1000 ml. Dissolve 1.91 g of borax in water to make 100 ml. Mix 973 ml of sodium carbonate solution with 27 ml of borax solution before use, shake thoroughly.

Citrate BS

Dissolve 4.2 g of citric acid in 40 ml of a solution of sodium hydroxide in 20% 1 mol/L ethanol solution. Dilute with 20% ethanol solution to 100 ml.

Citrate BS (pH 6.2)

Adjust the pH value of 2.1% citric acid solution to 6.2 with 50% sodium hydroxide solution.

Citrate-Disodium Hydrogen Phosphate BS (pH 4.0)

(a) Dissolve 21 g of citric acid or 19.2 g of anhydrous citric acid in water to make 1000 ml, preserve in a refrigerator.
 (b) Dissolve 71.63 g of disodium hydrogen phosphate in water to make 1000 ml.
 To 61.45 ml of solution (a) add 38.55 ml of solution (b) and mix well.

Lithium-Acetate BS (pH 3.0)

Add 800 ml of water to 50 ml of glacial acetic acid and mix. Adjust the pH value to 3.0 with lithium hydroxide, dilute with water to 1000 ml.

Phosphate BS

Dissolve 38.0 g of sodium dihydrogen phosphate and 5.04 g of disodium hydrogen phosphate in water to make 1000 ml.

Phosphate BS (pH 2.0)

(a) Dilute 16.6 ml of phosphoric acid with water to 1000 ml and mix well.
 (b) Dissolve 71.63 g of disodium hydrogen phosphate in water to make 1000 ml.
 To 72.5 ml of solution (a) add 27.5 ml of solution (b) and mix well.

Phosphate BS (pH 2.5)

Dissolve 100 g of potassium dihydrogen phosphate in 800 ml of water, adjust the pH value to 2.5 with hydrochloric acid, make up to 1000 ml with water.

Phosphate BS (pH 5.0)

Adjust the pH value of 0.2 mol/L sodium dihydrogen phosphate solution to 5.0 with sodium hydroxide TS.

Phosphate BS (pH 5.8)

Dissolve 8.34 g of potassium dihydrogen phosphate and 0.87 g of dipotassium hydrogen phosphate in water to make 1000 ml.

Phosphate BS (pH 6.5)

Dissolve 0.68 g of potassium dihydrogen phosphate in 15.2 ml of 0.1 mol/L sodium hydroxide solution, dilute with water to 100 ml.

Phosphate BS (pH 6.6)

Dissolve 1.74 g of sodium dihydrogen phosphate, 2.7 g of disodium hydrogen phosphate and 1.7 g of sodium chloride in water to make 400 ml.

Phosphate-Pancreatin BS (pH 6.8)

(a) Dissolve 6.8 g of potassium dihydrogen phosphate in 500 ml of water and adjust the pH value to 6.8 with 0.1 mol/L sodium hydroxide solution.
 (b) Dissolve 10 g of pancreatin in water.
 Mix the two solutions and dilute with water to 1000 ml.

Phosphate BS (pH 6.8)

Add 118 ml of 0.2 mol/L sodium hydroxide solution to 250 ml of 0.2 mol/L potassium dihydrogen phosphate solution, dilute with water to 1000 ml and shake thoroughly.

Phosphate BS (pH 7.0)

Dissolve 0.68 g of potassium dihydrogen phosphate in 29.1 ml of 0.1 mol/L sodium hydroxide solution and dilute with water to 100 ml.

Phosphate BS (pH 7.2)

Mix 50 ml of 0.2 mol/L potassium dihydrogen phosphate solution with 35 ml of 0.2 mol/L sodium hydroxide solution, dilute with freshly boiled and cooled water to 200 ml and mix well.

Phosphate BS (pH 7.3)

Dissolve 1.9734 g of disodium hydrogen phosphate and 0.2245 g of potassium dihydrogen phosphate in water to make 1000 ml. Adjust the pH value to 7.3.

Phosphate BS (pH 7.4)

Dissolve 1.36 g of potassium dihydrogen phosphate in 79 ml of 0.1 mol/L sodium hydroxide solution, dilute with water to 200 ml.

Phosphate BS (pH 7.6)

Dissolve 27.22 g of potassium dihydrogen phosphate in water to make 1000 ml.
 Mix 50 ml of this solution with 42.4 ml of 0.2 mol/L sodium hydroxide solution, dilute with water to 200 ml.

Phosphate BS (pH 7.8)

(a) Dissolve 35.9 g of disodium hydrogen phosphate in water to make 500 ml.
 (b) Dissolve 2.76 g of sodium dihydrogen phosphate in water to make 100 ml.
 To 91.5 ml of solution (a) add 8.5 ml of solution (b), mix well.

Phosphate BS (pH 7.8-8.0)

Dissolve 5.59 g of dipotassium hydrogen phosphate and 0.41 g of potassium dihydrogen phosphate in water to make 1000 ml.

Phosphate-Triethylamine BS

Mix about 4 ml of phosphoric acid with about 7 ml of triethylamine, dilute with 50% methanol to 1000 ml, adjust the pH value to 3.2 with phosphoric acid.

Phthalate BS (pH 5.6)

Dissolve 10 g of potassium biphthalate in 900 ml of water with stirring. Adjust to pH 5.6 with sodium hydroxide TS (or dilute hydrochloric acid). Dilute with water to 1000 ml and mix well.

Potassium Acetate BS (pH 4.3)

Dissolve 14 g of potassium acetate in 20.5 ml of glacial acetic acid, and dilute with water to 1000 ml.

Sodium Acetate BS (pH 3.6)

Dissolve 5.1 g of sodium acetate in 20 ml of glacial acetic acid, dilute with water to 250 ml.

Sodium Acetate BS (pH 3.7)

Dissolve 20 g of anhydrous sodium acetate in 300 ml of water, add 1 ml of bromophenol blue IS and 60-80 ml of glacial acetic acid until the colour changes from blue to pure green, and then dilute with water to 1000 ml.

Sodium Acetate BS (pH 3.8)

Mix 13 ml of 2 mol/L sodium acetate solution with 87 ml of 2 mol/L acetic acid solution. Add 0.5 ml of cupric sulfate solution which contains 1 mg of Cu per ml.
 Dilute with water to 1000 ml.

Sodium Acetate BS (pH 4.5)

Dissolve 18 g of sodium acetate in 9.8 ml of glacial acetic acid, and dilute with water to 1000 ml.

Sodium Acetate BS (pH 4.6)

Dissolve 5.4 g of sodium acetate in 50 ml of water, adjust to pH 4.6 with glacial acetic acid, dilute with water to 100 ml.

Sodium Acetate BS (pH 6.0)

Dissolve 54.6 g of sodium acetate in 20 ml of 1 mol/L acetic acid solution. Dilute with water to 500 ml.

Sodium Formate BS (pH 3.3)

To 25 ml of 2 mol/L formic acid solution add 1 drop of phenolphthalein IS, neutralize with 2 mol/L sodium hydroxide solution, and then add 75 ml of 2 mol/L formic acid solution. Dilute with water to 200 ml. The pH value of the solution is 3.25-3.30.

Trometamol BS (pH 8.0)

Dissolve 12.14 g of trometamol in 800 ml of water with stirring, dilute with water to 1000 ml. Adjust to pH 8.0 with 6 mol/L hydrochloric acid solution.

Trometamol BS (pH 8.1)

Dissolve 0.294 g of calcium chloride in 40 ml of 0.2 mol/L trometamol solution. Adjust to pH 8.1 with 1 mol/L hydrochloric acid solution, and then dilute with water to 100 ml.

Trometamol BS (pH 9.0)

Dissolve 6.06 g of trometamol, 3.65 g of lysine hydrochloride, 5.8 g of sodium chloride and 0.37 g of disodium edetate in 1000 ml of water, adjust to pH 9.0.

Urotropine BS

Dissolve 75 g of urotropine in water, add 4.2 ml of concentrated ammonia solution, and then dilute with water to 250 ml.

XV E Indicator Solutions

Azo Violet IS

Dissolve 0.1 g of azo violet in 100 ml of dimethylformamide.

Brilliant Green IS

Dissolve 0.5 g of brilliant green in 100 ml of glacial acetic acid.

Colour changes from yellow to green (pH 0.0-2.6).

Bromocresol Green IS

Dissolve 0.1 g of bromocresol green in 2.8 ml of sodium hydroxide solution (0.05 mol/L), and dilute with water to 200 ml.

Colour changes from yellow to blue (pH 3.6-5.2).

Bromocresol Purple IS

Dissolve 0.1 g of bromocresol purple in 20 ml of 0.02 mol/L sodium hydroxide solution, and dilute with water to 100 ml. Colour changes from yellow to violet (pH 5.2-6.8).

Bromophenol Blue IS

Dissolve 0.1 g of bromophenol blue in 3.0 ml of 0.05 mol/L sodium hydroxide solution, and dilute with water to 200 ml. Colour changes from yellow to bluish green (pH 2.8-4.6).

Bromothymol Blue IS

Dissolve 0.1 g of bromothymol blue in 3.2 ml of 0.05 mol/L sodium hydroxide solution, and dilute with water to 200 ml. Colour changes from yellow to blue (pH 6.0-7.6).

Calcein Indicator Mixture

Mix uniformly 0.1 g of calcein with 10 g of potassium chloride by grinding.

Calcon Indicator Mixture

Mix uniformly 0.1 g of calcon with 10 g of anhydrous sodium sulfate by grinding.

Catechol Violet IS

Dissolve 0.1 g of catechol violet in 100 ml of water. Colour changes from yellow to violet and then to purplish-red (pH 6.0-7.0-9.0).

Congo Red IS

Dissolve 0.5 g of congo red in 100 ml of 10% ethanol. Colour changes from blue to red (pH 3.0-5.0).

Cresol Red IS

Dissolve 0.1 g of cresol red in 5.3 ml of 0.05 mol/L sodium hydroxide solution, and dilute with water to 100 ml. Colour changes from yellow to red (pH 7.2-8.8).

m-Cresol Purple IS

Dissolve 0.1 g of m-cresol purple in 10 ml of 0.01 mol/L sodium hydroxide solution, and dilute with water to 100 ml.

Colour changes from yellow to purple (pH 7.5-9.2).

Cresol Red-Thymol blue IS

Mix 1 volume of cresol red IS with 3 volume of a 0.1% thymol blue solution.

Crystal Violet IS

Dissolve 0.5 g of crystal violet in 100 ml of glacial acetic acid.

Curcuma IS (Turmeric IS)

Extract 20 g of curcuma powder with 4 quantities of each of 100 ml of water to remove water soluble matter and dry the residue at 100°C. Macerate with 100 ml of ethanol for a few days and filter.

Dimethyl Yellow IS

Dissolve 0.1 g of dimethyl yellow in 100 ml of ethanol. Colour changes from red to yellow (pH 2.9-4.0).

Dimethyl Yellow-methylene Blue IS

Dissolve 15 mg of dimethyl yellow and 15 mg of methylene blue in 100 ml of chloroform with shake (heat gently if necessary), and filter.

Dimethyl Yellow-solvent blue 19 IS

Dissolve 15 mg of dimethyl yellow and 15 mg of solvent blue 19 in 100 ml of chloroform.

Diphenylcarbazide IS

Dissolve 1 g of diphenylcarbazide in 100 ml of ethanol.

Eriochrome Black T Indicator Mixture

Mix uniformly 0.1 g of eriochrome black T with 10 g of sodium chloride by grinding.

Ethoxychrysoidine IS

Dissolve 0.1 g of ethoxychrysoidine in 100 ml of ethanol. Colour changes from red to yellow (pH 3.5-5.5).

Eosin Sodium IS

Dissolve 0.5 g of eosin sodium in 100 ml of water.

Ferric Ammonium Sulfate IS

Dissolve 8 g of ferric ammonium sulfate in 100 ml of water.

Fluorescein IS

Dissolve 0.1 g of fluorescein in 100 ml of ethanol.

Litmus IS

Add 40 ml of ethanol to 10 g of litmus powder, heat under reflux for 1 hour. Allow to settle and decant off the supernatant liquid. Repeat the operation twice using 30 ml of ethanol each time. Wash the residue with 10 ml of water and decant off the washing liquid. Boil the residue with 50 ml of water, allow to cool and filter. Colour changes from red to blue (pH 4.5-8.0).

Malachite Green IS

Dissolve 0.3 g of malachite green in 100 ml of glacial acetic acid. Colour changes from yellow to green (pH 0.0-2.0); from green to colourless (pH 11.0-13.5).

Metaphthalein IS

Dissolve 1 g of metaphthalein and small amount of ammonia TS in 100 ml of water.

Methyl Orange IS

Dissolve 0.1 g of methyl orange in 100 ml of water. Colour changes from red to yellow (pH 3.2-4.4).

Methyl Orange-Methylene Blue IS

To 20 ml of methyl orange IS add 8 ml of 0.2% solution of methylene blue, and mix well.

Methyl orange-Xylene Cyanol blue FF IS

Dissolve 0.1 g of methyl orange and 0.1 g of xylene cyanol blue FF in 100 ml of ethanol.

Methyl Red IS

Dissolve 0.1 g of methyl red in 7.4 ml of 0.05 mol/L sodium hydroxide solution and dilute with water to 200 ml. Colour changes from red to yellow (pH 4.2-6.3).

Methyl Red-Bromocresol Green IS

To 20 ml of 0.1% alcoholic solution of methyl red add 30 ml of 0.2% ethanol solution of bromocresol green, and mix well.

Methyl Red-Methylene blue IS

To 20 ml of 0.1% alcoholic solution of methyl red add 8 ml of 0.2% solution of methylene blue, and mix well.

Naphtholbenzein IS

Dissolve 0.5 g of α -naphtholbenzein in 100 ml of glacial acetic acid.

Colour changes from yellow to green (pH 8.5-9.8).

Neutral Red IS

Dissolve 0.5 g of neutral red in 100 ml of water and filter. Colour changes from red to yellow (pH 6.8-8.0).

Nile Blue IS

Dissolve 1 g of nile blue in 100 ml of glacial acetic acid. Colour changes from blue to red (pH 10.1-11.1).

p-Nitrophenol IS

Dissolve 0.25 g of p-nitrophenol in 100 ml of water.

Orange IV IS

Dissolve 0.5 g of orange IV in 100 ml of glacial acetic acid. Colour changes from red to yellow (pH 1.4-3.2).

o-Phenanthroline IS

Dissolve 0.5 g of ferrous sulfate in 100 ml of water, add 2 drops of sulfuric acid and 0.5 g of o-phenanthroline. Shake thoroughly.

This solution should be freshly prepared.

Phenol Red IS

Dissolve 100 mg phenol red in 100 ml of ethanol (Filter if necessary).

Phenol sulfonphthalein IS

Dissolve 0.1 g of phenol sulfonphthalein in 5.7 ml of 0.05 mol/L sodium hydroxide solution, and dilute with water to 200 ml.

Colour changes from yellow to red (pH 6.8-8.4).

Phenolphthalein IS

Dissolve 1 g of phenolphthalein in 100 ml of ethanol. Colour changes from colourless to red (pH 8.3-10.0).

Phthalein purple IS

Adjust to pH of 10 ml of water to 11 with ammonia solution, and then add 10 mg of phthalein purple and dissolve.

Potassium Chromate IS

Dissolve 10 g of potassium chromate in 100 ml of water.

Quinaldine Red IS

Dissolve 0.1 g of quinaldine red in 100 ml of methanol. Colour changes from colourless to red (pH 1.4-3.2).

Quinaldine Red-Methylene Blue IS

Dissolve 0.3 g of quinaldine red and 0.1 g of methylene blue in 100 ml of anhydrous methanol.

Sodium Alizarinsulfonate IS

Dissolve 0.1 g of sodium alizarinsulfonate in 100 ml of water.

Colour changes from yellow to purple (pH 3.7-5.2).

Solvent Blue 19 IS

Dissolve 0.5 g of solvent blue 19 in 100 ml of glacial acetic acid.

Starch IS

Add 5 ml of water to 0.5 g of soluble starch and mix well,

then pour the suspension slowly into 100 ml of boiling water with stirring. Boil for 2 minutes, cool and decant the supernatant liquid.

This solution should be freshly prepared.

Starch Iodide IS

Dissolve 0.2 g of potassium iodide in 100 ml of freshly prepared starch IS.

Sudan IV IS

Dissolve 0.5 g of sudan IV in 100 ml of chloroform.

Tetrabromophenolphthalein Potassium Ethyl Ester IS

Dissolve 0.1 g of tetrabromophenolphthalein potassium ethyl ester in 100 ml of glacial acetic acid.

Thymol Blue IS

Dissolve 0.1 g of thymol blue in 4.3 ml of 0.05 mol/L sodium hydroxide solution, and dilute with water to 200 ml.

Colour changes from red to yellow (pH 1.2-2.8); from yellow to bluish-violet (pH 8.0-9.6).

Thymolphthalein IS

Dissolve 0.1 g of thymolphthalein in 100 ml of ethanol.

Colour changes from colourless to blue (pH 9.3-10.5).

Xylenol Orange IS

Dissolve 0.2 g of xylenol orange in 100 ml of water.

Zinc-Starch Iodide IS

Mix 100 ml of water, 5 ml of potassium iodide solution (3→20) with 10 ml of zinc chloride solution (1→5), boil and add starch suspension (to 5 g of soluble starch add 30 ml of water and mix well) with stirring, and continue to boil for 2 minutes, allow to cool.

Preserve in a well-closed bottle, stored in a cool place.

XV F Volumetric Solutions

Ammonium Ferrous Sulfate (0.1 mol/L) VS

[$\text{Fe}(\text{NH}_4)_2(\text{SO}_4)_2 \cdot 6\text{H}_2\text{O}$ 392.13] 39.21 g→1000 ml
Preparation Dissolve 40 g of ammonium ferrous sulfate in a previously cooled mixture of 40 ml of sulfuric acid and 200 ml of water, make up to 1000 ml with water and mix well.

Standardization To 25 ml of ammonium ferrous sulfate solution, accurately measured, add two drops of o-phenanthroline IS and titrate with ceric sulfate (0.1 mol/L) VS until the colour turns from pale red to pale green. Calculate the concentration of ammonium ferrous sulfate VS according to the volume consumed.

This solution should be standardized before use.

Ammonium Thiocyanate (0.1 mol/L) VS

[NH_4SCN 76.12] 7.612 g→1000 ml
Preparation Dissolve 8.0 g of ammonium thiocyanate in water to make 1000 ml, and mix well.

Standardization To 25 ml of silver nitrate (0.1 mol/L) VS, accurately measured, add 50 ml of water, 2 ml of nitric acid and 2 ml of ferric ammonium sulfate IS; titrate with ammonium thiocyanate solution to the appearance of pale reddish-brown colour which persists on shake vigorously. Calculate the concentration of the ammonium thiocyanate VS according to the volume consumed. Sodium thiocyanate (0.1 mol/L) VS or potassium thiocyanate (0.1 mol/L) VS can be used in place of the Ammonium Thiocyanate (0.1 mol/L) VS.

Barium Perchlorate (0.05 mol/L) VS

[$\text{Ba}(\text{ClO}_4)_2 \cdot 3\text{H}_2\text{O}$ 390.32] 19.52 g→1000 ml
Preparation To 15.8 g of barium hydroxide add 75 ml of water and 7.5 ml of perchloric acid, adjust to pH 3.0 with

perchloric acid and filter if necessary. Add 150 ml of ethanol and dilute to 250 ml with water. Make up to 1000 ml with acetate buffer solution (dissolve 10 g of anhydrous sodium acetate in 300 ml of water, adjust to pH 3.7 with glacial acetic acid and make up to 1000 ml with water).

Standardization To 5 ml of sulfuric acid (0.05 mol/L) VS, accurately measured, add 5 ml of water, 60 ml of ethanol, 0.5 ml of 0.1% alizarin red solution as the indicator solution and 50 ml of acetate buffer solution described above. Titrate with barium perchlorate (0.05 mol/L) VS until the colour changes to orange red and calculate the concentration of barium perchlorate VS according to the volume consumed.

Benzalkonium Chloride (0.01 mol/L) VS

Preparation Dissolve 3.8 g of benzalkonium chloride in water, add 10 ml of sodium acetate BS (pH 3.7) and dilute with water to 1000 ml. Mix well.

Standardization Dissolve about 0.18 g of analytical pure potassium chloride, accurately weighed, previously dried for 1 hour at 150°C, in sodium acetate BS (pH 3.7) to make 250 ml. Mix well. Transfer accurately 20 ml to a 50 ml volumetric flask, add accurately 25 ml of sodium tetraphenylborate (0.02 mol/L) VS, dilute with water to 50 ml and mix well. Filter with dry filter paper, discard the initial filtrate. Transfer accurately 25 ml of the successive filtrate to a 150 ml conical flask, add 0.5 ml of bromophenol blue IS. Titrate with benzalkonium chloride (0.01 mol/L) VS to a blue colour. Each ml of benzalkonium chloride (0.01 mol/L) VS is equivalent to 0.7445 mg of potassium chloride.

Bromine (0.05 mol/L) VS

[Br₂ 159.81] 7.990 g→1000 ml
Preparation Dissolve 3.0 g of potassium bromate and 15 g of potassium bromide in water to make 1000 ml, and mix well.

Standardization To 25 ml of bromine VS, accurately measured, in an iodine flask add 100 ml of water and 2.0 g of potassium iodide, shake thoroughly. Add 5 ml of hydrochloric acid, stopper the flask and allow to stand in the dark for 5 minutes. Titrate with sodium thiosulfate (0.1 mol/L) VS, add 2 ml of starch IS towards the end point of titration, continue to titrate until the blue colour disappears. Calculate the concentration of the bromine VS according to the volume consumed.

When the room temperature is above 25°C, the reacting liquid must be cooled to about 20°C. Bromine VS should be standardized immediately before use.

If bromine (0.005 mol/L) VS is needed, dilute bromine (0.05 mol/L) VS with water and standardize accordingly.

Storage Preserve in well-closed amber coloured glass bottle, stored at a cool place.

Ceric Sulfate (0.1 mol/L) VS

[Ce (SO₄)₂ · 4H₂O 404.30] 40.43 g→1000 ml

Preparation Dissolve 42 g of ceric sulfate (or 70 g of ceric ammonium sulfate) in 500 ml of water and 28 ml of sulfuric acid by heat, cool, add water to make 1000 ml.

Standardization Dissolve about 0.15 g, accurately weighed, of arsenic trioxide, previously dried to constant weight at 105°C, in 10 ml of sodium hydroxide (1 mol/L) VS, by warm, add 50 ml of water, 25 ml of hydrochloric acid, 5 ml of iodine monochloride TS and 2 drops of α -phenanthroline IS, then titrate with ceric sulfate (0.1 mol/L) VS towards the end point of titration, heat it to 50°C and continue to titrate until the colour turns from pale red to pale green. Each ml of ceric sulfate (0.1 mol/L) VS is equivalent to 4.946 mg of arsenic trioxide.

If ceric sulfate (0.01 mol/L) VS is needed, dilute ceric sulfate (0.1 mol/L) VS with water containing 2.8%

(ml/ml) of sulfuric acid.

Disodium Edetate (0.05 mol/L) VS

[C₁₀H₁₄N₂Na₂O₈ · 2H₂O 372.24] 18.61 g→1000 ml

Preparation Dissolve 19 g of disodium edetate in water to make 1000 ml and mix well.

Standardization Dissolve 0.12 g of zinc oxide primary standard, previously ignited to constant weight at about 800°C and accurately weighed, in 3 ml of dilute hydrochloric acid. Add 25 ml of water and 1 drop of 0.025% ethanolic solution of methyl red, and add ammonia TS until a slight yellow colour is obtained. Add 25 ml of water, 10 ml of ammonium chloride BS (pH 10.0) and a small amount of eriochrome black T indicator. Titrate with disodium edetate VS until the colour changes from violet to pure blue. Perform a blank determination and make any necessary correction. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 4.069 mg of ZnO.

Storage Preserve in a glass stoppered bottle, avoid to contact with rubber.

Ethanolic Potassium Hydroxide (0.5 mol/L) VS

[KOH 56.11] 28.06 g→1000 ml

Preparation Dissolve 35 g of potassium hydroxide in a conical flask, in aldehyde-free ethanol to make 1000 ml, well close with a rubber stopper and allow to settle for 24 hours. Decant the supernatant liquid immediately and transfer into a rubber stoppered amber coloured glass bottle.

Standardization Dilute 25 ml of hydrochloric acid (0.5 mol/L) VS with 50 ml of water, add a few drops of phenolphthalein IS. Titrate with ethanolic potassium hydroxide (0.5 mol/L) VS. Calculate the concentration of the ethanolic potassium hydroxide VS according to the volume consumed.

This solution should be standardized before use.

Storage Preserve in well closed a rubber stoppered amber coloured glass bottle.

Hydrochloric Acid (1, 0.5, 0.2 or 0.1 mol/L) VS

[HCl 36.46] 36.46 g→1000 ml

18.23 g→1000 ml

7.292 g→1000 ml

3.646 g→1000 ml

Preparation (1) Hydrochloric Acid (1 mol/L) VS Dilute 90 ml of hydrochloric acid with water to 1000 ml and mix well.

(2) Hydrochloric Acid (0.5, 0.2 or 0.1 mol/L) VS Dilute 45 ml, 18 ml or 9.0 ml of hydrochloric acid respectively with water to 1000 ml and mix well.

Standardization (1) Hydrochloric Acid (1 mol/L) VS Weigh accurately about 1.5 g of anhydrous sodium carbonate primary standard, previously dried to constant weight at 270-300°C, and dissolve it in 50 ml of water. Add 10 drops of methyl red-bromocresol green IS, titrate with hydrochloric acid (1 mol/L) VS until the colour turns from green to purplish-red. Boil for 2 minutes, cool to room temperature and continue the titration until the colour turns from green to dark purple. Each ml of hydrochloric acid (1 mol/L) VS is equivalent to 53.00 mg of anhydrous sodium carbonate.

(2) Hydrochloric Acid (0.5 mol/L) VS Weigh accurately about 0.8 g of anhydrous sodium carbonate primary standard titrate as directed above. Each ml of hydrochloric acid (0.5 mol/L) VS is equivalent to 26.50 mg of anhydrous sodium carbonate.

(3) Hydrochloric Acid (0.2 mol/L) VS Weigh accurately about 0.3 g of anhydrous sodium carbonate primary standard titrate as directed above. Each ml of hydrochloric acid (0.2 mol/L) VS is equivalent to 10.60 mg of anhydrous sodium carbonate.

(4) Hydrochloric Acid (0.1 mol/L) VS Weigh accurately about 0.15 g of anhydrous sodium carbonate primary

standard titrate as directed above. Each ml of hydrochloric acid (0.1 mol/L) VS is equivalent to 5.30 mg of anhydrous sodium carbonate.

If hydrochloric acid (0.05, 0.02 or 0.01 mol/L) VS is needed, dilute hydrochloric acid (1 or 0.1 mol/L) VS with water, standardize if necessary.

Iodine (0.05 mol/L) VS

[I₂ 253.81] 12.69 g→1000 ml

Preparation Dissolve 13.0 g of iodine and 36 g of potassium iodine in 50 ml of water, add 3 drops of hydrochloric acid and dilute with water to 1000 ml, mix well and filter with a sintered glass filter.

Standardization Weigh accurately about 0.15 g of arsenic trioxide primary standard, previously dried to constant weight at 105°C, and dissolve it in 10 ml of sodium hydroxide (1 mol/L) VS by heating gently. Add 20 ml of water, 1 drop of methyl orange IS, and add sulfuric acid (0.5 mol/L) VS until the colour turns from yellow to pink. Then add 2 g of sodium bicarbonate, 50 ml of water and 2 ml of starch IS, titrate with iodine VS until the solution is bluish-violet in colour. Each ml of iodine (0.05 mol/L) VS is equivalent to 4.946 mg of arsenic trioxide.

If iodine (0.025 mol/L) VS is needed, dilute the iodine (0.05 mol/L) VS with water.

Storage Preserve in well-closed, amber glass bottle, store at a cool place.

Lithium Methoxide (0.1 mol/L) VS

[CH₃OLi 37.97] 3.797 g→1000 ml

Comply with the preparation, the standardization and the storage described under sodium methoxide (0.1 mol/L) VS, use 0.694 g of freshly cut metallic lithium.

Mercuric Nitrate (0.02 mol/L or 0.05 mol/L) VS

[Hg(NO₃)₂ · H₂O 342.62] 6.85 g→1000 ml

17.13 g→1000 ml

Preparation (1) Mercuric Nitrate (0.02 mol/L) VS Dissolve 6.85 g of mercuric nitrate in 20 ml of 1 mol/L nitric acid solution, make up to 1000 ml with water and mix well.

(2) Mercuric Nitrate (0.05 mol/L) VS Dissolve 17.2 g of mercuric nitrate in 400 ml of water and 5 ml of nitric acid, filter, dilute with water to 1000 ml and mix well.

Standardization (1) Mercuric Nitrate (0.02 mol/L) VS Dissolve about 15 mg of sodium chloride primary standard, weigh accurately, previously dried to constant weight at 110°C, in 50 ml of water, carry out the method for potentiometric titration (Appendix VII A), titrate with mercuric nitrate (0.02 mol/L) VS with stirring, using platinum electrode as an indicator electrode and mercury-mercurous sulfate as a reference electrode. Each ml of mercuric nitrate (0.02 mol/L) VS is equivalent to 2.338 mg of sodium chloride.

(2) Mercuric Nitrate (0.05 mol/L) VS Weigh accurately about 0.15 g of sodium chloride primary standard previously dried to constant weight at 110°C, and dissolve it in 100 ml of water, add 1 ml of diphenylcarbazide IS and titrate with mercuric nitrate VS, shake vigorously until a pale rose violet colour appears. Each ml of mercuric nitrate (0.05 mol/L) VS is equivalent to 5.844 mg of sodium chloride.

Methanolic Potassium Hydroxide (0.1 mol/L) VS

[KOH 56.11] 5.611 g→1000 ml

Preparation Dissolve 6.8 g of potassium hydroxide in 4 ml of water, add methanol to 1000 ml, well close with a rubber stopper and allow to settle 24 hours. Decant the supernatant liquid immediately and transfer into a rubber stoppered amber coloured glass bottle.

Standardization Comply with standardization described under ethanolic potassium hydroxide (0.5 mol/L) VS.

Storage Preserve in well closed a rubber stoppered amber coloured glass bottle.

Oxalic Acid (0.05 mol/L) VS

[C₂H₂O₄ · 2H₂O 126.07] 6.304 g→1000 ml

Preparation Dissolve 6.4 g of oxalic acid in water to make 1000 ml and shake thoroughly.

Standardization Add 200 ml of water and 10 ml of sulfuric acid to 25 ml of oxalic acid VS, accurately measured. Titrate with potassium permanganate (0.02 mol/L) VS towards the end point of titration, heat the solution to 65°C and continue the titration until the pale red colour persists for 30 seconds. The temperature of the solution should not be lower than 55°C at the end of titration. Calculate the concentration of oxalic acid VS according to the volume consumed.

If oxalic acid (0.25 mol/L) VS is needed, weigh about 32 g of oxalic acid, prepare and standardize as directed above but titrate with potassium permanganate (0.1 mol/L) VS.

Storage Preserve in well-closed stoppered amber coloured glass bottle.

Perchloric Acid (0.1 mol/L) VS

[HClO₄ 100.46] 10.05 g→1000 ml

Preparation To 750 ml of anhydrous glacial acetic acid add an amount of acetic anhydride equivalent to 5.22 ml per g of water present, add 8.5 ml of perchloric acid (70%-72%) and mix well. Add 23 ml of acetic anhydride dropwise with shake, cool and dilute with anhydrous glacial acetic acid to 1000 ml, mix well and allow to stand for 24 hours. If the reactant is susceptible to acetylation, the water content of perchloric acid VS should be determined (Appendix VIII M, method 1), and adjusted to 0.01%-0.2% by the addition of water or acetic anhydride.

Standardization Weigh accurately about 0.16 g of potassium biphthalate primary standard, previously dried to constant weight at 105°C, and dissolve in 20 ml of anhydrous glacial acetic acid. Add 1 drop of crystal violet IS and titrate slowly with perchloric acid (0.1 mol/L) VS to a blue end point. Perform a blank determination and make any necessary correction.

Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 20.42 mg of potassium biphthalate.

If perchloric acid (0.05 or 0.02 mol/L) VS is needed, dilute perchloric acid (0.1 mol/L) VS with anhydrous glacial acetic acid and standardize, if necessary.

Perchloric Acid in dioxane (0.1 mol/L) VS Dissolve 8.5 ml of perchloric acid (70%-72%) in 100 ml of isopropanol and dilute with dioxane to 1000 ml.

Weigh accurately about 0.16 g of potassium biphthalate primary standard, previously dried to constant weight at 105°C, and dissolve it in 25 ml of propylene glycol and 5 ml of isopropanol by warming. Cool, add 30 ml of dioxane and a few drops of methyl orange-xylene cyanol blue IS, titrate with perchloric acid in dioxane VS until the colour turns from green to bluish-grey. Perform a blank determination and make any necessary correction.

Storage Preserve in well-closed amber coloured glass bottle.

Potassium Bromate (0.01667 mol/L) VS

[KBrO₃ 167.00] 2.784 g→1000 ml

Preparation Dissolve 2.8 g of potassium bromate in water to make 1000 ml and mix well.

Standardization To 25 ml of potassium bromate VS, accurately measured, in an iodine flask add 2.0 g of potassium iodide and 5 ml of dilute sulfuric acid, stopper the flask and mix well. Allow to stand in the dark for 5 minutes, dilute with 100 ml of water, titrate with sodium thiosulfate (0.1 mol/L) VS towards the end point of titration, add 2 ml of starch IS, continue to titrate until the blue colour disappears. Calculate the concentration of the potassium bromate VS according to the volume consumed.

If the room temperature is above 25°C, the reacting liquid and the water of dilution must be cooled to about 20°C.

Potassium Dichromate (0.01667 mol/L) VS

[K₂Cr₂O₇ 294.18] 4.903 g→1000 ml

Preparation Weigh accurately about 4.903 g of potassium dichromate primary standard, previously dried to constant weight at 120°C, and dissolve in water to make 1000 ml and mix well.

Potassium Iodate (0.05 or 0.01667 mol/L) VS

[KIO₃ 214.00] 10.700 g→1000 ml

Preparation Potassium Iodate (0.05 mol/L) VS Weigh accurately 10.700 g of potassium iodate primary standard, previously dried to constant weight at 105°C, and dissolve it in water to make 1000 ml, mix well.

Potassium Iodate (0.01667 mol/L) VS Weigh accurately 3.5667 g of potassium iodate primary standard, previously dried to constant weight at 105°C, and dissolve it in water to make 1000 ml, mix well.

Potassium Permanganate (0.02 mol/L) VS

[KMnO₄ 158.03] 3.161 g→1000 ml

Preparation Boil about 3.2 g of potassium permanganate with 1000 ml of water for 15 minutes, allow to stand in a well closed vessel for 2 days, filter with a sintered glass filter and mix well.

Standardization Weigh accurately about 0.2 g of sodium oxalate primary standard, previously dried to constant weight at 105°C, and dissolve it in 250 ml of freshly boiled and cooled water and 10 ml of sulfuric acid with stirring. Add quickly from a burette about 25 ml of potassium permanganate (0.02 mol/L) VS with shaking to avoid the production of precipitate, after the fading of its colour, heat the solution to 65°C and continue to titrate until the red colour persists for 30 seconds. The temperature of the solution should not be lower than 55°C at the end of titration. Each ml of potassium permanganate (0.02 mol/L) VS is equivalent to 6.70 mg of sodium oxalate.

If potassium permanganate (0.002 mol/L) VS is needed, dilute potassium permanganate (0.02 mol/L) VS with water, boil and cool. Filter and standardize, if necessary.

Storage Preserve in well-closed amber coloured glass bottle.

Silver Nitrate (0.1 mol/L) VS

[AgNO₃ 169.87] 16.99 g→1000 ml

Preparation Dissolve 17.5 g of silver nitrate in water to make 1000 ml and mix well.

Standardization Weigh accurately about 0.2 g of sodium chloride primary standard, previously dried to constant weight at 110°C, and dissolve it in 50 ml of water. Add 5 ml of dextrin solution (1→50), 0.1 g of calcium carbonate and 8 drops of fluorescein IS, titrate with silver nitrate (0.1 mol/L) VS until the colour of the opalescent liquid turns from yellowish-green to red. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 5.844 mg of sodium chloride.

If silver nitrate (0.01 mol/L) VS is needed, dilute silver nitrate (0.1 mol/L) VS with water immediately before use.

Storage Preserve in a well-closed amber coloured glass bottle.

Sodium Acetate (0.1 mol/L) VS

[C₂H₃NaO₂ 82.04] 8.204 g→1000 ml

Preparation Dissolve 5.3 g of anhydrous sodium carbonate in 100 ml of anhydrous glacial acetic acid (5.22 ml of acetic anhydride per g of water) with stirring, add anhydrous glacial acetic acid to 1000 ml and mix well.

Standardization To 15 ml of perchloric acid (0.1 mol/L) VS, accurately measured add a few drops of crystal violet

IS, titrate with sodium acetate (0.1 mol/L) VS until the colour turns to green. Calculate the concentration of sodium acetate VS according to the volume consumed.

Sodium Hydroxide (1, 0.5 or 0.1 mol/L) VS

[NaOH 40.00] 40.00 g→1000 ml

20.00 g→1000 ml

4.000 g→1000 ml

Preparation Shake sodium hydroxide with water to make a saturated solution, cool, transfer to a polyvinyl plastic bottle and allow to stand for several days.

Dilute 56, 28 or 5.6 ml respectively of the saturated and clarified sodium hydroxide solution with freshly boiled and cooled water to 1000 ml, and mix well.

Standardization (1) Sodium Hydroxide (1 mol/L) VS Weigh accurately about 6 g of potassium biphthalate primary standard, previously dried to constant weight at 105°C, add 50 ml of freshly boiled and cooled water and shake thoroughly. Add 2 drops of phenolphthalein IS and titrate with sodium hydroxide (1 mol/L) VS to a pink end point. Potassium biphthalate should have been completely dissolved towards the end point of titration.

Each ml of sodium hydroxide (1 mol/L) VS is equivalent to 204.2 mg of potassium biphthalate.

(2) Sodium Hydroxide (0.5 mol/L) VS Weigh accurately about 3 g of potassium biphthalate primary standard, previously dried to constant weight at 105°C. Standardize as directed above. Each ml of sodium hydroxide (0.5 mol/L) VS is equivalent to 102.1 mg of potassium biphthalate.

(3) Sodium Hydroxide (0.1 mol/L) VS Weigh accurately about 0.6 g of potassium biphthalate primary standard, previously dried to constant weight at 105°C. Standardize as directed above. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 20.42 mg of potassium biphthalate.

If sodium hydroxide (0.05, 0.02 or 0.01 mol/L) VS is needed, dilute sodium hydroxide (0.1 mol/L) VS with freshly boiled and cooled water. Standardize against hydrochloric acid (0.05, 0.02 or 0.01 mol/L) VS, if necessary.

Storage Preserve in a tightly closed polyvinyl plastic bottle, insert 2 glass tubes through the stopper, connect one of the tubes to a soda lime tube, use the other tube for the outlet of the volumetric solution.

Sodium Methoxide (0.1 mol/L) VS

[CH₃ONa 54.02] 5.402 g→1000 ml

Preparation Place 150 ml of dehydrated methanol (it contains water less than 0.2%) in a vessel cooled with ice water, add 2.5 g of freshly cut metallic sodium in portions, add dehydrated benzene (it contains water less than 0.02%) to make 1000 ml and mix well.

Standardization Weigh accurately about 0.4 g of benzoic acid primary standard, previously dried to constant weight in a vacuum desiccator over phosphorus pentoxide, and dissolve it in 15 ml of dehydrated methanol. Add 5 ml of dehydrated benzene and 1 drop of a 1% solution of thymol blue in dehydrated methanol, titrate with sodium methoxide VS to a blue end point. Perform a blank determination and make any necessary correction.

Each ml of sodium methoxide (0.1 mol/L) VS is equivalent to 12.21 mg of benzoic acid.

Sodium methoxide VS must be standardized immediately before use, protected from carbon dioxide and avoid volatilization of solvent.

Storage Preserve in a well-closed container of a titrating assembly, protected from carbon dioxide and moisture.

Sodium Nitrite (0.1 mol/L) VS

[NaNO₂ 69.00] 6.900 g→1000 ml

Preparation Dissolve 7.2 g of sodium nitrite and 0.10 g of anhydrous sodium carbonate in water to make 1000 ml and mix well.

Standardization Weigh accurately about 0.5 g of sulfanilic acid primary standard, previously dried to constant weight at 120°C, and dissolve it in 30 ml of water and 3 ml of concentrated ammonia TS. Add 20 ml of hydrochloric acid solution (1→2) with stirring, plunge the burette into the solution so that about 2/3 of the tip is under the liquid surface, titrate with sodium nitrite VS quickly with stirring at a temperature below 30°C. Withdraw the burette tip towards the end point of titration, rinse it with water and add the washings to the solution, continue the titration slowly, adopt the dead-stop method for end point determination. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 17.32 mg of sulfanilic acid.

When sodium nitrite (0.05 mol/L) VS is needed, dilute sodium nitrite (0.1 mol/L) VS with water and standardize, if necessary.

Storage Preserve in well-closed amber coloured glass bottle.

Sodium Tetraphenylborate (0.02 mol/L) VS

$[(C_6H_5)_4BNa]$ 342.22] 6.845 g→1000 ml

Preparation Dissolve 7.0 g of sodium tetraphenylborate in 50 ml of water with shake. Add freshly prepared aluminum hydroxide gel (dissolve 1.0 g of aluminum chloride in 25 ml of water, add sodium hydroxide TS dropwise with stirring until the pH is 8-9), 16.6 g of sodium chloride and stir thoroughly. Add 250 ml of water and shake for 15 minutes, allow to stand for 10 minutes and filter. Add sodium hydroxide TS dropwise to the filtrate until the pH is 8-9, and then dilute with water to 1000 ml, mix well.

Standardization To 10 ml of sodium tetraphenylborate VS add 10 ml of sodium acetate BS (pH 3.7) and 0.5 ml of bromophenol blue IS, and then titrate with benzalkonium chloride (0.01 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Calculate the concentration of sodium tetraphenylborate (0.02 mol/L) VS according to the volume consumed.

This solution should be standardized before use.

Dilute this solution with water before use, if sodium tetraphenylborate (0.01 mol/L) VS is needed, and standardize, if necessary.

Storage Preserve in well-closed amber coloured glass bottle.

Sodium Thiosulfate (0.1 mol/L) VS

$[Na_2S_2O_3 \cdot 5H_2O]$ 248.19] 24.82 g→1000 ml

Preparation Dissolve 26 g of sodium thiosulfate and 0.20 g of anhydrous sodium carbonate in freshly boiled and cooled water to make 1000 ml, shake thoroughly, allow to stand for 1 month and filter.

Standardization Weigh accurately about 0.15 g of potassium dichromate primary standard, previously dried to constant weight at 120°C, and dissolve it in 50 ml of water in an iodine flask. Add 2.0 g of potassium iodide and dissolve with gentle shake, add 40 ml of dilute sulfuric acid. Stopper the flask and shake thoroughly, allow to stand in the dark for 10 minutes, Dilute with 250 ml of water and titrate with sodium thiosulfate (0.1 mol/L) VS until the end point is nearly reached, add 3 ml of starch IS and continue to titrate until the colour turns from blue to brilliant green.

Perform a blank determination and make any necessary correction. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 4.903 mg of potassium dichromate. When the room temperature is above 25°C, the reacting liquid and water of dilution must be cooled to about 20°C.

If sodium thiosulfate (0.01 or 0.005 mol/L) VS is needed, dilute sodium thiosulfate (0.1 mol/L) VS with freshly boiled and cooled water immediately before use.

Sulfuric Acid (0.5, 0.25, 0.1 or 0.05 mol/L) VS

$[H_2SO_4]$ 98.08] 49.04 g→1000 ml

24.52 g→1000 ml

9.81 g→1000 ml

4.904 g→1000 ml

Preparation Sulfuric acid (0.5 mol/L) VS Add slowly 30 ml of sulfuric acid to water with stirring, cool to room temperature, dilute with water to 1000 ml, mix well.

Sulfuric acid (0.25, 0.1 or 0.05 mol/L) VS Add slowly 15 ml, 6.0 ml or 3.0 ml of sulfuric acid to water with stirring, dilute with water to 1000 ml, mix well.

Standardization Standardize as described under hydrochloric acid (1, 0.5, 0.2 or 0.1 mol/L) VS.

If sulfuric acid (0.01 mol/L) VS is needed, dilute sulfuric acid (0.5, 0.1 or 0.05 mol/L) VS with water and standardize, if necessary.

Tetrabutylammonium Hydroxide (0.1 mol/L) VS

$[(C_4H_9)_4NOH]$ 259.48] 25.95 g→1000 ml

Preparation Dissolve 40 g of tetrabutylammonium iodide in 90 ml of dehydrated methanol in a stoppered glass conical flask. Place in an ice bath, add 20 g of finely powdered silver oxide, stopper the flask and shake vigorously for 60 minutes. Centrifuge a few ml and test the supernatant liquid for iodide. If the test is positive, add an additional 2 g of silver oxide to the above mixture and shake vigorously for 30 minutes. When all of the iodide has reacted, filter through a sintered glass funnel, rinse the flask and the funnel with three portions of 50 ml of dehydrated toluene, add the rinsings to the filtrate. Dilute with a mixture of dehydrated toluene and dehydrated methanol (3 : 1) to 1000 ml and mix well. Flush the solution for 10 minutes with dry nitrogen which is free from carbon dioxide. If the solution is not clear, add a few ml of dehydrated methanol.

Standardization Weigh accurately about 90 mg of benzoic acid primary standard, previously dried to constant weight in a vacuum desiccator over phosphorous pentoxide, and dissolve in 10 ml of dimethylformamide. Add 3 drops of a 0.3% solution of thymol blue in dehydrated methanol, and titrate to a blue end point with tetrabutylammonium hydroxide VS (adopt potentiometric method to indicate the end point). Perform a blank determination and make any necessary correction. Each ml of tetrabutylammonium hydroxide (0.1 mol/L) VS is equivalent to 12.21 mg of benzoic acid.

Storage Preserve in well-closed container, keep away from the carbon dioxide and moisture in air.

Zinc (0.05 mol/L) VS

$[Zn]$ 65.39] 3.270 g→1000 ml

Preparation Dissolve 15 g of zinc sulfate (equivalent to 3.3 g of Zn) in 10 ml of dilute hydrochloric acid and sufficient water to make 1000 ml, mix well.

Standardization To 25 ml of zinc (0.05 mol/L) VS, accurately measured, add 1 drop of a 0.025% solution of methyl red in ethanol, add ammonia TS dropwise until a slight yellow colour appears. Add 25 ml of water, 10 ml of ammonium chloride BS (pH 10.0) and a small amount of eriochrome black T indicator, titrate with disodium edetate (0.05 mol/L) VS until the colour changes from purple to pure blue.

Perform a blank determination and make any necessary correction. Calculate the concentration of zinc VS according to the volume consumed.

XV G Reference Standards

Acetaminophenol
Acetanilide

Acetazolamide	Casein
Acetylspiramycin	Cefadroxil
Aciclovir	Cefaclor
Adipiodone	Cefaclor δ -3-Isomer
Adrenaline	Cefalexin
β -Alanine	Cefalotin
Alarelin Acetate	Cefathiamidine
Alfacalcidol	Cefazolin
Alprostadil	Cefdinir
Almitrine Bismesylate	Cefoperazone
Altretamine	Cefoperazone Impurity A
Amikacin Impurity A	Cefoperazone S-isomer
Aminobenzoic Acid	Cefotaxime
(+)- α -Amino-butanol	Cefradine
2-Amino-2'-chloro-5-nitrodiphenyl Ketone	Ceftazole
Amiodarone Hydrochloride	Ceftriaxone
Amiloride Hydrochloride	Cefuroxime
Aminoglutethimide	Cefuroxime Axetil
Amoxicillin	Chlorambucil
Amphotericin B	Chloramphenicol
Ampicillin	Chloramphenicol A Crystal Form
Amrinone	Chloramphenicol B Crystal Form
Anhydrous 4-demethyl Metamizole Sodium	Chlorhexidine Acetate
Anhydrous Glucose	Chlormadinone Acetate
Anhydrous Morphine	Chlortetracycline Hydrochloride
Anisodamine Hydrobromide	4-[2-(5-Chloro-2-methoxybenzamide) ethyl] benzene Sulfonamide
Antazoline Hydrochloride	<i>o</i> -Chlorobenzylpenicillin Sodium
Arginine	2-Chloro-4-nitroaniline
Artemether	Chloroquine Phosphate
Artemisinin	Chlorphenamine Maleate
Artesunate	Chlorprothixene
Asparaginase	Chlortalidone
Aspartate	Chlortetracycline Hydrochloride
Atenolol	Cholic Acid
Atropine Sulfate	Choline Chloride
Azathioprine	Chorionic Gonadotrophin
Azithromycin	Ciclopirox Olamine
Bacitracin	Ciclosporin
Beclometasone Dipropionate	Cilostazol
Bendazac Lysine	Cimetidine
Bendrofluazide	Cinchonidine
Benorilate	Ciprofloxacin
Benproperine Phosphate	Ciprofloxacin Lactate
Benserazide Hydrochloride	Citicoline Sodium
Benzaldehyde	<i>cis</i> -Tranexamic Acid
Benzathine Benzylpenicillin	Clavulanic Acid
Benzhexol Hydrochloride	Clemastine Fumarate
1-Benzoyl-3-methyl-5-aminopyrazole	Clenbuterol Hydrochloride
Benzoyl Peroxide	Clindamycin
1-Benzyl-3-hydroxy-indazole	Clioquinol
Benzylpenicillin	Clobetasol Propionate
Betacyclodextrin	Clofibrate
Betamethasone	Clomifene Citrate
Bifendate	Clomipramine Hydrochloride
Bifonazole	Clonazepam
Bisacodyl	Clonidine Hydrochloride
Bulleyaconitine A	Clorprenaline Hydrochloride
Buprenorphine Hydrochloride	Clotrimazole
Caffeine	Cloxacillin
Calcium Folate	Clozapine
Capreomycin	Codeine Phosphate
Captopril	Coenzyme Q ₁₀
Captopril Disulfide	Colistin
Carbachol	Cortisone Acetate
Carbamazepine	Crotamiton
Carbocysteine	Curcumenol
Carboplatin	Cyclohexylamine
Carmofur	Cyclophosphamide
Carteolol Hydrochloride	Cysteine

Cystine	Fenfluramine Hydrochloride
Danazol	Fentanyl Citrate
Dapsone	Ferulic acid
Daunorubicin	Fleroxacin
Declozine Hydrochloride	Fluconazole
Deslanoside C	Flucytosine
Desoxycortone Acetate	Fludrocortisone Acetate
Dexamethasone	Flunarizine Hydrochloride
Dexamethasone Acetate	Fluocin
Dexamethasone Sodium Phosphate	Fluocinonide
Dialcoholate Chloramphenicol	Fluorouracil
Diatrizoic Acid	Fluphenazine Hydrochloride
Diazepam	Flurazepam Hydrochloride
Diclofenac Sodium	Folic Acid
Diethylene Glycol	Formylated Recombinant Human Insulin
Diethylstilbestrol	Fosfomycin
Difenidol Hydrochloride	Fructose
Digitalis	Ftibamzone
Digitoxin	Furosemide
Digoxin	Gadopentetate Meglumine
Dihydroartemisinin	Galactose
3,4-Dihydroxy-2'-methylamino acetophenone-3,4-Dineopentanoic Perchlorate	Galanthamine Hydrobromide
2,3-Dihydro-6-phenyl-imidazo [2,1-b] thiazole	Gemfibrozil
Diltiazem Hydrochloride	Gentamycin
Dimenhydrinate	Gentamycin C ₁
Dimercaptosuccinic Acid	Glibenclamide
Dimer of Human Insulin	Gliclazide
Dimer of Human Somatropin	Glipizide
Dioxane	Gliquidone
Diphenhydramine Hydrochloride	Glutamic Acid
Diphenoxylate Hydrochloride	Glycopyrrolate
Diphenyl-(2-chlorophenyl) methanol	Granisetron Hydrochloride
Dipivefrin Hydrochloride	Griseofulvin
Dipotassium Glycyrrhizinate	Halcinonide
Dithranol	Haloperidol
Dopamine Hydrochloride	Heparin
Doxapram Hydrochloride	Histamine Phosphate
Doxepin Hydrochloride	Histidine
Doxorubicin Hydrochloride	Huperzine A
Doxycycline	Hyaluronidase
β -Doxycycline	Hydrazine Sulfate
Doxycycline Hydrochloride	Hydrochlorothiazide
Econazole Nitrate	Hydrocortisone
Emetine Hydrochloride	Hydrocortisone Acetate
Enalaprilat	Hydrocortisone Butyrate
Enalapril Diketone	Hydrocortisone Sodium Succinate
Enalapril Maleate	Hydroquinone
Enflurane	<i>p</i> -Hydroxylacetylaminobenzene
Enoxacin	α -Hydroxyphenylglycine
Ephedrine Hydrochloride	1-(4-Hydroxy-3-methylbenzyl)-2-(tertiary butylamino)ethanol
Epirubicin	Hydroxyprogesterone Caproate
Ergometrine Maleate	Hydroxyzine Hydrochloride
Erythromycin	Hymecromone
Erythromycin Ethylsuccinate	Ibuprofen
Estazolam	Imidazole
Estradiol	Imipramine Hydrochloride
Estradiol Benzoate	Indapamide
Etamsylate	Indometacin
Ethambutol Hydrochloride	Inosine
1,2-Ethanediol	Iotalamic Acid
Ethinylestradiol	Isocarboxazid
Ethyl acrylate	Isoprenaline Hydrochloride
Ethylene oxide	Isoquinoline Compound [1,2,3,4-Tetrahydro-2-(4-sulfonylamido-phenyl)-4,4-dimethyl-7-methoxy-1,3-isoquinoline Diketone
Etimicin	Isosorbide Dinitrate C
Etomidate	Isotretinoin
Famciclovir	Jateorrhizine
Famciclovir Hydrochloride	Kanamycin
Farrotidine	

Kanamycin B	Netilmicin
Ketoconazole	Nifedipine
Ketoprofen	Nilestriol
Ketotifen Fumarate	Noradrenaline Bitartrate
Kitasamycin	Norethisterone
Lactose	Norfloxacin
Lactulose	Norgestrel
Levamisole Hydrochloride	Norvancomycin
Levodopa	Noscapine
Levonorgestrel	Ofloxacin
Lidocaine	Omeprazole
Ligustrazine Phosphate	Omeprazole Sulfonyl Compound
Lincomycin	Ondansetron Hydrochloride
Lindane	Oxacillin Sodium
Lithium Carbonate	Oxaprozin
Lofexidine Hydrochloride	Oxazepam
Loperamide Hydrochloride	Oxytetracycline
Lysine Hydrochloride	Papaverine Hydrochloride
Malaridine Phosphate	Paracetamol
Maprotiline Hydrochloride	Parachlorophenol
Mebendazole	Paromomycin
Meclofenoxate Hydrochloride	Paroxetine Hydrochloride
Medroxyprogesterone Acetate	Pefloxacin
Mefenamic Acid	Penicillamine
Meloxicam	Perphenazine
Meleumycin	Pethidine Hydrochloride
Menadione	Phenoxybenzamine Hydrochloride
Menadione Sodium Bisulfite	Phenprobamate
Menotropins	Phenylglycine
6-Mercaptopurine	Phenytoin
Meropenem	Pilocarpine Nitrate
Metacycline	Pipemidic Acid
Metamizole Sodium	Piperacetanile
Methacrylic Acid	Piperacillin
Methacrylic Acid Copolymer I	Piperazine
Methacrylic Acid Copolymer II	Piperazine Ferulate
Methionine	Piroxicam
Methotrexate	Pizotifen
6-Methoxy-2-acetylnaphthalene	Poloxamer
<i>p</i> -Methylbenzene Sulfonamide	Polymycin B
<i>o</i> -Methylphenol	Posterior Pituitary
<i>N</i> -Methylpiperazine	Potassium Dehydroandrographolide Succinate
α -Methylpyridine	Potassium Iodide
4 [2-(5-methylpyrazine-2-carboxamido)ethyl] phenyl sulfonamid	Praziquantel
Methyl 3,5-diamino-6-chloropyrazine-2-carboxylate	Prazosin Hydrochloride
Methyl methacrylate	Prasterone Sulfate
Methyl 5-methyl-3-isoxazolecarboxylate	Prednisolone
2-methyl-5-nitro Imidazole	Prednisolone Acetate
Metildigoxin	Prednisone Acetate
Metoclopramide	Primidone
Metronidazole	Procaccerol Hydrochloride
Mezlocillin	Progesterone
Miconazole Nitrate	Proglumide
Micronomicin	Propranolol Hydrochloride
Minocycline	Propylthiouracil
Minoxidil	Pseudoephedrine Hydrochloride
Mitomycin	Puerarin
Moclobemide	Qunidine
Morphine	Quinestrol
Naloxone Hydrochloride	Ranitidine Hydrochloride
Nandrolone Phenylpropionate	Raubasine
Naphazoline Hydrochloride	Recombinant Human Insulin
Naproxen	Recombinant Human Somatropin
Naproxen Sodium	Reserpine
Nefopam Hydrochloride	Ribavirin
Neomycamine	Ribostamycin
Neomycin	Rifampicin
Neomycin Sulfate	Rotundine Hydrochloride
Neostigmine Methylsulfate	

Roxithromycin	Thiamphenicol
Salbutamol	Thiopental
Salbutamol Sulfate	Thioridazine Hydrochloride
Salcatonin	Thrombin
Salicylic Acid	Ticlopidine Hydrochloride
Sarcosine	Tioguanine
Scopolamine Butylbromide	Tobramycin
Scopolamine Hydrobromide	Tolazoline Hydrochloride
Serazide Hydrochloride	Tramadol Hydrochloride
Sisomicin	<i>cis</i> -Tramadol Hydrochloride
Sodium Cromoglicate	Tranexamic Acid
Sodium Fluoride	<i>cis</i> -Tranexamic Acid
Sodium Houttuyfonate	Tretinoin
Sodium Selenite	Triamcinolone
Sodium Stibogluconate	Triamcinolone Acetonide
Sparfloxacin	Triamterene
Spirolactone	Triazolam
Spectinomycin	Trihydrate Ampicillin
Stanozolol	Trihydroxyl Benzyl Benserazide Hydrochloride
Streptomycin	Trimethoprim
Strophanthin G	Trypsin
Sulbactam	Tryptophan
Sulbenicillin	Tyrosine
Sulfamethazine	Ubenimex
Sulfamethoxazole	Urokinase
Sulfanilamide	Verapamil Hydrochloride
Sulfaoxazole	Vincristine Sulfate
Sulindac	Vindesine Sulfate
Sulpiride	Vinorelbine Tartrate
Sultamicillin	Vitamin B ₆
Suxamethonium Chloride	Vitamin B ₁₂
E-Tamoxifen Citrate	Vitamin D ₂
Tegafur	Vitamin D ₃
Testosterone Undecanoate	Vitamin E
Testosterone Propionate	Vitamin K ₁
Tetracycline Hydrochloride	Xanthinol Nicotinate
Thebaine	
Theophylline	

Appendix XVI Infrared Reference Spectra

Infrared reference spectra used for identification or purity test of drugs can be found in the "Atlas of Infrared Spectra of Drugs", a companion volume to the Chinese Pharmacopoeia. The instruments used for recording the spectra, procedure for preparation of samples, requirements for the spectrum recording and some information are described under the Notice section of the Atlas.

Index

(The monograph title is followed by spectrum number)

Name	Spectrum No.
Acedapsone	541
Acenocoumarol	543
Acetazolamide	9
Acetylcysteine	7
Aciclovir	213
Adenosine Disodium Triphosphate	903
Alanine	68
Albendazol	212
Allopurinol	194
Almitrine Bismesylate	900
Alprazolam	215
Amantadine	369
Ambroxol Hydrochloride	1102
Amiloride Hydrochloride	828
Aminoglutethimide	417
Aminomethylbenzoic Acid	410
Amiodarone Hydrochloride	382

Pharmaceutical Purposes

nonsterile preparations. It may also be used as extraction of medicinal materials for nonsterile. Purified water should not be used for injections or as their diluent.

It can be produced by various methods. Every production should be monitored to prevent from contamination. It should generally be prepared and used as the solvent, diluent or water for

Water for Injection Water for Injection is water prepared by purified water. It complies with the requirements of the test of bacterial endotoxins. Bacterial contamination should be prevented during the production process, distribution. The quality of water for injection should meet the requirements of the monograph of water for injection in Volume II.

preparation process, storage, distribution and use.

The system for water preparation should be verified, systems of daily monitoring, analysis and report should be established, and complete original data should be kept for reference. Storage tank and pipes should be cleaned and sterilized periodically by suitable methods (illumination with ultra-violet lamps, heat sterilization, etc.).

Drinking Water Drinking Water may be used for washing crude drugs before purification and for preliminarily washing pharmaceutical appliances. Unless otherwise specified, drinking water may also be used as the solvent for extraction of crude drugs.

Purified Water Purified water is prepared from drinking water by distillation, ion exchange, reverse osmosis or by means of any other appropriate methods. It contains no additives and its quality complies with the requirements of the monograph of purified water in Volume II.

Purified water may be used as the solvent for preparation of ordinary pharmaceutical preparations, or as a reagent in the test, or as the solvent for extraction of crude drugs for preparation of sterile preparations such as injections or eye drops of traditional Chinese drugs, or as the solvent or diluent for preparation of oral preparations or preparations for external use, or as the water for precisely washing

Water for injection may be used as the solvent or diluent for preparation of injections, or for precisely washing their containers. It may be used as the solvent for preparation of eye drops if necessary.

In order to guarantee the quality of water for injection, every step of the production process of preparation of water for injection by distillation should be monitored at all time, and the appliances for preparation and transportation be washed and sterilized periodically to strictly prevent from bacterial endotoxins. Water for injection should generally be kept at a temperature exceeding 80°C, kept circulating at 65°C or preserved on sterile condition below 4°C, and be used not exceeding 12 hours after preparation.

Sterile Water for Injection Sterile Water for Injection is prepared from water for injection according to the technological conditions under which injections are prepared. It is mainly used as the solvent for sterile powders for injection or as diluent for injections. Its quality complies with the requirements of the monograph of sterile water for injection.

The specification of filling for sterile water for injection should meet the clinical requirements. Contamination due to large dimension or multi-use must be avoided.

Appendix XVIII Methods of Sterilisation

Sterilisation is the process to inactivate or remove any viable micro-organisms of a product by physical or chemical means. The methods described in this chapter may be used for the sterilisation of preparations, raw materials, excipients and medical devices.

Sterility is the absence of any viable micro-organisms. Absolute sterility of a product can not be guaranteed nor can it be demonstrated by testing to any batch of sterilized product. In practice, a product is sterilized to decrease the survival probability of micro-organisms to a specified level, and is designated as sterility assurance level (SAL). The survival probability of micro-organisms of a product treated by terminal sterilization is not more than 10^{-6} . The SAL of a process for a given product is established by appropriate validation studies.

The sterility assurance of a sterile product can not be guaranteed by testing, but depends on the use of the validated sterilisation process, good manufacturing practice (GMP), and good quality assurance system. It is essential that the following factors are fully considered in choosing a suitable sterilisation procedure, including nature of the product to be sterilized, effectiveness and economy of the procedure, and integrity and stability of the product after sterilisation.

It is essential to validate the process before being applied to practice. The validated items include:

- (1) Establish the validation protocols and the evaluation standard.
- (2) Ensure that the equipments are suitable and running effectively.
- (3) Demonstrate that the key equipment and instrumentation are capable of operating within the prescribed parameter criteria.
- (4) Perform replicate cycles by employing actual or simulated product and demonstrate the effectiveness of the process.
- (5) Summarize the records and complete the documents above, to form a validation report.

In manufacture practice, the process of sterilisation should be monitored, and the key parameters of the procedure (such as temperature, pressure, duration, humidity, concentration of the gas and the dose of radiation etc.) should be within the validated limits. The Validation of sterilisation process should be repeated at suitable interval. Revalidation is carried out whenever major changes in the procedure, including changes in the load, take place.

The sterility assurance is related with the degree of microbial contamination of the product before sterilisation and the resistance of the contaminating micro-organisms. Therefore, it is essential to control the level of viable micro-organisms contamination of a product prior to sterilisation and the resistance of the contaminating micro-organisms, to choose adequate precautions to minimize the contamination within the prescribed limits in the manufacturing process.

It is necessary to avoid re-contamination of the product after sterilisation. In all cases, the container and closure are required to maintain the sterility of the product throughout its shelf-life.

Methods of Sterilisation

The frequently-used methods include steam, dry heat, ionization radiation, gas and filtration. One or combinations of the above methods may be used, depending on the nature of the product. Wherever possible, the terminal sterilization should be chosen. If terminal sterilization is not possible, filtration or aseptic processing is used. Wherever possible, appropriate additional treatment (for example, steam) of a non-final product is applied.

1. Steam sterilisation

In this method, the products are placed in a chamber, and sterilized by saturated steam under pressure or overheated water flow which leads to denaturation of protein and nucleic acid to achieve the inactivation of micro-organisms. Steam is the most effective and most widely used method, and may be used for pharmaceutical preparations, containers, culture media, sterile coats, plastic plugs, and other materials resistant to high temperature and moisture. Steam sterilization does not guarantee the complete inactivation of bacterial spores, and is often used as an complementary sterile technique for thermo-labile products.

The process is usually carried out by the following conditions:

121°C	15 min
121°C	30 min
116°C	40 min

Other combinations of time and temperature may be used provided that they could give an SAL of 10^{-6} or less. For thermo-stable product, deep sterilisation is used, the SAL should be less than 10^{-12} . For thermo-labile products, the standard time of sterilisation (F_0) (means the standard duration in the condition of 121.1°C of sterile temperature, one minute of D-value, and 10.0°C of Z-value) usually is not less than eight minutes. If F_0 is less than eight, the contamination of micro-organisms should be monitored in the whole manufacturing process, all the measures should be taken to minimize the level of contamination of micro-organisms and to ensure that products being sterilized meet the requirements of sterility assurance.

For steam sterilisation, the products to be sterilized should be loaded in the sterilizing chamber perfectly, no tightness, to ensure that they are all effectively and equally sterilized. Knowledge of the coolest part of the chamber is obtained before this method is applied. Put the biological indicator at the coolest part to ensure SAL of the products has been achieved. Spores of *Bacillus stearothermophilus* are usually used as the indicator for this method.

2. Dry heat sterilisation

Dry heat sterilisation is carried out in an oven or tunnel equipment for sterilisation with forced air circulation, where micro-organisms and pyrogens are inactivated by high temperature. This method is suitable for products where steam sterilisation is inappropriate, such as glass utensils, metal containers, fibre products, solid drugs, and liquid paraffin wax.

The process is usually carried out by heating the product at 160-170°C for 120 minutes or longer, 170-180°C for 60 minutes or longer, or 250°C for 45 minutes or longer. Other

combinations of time and temperature may be used provided that they could give an SAL of 10^{-6} or less. For thermo-stable product, sterilize it until the SAL is $\leq 10^{-12}$ wherever possible. In the latter case, sterility test for these products prior to sterilisation is not necessary. Dry heat at 250°C for 45 minutes can also remove the pyrogens of containers and other equipments.

Put the products in suitable containers to ensure that they are all effectively and equally sterilized.

Knowledge of the coolest part of the chamber is obtained before this method is applied. Spores of *Bacillus subtilis* are usually used as the indicator for this method. Put the biological indicator at the coolest part to ensure SAL of the products has been achieved. Endotoxin inactivation test can verify the effectiveness of depyrogenation. Generally not less than 1000 EU of endotoxin which is derived from *Escherichia coli* may be added into the items prior to depyrogenation, in this case the reduction of the endotoxin is at least 3-log.

3. Ionising radiation sterilisation

Sterilisation by this method is achieved by exposure of the product to ionizing radiation in the form of gamma radiation from a suitable radioisotopic source (such as cobalt 60) or of a beam of electrons energized by a suitable electron accelerator. This method may be used for medical devices, containers, manufacturing equipments, and other raw materials and preparations resistant to radiation.

The SAL of the product is not more than 10^{-6} after ionising radiation sterilisation. The key parameter of ionising radiation sterilisation is mainly absorbed radiation dose. The radiation dose absorbed by the material being irradiated should be identified according to the suitability of the products and the maximum amount of the contaminated micro-organisms and the maximum resistance to radiation. It should be validated before the performance that the safety, efficiency and stability of a product should not be changed by the radiation dose. A reference absorbed dose is 25 kGy. Use the lowest possible radiation dose for the final product, raw materials and medical devices. Before irradiation, test the number of contaminated microorganisms and the resistance to the irradiation of the product to evaluate the SAL of the procedure.

During the procedure, the radiation absorbed by the product should be monitored regularly by means of suitable chemical or physical methods to ensure that the dose is appropriate. If dosimeters radiated along with sterilized products are adopted, place them at specific positions. Calibrate against a standard source at suitable intervals.

Spores of *Bacillus pumilus* are usually used as the indicator for this method.

4. Gas sterilisation

In this method, micro-organisms are inactivated in a high-pressure chamber filled with gas of disinfectors, for example, ethylene oxide, hydrogen peroxide, formaldehyde and ozone (O_3). This method is suitable for the products which are stable in these gases. Inflammability, teratogenesis and residue toxicity of the gases should be considered in the process of sterilisation.

The most generally used gas in this method which is carried out in a high pressure chamber filled with sterilized gas is ethylene oxide, usually mixed with 80%-90% inert gases. This method is applicable to medical devices and plastic products that are not durable by using high temperature methods. This method is not applicable to products which contain chlorine or can absorb ethylene oxide.

Temperature, humidity and gas concentration in the chamber, as well as the duration could affect the effectiveness of sterilisation by using ethylene oxide. The following conditions are recommended:

Temperature: $(54 \pm 10)^{\circ}\text{C}$.

Pressure: $8 \times 10^5 \text{ Pa}$

Relative humidity: $(60 \pm 10)\%$

Duration: 90 minutes

The process of sterilisation is validated before application. During the procedure, the chamber is vacuumized first, then filled with vapor to the specified humidity and temperature. Fill in the filtered and pre-heated ethylene oxide. During the process, seriously monitor the temperature, humidity, pressure, concentration of ethylene oxide and time. Use biological indicators to monitor the effectiveness of sterilisation, if necessary. The process should be supervised by skilled technicians. After the material to be sterilized is exposed either to ethylene oxide or to a mixture of ethylene oxide with a suitable inert gas, adequate time should be left to allow dispersal of residual ethylene oxide and other volatile residues. It should be monitored that the residues are within the prescribed limits. Eliminate the remaining gas in the product to a degree free of toxicity to human.

Leaking test should be carried out to ensure obturation of the chamber. Package materials and alignment of the products can affect the gas penetration and diffusion. Spores of *Bacillus subtilis* are usually used as the indicator for this method.

5. Filtration

In this method, micro-organisms in the gas or liquid products are removed by filtering through a certain type of filter material. It is usually used for thermo-labile solutions of drugs and raw materials. Sterilisation filter units use microporous filter membranes (hydrophilic or lipophilic) as the filter material. The pore size is usually less than $0.22 \mu\text{m}$. Avoid loss of solute by absorption on to the filter and to avoid the release of contaminants from the filter. Avoid use of membranes containing asbestos. The filter unit and membranes are sterilized before use. The filter units is cleaned first and then new membranes are used for a new batch of products.

The sterility assurance level in this method is related with bioburden of a product prior to sterilisation and the log reduction value (LRV) of the filter unit. Calculate LRV with the following expression:

$$\text{LRV} = \lg N_0 - \lg N$$

Where N_0 represents the number of micro-organisms before filtration, and N is the number after filtration.

LRV is used to express the efficiency of filtration. The LRV per cm^2 of active filter surface is not less than 7 for $0.22 \mu\text{m}$ -pore-size membranes. Two filters may be linked to increase the efficiency.

Key factors, such as pore size, membrane integrity and LRV cannot be monitored in the filtration process. Therefore, The integrity and effectiveness of the membranes should be validated before use. Validate the filter unit for at least once in a working day.

The products sterilized by this method should be operated in a cleaned area with rigorous monitoring and a sterile area is recommended. Relative facility, package container, stopper and other materials should be sterilized by appropriate methods, and recontamination should be avoided.

Pseudomonas diminuta are usually used as the indicator for this method.

6. Aseptic preparation

Aseptic preparation denotes the manufacturing of sterile preparations under sterile condition. It may include aseptic filling of products into containers and aseptic lyophilization. Filtration is usually used in the latter process.

It is necessary to monitor the environmental of aseptic preparation, and the filtration should be carried out under sterile conditions. The equipments, containers, plugs and other materials should be used suitable sterilization methods

and recolonisation should be avoided.

Sterility assurance of this process is carried out by simulating test for sterility by aseptic filling culture media. Sterility of the circumstance, personnel and materials should be monitored in the whole process.

The aseptic preparation should be validated at intervals, including periodic environmental filter examination and simulating test for sterility by aseptic filling culture media.

Biological indicators

Biological indicators are preparations of viable micro-organisms used to assess the performance of sterilisation equipments, to validate and monitor the effectiveness of sterilisation process. They usually consist of bacterial spores.

1. The Requirements for micro-organisms used as biological indicators

Different biological indicators are used for different sterilisation methods. The micro-organisms used as biological indicators comply with the following requirements:

- (1) The test strain is more resistant than any possible contaminating micro-organisms in the product to be examined.
- (2) The test strain is non-pathogenic.
- (3) The test strain is resistant to mutation and easy to store.
- (4) The test strain is easy to culture. If resting spores are used, they should be more than 90% of the indicator.

2. Preparation of biological indicators

The biological indicators are prepared using a specified procedure. Characteristics of the micro-organisms are determined before use, for example, D-value, which is the duration (expressed in minutes) with which the number of viable organisms are reduced to 10% of the original number at a definite temperature. Use suitable culture media for the incubation. Suspend the cultures, which mainly consist of spores. Store the spores as suspensions in nutrient liquids. Biological indicators consist of a definite number of one of more types of spores. They are usually placed on an inert carrier, for example a strip of filter paper, a glass slide, stainless or plastic materials. Spore suspensions may be presented in sealed ampoules. Biological indicators are packed with suitable materials, and an expiry date is set. The carriers and package materials protect the biological indicators from any deterioration or contamination, while allowing the sterilizing agent to enter into and contact with the micro-organisms. The packages are designed to facilitate storage, transportation, sampling and subculture. Some biological indicators may be inoculated directly into a liquid product to be sterilized or into a liquid product similar to that to be sterilized. In the latter case, the equivalence of the liquid products are demonstrated.

3. Application of biological indicators

In validation of sterilisation process, though some parameter can be used, the effectiveness of a sterilisation process is most easily assessed by the degree to which biological indicators are inactivated. Commercial biological indicators, or spores prepared from resistant micro-organisms isolated from contaminants are used as biological indicators. The resistance, purity and number of spores are validated for the

biological indicators. The quantity and resistance of spore of the biological indicators used should be more or greater than the contamination of the product to ensure the effectiveness of the process. Put the biological indicators at different position of the chamber for the terminal sterilisation. Avoid direct contact of the indicator with the product to be sterilized. Incubate the indicators after specified sterilisation on suitable culture media to guarantee inactivation of all the spores.

Commercial biological indicators may be used for validation test of deep sterilisation. For susceptible products, select suitable strains and spores as the biological indicator and design the process depending on the degree that the products are contaminated. Sterility assurance of these products are assessed by monitoring the number and resistance of contaminating micro-organisms and the validation test.

4. Common biological indicators

(1) **Steam sterilisation** Spores of *Bacillus stearothermophilus* (for example, NCTC 10007, NCIMB 8157, ATCC 7953) are recommended as the indicator for steam sterilisation. The D-value is 1.5-3.0 minutes, the number of viable spores in each tablet (or ampul) is 5×10^5 - 5×10^6 , and all the micro-organisms are inactivated at 121°C for 19 minutes. Spores of *Clostridium sporogenes* (for example, NCTC 8594, NCIMB 8053, ATCC 7955) may also be used, with D-value of 0.4-0.8 minutes.

(2) **Dry-heat sterilisation** Spores of *Bacillus subtilis* (for example, NCIMB 8058, ATCC 9372) are recommended as the indicator for dry-heat sterilisation. The D-value is more than 1.5 minutes, the number of viable spores in each tablet is 5×10^5 - 5×10^6 . Use *Escherichia coli* endotoxin for validation of depyrogenation, the amount added is not less than 1000 EU.

(3) **Ionising radiation sterilisation** Spores of *Bacillus pumilus* (for example, NCTC 10327, NCIMB 10692, ATCC 27142) are recommended as the indicator for ionising radiation sterilisation. The number of viable spores in each tablet is 10^7 - 10^8 . The D-value is around 3 kGy when a 25 kGy radiation dose is applied. Contaminated micro-organisms in the product may be more resistant to radiation than *B. pumilus*. Therefore, the latter can only be used to monitor the process, and cannot be used to establish the radiation dose.

(4) **Gas sterilisation** Spores of *Bacillus subtilis* (for example, NCTC 10073, ATCC 9372) are recommended as the indicator for gas sterilisation with ethylene oxide. The number of viable spores in each tablet is 1×10^6 - 5×10^6 . The D-value is more than 2.5 minutes, and the concentration of ethylene oxide is 600 mg/L. The relative humidity is 60%. The microorganisms are inactivated at 54°C for 60 minutes. Spores of *Bacillus stearothermophilus* (for example, NCTC 10007, NCIMB 8157, ATCC 7953) are recommended as the indicator for gas sterilisation with hydrogen peroxide.

(5) **Filtration** *Pseudomonas diminuta* (for example ATCC 19146) is recommended as the indicator when 0.22 µm-pore-size membranes are used for filtration. *Serratia marcescens* (for example, ATCC 14756) is recommended when 0.45 µm-pore-size membranes are used.

Appendix XIX Names, Symbols and Atomic Weights of Elements

C=12.00

Element	Symbol	Atomic weight	Element	Symbol	Atomic weight
Aluminium	Al	26.981538(2)	Magnesium	Mg	24.3050(6)

1. The last digit of an atomic mass is shown in parentheses.
 2. The figure in square brackets is the atomic mass of an isotope which exists with the longest half-life.

Appendix XX

XX A Guidelines for Validation of Analytical Method Adopted in Pharmaceutical Quality Specification

The purpose of validation of analytical method is to ensure that the adopted method meets the requirements for the intended analytical applications. In the course of drafting of the drug quality specification the analytical method must be verified. In case of changing of pharmaceutical synthetic processes or the components of preparation, or revising of the original analytical method, the analytical method of the specification must also be validated. Both process and result of the method validation must be recorded in the description of draft and revision of pharmaceutical quality specification.

The analytical items that must be verified include identification, quantification or limit test of impurities, content determination of the active ingredient in drug substance or preparation and that of other components in the preparation, such as degradation products, antiseptic etc. In the dissolution and release test of pharmaceuticals, the analytical method of dissolution amount must also be validated.

The parameters of validation characteristics include accuracy, precision (including repeatability, intermediate-precision and reproducibility), specificity, limit of detection, limit of quantitation, linearity, range and ruggedness. The parameters to be validated depend on the purpose for which the procedure is required. The analytical items and the corresponding parameters to be validated are listed in the attached table, which can be used for reference.

The parameters of analytical method to be validated are as follow.

Accuracy The accuracy of an analytical method is the closeness of test results obtained by that method to the true value or the reference value. Accuracy is often expressed as percent recovery and should be in the specified range.

1. Accuracy of the method for content determination

The accuracy for drug substance may be determined with a reference substance or a sample with known purity, or by comparing the result obtained by this method with the result obtained by another method of which the accuracy has been established. The accuracy for drug preparation may be determined with the mixture of components, to which known amounts of analyte have been added. If it is not possible to obtain all the components, the accuracy may be determined by adding known amounts of analyte to the preparation, or by comparing the result obtained by this method with the result obtained by another method which accuracy has been known. When the precision, linearity and specificity of a method have been developed, then it is not necessary to determine the accuracy because the accuracy can be calculated.

2. Accuracy of quantitative determination of impurity

The accuracy may be determined by adding known amounts of impurity to the drug substance or preparation. When the

impurity or degradation product is not available, the accuracy may be determined by comparing the result obtained by this method with the result obtained by another method which accuracy has been known, such as pharmacopoeial method or validated method. The response factor of the drug substance may be used if the response factor or the relative response factor of the impurity or degradation product to the drug substance can not be determined. The percent ratio of weight or area of a single impurity and total impurities to that of the active ingredient should be testified definitely.

3. Requirement for the data

In specified range, the accuracy should be evaluated using at least 9 testing results of the sample, for example, 3 different concentration levels are selected, 3 testing solutions of each level are prepared and measured. The percent recovery of the added amount, or the difference between the average value of testing results and the actual value and its confidential limit should be reported.

Precision The precision of an analytical method is the degree of agreement among individual test results when the procedure is applied repeatedly to multiple samplings of a homogeneous sample. The precision of an analytical method is usually expressed as deviation, standard deviation or relative standard deviation.

Repeatability is the precision obtained by the same analyst within a laboratory over a short period of time with the same equipment. Intermediate-precision is the precision obtained by different analysts within the same laboratory on different days with different equipment. Reproducibility is the precision obtained by different analysts in different laboratories using the same analytical procedure.

Precision of the method should be considered when the content of the active ingredient or impurity is determined.

1. **Repeatability** In specified range, repeatability should be evaluated with at least 9 measurement results, for example, 3 different concentration levels are selected, 3 testing solutions of each level are prepared and measured. Repeatability can also be evaluated with at least 6 measurement results when the concentration level of the analyte at 100%.

2. **Intermediate-precision** Scheme should be designed to inspect the effect of random variable factors on the precision. The variable factors include different dates, different analysts and different equipment.

3. **Reproducibility** Reproducibility should be done when an analytical method is adopted as the legal standard. For example, reproducibility should be inspected by collaborative study when pharmacopoeial method will be developed. Both the process of the collaborative study and result of the reproducibility should be recorded in the description of draft file. Where a reproducibility testing is to be conducted, the sample should be uniform, properly stored and transported to obtain reliable result.

4. **Requirement for data** Standard deviation, relative standard deviation and confidential limit should be reported.

Specificity The specificity of an analytical method is its ability to measure accurately and specifically the analyte in

the presence of components that may be expected to be present in the sample matrix, such as impurity, degradation product and excipients. Specificity should be inspected when identification, impurity test and content determination will be done. If the specificity of the method is not enough, other methods should be adopted for supplementation.

1. **Identification** The compounds that may coexist or have close related structures should be distinguished from the active ingredient. The sample without the tested ingredient, compound with close related structures and related chemical compound should all offer negative response.

2. **Assay and test for impurity** The representative graphs should be recorded for verifying specificity when chromatography or other separation methods are used. The position of each component should be marked in the graph. The resolution of the chromatographic method should meet the requirements. If available, the impurities or excipients may be added to the sample for assay to inspect whether the result is interfered, and the result can be compared with that from the sample without adding impurities or excipients. As to test for impurity, a certain amount of the impurity may be added to the sample to inspect whether the impurity can be separated from other ingredients.

If the impurities or degradation products are not available, the sample with impurities or degradation products may be used for determination, and the result may be compared with that obtained by the pharmacopoeial method or other validated method. Accelerating decomposition may be done for studying degradation products, such as irradiation with strong light, high temperature, high humidity, acidic or alkaline hydrolysis, oxidation etc. The results of two methods should be compared for content determination and the number of impurities should be compared with that obtained in test for impurity. Diode array detector and mass spectrometer may be used for purity test when necessary.

Limit of Detection The limit of detection is the lowest concentration of the analyte in a sample that can be detected. The methods in common use are as follows.

1. **Noninstrumental method** The limit of detection is generally determined by the analysis of samples with known concentrations of analyte and by establishing the minimum level at which the analyte can be reliably detected.

2. **Signal-to-noise ratio method** The method for the instrumental method which can record the noise of the baseline, the minimum level at which the analyte can be reliably detected, can be established by comparing the test results from samples with known concentrations of analyte with those of blank samples. The concentration or the amount injected into the instrument corresponding to the signal-to-noise ratio of 2 : 1 or 3 : 1 is generally accepted.

3. **Requirement for data** The test graphs should be attached, the test process and the results should be declared.

Limit of Quantitation Limit of quantitation is the lowest concentration of the analyte in a sample that can be determined with acceptable precision and accuracy under the stated experimental conditions. The limit of quantitation should be determined when the quantitative determination for impurities and degradation products are developed.

Signal-to-noise ratio method is a common approach to determine the limit of quantitation. The concentration or the amount injected into the instrument corresponding to the signal-to-noise ratio of 10 : 1 is generally accepted.

Linearity The linearity of an analytical method is its ability to elicit test results that are directly proportional to the concentration of analyte in samples within a given range. Linearity relationship should be determined over the claimed range of the method. The samples with varying concentrations of analyte for linearity determination are prepared by diluting accurately a stock solution, or by measuring accurately an amount of analyte separately. Five portions of samples should be prepared at least. The treatment is normally a calculation of a regression line by the method of least squares of test results versus analyte concentrations. In some cases, the test data may have to be subjected to mathematical transformation prior to the linearity regression analysis. Requirement for data: regression equation, correlation coefficient and the linear graph should be given.

Range The range of an analytical method is the concentration or quantity interval between the upper and lower levels of analyte (including these levels) that have been demonstrated to be determined with precision, accuracy, and linearity using the method as written.

The range should be determined according to practical application and the results and requirement of linearity, accuracy and precision. The range should be 80% to 120% of the test concentration for content determination of drug substance and preparation. The range should be 70% to 130% of the test concentration for content uniformity of preparation, and may be widened appropriately according to the dosage forms, such as aerosol, sprays. For test of dissolution or release, the range should be $\pm 20\%$ of the limit. If the range of limit is provided, it should be -20% of lower limit to $+20\%$ of upper limit. For study of impurity determination, the range should be stipulated from -20% to $+20\%$ of the provided limit on the basis of preliminary actual determination. If the content determination and impurities test are to be done with normalization method simultaneously, the linear range should be -20% of the provided limit of impurity to $+20\%$ of the provided limit of content (or upper limit).

Ruggedness Ruggedness of an analytical method is the degree of tolerance that the determining result is not affected when there is small change in the operational condition. The ruggedness of the method should be taken into account at the beginning to develop an analytical method. If the requirement for test condition is hard, it should be recorded clearly in the method. The typical variable factors are stability of the test solution, times and duration of sample extraction, and so on. The variable factors of liquid chromatography are composition and pH value of the mobile phase, same type of chromatographic column but from different manufacturers or different batches, column temperature, flow rate, etc. The variable factors of GC are column and stationary phase with different brand or different batches, different type of support, column temperature, sample inlet and detector temperature, etc. It should be illustrated whether the testing conditions with slight change meet the requirements for system suitability test to validate the method.

Tab. List of validation characteristics required to be evaluated in tests of each type

Parameters	Identification	Impurity test		Determination of content or release
		Quantitation	Limit of test

Range	—	+	—	+
Ruggedness	+	+	+	+

① It is not necessary to validate the intermediate precision when the reproducibility has been developed.

② The lack of the specificity of an analytical method may be compensated by other relevant analytical methods.

③ It depends on the specific condition.

XX B Guidances in vivo Bioavailability and Bioequivalence Studies for Drug Preparations

Bioavailability means the rate and extent of the active ingredient absorbed into bloodstream from a drug preparation. Bioequivalence means no significant statistical difference in the main pharmacokinetic parameters reflecting rate and extent of the absorbed active ingredient in different preparations when administered at the same dose and under similar test conditions.

The extent of absorption of active ingredient in preparations for oral or other *non-vascular* administration can be affected by many factors. Among them, the factors affecting absorption are production processes, powder particle size, crystal forms or polymorphism, and the excipients such as binders, disintegrants, lubricants, coating materials, solvents, suspending agents and etc. The bioavailability is an important index which assures the inherent quality of the products, and the bioequivalence is the main basis to guarantee the quality consistency of identical active ingredient in different preparations. Although the concepts of them are not completely identical, the experiment method is almost the same. This guidance is especially for the purpose to ensure the effectiveness, safety of pharmaceutical products and to control the quality. Whether bioequivalence or bioavailability study is needed for pharmaceutical products depends on the regulations enacted by the authority.

The clinical institutes and analytical laboratories performing bioavailability and bioequivalence studies should be identified along with the name of unit as well as names, titles and curriculum vitae of the medical, scientific or analytical directors.

The Basic Requirements for Analytical Methods of Biological Specimen The specificity and the sensitivity of quantitative analytical methods for active ingredient and metabolites in biological specimen are the key points for performing successful bioavailability and bioequivalence studies. The chromatography, such as HPLC, GC and the combination techniques, e. g., GC-MS, LC-MS, LC-MS-MS, are best recommended, and internal standard method is normally used for quantitative analysis. Biological or biochemical methods also can be used if necessary.

Because there are various factors, which can affect biological specimen analysis, e. g., less specimen, low concentration of active ingredient, endogenous substances (such as inorganic

salt, lipid, protein and metabolite) and individual difference, analytical methods of biological specimen must be established on the basis of the structure of the substance being examined, biological matrix and predicted concentration range and the methods must be validated to assure the reliability of the methods.

1. *Specificity* It should be demonstrated that the measured analyte is an unchanged active ingredient or special active metabolite. The sample analysis should not be interfered by endogenous substances and relevant metabolite. It is necessary to submit the chromatograms of blank biological matrix, standard substance (indicated with its concentration) combined with blank biological matrix and the biological sample taken after administration. Specificity study should be enforced for the compound preparations to exclude the possible interference.

2. *Standard curve and linear range* Standard curve should be obtained by the method of regression analysis on the basis of the relationship between responses and concentrations of measured analyte. Linear range is the interval between the upper and lower concentration in a standard curve. In this range, the precision and accuracy of the measured results required by the study can be achieved.

A standard curve should consist of at least 6 concentrations made of the same biological matrix as samples. Linear range should cover the entire range of concentrations of the unknown samples. Estimation of unknown concentrations by extrapolations of linear range is not recommended. The zero point is not included in the standard curve.

3. *Precision and accuracy* It is required that precision and accuracy should be determined using 3 concentrations of the quality control sample at the same time, one approach the lower limit of quantitation (LLOQ) and must be within 3-fold of LLOQ; one approach the upper boundary of the standard curve; and one near the center. At least 5 samples per concentration should be measured.

The precision can be interpreted as the relative standard deviation (RSD) within-day and between-day, by determining the quality control sample. In general, RSD should not exceed 15%, except for near the lower limit of quantitation where it should not exceed 20%.

Accuracy refers to the closeness of the concentration of biological specimen to the true value determined by a special method. It should be within 85% to 115%, but within 80% to 120% for near the lower limit of quantitation.

4. *Lower limit of quantitation* The lower limit of quantitation is the lowest concentration on the standard curve. At least, it should meet analysis of the concentration of specimen at the time of three to five times the half-life or

one tenth to one twentieth of the C_{max} of the active ingredient concentration. Its accuracy should be within 80% to 120% of the true concentration. RSD should be less than 20%, and signal-to-noise ratio should be more than 5.

5. *Stability of the specimen* According to the concrete conditions, the stability of the biological specimen which contains the active ingredient should be evaluated under the room temperature, freezing and thawing condition, and different storage period, for the purpose of determining the storage condition and period of the biological specimen.

6. *Recovery of extraction* The recovery of extraction should be evaluated using upper, middle and lower concentrations of a sample. All results should be identical, precise, and reproducible.

7. *Quality control samples* The quality control samples, which are used to quality control, are biological matrix spiked with known quantities of the drug substance to be analysed.

8. *Quality control* The unknown biological specimen is determined after the analytical method is validated. Analysis of unknown samples can be done by single determination, or replicate analysis if necessary. A new standard curve should be generated for analysis of each batch of biological specimen and the duplicate quality control samples at three concentrations (upper, middle and lower) should be incorporated into each run. In general, the deviation from the results of the quality control samples is not more than 15%, and the deviation from the low concentration is not more than 20%. Not more than two quality control samples in different concentrations, whose results exceed the limit, are allowed. If not, the test results that day are invalid.

9. *Test results* The analytical methods in detail, published references, every standard curves, and the calculating process of results of quality control samples and unknown samples should be included in the test results. The chromatograms of all unknown samples, including the chromatograms of all associated standard curve and quality control samples should be available for regulatory authorities.

Ordinary Preparations

1. *Selection of Subjects* The requirements for the subjects who will be selected for the studies of the bioavailability and bioequivalence are:

(1) Conditions of subjects In general cases, healthy male is selected. In special cases the reason should be explained, i. e., drug for the gynecological usage. Adult subjects should be selected for the drug that is for children use. The detail is as following.

a. Sex distinction; Male.

b. Age: Generally the ages of 18-40 years are required. In the same study group, the difference in age should be controlled in a range of 10 years.

c. Body weight: Standard body weight $\pm 10\%$, body weights should be similar for subjects in the same study group, the unit of body weight is kilogram.

d. Subjects should be healthy, without any history of heart, hepatic, digestive disease, abnormal metabolism and nervous system diseases etc. A health examination should be taken which includes: ECG, blood pressure, heart rate, hepatic, renal, pulmonary function and blood test etc, all results should be normal. Related examinations are needed for special drugs, e. g., the examination of blood sugar level should be taken for drug that can reduce blood sugar level.

e. Subjects should be without any history of allergy and posture hypotension.

f. Any other drugs should not be taken within the past two weeks and during the whole study period. During the study period, tobacco, alcohol and any drinks containing caffeine

are prohibited.

g. Both investigators and subjects should sign informed consent form.

(2) The number of subjects Enough number of subjects are necessary, 18-24 subjects are required according to the related regulation. If necessary, the number could be increased.

2. *Reference Preparations* Reference preparations should be used in the studies of bioavailability and bioequivalence as a control. Reference preparations should be safe and effective. The selective principles of the reference preparations are as follows.

In the study of absolute bioavailability, the commercial dosage form of intravenous injection should be selected as a reference preparation. In the study of relative bioavailability or bioequivalence, reference preparations should be selected among the same type dominant product, which is commercially supplied domestically or abroad.

3. *Test Preparations* Test preparations should be magnified pilot product, which complies with the requirements of quality standards for clinical practice. The data of in vitro dissolution, stability, content or potency etc. should be presented. For particular products, documents about their polymorphism and optical isomers should be presented.

4. *Study design* When comparing two products, i. e., the test product and reference product, two-period and two-product crossover study is usually adopted. In order to erase influence of test period and individual difference on the study results, the subjects are randomly assigned into two groups. One group is administered with test sample first and then with reference sample; the other is administered with reference sample first and then with test sample. Between these two periods of the study, an interval is taken as wash out period, which is typically one or two weeks and should not be less than 10 half-life of the active ingredient.

For comparing among three products: two test products and one reference product, it is better to adopt three-product three periods double 3×3 Latin square study. The wash out periods between each study period are typically one or two weeks.

Sampling time points is important for a reliable test. The pre-dose sample should be collected, a perfect plasma concentration-time curve should include absorption phase, distribution phase and elimination phase. In general, at least four sampling time points are taken in front of the peak of plasma concentration-time curve, six or more sampling time points should be taken after the peak, there should be enough points around the peak time, the total sampling time points should not be less than 12. In general, sampling should be lasted till 3-5 elimination half-lives of the active ingredient, or the plasma concentration lower than $\frac{1}{10} \sim \frac{1}{20} C_{max}$.

When plasma concentration can not be analyzed, the analysis can be performed by adopting other biological samples, e. g. urine, but the test drug and study method should be in agreement with the requirements for measurement of bioavailability.

5. *The determination of administration dose* In study of bioavailability and bioequivalence, the dose is usually in agreement with clinical administration dose. It is better to administer the same dose of test preparation as that of reference preparation. In the case where the use of different doses is needed, the reason should be explained and if the test drug accords with linear pharmacokinetic in this dose range, the doses should be adjusted for the calculation of bioavailability.

6. *Study procedure* Following an overnight fasting (at least 10 hours), the subjects should be administered a single

dose of test or reference preparation with 250 ml warm water in the next morning. Subjects can have water after 2 hours and have standard meal after 4 hours of administration. According to the requirements, at different sampling time point the venous blood samples are collected. On the basis of requirement, the blood samples (whole blood, plasma or serum) are collected and frozen for analysis. After administration the subjects should avoid strenuous exercise. The blood sample should be collected in clinical monitoring room. If some adverse event happened, the effective treatment should be taken immediately. The study could be stopped if necessary.

7. Pharmacokinetic analysis Make tables and diagrams to show the data of plasma concentration of samples, and their mean value and standard deviation, at different time obtained from each subject. Then the relative pharmacokinetic parameters for each subject, and their mean values and standard deviations are calculated respectively. The main pharmacokinetic parameters are the half-life ($T_{1/2}$) of elimination, the peak drug concentration (C_{max}), the time for peak concentration (T_{max}) and the area under the plasma concentration-time curve (AUC). C_{max} and T_{max} are expressed directly by the values obtained from experiment without interpolation. AUC_{0-t_n} (area under the plasma concentration-time curve from time zero to time t) are calculated by trapezoidal rule or logarithmic trapezoidal rule, where t_n is the sampling time of the last measurable concentration. $AUC_{0-\infty}$ (area under the plasma concentration-time curve from time zero to time infinity) is calculated using the formula: $AUC_{0-\infty} = AUC_{0-t_n} + C_{t_n}/\lambda_z$, where C_{t_n} is the drug concentration of last sample point, and λ_z is the constant of terminal elimination rate. $T_{1/2}$ can be obtained using the formula of $T_{1/2} = 0.693/\lambda_z$, where λ_z is calculated from the slope of terminal linear part of log-plasma concentration-time curve.

Concerning to human bioavailability test, the AUC_{0-t_n} from time zero to the time for last sampling point should satisfy: $(AUC_{0-t_n}/AUC_{0-\infty}) \times 100\% > 80\%$.

8. Calculation of bioavailability (1) Single dose Bioavailability F should be calculated respectively by using AUC_{0-t_n} and $AUC_{0-\infty}$ of each subject, and the mean value and standard deviation are also calculated. When the dose of test preparation (T) is the same as that of reference preparation (R).

$$F = (AUC_{0-t_n})_T / (AUC_{0-t_n})_R \times 100\%$$

$$F = (AUC_{0-\infty})_T / (AUC_{0-\infty})_R \times 100\%$$

If the test drug being of the characteristic of linear pharmacokinetic, the dose of test preparation can be different from reference preparation, and the F can be modified and expressed in the following:

$$F = [(AUC_{0-t_n})_T \times D_R / (AUC_{0-t_n})_R \times D_T] \times 100\%$$

$$F = [(AUC_{0-\infty})_T \times D_R / (AUC_{0-\infty})_R \times D_T] \times 100\%$$

where, D_R is the administration dose of reference preparation and D_T is the administration dose of test preparation. The dose of test and reference preparation should be calculated according to actual content.

Data of metabolites: Prototype drug in blood may not be measured because of pro-drugs or because drugs are metabolized very quickly in the body. In this case, the bioavailability of these drugs can be studied using appropriate corresponding active metabolites.

The calculation of bioavailability is made mainly on the basis of AUC_{0-t_n} and the $AUC_{0-\infty}$ is used as a reference.

(2) Multiple Dose In the cases mentioned below, when steady state is reached after multiple dose administration,

the bioavailability can be estimated by means of the plasma drug concentration at steady state.

a. Extent of absorption of drug is similar, but the absorption rate of drug is quite different.

b. The difference of bioavailability among different individuals is large.

c. Extended, controlled release preparation.

d. After administration of single dose, the concentration of prototype drug or its metabolite is very low, which can not be measured by appropriate analytic method.

After multiple dose administration with an equal interval time τ a steady state is reached, then blood samples are collected multiply during the administration interval. The drug concentration is analyzed, and the area under the plasma concentration-time curve from time zero to time τ (AUC^*) in the dosing interval at steady state is calculated. When the dose of test preparation is equal to that of reference preparation, the relative bioavailability can be calculated in the following:

$$F = AUC_T^* / AUC_R^* \times 100\%$$

where AUC_T^* and AUC_R^* represent AUC at steady states for test and reference preparations respectively.

9. The evaluation of bioequivalence (statistical analysis of pharmacokinetic data) The statistical analysis should be focused on main pharmacokinetic parameters (e. g., AUC , C_{max}), and the bioequivalence is evaluated. After the data of AUC and C_{max} are converted by a log-metric scale, the statistical analysis is performed by means of the variance analysis and the two-tailed confidence interval method. If the 90% fiducial limits of the parameter AUC of test preparation is located within a range of 80%-125% of reference preparation and if C_{max} is within 70%-143% of reference preparation, the bioequivalence between the test and reference preparations is recognized. T_{max} can be tested by non-parameter method.

To facilitate bioequivalence comparisons, pharmacokinetic parameters (AUC and C_{max}) for each subject should be displayed in a parallel table for the preparations tested. Ratio (T/R) and log ratio between the test and reference values should be tabulated side by side for all subjects. In addition to the arithmetic mean for the test and reference products, the geometric means should be calculated. All means are to be included in the report.

10. Clinical report, side effects, and adverse reactions

Medical histories, physical examination and laboratory reports of subjects, and all incidents of possible side effects and adverse reactions related to the study should be reported.

Extended, Controlled Release Preparations In vivo bioavailability and bioequivalence studies of extended, controlled release preparations should be determined under the conditions of single and multiple dose.

1. Single dose, two-period crossover study The objective of this study is to compare the rate and extent of absorption of the test preparation and reference preparation under fasting conditions of subjects and to determine whether extended, controlled release preparation are bioequivalent with the reference preparation, and have the extended, controlled release character.

(1) The requirements for subjects and the criteria of selection are the same as described under Ordinary Preparations.

(2) Reference preparations In general, the reference preparations should be selected among the same type dominant product, which is commercially supplied domestically or abroad. If the products are new created extended, controlled release preparations, the dominant ordinary preparations, which are commercially supplied domestically

parameter C_{\max} is reduced, t_{\max} is extended, and at least one parameter in the results does not comply with the requirements of bioequivalence by statistic analysis according to part 9 described under ordinary preparations.

2. *Multiple dose, two-period crossover study* The objective of this study is to investigate the rate and extent of absorption, and fluctuation of blood concentration at the steady state when multiple doses of test and reference extended, controlled release preparations are given.

(1) The requirements and selection criteria for subjects The selection of subjects is similar as described under Single dose study and the subjects used in Single dose study can be continuously selected. 18 to 24 subjects are required. If necessary, the number can be increased. Reference preparations are similar as described under Single dose study.

(2) Study design and procedure A randomized crossover study design and multiple doses administration of test and reference preparations are recommended. For test preparation, the studied out scheme of dosage and administration is used. The preparations, which are administrated once a day, should be dosed in the morning following a fast of at least 10 hours; subjects should continue fasting for 2 to 4 hours after dosing. For preparations which are dosed twice a day, the first dose should be given following a fast of 10 hours, and subjects should continue fasting 2-4 hours after dosing; the second dose should be administrated before or after the meal of 2 hours and subjects should continue fasting for 2 hours post-dose. Each dose should be administered with 250 ml of warm water. In general, subjects can drink water after 1-2 hours of dosing. When reference is ordinary preparation, the routine clinical dosage and administration is used, but the overall dosage should be equal to the dosage per day of test extended, controlled release preparations.

(3) Blood-sampling design After multiple doses are given for a period of at least 7 elimination half-lives, three trough concentrations (C_{\min}) on three consecutive days should be determined to ascertain that the blood concentrations are at steady state. Blood sampling should be collected at the same time (normally in the morning) of different days in order to offset an interference of time to pharmacokinetics and be comparable. After reaching steady state and in a dosing interval of the last dose administration, adequate blood samples should be collected according to blood-sampling design of Single dose study. Then the blood concentration-

data during that interval will be measured and needed parameters of pharmacokinetics, e. g., the concentration, the time for peak concentration, trough concentration at steady state (C_{av}) and AUC^{ss} be calculated.

pharmacokinetics data processing a. Make tablet and o show the data of plasma concentration of and their mean value and standard deviation at ne obtained from each subject.

total C_{\max} , C_{\min} , T_{\max} , C_{av} , AUC^{ss} , and mean standard deviation of each parameter should be C_{\max} and T_{\max} are obtained directly from data interpolation. In general, C_{\min} is obtained from the two trough concentrations. One is sampled before ring an interval of the last dose administration, r is sampled at the τ . AUC^{ss} is calculated by the rule.

g concentration at steady state (C_{av}) which can be calculated as following:

$$C_{av} = (AUC^{ss}) / \tau$$

is area under the blood concentration-time curve from zero to time τ over a dosing interval at steady state is the dosing interval.

ability at steady state can be calculated as follows:

$$F = (AUC^{ss})_T / (AUC^{ss})_R \times 100\%$$

$$F = (AUC^{ss})_T \times D_R / (AUC^{ss})_R \times D_T \times 100\%$$

d. Percent degree of fluctuation ($DF\%$) of blood concentration, which can be calculated as following.

$$DF = 100\% \times (C_{\max} - C_{\min}) / C_{av}$$

where C_{\max} is peak drug concentration, obtained directly from the data, after the last dose is administrated at steady state and C_{\min} is a trough concentration at the end of last dosing interval during steady state. If reference preparation is the same extended release preparation, D_F/τ of test preparation should not be more than 143% of reference preparation. If reference preparation is ordinary preparation, D_F/τ of test preparation should be significantly less than that of ordinary preparation.

e. Statistical analysis and bioequivalence evaluation The methods and requirements for statistical analysis and bioequivalence evaluation are similar as described under Single dose study of extended, controlled release preparations.

f. Clinical report, side effects, and adverse reactions The requirements are the same as that for ordinary preparations.

XX C Guidelines for the Stability Testing of Drug Substances and Preparations

The purpose of stability testing is to provide information on the quality variation of a drug substance or drug preparation with time under the influence of a variety of environmental factors, such as temperature, humidity and light, to substantiate the recommended manufacture, package, storage, transportation and shipment conditions, and to establish shelf lives of the drug concerned.

The basic requirements for stability testing include: (1) Affecting factors testing, accelerated testing and long-term testing. One batch of drug substance is required for affecting factors testing. Three batches of substance/drug preparation are required for accelerated and long-term testing. (2) Drug substances used for stability testing should be from pilot

scale, and the amount required for testing should be equivalent to that for stability testing of their preparations. The manufacturing process should be the same as those for full scale production. The drug preparations used for stability testing should be from extended pilot scale (e.g., about 10000 tablets or capsules for Tablets or Capsules, at least about 10 times the amount needed for tests of each item for large volume preparations, such as intravenous infusion, oral solution, etc., the amount of particular preparation or dosage form can be varied depending on specific conditions.), and the formulation and manufacturing process should be the same as those of full scale manufacturing. (3) The quality specification of the drug for stability testing should be identical to that for pre-clinical and clinical studies. (4) The container, packaging materials and final package of the drug for accelerated and long-term testing should be the same as those for marketing. (5) The testing methods for assessment of drug stability testing must be accurate, precise and specific for the drug substance or preparation as well as for related substances (including degradation products and other substances introduced under various environmental or product related factors), and these analytical parameters should be validated to ensure the reliability of the results of the stability testing. The determination of degradation products and related products is important in the stability testing. (6) Because the quantity of the pilot production is less than that of full scale manufacturing, the applicant shall promise that the accelerated and long-term testings are also to be conducted for the first three batches of the validated full scale manufacturing. This guideline consists of two parts; the first is for drug substance, and the second is for drug preparation.

Drug substance The following tests for drug substance should be carried out.

1. Affecting factors testing This testing is normally carried out under more severe conditions than those used for accelerated testing. The purpose is to investigate the intrinsic stability of the drug substance in order to identify the factors that affecting stability, and the likely degradation pathways and degradation products, so that provide the rational scientific evidence for manufacturing, package, storage of the drug preparation and establishment of the analytical method for degradation products. This testing may be carried out on sample of a single batch. The substance being examined is usually distributed evenly in a suitable container (e.g., weighing bottle or petri dish) to form a thin layer with a thickness of not more than 5 mm, or not more than 10 mm for loose substance. Where significant change in degradation products is found according to the testing result, qualitative and quantitative analysis should be conducted for the degradation products due to the potential safety problem when necessary.

(1) **High temperature testing** Open the loaded container and place it in a suitable clean and tightly closed facility at 60°C for ten days. Sampling at the fifth and the tenth day and examine the specified items of stability testing. Where the substance changes significantly (e.g., a 5% potency loses from the initial assay value), the additional testing at 40°C should be conducted.

(2) **High humidity testing** Open the loaded container and place it in a closed facility with constant humidity at 25°C/90% ± 5% RH for ten days. Sampling at the fifth and the tenth day and examine the specified items of stability testing. The weight of the substance before and after testing is weighed accurately to evaluate the hygroscopic properties of the substance. Where increase is more than 5% of its weight, additional testing at 25°C/75% ± 5% RH should be conducted. Conditions of constant humidity are made up by

placing a saturated salt solution in the lower part of the closed container, such as a desiccator. According to the requirements for relative humidity, saturated solutions of NaCl (75% ± 1% RH at 15.5°C to 60°C) and KNO₃ (92.5% RH at 25°C) may be used appropriately.

(3) **Photostability testing by strong light** Open the loaded container and place it in a light cabinet or other suitable light device. The substance being examined should be exposed to light of 4500 lx ± 500 lx for 10 days and sampling at the fifth and the tenth day and examine the specified items for stability testing. Any changes in appearance of the substance should be noticed.

As to the light emitting device, It is recommended to use the device of the tunable exposure box. A light cabinet may also be used, in which several daylight lamps are placed to achieve the defined exposure, and the height of the sample platform may be adjusted. An aspirator is installed at the upper part of the cabinet to eliminate the heat possibly produced. An illuminometer is fixed on the cabinet to monitor the illumination of the cabinet at any moment. The light cabinet should not be interfered by natural light and keep the illumination intensity constant. Note should be prevented in light cabinet.

According to the chemical, physical and microbiological properties of the drug, experiment can be designed when necessary for exploring the affect of pH, oxygen and other factors on stability of the drug, and analytical method of related substances should be developed. For innovative or new drugs, it is necessary to study the properties of their decomposition products.

2. Accelerated testing This testing is carried out under extraordinary conditions. The purpose is to study and predict the drug stability by accelerating the chemical or physical change of the drug to provide the necessary data for evaluation, manufacturing, transportation and storage of drug. Three batches of samples, with the package as same as the market package, are required for accelerated testing, being placed at 40°C ± 2°C/75% ± 5% RH for 6 months. The equipment must be capable of controlling the temperature within a range of ± 2°C and relative humidity of ± 5% RH and monitoring the actual temperature and humidity. The drug substance should be examined respectively at the first, second, third and sixth month during the testing periods according to the specific items for stability testing. If the examined substance does not conform to the quality standard in 6 months duration under conditions of accelerated testing at 40°C ± 2°C/75% ± 5% RH, additional testing at an intermediate condition, such as 30°C ± 2°C/65% ± 5% RH (saturated solution of NaCrO₄ may be used, the relative humidity is 64.8%-61.5% at 30°C), should be conducted for six months. It is recommended that a water-separating type of electric heating constant temperature culture box (20-60°C) be used for the accelerated testing. A desiccator containing a saturated salt solution with a definite relative humidity is put at the lower part of the box, the temperature should be even controllable as required and suitable for long-term use. A constant humidity and temperature box or other suitable device can also be used. For temperature sensitive or less stable drug substance, suppose to be stored only in a refrigerator (4-8°C), the six months accelerated testing may be carried out at 25°C ± 2°C/60% ± 5% RH.

3. Long-term testing Long-term testing is carried out under the conditions close to the actual storage conditions for the drug. The purpose is to provide data for the shelf life of the drug. Three batches of drug substance, with the package as same as market package are placed for 12 months under the defined long-term conditions (25°C ± 2°C/60% ± 10% RH). The stability testing on specified items will be carried out at

the 0, 3rd, 6th, 9th, 12th month. Thereafter, the examinations at the 18th, 24th and 36th month are still required. Shelf life of the drug is fixed by comparing the results at different duration with those at 0 month. Statistical analysis is generally conducted using 95% confidence limit because of the variation of the experimental data. If the variation of the statistical analytical results of the 3 batches is small, the average is taken as the shelf life, if the variation is significant, the value obtained in shortest duration is taken as the shelf life. If the variation of the results of stability testing is so small, the drug is taken to be stable, then the statistical analysis can be omitted.

For the drug substance less stable on temperature, long-term testing may be carried out at $6^{\circ}\text{C} \pm 2^{\circ}\text{C}$ for 12 months according to the above described requirements. The examination should be continued after 12 months. Shelf life of the drug stored at low temperature should be formulated based on the results of stability testing.

The condition of $25^{\circ}\text{C} \pm 2^{\circ}\text{C}/60\% \pm 10\%$ for long-term stability testing is adopted on the basis of the International climatic zone (see table).

Mean climatic conditions: calculated data and derived storage conditions¹

Climatic zone	Calculated data			Derived storage conditions (for real-time studies)	
	$^{\circ}\text{C}^2$	$^{\circ}\text{CMKT}^3$	$\% \text{RH}^4$	$^{\circ}\text{C}$	$\% \text{RH}$
I	20.0	20.0	42	21	45
II	21.6	22.0	52	25	60
III	26.4	27.9	35	30	35
IV	26.7	27.4	76	30	70

¹ Based on: Grimm W. Storage conditions for stability testing in the EC, Japan and USA; the most important market for drug products. *DN9 development and industrial pharmacy*, 1993, 19: 27952830.

² Calculated temperatures are derived from measured temperatures, but all measured temperatures of less than 19°C were set equal to 19°C .

³ MKT=mean kinetic temperature (see p. 198).

⁴ RH=relative humidity.

The United Kingdom, North Europe, Canada and Russia are in the region of temperate zone. The United States of America, Japan and West Europe (Portugal-Greece) are in the region of subtemperate zone. Iran, Iraq and Sudan are in the region of dry and hot zone. Brazil, Ghana, Indonesia, Nicaragua and Philippine are in the region of humid and hot zone. The long-term testing condition of $25^{\circ}\text{C} \pm 2^{\circ}\text{C}/60\% \pm 10\%$ RH is adopted because China is mostly in the region of subtemperate zone, which is basically consistent with that adopted by ICH.

The drug substance for accelerated testing and long-term testing should be packaged with simulated small barrel, but the material and packaging conditions should be similar with those of the big barrel.

Drug Preparation The stability studies for the drug preparation should be based on the knowledge of stability of the drug substance, especially the influence of temperature, humidity and light on the drug substance stability. During the process of formula optimization and technical designation, some necessary affecting factors testing should be carried out, and the packaging conditions should also be investigated to conduct the following testings:

1. *Accelerated stability testing* This testing is carried out

under exaggerated storage conditions. The purpose is to predict stability of the drug preparation by accelerating the chemical or physical change of drug preparation and provide the necessary data for evaluation, manufacturing, transportation and storage of the drug. Three batches of samples, with the package as same as market package, should be placed under the conditions of accelerated testing at $40^{\circ}\text{C} \pm 2^{\circ}\text{C}/75\% \pm 5\%$ RH for 6 months. The equipment must be capable of controlling temperature within a range of $\pm 2^{\circ}\text{C}$ and relative humidity of $\pm 5\%$ RH and monitoring the actual temperature and humidity during storage. The preparation should be examined respectively at the first, second, third, sixth month during the testing periods according to the specified items for stability testing. If the examined preparation does not conform to the quality standard during 6 months under above mentioned conditions, additional testing at an intermediate condition, such as $30^{\circ}\text{C} \pm 2^{\circ}\text{C}/65\% \pm 5\%$ RH, should be conducted for six months. Relative humidity is not required for Solutions, Suspensions, Creams and Injections. The equipment used is the same as those used for drug substance. For temperature sensitive or less stable drug preparation, suppose to be stored in a refrigerator ($4-8^{\circ}\text{C}$), the six months accelerated testing may be carried out at $25^{\circ}\text{C} \pm 2^{\circ}\text{C}/60\% \pm 5\%$ RH.

It is appropriate that the accelerated testing is directly carried out at $30^{\circ}\text{C} \pm 2^{\circ}\text{C}/65\% \pm 5\%$ RH for Creams, Suspensions, Ointments, Eye ointments, Suppositories, Aerosols, Effervescent tablets and Effervescent granules, other requirements are the same as those described above.

For the drug preparations in semi-permeable container, such as Solutions in plastic bag, Eye drops or Nasal drops in plastic bottle, etc., the accelerated testing should be carried out at $40^{\circ}\text{C} \pm 2^{\circ}\text{C}/20\% \pm 2\%$ RH (saturated solution of $\text{CH}_3\text{COOK} \cdot 1 \frac{1}{2} \text{H}_2\text{O}$ may be used).

2. *Long-term stability testing* Long-term stability testing is carried out under the condition close to the actual drug storage conditions. The purpose is to provide data for the drug shelf life. Three batches of drug preparation with package as same as the market package are placed for 12 months under the defined conditions long-term stability testing at $25^{\circ}\text{C} \pm 2^{\circ}\text{C}/60\% \pm 10\%$ RH. The stability testing on the specified items will be carried out at the 0, 3rd, 6th, 9th, 12th month. Thereafter the examinations at the 18th, 24th and 36th month are still required. The drug shelf life is fixed by comparing the results at different time duration with those at 0 month. Statistical analysis is generally conducted using 95% confidence limit because of the variation of the experimental data. If the variation of the statistical analytical results of the three batches is small, the average is taken as the shelf life, if the variation is significant, the shortest time duration is taken as the drug shelf life. Statistical analysis can be omitted for stable drug. For the temperature sensitive or less stable drug preparation, long-term testing may be carried out at $6^{\circ}\text{C} \pm 2^{\circ}\text{C}$ for 12 months and the preparation should be examined according to the time requirement described above. The shelf life of the drug stored at low temperature should be formulated based on the results of the stability testing.

For some drug preparation, stability should be investigated in the process of use.

Important items of drug stability testing The major items are shown in the following table. The items of the various preparation types unlisted in this table may be determined according to the requirements for the correlated preparations.

Tab. The important items of stability testing for new drug substance and preparation

Type of preparation	Emphatic items for drug stability
Drug substance	Appearance, melting point, content, related substances, hygroscopic and other items selected according to monograph
Tablets	Appearance, content, related substances, disintegration time or dissolution or drug release
Capsules	Appearance, content, related substances, disintegration time or dissolution or drug release, water content, precipitate on the content of soft capsules
Injections	Appearance, content, pH, visible particles, related substances, sterility should be inspected
Suppositories	Appearance, content, softening time and related substances
Ointments	Appearance, homogeneity, particle size and related substances
Creams	Appearance, homogeneity, particle size, related substances and demixing
Pastes	Appearance, homogeneity, particle size and related substances
Gels	Appearance, homogeneity, particle size, related substances, demixing on emulsion
Ophthalmic preparations	Appearance clarity, visible particles, content, pH, and related substances for solutions Appearance, content, pH, related substances, particles size and redispersibility for suspensions Appearance, clarity, content, pH, related substances and sterility for eye lotions Appearance, clarity, content, pH, related substances, particles size and sterility for eye pills
Pills	Appearance, content, related substances and disintegration
Syrups	Appearance, content, clarity, relative density, related substances and pH
Oral solutions	Appearance, content, clarity and related substances
Oral creams	Appearance, content, demixing and related substances
Oral suspensions	Appearance, content, ratio of settling volume, related substances and redispersibility
Powders	Appearance, Content, particle size, related substances and uniformity of appearance
Inhale aerosols	Leakage rate, dose in each bottle, related substance, number of deliveries of each bottle, dose in each delivery and particle size distribution.
Powders for Inhalation	Emptying rate, number of deliveries of each bottle, dose in each inhale, related substances and particle size distribution
Sprays	Number of deliveries in each bottle, volume in each delivery, dose in each inhale, related substances and droplet size distribution
Granules	Appearance, content, particle size, related substances
Patches (transdermal patches)	Appearance, content, related substance, release rate and adhesion
Rinsing agents, lotions, enemas	Appearance, content, related substance, demixing (emulsion type), dispersibility (suspension type), sterile for rinsing agents
Liniment, Paints	Appearance, content, related substance, demixing (emulsion type), dispersibility (suspension type) filming for film paints
Ear preparation	Appearance, content, related substances. For Ear powders, sprays and semi-solid preparations, selection of items is base on requirements of the dosage form respectively.
Nasal preparation	Appearance, pH, content, related substances. For nasal powders, sprays and semi-solid preparations, selection of items is based on the requirements of the dosage form respectively.

Note: The variation of number and quantity of related substances including decomposition products and other products produced by other factors should be stated in the item of related substances. If possible, it should be stated that which related substance is the intermediate of the drug substance or decomposition product.

XX D Guidelines for Sustained, Controlled and Delayed Release Preparations

Comparing to ordinary preparations, sustained and controlled release preparations have longer therapeutic effect, lower adverse effects and lower dosing frequency. According to the requirements of the design of the preparations, drugs in these preparations can release in vivo slowly, and drug plasma concentrations show less peak-valley fluctuation, thus they can avoid adverse effects caused by extra amount of drugs beyond the therapeutic range (therapeutic window) and maintain the effective concentration in the therapeutic

range. Sustained and controlled release preparations also include ocular, nasal, ear, vaginal, rectal, oral cavity or dental, transdermal or subdermal, intramuscular and subdermal implant preparations, which can lag the release and absorption of drugs and avoid the "first pass effect" of *portahepatic* system. Delayed release preparations are those which do not release drug rapidly after administration, such as intestinal-specific drug delivery systems or colon-specific drug delivery systems which can avoid deactivation in stomach or stimulation of drugs to stomach. Delayed release preparations also include pulsatile release systems which burst release their drugs under certain conditions. Release theories of sustained, controlled and delayed release preparations mainly include controlling dissolution, diffusion, *erosion* or a combination of dissolution and diffusion, sometimes also include osmotically controlled and ion-exchange mechanism. Releasing processes can be fitted using different equations,

such as first-order kinetic, Higuchi and zero-order kinetic equations, etc. The main difference between sustained release and controlled release is that sustained release preparations do not release their drugs at a steady rate, that is to say its release rate is not constant but declines with time; while the controlled release preparations release their drugs through zero-order kinetic pattern, of which the release rate maintains constant. Administration of these preparations results in a considerably steady plasma concentration of the drug with little peak-valley fluctuation, until almost completely absorbed. Usually the amount of drugs in sustained and controlled release preparations is larger than that in corresponding ordinary single dose preparations and they are prepared by more complex processes. In order to generate reliable therapeutic effects and reduce adverse effects caused by burst releasing, in the process of preparation design, pilot production and manufacturing, measures should be taken to avoid or reduce burst releasing. Drug release profile in vitro and performance in vivo must accord with clinical requests and be affected very little, if any, by physiological or food factors. On the other hand, in order to control the quality and ensure the safety and efficacy of the preparations, release profile testing in vitro must reflect the basic condition in vivo. While the following guidelines will focus on sustained, controlled and delayed release oral preparations, the principles may be applicable to other routes of drug administration.

Definition of sustained, controlled and delayed release preparations

1. *Sustained release preparations* They are a kind of preparations which slowly release drug or drugs at a non-steady rate in a stipulated medium, and the dosing frequency should be reduced to half of or less than that of the corresponding ordinary preparations, thus can improve the patient's compliance evidently.

2. *Controlled release preparations* They are a kind of preparations which slowly release drug or drugs at a steady or almost steady rate in a stipulated medium, and the dosing frequency should be reduced to half of or less than that of the corresponding ordinary preparations, the drug plasma concentration should be more steady than that of sustained release preparations, thus can improve the patient's compliance evidently.

3. *Delayed release preparations* They are a kind of preparations which do not release drugs rapidly after administration, including intestinal dissolution preparations, colon-specific preparations and pulsatile release preparations. Intestinal dissolution preparations are a kind of intestinal specific preparations which do not or almost do not release drugs in a certain acidic solution within a fixed duration, but can release drugs completely or almost completely in phosphate buffer solution pH 6.8. Colon-specific preparations are a kind of preparations which do not release drugs at the upper part of the gastrointestinal tract, but can release most or all of drugs in the colon. That is to say they can not or almost can not release the drugs in an acidic medium or a phosphate buffered solution of pH 6.8 within a fixed duration, but can release most or all of the drugs in a phosphate buffer solution pH 7.5-8.0. Pulsatile release preparations are a kind of preparations which do not release drugs rapidly after administration but can burst release once or several times under certain conditions (such as in body fluid for a period of time, certain pH value or the effect of some enzyme).

Drug release test in vitro

This test is conducted under the imitative condition of gastrointestinal environment in vivo (such as temperature, pH value of the medium and stirring speed, etc.) to

investigate the drug release rate of the preparations. And then finally, on the basis of the testing, to establish a rationalized release profile in vitro which can be used for supervision of the manufacturing process and quality control.

1. *Apparatus* Unless otherwise indicated, release test in vitro of sustained, controlled and delayed release preparations can be carried out with dissolution determination apparatuses.

Patches can be tested by release test methods (Appendix X D, method 3) and the results should comply with the requirements.

2. *Temperature control* The release test of sustained, controlled and delayed release preparations should be conducted at $37^{\circ}\text{C} \pm 0.5^{\circ}\text{C}$ approximating to the body temperature, but patches at $32^{\circ}\text{C} \pm 0.5^{\circ}\text{C}$ approximating to the temperature of epiderm.

3. *Release medium* Deaerative freshly prepared purified water is regarded as the preferable release medium; if substantiated by the solubility characteristic of the drug substance, the formulation or the absorption site, dilute hydrochloric acid (0.001 mol/L to 0.1 mol/L) or phosphate buffer solution pH 3 to 8 may be used; for some drugs with limited solubility use of organic solvents is not favored, but addition of a small amount of surfactants (such as sodium lauryl sulfate) is allowed.

The volume of the release medium should conform to the sink condition.

4. *Time points of sampling for release test* Except delayed release preparations, release profile test in vitro must reflect the characteristics of the variation of the release profile of the tested preparations and meet the needs of statistic analysis. The complete release time duration must not be less than the interval time of dosing frequency and the generated cumulative release rate should be more than 90%. Unless otherwise specified, usually the data of the whole releasing process are utilized to make a curve of cumulative release rate versus time, thus the rational release rates are worked out.

From the release rate curve at least three test time points are chosen to characterize the in vitro drug release profile for sustained release preparations. An early time point, usually 0.5-2 hours is chosen to show that the potential burst release is not happened. An intermediate time point is chosen to define the character in vitro release profile of the dosage form, and a final time point is chosen to convey essentially complete release of the drug. These three points can be used to convey the drug release profile in vitro as a whole.

For controlled release preparations two additional test time points should be added, these five points can be used to convey the drug release profile of controlled release preparations in vitro. The range of percentage of drug release amount should be smaller than that of sustained release preparations.

If necessary, more test time points can be added.

The test time points of delayed release preparations are chosen according to the clinical requirements.

For products containing more than a single active ingredient, every main active ingredient should be tested according to the above requirements.

5. *Test on reproducibility and uniformity of manufacturing process* Batch-to-batch reproducibility for the release profile in vitro of over three batches (6 tablets or pills each batch) should be examined. The uniformity for the release profile in vitro of the same batch product (6 tablets or pills each batch) should be examined.

6. *Model fitting for drug release* The data of drug release can be fitted using first-order equation and Higuchi equation:

$$\ln(1 - M_t/M_{\infty}) = -kt \text{ (first-order equation)}$$

$$M_t/M_{\infty} = kt^{1/2} \text{ (Higuchi equation)}$$

The data of drug release of controlled release preparations can be fitted using zero-order equation:

$$M_t/M_{\infty} = kt \text{ (zero-order equation)}$$

where M_t is the cumulative release amount at time t , M_{∞} is the cumulative release amount while time tends to ∞ , M_t/M_{∞} is the percentage of cumulative drug release amount at time t . The fitted results of the largest regression coefficient (r) and the smallest mean square error (MSE) are regarded to be the best.

Tests on sustained, controlled and delayed release preparations in vivo

In vivo pharmacodynamic and pharmacokinetic tests should be used to evaluate the safety and efficacy of sustained, controlled and delayed release preparations. First of all, the special physicochemical characters of the drugs in sustained, controlled and delayed release preparations should be studied completely, which include polymorphism, particle size and distribution, solubility, dissolution rate, stability and variables controlling the drug release under extreme conditions of physiological environment. Some physicochemical characters of drugs in preparations (such as solubility) may be affected by the prescription, so solubility of drug under related conditions should be tested. For the drugs with limited solubility, if any surfactant (such as sodium lauryl sulfate) is used in their prescription, it is necessary to understand their solubility.

For the pharmacokinetic characters of drug, the ordinary preparations of the drug (vascular or oral solution, or other approved preparation) are recommended as reference to recognize and evaluate the release and absorption of sustained, controlled and delayed release preparations. During the designing course of oral sustained, controlled and delayed release preparations, it is significant to test the drug absorption in each section of gastrointestinal tract (especially for absorption in colon section of colon-specific drug delivery system). Influence of food also should be considered.

The pharmacodynamic characters of drug should reflect the relationship in sufficiently extensive dosage range between the drug plasma concentration and clinical response (therapeutic effect or side effect). In addition, the characters of equilibrium time between drug plasma concentration and clinical response should be studied. If there is a well-defined relationship between the plasma concentration of drug or metabolite and clinical response, the clinical performance of sustained, controlled and delayed release preparations could be characterized by plasma concentration-time data, otherwise, clinical tests and pharmacokinetics-pharmacodynamics tests should be carried out.

Details of bioavailability and bioequivalence testing of sustained, controlled and delayed preparations can be seen in Appendix XIX B, under the guidelines on bioavailability in vivo and bioequivalence of preparations.

Stimulation and/or allergy at their action sites should be examined for non-oral sustained, controlled and delayed release preparations.

In vivo-in vitro correlations

Methods for establishment of in vivo-in vitro correlations

In vivo-in vitro correlations refers to the establishment of a rational quantitative relationship between a biological property produced by a dosage form, or the parameters (e.g. T_{max} , C_{max} or AUC) derived from the biological property, and the physicochemical property or characteristic (such as release profile in vitro) of the same dosage form.

For sustained, controlled and delayed release preparations,

a test on correlation between drug release in vitro and absorption in vivo should be carried out. It should reflect the relationship between the whole release curve in vivo and the whole plasma concentration-time curve which determines the correlation. Only when the correlation between release in vitro and absorption in vivo exists, the situation in vivo can be predicted by the release curve in vitro.

There are three situations involved in the in vitro-in vivo correlation: (1) Each corresponding time point on release in vitro curve and absorption in vivo curve (cumulated by drug plasma concentration data) is correlated, respectively. This is called the point-to-point correlation, showing that the two curves are coincident. (2) The correlation between the average release time in vitro and the average delay time in vivo is established by using statistical moment analysis principle. Because the average delay time of close values may be produced by many different curves in vivo, the average delay time in vivo cannot indicate the whole plasma concentration-time curve in vivo. (3) Single point correlation between a release time point ($t_{50\%}$, $t_{90\%}$ etc.) and a pharmacokinetic parameter (e.g. AUC, C_{max} or t_{max}) only indicates the partial correlation.

Methods adopted by these guidelines

These guidelines on the in vitro-in vivo correlation of sustained, controlled and delayed release preparations admit that, when each time point on the absorption curve of the absorbing phase in vivo and each corresponding time point on the release curve in vitro are regressed, if the correlation coefficient of the obtained linear regression equation meets the corresponding requirements, correlation can be concluded.

1. Establishment of in vitro-in vivo correlation

(1) Release curve in vitro of cumulative release percentage in vitro versus time If the release profile of sustained, controlled and delayed release preparations changes with external conditions, two types of samples should be made (one releases slower, the other faster than the original preparation). The external conditions affecting the release speed should be investigated first. Then, according to the optimal conditions based on the release test in vitro, the release curve in vitro of cumulative release percentage in vitro versus time can be drawn.

(2) Absorption curve in vivo of absorption percentage in vivo versus time The data of plasma concentration-time curve generated from the single dose crossover test, for the drug whose absorption in vivo fits with one-compartment model can be converted into absorption curve of absorption percentage in vivo versus time. The absorption percentage (F_a) in vivo of the drug at any time can be calculated by the following Wagner-Nelson equation:

$$F_a = (C_t + kAUC_{0-t}) / (kAUC_{0-\infty}) \times 100\%$$

where C_t is the plasma concentration at time t , k is the elimination rate constant.

The absorption percentage of each time point of drug with two-compartment model can be calculated by simplified Loo-Rigleman equation.

2. Examination of in vivo-in vitro correlation When the release of drug in vitro is the rate-determining step of the absorption process in vivo, the release percentage on the release curve in vitro and the absorption percentage of each corresponding time point on the absorption curve of the absorbing phase in vivo of the same batch samples are regressed by the method of linear least square regression principle, thus the linear regression equation can be obtained.

If the correlation coefficient of the line is larger than the critical correlation coefficient ($P < 0.001$), the in vivo-in vitro correlation is confirmed.

XX E Guidelines for Preparations of Microcapsules, Microspheres and Liposomes

Preparations of microcapsules, microspheres and liposomes are those made up of drugs and suitable excipients, which after microencapsulation, are used to produce various kinds of preparations for different uses and modes of administration to meet clinical requirements.

Transformation of drugs into microcapsules, microspheres and liposomes can cover their unpleasant smell and flavor, enhance stability, prevent them from deactivation in stomach or lessen their stimulation to stomach, facilitate transportation, application and storage by solidification of liquid drugs, reduce the incompatible changes in compound preparations and help the preparations achieve sustained, controlled and delayed release, for some of them, targeting release characteristics.

Microcapsules, microspheres and liposomes can be used as drug carriers, some of them with targeting characteristics are usually called targeted preparations. Targeted preparations can concentrate the drug in or near the targeted tissues and organs to increase the therapeutic effects and to significantly lessen their adverse drug reaction on other tissues, organs and the whole body.

The drug release mode of targeted preparations can be divided into three types: ① Targeted preparations of the first class are those which deliver the drug in the capillary vessel bed of the targeted organs; ② Targeted preparations of the second class are those which deliver the drug in specific cells (e.g. tumor cells) of the targeted area without effects on normal cells; ③ Targeted preparations of the third class are those which act on a certain area in the cell.

Types of drug carriers

1. **Microcapsules** Microcapsules are extra fine capsules produced by coating the solid or liquid drug with a thin layer of excipients. Usually their size ranges from 1 μm to 250 μm , while those whose size ranges from 0.1 μm to 1 μm are called sub-microcapsules, from 10 nm to 100 nm, called nanocapsules.

2. **Microspheres** Microspheres are extra fine spheres of solid entity in which drug is dispersed or dissolved in the excipients. Usually their size ranges from 1 μm to 250 μm , while those whose size ranges from 0.1 μm to 1 μm are called sub-microspheres, from 10 nm to 100 nm, called nanospheres.

3. **Liposomes** Liposomes are extra fine vesicles formed by entrapping drug in the molecular bilayers of lipid excipients. They are divided into unilamellar and multilamellar vesicles. Usually small unilamellar vesicles are 0.02-0.08 μm in size and large unilamellar vesicles 0.1-1 μm in size; multilamellar are 1-5 μm in size. Usually small unilamellar vesicles are called nano-liposomes.

Excipients in common use

Usually excipients can be divided into three types;

1. **Natural materials** Natural materials are bioconsistent and biodegradable, such as gelatin, protein, starch, chitosan, alginate, phospholipid and cholesterol, etc.

2. **Semisynthesized materials** They are divided into two types; biodegradable and unbiodegradable materials *in vivo*. The biodegradable materials include hydrosoybean phospholipid, polyethylene glycol distearic phospholipid,

ethanolamine, etc. Unbiodegradable materials include methylcellulose, ethylcellulose, carboxymethylcellulose salt, hydroxypropylmethyl cellulose, cellulose acetate phthalate, etc.

3. **Synthesized materials** They are divided into two types; biodegradable and unbiodegradable materials *in vivo*. The considerably widely used biodegradable materials include poly-lactic acid, poly-amino acid, poly-hydroxybuturate, poly-lactide-glycolide, etc. Unbiodegradable materials include polyamide, polyvinyl alcohol, Eudragin, and silicon rubber, etc.

In addition, wetters, emulsifiers, antioxidants or surfactants can be added for preparing microcapsules, microspheres and liposomes.

Testing items for controlling manufacturing processes and in storage periods

1. **Limit test of harmful organic solvents** When harmful solvents have been brought in the manufacturing processes, the residual solvent should be determined according to the Appendix VIII P of the Pharmacopoeia under *Determination of residual solvents*. If no limits have been stipulated, relevant ICH guidelines can be consulted, or a method for determining the solvent and the limit should be established.

2. Tests of shape, particle size and its distribution

(1) **Shape observation** Microcapsules, microspheres and liposomes can be observed under a microscope. If the particles size is less than 2 μm , scanning or transmission electron microscope should be utilized. Photos should be provided in any cases.

(2) **particle size and its distribution** The average value of particle size and the data or graphs of its distribution should be provided. There are several methods to determine the particle size, such as optical microscopy, electrical induction method, light induction method or laser scattering method, etc. A minimum of 500 particles must be measured, and a computer software or the following equation can be used to calculate the arithmetic average diameter (d_{av}):

$$d_{av} = \frac{\sum(nd)}{\sum n} = \frac{(n_1d_1 + n_2d_2 + \dots + n_nd_n)}{(n_1 + n_2 + \dots + n_n)}$$

where n_1, n_2, \dots, n_n are particle numbers with particle size of d_1, d_2, \dots, d_n respectively.

The data of particle size distribution of microcapsules, microspheres and liposomes are often expressed by the particle numbers or percentage in different particle size ranges; sometimes span is employed instead. The smaller the span, the narrower the distribution, i.e. the particles are more uniform in size.

$$Span = (D_{90} - D_{10}) / D_{50}$$

where D_{10}, D_{50}, D_{90} are diameters corresponding to the position of 10%, 50%, 90% in the accumulated distribution graph.

If graphs are necessary, the particle size of the data of the particle size distribution is plotted as abscissa against the frequency (the percentage of particle numbers in different size ranges in the total number of the particles) as the ordinate to produce the histogram of size distribution. The particle size distribution curve can be obtained by plotting the frequency of different particle size ranges against the mean values of different particle size ranges.

3. **Examination of drug content or entrapment rate** The data of drug content or entrapment rate must be provided for microcapsules, microspheres and liposomes.

Drug content is the percentage of drug by weight in the system (microcapsules, microspheres and liposomes):

$$\text{Drug content} = \frac{\text{drug wt. in the system}}{\text{total wt. of the system}} \times 100\%$$

where wt. is weight.

If microcapsules, microspheres and liposomes are dispersed in the liquid medium, determination should be performed after using proper separation methods (such as gel column chromatography, centrifugation or dialysis), then the following equation is used to calculate the entrapment rate:

$$\text{Entrapment rate} = \frac{\text{trapped drug wt. in the system}}{\text{total drug wt. in the system}} \times 100\%$$

$$= \frac{\text{total drug wt. in the system} - \text{untrapped drug wt. in the liquid medium}}{\text{total drug wt. in the system}} \times 100\%$$

Entrapment rate should not be less than 80%.

4. *Examination of burst effect or leakage rate* The conditions of drug trapped in microcapsules, microspheres, liposomes are commonly divided into adsorbed, entrapped or implanted. The drug adsorbed on the surface of microcapsules, microspheres and liposomes releases rapidly when tested in vitro, which is called burst effect. Released amount should be less than 40% in the first 0.5 h.

If the product of microcapsules, microspheres and liposomes are dispersed and stored in the liquid medium, the leakage rate should be calculated according to the following equation:

Leakage rate

$$= \frac{\text{drug amount leaked into the medium after a period of storage}}{\text{trapped drug amount before storage}} \times 100\%$$

5. *Examination of oxidation degree of liposomes* Phosphatide in liposomes may easily be oxidized, which is an important problem in liposomes. There are three stages for the oxidation of phosphatide in the lipid mixed with unsaturated fatty acid: the coupling of single double bond, the formation of oxidation products, and the formation of aldehyde and the rupture of bond. The oxidation degree is difficult to be evaluated by just one test, because the products formed in each stage are different. The oxidation index is used as indication in the Guidelines.

Determination of the oxidation index The phosphatide after oxidative coupling exhibits a maximum absorbance at about 230 nm, which is different from those inoxidables. When the lecithoid liposomes is examined, the oxidation index should be less than 0.2. The procedure is: dissolve the phosphatide in anhydrous ethanol to produce a clear solution with a certain concentration, measure the absorbances of the solution at 233 nm and 215 nm respectively. The oxidation index is calculated by the following equation:

$$\text{Oxidation index} = \frac{A_{233 \text{ nm}}}{A_{215 \text{ nm}}}$$

6. *Preparations of microcapsules, microspheres and liposomes should conform to the general requirements for the corresponding preparations* Besides the requirements of these guidelines, preparations of microcapsules, microspheres and liposomes should also conform to the stipulation of the general requirements for the corresponding preparations (such as tablets, capsules, injections, ophthalmic preparations, nasal preparations, patches, aerosols, etc). Sustained, controlled and delayed release preparations made from microcapsules, microspheres and liposomes should conform to the guidelines of sustained, controlled and delayed release preparations.

7. *Evaluation of targeted drug delivery systems* Targeting data should be provided for targeted drug delivery systems, such as drug distribution data *in vivo* and pharmacokinetic parameters of distribution *in vivo*.

XX F Guidelines for the Analysis of Impurities in Drugs

This appendix is the guideline on the analysis of impurities for the quality specifications of chemically synthesized or semi-synthesized organic drug substances and their preparations, and can be used for the drug research, production, and drafting or revising of quality specifications as reference.

Any substance that affects the purity of a drug is considered as an impurity. Impurities included in a drug specification may be introduced from production process, starting materials or excipients of the drug produced with specified process and materials officially approved by the competent drug regulatory authority. The impurities may be the degradation products arising in the storage period, which could be validated by stability testing. The new impurities caused by change of production process or materials, or from foreign substances adulterated or contaminated are not included in the impurities of the drug specification. Application for changing in production process or materials, and requesting for revision of the drug specification due to new impurities caused by the changing shall be submitted to the competent authority for approval according to law. Drugs shall not be adulterated or contaminated by foreign substances. Non-official methods may be adopted to monitor the counterfeit drugs on the basis of individual case when necessary.

The classification of impurities and their testing item titles in the drug specification

Impurities could be classified as organic impurities, inorganic impurities and organic volatile impurities according to their chemical category and characteristics. Impurities could be classified as related substances (including degradation products), other impurities, foreign substances, and so on according to their source. Impurities could be classified as other steroids, other alkaloids, geometric isomers, optical isomers, etc based upon the structural relationship. Impurities could be classified as toxic and ordinary impurities according to their toxicity. The ordinary impurities have no significant biological activity when limited amount of the impurities exists in drug. However, toxic impurities have significant undesirable biological activity. There are different ways for classifying impurities. The item title for an impurity test in a drug specification shall be normalized based on the requirements of the *Manual for Revising to National Drug Standards* published by the Commission of the Chinese Pharmacopoeia. The item title for organic impurity may be selected according to the following principles:

(1) Where the impurity is a known substance, the chemical name of the impurity can be used as the item title, such as "Morphine" in the monograph of Codeine Phosphate, "*p*-Chlorophenol" in the monograph of Clofibrate, "Piperidylpropionophenone" in the monograph of Benzhexol Hydrochloride, "Lincomycin B" in the monograph of Lincomycin Hydrochloride, and "Chymotrypsin" in the monograph of Trypsin. Where the chemical name of the impurity is too long to describe, and has no corresponding adopted abbreviation, such principle for the selection of item title may be used as "Mercapto compounds" in the monograph of Spironolactone, "Phenones" in the monograph of Adrenaline, and "Alkene" in the monograph of Difenidol Hydrochloride. The impurities with confirmed structure should be provided in the description of the draft of the

quality specification.

(2) Where the category of the impurity is known, but the impurity can not be justified to be a single substance, the item title of such impurity may be "other steroids", "other alkaloids", "other amino acids", "reducing sugars", "fatty acids", "primary aromatic amines", "chlorinated compounds", "residual solvents", or "related substance", and so on.

(3) For some unknown impurities, the selection of item title may be based upon the testing method, such as "light absorption of impurity", "oxidizable substances", "carbonisable substances", "non-volatile substances", "volatile impurities", and so on.

Selection of impurity testing items for quality specification

Study on impurities in new drug substances and new preparations shall be conducted in accord with the relevant requirements for registration application of new drugs in China. The study could also be performed by referring to the ICH guidelines Q3A or Q3B. The safety evaluation for impurities and degradation products should be made. Effective analytical method of separation shall be adopted by the new drug research institutions for determining actually present and potential impurities arising from synthesis, purification and storage. Characterization or structure confirmation shall be carried out for the impurity that its apparent level is 0.1% or above 0.1%, and for the toxic impurity or impurity with significant biological action that its apparent level is even less than 0.1%. The degradation products found in the stability testing (accelerate and long term testing) shall be studied according to the above requirements. Impurity testing items in the new drug specification should include the impurities and degradation products detected in the quality study and stability testing, and appeared in the batches produced in an industrial scale. The corresponding acceptance criteria shall be provided. Impurities controlled in the drug substance specification will generally not be controlled in its preparation specification except degradation products and toxic impurities. Inorganic impurity testing items for drug substances and preparations shall be selected according to the manufacturing process and starting materials. Testing items for toxic inorganic impurities shall be established for the drug specification.

Where the impurity profile found in the study or production of a generic drug is different from that of the innovated one or from the existing official standard, the new impurities shall be studied according to the above requirements, and an application for revising to the original specification or establishing a new specification shall be submitted to the relevant drug regulatory authority for review and approval.

The concomitant isomers and the antibiotics multi-components are generally not the testing items of impurities. For concomitants, their proportion may be specified in the specification to ensure the consistency of drug substances used for production and those for registration application. The toxic concomitants will be considered as impurities instead of concomitants. Where the drug is a single enantiomer, other co-existent enantiomers shall be impurities. Where there is an official standard for a single enantiomer drug, the testing item of optical rotation should be set for the specification of the corresponding racemic drug.

Testing items for organic volatile impurities may be established according to the organic solvents used in the production process and the residual amount. The pharmacopoeia requirement for testing organic volatile impurities or the ICH document Q3C may be used as reference. The testing items for the residual toxic solvents shall be established.

Analytical methods for impurity testing and acceptance criteria of impurity

The analytical methods for impurity testing should be specific

and sensitive. Modern analytical methods for separation should be used for impurity testing. The substance to be examined should be well resolved with impurities and degradation products. The limit of detection should meet the requirement for the limit tests. For the impurities to be quantified, the limit of quantification should meet the corresponding requirement.

The analytical methods for impurity testing should be validated according to the requirements of the Chinese Pharmacopoeia. Several different methods or conditions for separation and determination may be adopted in the research stage, results obtained should be compared to select a suitable method as the compendium method. The suitability of an established method should be considered, equipments and materials selected should be available. The special materials used for the testing should be specified in the specification when necessary. In the research stage for the analysis of impurity, testing solutions can be prepared for chromatographic determination using the possible impurities and products from forced degradation, or by adding such impurities into the substance to be examined. Suitability requirements should be established by necessary adjustment of chromatographic parameters to ensure the method to be specific and sensitive.

Impurities and degradation products of a new drug developed, and new impurities or new degradation products found in the generic drugs should be prepared by isolation and purification, or by synthesis for the safety evaluation and quality study. When the impurities or degradation products could not be obtained, reason should be provided in the application dossier submitted, and in the description of the draft of the quality specification by the research institution.

Where modern chromatographic method is used for the separation of impurities, the known impurities and toxic impurities may be identified using impurity reference substances. Relative retention values can be used for the identification when the reference substances are not available. Impurities can be studied with different wavelengths using multi-wavelength detector, relative response factors of known and/or toxic impurities at a fixed wavelength to the substance to be examined should be calculated. Where the relative response factor is in the range of 0.9-1.1, content of impurity can be calculated using the response factor of the reference standard of the substance to be examined. Where the relative response factor exceeds the range of 0.9-1.1, it is suitable to use impurity reference standard to calculate the content, or the result be calculated by correction with a validated relative response factor. The unknown impurities could be quantified by comparison with the reference standard of the substance to be tested. The method of quantitative calculation for impurities should clearly be described in the drug specification. In general, The acceptance criteria of each single impurity and total impurities should be specified in the quality specification.

Where the thin-layer chromatography is used for impurity analysis, semi-quantitative estimation for impurity spots may be conducted by comparison with multi-level reference solutions of the impurity reference substance or the substance to be examined. The number and acceptance criteria for impurities should be specified in the quality specification.

The result of impurity limit test obtained by using chromatography may be influenced by the chromatographic parameters, relevant operation precautions should be provided in the description of the draft of the specification. For critical parameters the adjustments should be defined clearly in the specification to ensure the system suitability when necessary.

Several factors should be considered for establishing the acceptance criteria of impurities, such as the toxicology study of the impurity or the substance containing limited

quantity of the impurity, the route of administration, daily dose, patient population, possible pharmacology research on the impurity, the acceptability of the cost for the manufacturers to produce safe and high quality drugs and acceptability of the drug price for the consumers. Strict limits for toxic impurities or toxic residual organic solvents should be specified in the drug quality specification. The limit of residual solvent may be established according to the requirements of relevant Appendix of the Pharmacopoeia or relevant ICH documents.

XX G Guidance for the Quality Control of Positron Emission Tomographic Radiopharmaceutical Preparation

Positron emission tomographic (PET) radiopharmaceutical preparations refer to radiopharmaceuticals containing positron-emitting radionuclides. They are generally prepared at the time of clinical use by medical institutions or radiopharmaceutical manufacturers. There are two main sources of positron-emitting radionuclides: cyclotron produced and generator produced. The guidance is only suitable for the quality control of the PET radiopharmaceutical preparations produced through cyclotron. The quality control of PET radiopharmaceutical preparations produced through generator should refer to Guidance for the Quality Control of Technetium [^{99m}Tc] Radiopharmaceutical Preparations.

In order to assure the safety and efficacy of PET radiopharmaceutical preparation administration, quality control tests must be carried out according to the corresponding national standard for each batch of PET radiopharmaceutical preparation produced. If there is no national standard for a PET radiopharmaceutical preparation, the acceptance criteria should be established by the manufacturer, but such an acceptance criteria must be validated by the National Institute for the Control of Pharmaceuticals and Biological Products before its practical use.

The characteristics of preparation and quality control of PET radiopharmaceutical preparations:

1. Because of a very short physical half-life of the positron-emitting radionuclide, the preparation of PET radiopharmaceutical preparations must be rapid. Automated radiochemical synthesis devices are usually used to protect personnel involved from excessive radiation exposure.

2. PET radiopharmaceutical preparations are generally prepared locally, typically at sites located within, or affiliated with, medical institutions at the time of use. With a relatively longer half-life of fluorine [^{18}F], fluorine [^{18}F] PET radiopharmaceuticals can be prepared and supplied by other qualified medical institutions or radiopharmaceutical manufacturers nearby.

3. With the exception of fluorine [^{18}F] PET radiopharmaceutical preparations, each batch of PET radiopharmaceutical preparation generally leads to only a single or several doses administration.

4. Quality control tests must be rapid and practical.

Being subject to the characteristics of preparation and quality control of PET radiopharmaceutical preparations described above, it is impossible to carry out all quality control tests for every batch of PET radiopharmaceutical preparation before administration. According to the Drug Administration Law and the Regulations for the Administration of Radiopharmaceutical Preparation, this guidance is drawn up to guarantee the quality of PET radiopharmaceutical preparations, assure the safety and the efficacy of PET radiopharmaceutical preparation administration, and standardize the quality control for

PET radiopharmaceutical preparations.

1. For PET radiopharmaceutical preparations labelled with a nuclide having a physical half-life longer than 20.0 minutes (such as fluorine [^{18}F] PET radiopharmaceutical preparations), the following quality control tests should be performed on each batch prior to release or administration:

- (1) Description
- (2) pH value
- (3) Radiochemical purity
- (4) Radioactivity or radioactive concentration

Other quality control tests can be performed retrospectively after release or administration (retrospective quality control tests).

2. For PET radiopharmaceutical preparations labelled with a nuclide of a physical half-life equal to or shorter than 20.0 minutes (such as carbon [^{11}C], nitrogen [^{13}N] and oxygen [^{15}O] PET radiopharmaceutical preparations), a batch is defined as all related preparations (i.e., sub-batches) of the PET radiopharmaceutical preparation prepared under the same condition during a given day. The following quality control tests should be performed on an initial sub-batch from such PET radiopharmaceutical preparations prior to preparation of subsequent sub-batches:

- (1) Description
- (2) pH value
- (3) Radiochemical purity
- (4) Radioactivity or radioactive concentration

Other quality control tests can be performed retrospectively.

3. Retrospective quality control tests

If all the quality control test results of the PET radiopharmaceutical preparations prepared under the same compounding procedure (at least 6 consecutive batches) consistently conform to the established minimal acceptance criteria, the retrospective quality control tests can be performed at a defined periodic interval, but all quality control tests must be performed on a batch of PET radiopharmaceutical preparation at a minimum of once a month.

4. Quality control tests results

Accept or reject the individual batch of the PET pharmaceutical based on the conformity of quality control test results with established minimal acceptance criteria. If a batch of PET radiopharmaceutical preparation does not meet the established minimal acceptance criteria, its release or administration must be stopped immediately, and the subsequent preparation must be stopped too. The preparation of PET radiopharmaceutical preparations for human use can begin again only after having investigated what resulted in the unacceptable quality control test results, having solved the problem, and three consecutive validation studies that meet minimum acceptance criteria having been performed. If the unacceptable PET radiopharmaceutical preparation had been used clinically, it is necessary to observe the related patients carefully and follow them periodically, and take appropriate measures if necessarily. The manufacturer or medical institution that prepared the unacceptable PET radiopharmaceutical preparation should submit a report immediately to the local drug administration bureau and health bureau in case serious adverse reaction has occurred.

5. Quality assurance

(1) A PET radiopharmaceutical manufacturer or medical institution should have adequate facilities, instruments and equipment adaptable to the scale of PET radiopharmaceutical preparation and quality control. The instruments and equipment should be calibrated periodically to ensure the correct performance. Written operation and calibration procedures for the instruments and equipment should be established. Each use, calibration and maintenance should be documented.

(2) A PET radiopharmaceutical manufacturer or medical

institution should have an adequate number of corresponding technical personnel with the appropriate education and training. Each person performing an activity or a function in the quality control of PET radiopharmaceutical preparations should be trained in quality control of radiopharmaceutical preparations by the National Institute for the Control of Pharmaceuticals and Biological Products or other institutions authorized by State Food and Drug Administration.

(3) The standard operation procedures for preparation and quality control of PET radiopharmaceutical preparations should be established and performed strictly. The preparation and quality control of PET radiopharmaceutical preparations should be documented, and the documents should be maintained at least one year.

(4) Drug substances, materials and reagents used for the preparation and quality control of PET radiopharmaceutical preparations must be in compliance with established written specifications. Regulation procedures for the order, storage, testing and use of these materials should be established.

(5) To ensure the stability of the preparation process of PET radiopharmaceutical preparations, the computer and related automated equipment for preparation of PET radiopharmaceutical preparations must be controlled appropriately to ensure that changes in compounding software are instituted only by authorized personnel, that such changes are documented and verified.

(6) The standard operation procedures and computer software program that control the preparation process should be validated periodically, at a minimum of once a year. Whenever there is a change in the compounding procedures or computer software program that has the potential to alter the identity, quality, or purity of the PET radiopharmaceutical preparation, revalidation must be performed. Verification studies on a minimum of three consecutive batches, which show that the final product meets the acceptance criteria, are to be performed prior to the approval, for human use, of the revised standard operation procedures or computer software program for a given PET radiopharmaceutical preparation.

(7) The cleaning room or the aseptic workstation should be validated periodically to ensure proper performance.

(8) Each PET radiopharmaceutical preparation prepared by a medical institution can not be used clinically until the quality control testing of three consecutive batches of PET radiopharmaceutical preparations have been performed by the National Institute for the Pharmaceuticals and Biologic Products or other institutions authorized by State Food and Drug Administration, and the quality control tests results meet the acceptance criteria.

XX H Guidance for the Quality Control of Technetium [^{99m}Tc] Radiopharmaceutical Preparations

Technetium [^{99m}Tc] radiopharmaceutical preparations refer to radiopharmaceuticals containing technetium [^{99m}Tc] radionuclide for clinical diagnostic use, which include Sodium Pertechnetate [^{99m}Tc] Injection eluted from ^{99}Mo - ^{99m}Tc generators and other radiopharmaceutical preparations prepared with Sodium Pertechnetate [^{99m}Tc] Injection and corresponding freeze-dried cold kits.

Technetium [^{99m}Tc] radiopharmaceutical preparations are generally prepared through reconstituting ready-to-use freeze-dried cold kits with Sodium Pertechnetate [^{99m}Tc] Injection under aseptic condition by instant-labeling radiopharmaceutical manufacturers (radiopharmacy) or medical institutions that have the third or higher class license for Radiopharmaceutical Use.

As the preparation of technetium [^{99m}Tc] radiopharmaceutical preparations involves complicated chemical reactions between technetium-99m and non-radioactive compound, quality control tests for final products must be performed in addition that Sodium Pertechnetate [^{99m}Tc] Injection and the ready-to-use freeze-dried cold kits must meet corresponding acceptance criteria. Because the half-life of technetium [^{99m}Tc] is only 6.02 hour, technetium [^{99m}Tc] radiopharmaceutical preparations must be administered within minutes to several hours after preparation. It is impossible for a technetium [^{99m}Tc] radiopharmaceutical preparation to have completed all quality control tests before its release or administration. Technetium [^{99m}Tc] radiopharmaceutical preparations can be released and administered while quality control tests are being performed pursuant to article 16 of the Regulations for the Administration of Radiopharmaceutical Preparation. As one batch of technetium [^{99m}Tc] radiopharmaceutical preparation generally leads to only a single or several doses administration, the volume of which is usually only several milliliters, it is impracticable to perform all quality control tests for each batch of technetium [^{99m}Tc] radiopharmaceutical preparation.

Considering the above mentioned specialty of technetium [^{99m}Tc] radiopharmaceutical preparations, according to the Drug Administration Law and the Regulations for the Administration of Radiopharmaceutical Preparation, this guidance is drawn up to guarantee the quality of technetium [^{99m}Tc] radiopharmaceutical preparations and to assure the safety and the efficacy of technetium [^{99m}Tc] radiopharmaceutical preparation administration. The guidance is suitable for quality control of technetium [^{99m}Tc] radiopharmaceutical preparations prepared by instant-labeling radiopharmaceutical manufacturers (radiopharmacy) or medical institutions that have the third or higher class license for Radiopharmaceutical Use.

1. The obligatory quality control tests performed prior to release or administration

(1) Description

Visually examined through lead glass, physical appearance of a technetium [^{99m}Tc] radiopharmaceutical preparation should not significantly differ from the description described in the monograph. As for a clear colourless solution technetium [^{99m}Tc] radiopharmaceutical preparation, if particles, appearance of turbidity or a change in colour are observed, it must not be released or administered.

(2) pH value

The pH value of a technetium [^{99m}Tc] radiopharmaceutical preparation can be determined with a calibrated precise pH test paper, and must be in the defined range as described in the monograph.

(3) Radiochemical purity

Radiochemical purity should be determined according to the method described in the corresponding official monographs or other acceptance criteria. In case it takes long time to carry out the methods described in the official monographs, instant-labeling radiopharmaceutical manufacturers (radiopharmacy) or medical institutions can establish their own instant methods validated. The validation must be performed on at least three batches of technetium [^{99m}Tc] radiopharmaceutical preparations at three different periods (at time immediately after preparation, middle, and at the point of expiration time). The requirement described in the method established by instant-labeling radiopharmaceutical manufacturers (radiopharmacy) or medical institutions can't be lower than that described in the official monograph. For routine use, the method should be revalidated periodically, at a minimum of once a year, to ensure its applicability.

(4) Radioactivity

Radioactivity should be measured according to the Test of Radiopharmaceutical Preparations (Appendix XIII).

(5) Particle Size

For a technetium [^{99m}Tc] radiopharmaceutical preparation, particle size distribution is described in the monograph it should be tested according to Test for particle size distribution under the Test of Radiopharmaceutical Preparations (Appendix XIII) prior to release or administration and complied with the requirements

2. The quality control tests that can be performed while or after release or administration

(1) Bacterial endotoxin

Carry out the bacterial endotoxins test of a technetium [^{99m}Tc] radiopharmaceutical preparation as described under the corresponding monograph or the Test for Bacterial Endotoxin (Appendix XI E), the result should meet the minimal acceptance criteria.

(2) Sterility

Complies with the Test for Sterility (Appendix XI H).

(3) Biodistribution

For a technetium [^{99m}Tc] radiopharmaceutical preparation, test for biodistribution is described in the monograph, the test for biodistribution should be performed as described under corresponding monograph. The experiment animals should meet relevant regulations.

(4) If the result of any quality control tests described above does not meet the minimal acceptance criteria, its release, administration and related preparation should be stopped immediately, and make investigation to find the reasons. If the unacceptable technetium [^{99m}Tc] radiopharmaceutical preparation has been used clinically, it is necessary to observe the related patients carefully and visit them periodically, and take appropriate measures if necessarily. The manufacturer or medical institution that prepared the unacceptable technetium [^{99m}Tc] radiopharmaceutical preparation should submit a report immediately to the local drug administration bureau and health bureau.

(5) If all results of the quality control tests described above for technetium [^{99m}Tc] radiopharmaceutical preparations prepared under the same compounding procedure (at least 6 consecutive batches) consistently conform to the established minimal acceptance criteria, the test for bacterial endotoxins, sterility and biodistribution can be performed at a defined periodic interval, which depends on the quality control testing results.

3. Corresponding quality assurance

(1) A technetium [^{99m}Tc] radiopharmaceutical manufacturer (radiopharmacy) or medical institution should have adequate facilities, instruments and equipment adaptable to the scale of technetium [^{99m}Tc] radiopharmaceutical preparation and quality control. The instruments and equipment should be calibrated periodically to ensure the proper performance. Written operation and calibration procedures for the instruments and equipment should be established. Each use, calibration and maintenance should be documented.

(2) A technetium [^{99m}Tc] radiopharmaceutical manufacturer (radiopharmacy) or medical institution should have an adequate number of corresponding technical personnel with the appropriate education and training. Each person performing an activity or a function in the quality control of technetium [^{99m}Tc] radiopharmaceutical preparations should be trained in quality control of radiopharmaceuticals by the National Institute for the Control of Pharmaceuticals and Biological Products or other institutions authorized by State Food and Drug Administration.

(3) The standard operation procedures for preparation and quality control of technetium [^{99m}Tc] radiopharmaceutical preparations should be established and performed strictly. The preparation and quality control of technetium [^{99m}Tc] radiopharmaceutical preparations should be documented, and the documents should be maintained at least one year.

(4) Drug substances, materials and reagents used for the

preparation and quality control of technetium [^{99m}Tc] radiopharmaceutical preparations must be in compliance with established written specifications. Regulation procedures for the order, storage, testing and use of these materials should be established.

(5) The cleaning room or the aseptic workstation should be validated periodically to ensure its proper performance.

(6) For a technetium [^{99m}Tc] radiopharmaceutical manufacturer (radiopharmacy), all quality control tests for the first batch of Sodium Pertechnetate [^{99m}Tc] Injection eluted from newly purchased ^{99}Mo - ^{99m}Tc generators should be carried out before subsequent batches of Sodium Pertechnetate [^{99m}Tc] Injection eluted from the ^{99}Mo - ^{99m}Tc generators to prepare other technetium [^{99m}Tc] radiopharmaceutical preparations (measurement of molybdenum [^{99}Mo] content is only required for radionuclidic purity test). If all bacterial endotoxin and sterility tests of Sodium Pertechnetate [^{99m}Tc] Injections eluted from many batches of ^{99}Mo - ^{99m}Tc generator (at least 6 consecutive batches produced by the same manufacturer) meet the minimal acceptance criteria, tests for bacterial endotoxin and sterility of Sodium Pertechnetate [^{99m}Tc] Injections eluted from ^{99}Mo - ^{99m}Tc generators produced by the manufacturer can be performed periodically. But complete quality control tests for Sodium Pertechnetate [^{99m}Tc] Injection must be carried out at least once a month. Complete quality control tests for the first batch of technetium [^{99m}Tc] radiopharmaceutical preparation should be carried out when the batch of ready-to-use freeze-dried cold kit changes.

XX J Guidelines for Hygroscopicity

Hygroscopicity characterize the capability of drugs absorbing moisture at certain temperature and humidity. It is underlined that this method has been accepted as only an indication of hygroscopicity, and should be carried out on material which complies with the test for loss on drying or water content of the monograph of the Chinese pharmacopoeia. This method can also be used as a reference for choosing suitable package and store conditions of the drugs.

Determine as follow:

1. Use a glass weighing vessel 50 mm in external diameter and 15 mm high. Weigh the vessel and stopper (m_1). Place the amount of substance prescribed for the test for loss on drying or water in the vessel and weigh (m_2).
2. Place the unstoppered vessel in a desiccator at 25°C containing a saturated solution of ammonium chloride or ammonium sulphate or place it in a climatic cabinet set at 25±1°C and 80±2% relative humidity.
3. Allow to stand for 24 hours.
4. Stopper the weighing vessel and weigh (m_3).

Calculate the percentage increase in mass using the expression:

$$\frac{m_3 - m_2}{m_2 - m_1} \times 100\%$$

5. The result is interpreted as follows:

very hygroscopic: increase in mass is equal to or greater than 15%

hygroscopic: increase in mass is less than 15% and equal to or greater than 2%

slightly hygroscopic: increase in mass is less than 2% and equal to or greater than 0.2%

deliquescent: sufficient water is absorbed to form a liquid

XX K Guideline for Near-infrared(NIR) Spectrophotometry

Near-infrared (NIR) spectrophotometry is an analysis technique used in qualitative and quantitative analysis in which the specified spectrum of the substance being examined is measured among Near-infrared region (from about 780 nm to about 2500 nm or from about 12800 cm^{-1} to about 4000 cm^{-1}) and the correlation information is extracted by suitable chemometric algorithms. NIR spectra are dominated by C-H, N-H, O-H and S-H overtone resonances and combinations of fundamental vibrational modes. NIR bands are much weaker than the fundamental mid-IR vibrations from which they originate. NIR bands are always overlapping. Direct comparison of the spectrum obtained with the substance being examined with a reference spectrum of a chemical reference substance, as used in infrared absorption spectrophotometry, is not appropriate. Suitable validated mathematical treatment of the data is required.

Application range

Near-infrared spectrophotometry is advantageous because quick and accurate measurement can be often made without destroying the sample. Near-infrared spectrophotometry is a method that can test both off-line sample and on-line process sample. NIR spectrophotometry has a wide variety of applications for both chemical and physical analysis of pharmaceutical.

1. Chemical analysis

(1) Qualitative analysis

Identification of active substances, excipients, dosage forms, manufacturing intermediates, chemical raw materials and packaging materials.

(2) Quantitative analysis

Quantification of active substances and excipients, determination of chemical values such as hydroxyl value, iodine value, acid value, determination of water content, determination of degree of hydroxylation, control of solvent content.

(3) Process control.

2. Physical analysis

(1) Crystalline form and crystallinity, polymorphism, pseudopolymorphism, particle size.

(2) Examination of film properties.

(3) Process control, for example monitoring of blending and granulation.

Apparatus and control of instrument performance

1. Apparatus

NIR spectrophotometers are used for recording spectra in the region of about 780 nm to about 2500 nm (about 12800 cm^{-1} to about 4000 cm^{-1}). All NIR measurements are based on passing light through or into a sample and measuring the attenuation of the emerging beam. Spectrophotometers for measurement in the NIR region consist of a suitable light source, sampling device, a monochromator or interferometer, detector and suitable data processing and evaluation system. High intensity light sources such as tungsten lamp with shell of quartz or similar are used usually. The tungsten lamp light source can be highly stabilized. Silicon, lead sulphide, indium arsenide, indium gallium arsenide, mercury cadmium telluride (MCT) and deuterated triglycine sulphate are commonly used detector materials. Conventional cuvette sample holders, fibre-optic probes, transmission dip cells and spinning or traversing sample holders are a few common

sampling devices. The selection of detector and sampling device are based on the intended application, paying particular attention to the suitability of the sampling system for the type of sample to be analysed.

2. Control of instrument performance

(1) Verification of the wavelength scale

Verify the wavelength scale employed, generally in the region between about 780 nm to about 2500 nm (about 12800 cm^{-1} to about 4000 cm^{-1}) or in the intended spectral range using one or more suitable wavelength standards which have characteristic maxima or minima within the range of wavelengths to be used, for example, a mixture of rare-earth oxides such as dysprosium, holmium and erbium oxides. Measure the position of at least 3 peaks distributed over the range used. Acceptable tolerances are ± 1 nm at 1200 nm, ± 1 nm at 1600 nm and ± 1.5 nm at 2000 nm (± 8 cm^{-1} at 8300 cm^{-1} , ± 4 cm^{-1} at 6250 cm^{-1} and ± 4 cm^{-1} at 5000 cm^{-1}).

(2) Verification of photometric linearity

Verification of photometric linearity is demonstrated with a set of transmission or reflection standards with known values of transmittance or reflectance in percentage. Stability of the instrument is demonstrated with standards.

(3) Verification of photometric noise.

Determine the photometric noise using a suitable reflectance standard and/or two transmittance standards that one with high absorbance property is used at high-light flux to evaluate the instrument noise and the other one with low absorbance property is used at low-light flux to evaluate the instrument noise. When suitable standard can not be getting, the noise can be measured using 100 per cent of absorbance line. Scan the reflection standard over a suitable wavelength/wavenumber range in accordance with the manufacturer's recommendation and calculate the photometric noise as peak-to-peak noise. The photometric noise is consistent with the specification of the spectrophotometer.

Measurement methods

1. Transmission mode Transmittance (T) is a measure of the decrease in radiation intensity at given wavelengths when radiation is passed through the sample. The sample is placed in the optical beam between the source and detector. This method is suitable for liquid sample usually. Suitable sampling device is necessary for solid sample by this method. Another Transmission mode is transreflection mode. The detector and light source are on the same side of the sample. In the measurement of transreflection a mirror or a diffuse reflectance surface is used to reflect the radiation transmitted through the sample a second time. The result can be presented directly in terms of transmittance (T) or/and absorbance (A) in both cases.

$$T = I/I_0$$

$$A = -\lg T = \lg (1/T) = \lg (I_0/I)$$

Where, I_0 = intensity of incident radiation,
 I = intensity of transmitted radiation.

2. Diffuse reflection mode The diffuse reflection mode gives a measure of reflectance (R), the ratio of intensity of light reflected from the sample (I) to that reflected from a background or reference reflective surface (I_r). This method is suitable for solid sample usually. The sample is placed in a suitable sampling device. NIR radiation can penetrate a substantial distance into the sample, where it can be absorbed by vibrational combinations and overtone resonances of the analyte species present in the sample. Non-absorbed radiation is reflected back from the sample to the detector. A typical NIR reflectance spectra are obtained by calculating and plotting $\lg (1/R)$ versus the wavelength or wavenumbers.

$$R = I/I_r$$

$$A_R = \lg (1/R) = \lg (I_r/I)$$

Where, I = intensity of light diffusively reflected from the sample,

I_r = intensity of light reflected from the background or reference reflective surface.

Factors affect NIR spectral response

The main factors affect the NIR spectral response are sample temperature, moisture and solvent residues, sample thickness, sample optical properties, polymorphism and age of samples.

Basic requirement of qualitative analysis and quantitative analysis by Near-infrared (NIR) spectrophotometry

1. Qualitative analysis

Establish a spectral reference library first. Then pre-treat data and evaluate data. Validate the specificity and robustness of the database finally.

(1) Establishment of a spectral reference library.

Record the spectra of a suitable number of batches of the substance which have been fully tested according to established specifications and which exhibit the variation typical for the substance to be analysed (for example, manufacturer, physical form, particle size). The set of spectra represents the information for identification and characterization that defines the similarity border for that substance and is the entry for that substance in the spectral library used to identify the substance.

(2) Pre-treatment of data.

In many cases, some form of mathematical pretreatment of the spectrum must be performed prior to the development of a classification or calibration model. Typical methods are multiplicative scatter correction (MSC), the Kubelka-Munk transforms, spectral compression techniques that may include windowing and noise reduction and the numerical calculation of the first- or second-order derivative of the spectrum. In some cases spectra may also be normalized. Caution must be exercised when performing any mathematical transformation, as artefacts can be introduced or essential information can be lost. In all cases the rationale for the use of transform must be documented.

(3) Data evaluation.

Direct comparison of the spectrum of the substance being examined is made with the individual or mean reference spectra in the database on the basis of their mathematical correlation or other suitable algorithms. There are several different algorithms based on principal component analysis (PCA) combined with cluster analysis, SIMCA (soft independent modeling by class analogy), and others used in the software of NIR instruments.

(4) Validation of the database

a. Specificity

The validation of specificity involves of the classification using database spectra for positive identification of a given material and adequate discrimination against other materials in the database is to be established during the validation procedure. Potential challenges must be addressed to the spectral database. These can be materials received on site that are similar to database members in chemical structure. This challenge must fail identification. Independent samples of materials represented in the database, but not used to create it (i.e. different batches, blends) must give positive identification when analysed.

b. Robustness

The robustness of the qualitative procedure must also be

challenged to test the effect of minor changes to normal operating conditions on the analysis. There must be no changes to pre-processing and calibration algorithm parameters. Typical challenges are:

① Effect of differences across operators on variations in environmental conditions (for example, temperature and humidity in the laboratory).

② Effect of sample temperature, sample positioning on the optical window, probe depth and compression/packing of material.

③ Replacement of instrument parts or sampling presentation devices.

2. Quantitative analysis

Establish a spectral reference library for a calibration model first. Then pre-treat data. Validate the analytical procedures finally.

(1) Establishment of a spectral reference library for a calibration model.

Record spectra of a suitable number of samples with known values of the content throughout the range to be measured. Establish the calibration model to relate the response from an instrument to the properties of the samples. Any calibration algorithm that can be clearly defined in an exact mathematical expression and gives suitable results can be used. Multiple linear regression (MLR), partial least squares (PLS) and principal component regression (PCR) are commonly used.

(2) Pre-treatment of data.

Data pre-treatment can be defined as the mathematical transformation of the NIR spectral data to enhance spectral features and/or remove or reduce unwanted sources of variation prior to the development of the calibration model. The selection of suitable algorithms and pre-treatment calibration is based on the suitability for the intended use.

(3) Validation parameters.

Analytical performance characteristics to be considered for demonstrating the validation of NIR methods are similar to those required for any analytical procedure. Specific acceptance criteria for each validation parameter must be consistent with the intended use of the method. The validation parameters include specificity, linearity, range, accuracy, precision, robustness and outliers.

Ongoing model evaluation

Revalidation of a qualitative model will be necessary when changes in the physical properties of the material occur and when changes in the source of supply take place. Revalidation of a quantitative model is required on account of changes in the composition of the finished product, in the manufacturing process and in sources/grades of raw materials.

Transfer of databases

When databases are transferred to another instrument, type of the instrument, format of the data, spectral range, number of data points, spectral resolution and other parameters have to be taken into consideration. For example, when to establish a model on one instrument by representative samples the number of which is decided by the model, measure the spectra of these samples on another instrument. The spectra on both instruments are analysed by the model established on the first instrument. Two results must be tested statistically to demonstrate that the model is valid on the second instrument or not, otherwise model must be rebuilt on the second instrument.

Sodium Dihydrogen Phosphate 763
Sodium Dimercaptosuccinate 763
Sodium Dimercaptosuccinate for Injection 764
Sodium Etacrylate 764
Sodium Etacrylate for Injection 764
Sodium Ferulate 765
Sodium Ferulate for Injection 765
Sodium Ferulate Tablets 766
Sodium Glutamate 766
Sodium Glutamate Injection 767
Sodium Glycerophosphate 767
Sodium Glycerophosphate Injection 767
Sodium Hydroxide 936
Sodium Hydroxybutyrate 768
Sodium Hydroxybutyrate Injection 769
Sodium Iodide 769
Sodium Iodide [¹³¹I] Capsules 769
Sodium Iodide [¹³¹I] Oral Solution 770
Sodium Iodohippurate [¹³¹I] Injection 770
Sodium Lactate Injection 770
Sodium Lactate Ringer's Injection 771
Sodium Lactate Solution 771
Sodium Lauryl Sulfate 936
Sodium Morrhuate Injection 773
Sodium Nitrite 773
Sodium Nitroprusside 774
Sodium Nitroprusside for Injection 774
Sodium Pertechnetate [^{99m}Tc] Injection 775
Sodium Phosphate [³²P] Injection 775
Sodium Phosphate [³²P] Oral Solution 776
Sodium Phytate and Stannous Chloride for Injection 776
Sodium Prasterone Sulfate 777
Sodium Prasterone Sulfate for Injection 777
Sodium Pyrophosphate and Stannous Chloride for Injection 778
Sodium Pyrosulfite 937
Sodium Stibogluconate 778
Sodium Stibogluconate Injection 779
Sodium Thiosulfate 779
Sodium Thiosulfate Injection 780
Sodium Valproate 780
Sodium Valproate Tablets 781
Soft Soap 781
Sorbic Acid 937
Sorbitol 781
Sorbitol Injection 782
Soybean Oil 937
Soybean Oil for Injection 782
Sparfloxacin 783
Sparfloxacin Capsules 784
Sparfloxacin Tablets 784
Spectinomycin Hydrochloride 785
Spectinomycin Hydrochloride for Injection 785
Spectrophotometry A-27
Spironolactone 786
Spironolactone Capsules 786
Spironolactone Tablets 787
Stanozolol 787
Stanozolol Tablets 788
Starch 938
Statistical Methods for Biological Assays A-141
Stearic Acid 939
Sterile Water for Injection 897
Steviosin 939
Streptomycin Sulfate 788
Streptomycin Sulfate for Injection 789
Strong Ammonia Solution (Concentrated Ammonia Solution) 939
Strong Glutaral Solution 395
Strong Hydrogen Peroxide Solution 423
Strophanthin K 789
Strophanthin K Injection 790
Strychnine Nitrate 790
Strychnine Nitrate Injection 790
Sublimed Sulfur 791
Sucralfate 791
Sucralfate Capsules 792
Sucralfate Dispersible Tablets 792
Sucralfate Oral Suspension 793
Sucralfate Tablets 793
Sucrose 940
Sucrose Stearate S-3, S-7, S-11, S-15 940
Sulbactam Sodium 793
Sulbenicillin Sodium 794
Sulbenicillin Sodium for Injection 795
Sulfacetamide Sodium 795
Sulfacetamide Sodium Eye Drops 796
Sulfadiazine 796
Sulfadiazine Eye Ointment 796
Sulfadiazine Ointment 797
Sulfadiazine Silver 798
Sulfadiazine Silver Cream 798
Sulfadiazine Silver Ointment 799
Sulfadiazine Sodium 799
Sulfadiazine Sodium for Injection 799
Sulfadiazine Sodium Injection 800
Sulfadiazine Suspension 797
Sulfadiazine Tablets 797
Sulfadiazine Zinc 800
Sulfadiazine Zinc Ointment 800
Sulfadoxine 801
Sulfadoxine Tablets 801
Sulfafurazole 802
Sulfafurazole Tablets 802
Sulfamethoxazole 803
Sulfamethoxazole Tablets 805
Sulfamethoxazole, Sulfadiazine and Trimethoprim Tablets 805
Sulfasalazine 806
Sulfasalazine Enteric-coated Tablets 807
Sulfasalazine Suppositories 807
Sulfobromophthalein Sodium 808
Sulfobromophthalein Sodium Injection 808
Sulfur Ointment 791

Sulindac 808
 Sulindac Tablets 809
 Sulpiride 810
 Sulpiride Injection 810
 Sulpiride Tablets 810
 Sultamicillin Tosilate 811
 Sultamicillin Tosilate Capsules 812
 Sultamicillin Tosilate Granules 812
 Sultamicillin Tosilate Tablets 812
 Suppositories A-8
 Suxamethonium Chloride 813
 Suxamethonium Chloride Injection 813
 Syrups A-13

T

Tablets A-5
 Tamoxifen Citrate 814
 Tarmoxifen Citrate Tablets 814
 Taurine 815
 Taurine Capsules 815
 Taurine Eye Drops 815
 Taurine Granules 816
 Taurine Powder 816
 Taurine Tablets 816
 Technetium [^{99m}Tc] Albumin Aggregated Injection 816
 Technetium [^{99m}Tc] Etifenin Injection 817
 Technetium [^{99m}Tc] Methylene diphosphonate Injection 817
 Technetium [^{99m}Tc] Pentetate Injection 817
 Technetium [^{99m}Tc] Phytate Injection 818
 Technetium [^{99m}Tc] Pyrophosphate Injection 818
 Tegafur 819
 Tegafur Capsules 819
 Tegafur Injection 820
 Tegafur Tablets 820
 Terbutaline Sulfate 820
 Terbutaline Sulfate Aerosol 821
 Test for Allergen A-124
 Test for Bacterial Endotoxin A-107
 Test for Content Uniformity A-96
 Test for Depressor Substances A-112
 Test for Particulate Matter in Injections A-78
 Test for Pyrogens A-107
 Test for Sterility A-112
 Test for Tablet Friability A-97
 Test for the Prolongation of Insulin Effect A-128
 Test for Undue Toxicity A-106
 Test for Vasopressor Substance A-111
 Test for Visible Particles in injections A-83
 Test Papers A-183
 Test Solutions A-177
 Testosterone Propionate 822
 Testosterone Propionate Injection 823
 Testosterone Undecanoate 823
 Testosterone Undecanoate Injection 824
 Testosterone Undecanoate Soft Capsules 824
 Tests of Fats and Fatty Oils A-56
 Tetracaine Hydrochloride 825
 Tetracycline Hydrochloride 825
 Tetracycline Hydrochloride Capsules 826
 Tetracycline Hydrochloride for Injection 826
 Tetracycline Hydrochloride Tablets 827
 Thallous [^{201}Tl] Chloride Injection 827
 The Test of Radiopharmaceutical Preparations A-133
 Theophylline 828
 Theophylline Sustained-release Tablets 828
 Thermal Analysis A-72
 Thiamazole 829
 Thiamazole Tablets 829
 Thiamine Nitrate 830
 Thiamphenicol 830
 Thiamphenicol Capsules 831
 Thiamphenicol Enteric-coated Tablets 831
 Thin-layer Chromatography A-33
 Thiopental Sodium for Injection 832
 Thioridazine Hydrochloride 832
 Thioridazine Hydrochloride Tablets 833
 Thiotepa 833
 Thiotepa Injection 834
 Threonine 834
 Thyroid Tablets 835
 Tiabendazole 836
 Tiabendazole Tablets 836
 Ticlopidine Hydrochloride 836
 Ticlopidine Hydrochloride Capsules 837
 Ticlopidine Hydrochloride Tablets 838
 Timolol Maleate 839
 Timolol Maleate Eye Drops 839
 Timolol Maleate Tablets 839
 Tinctures A-8
 Tinidazole 840
 Tinidazole and Glucose Injection 840
 Tinidazole Capsules 841
 Tinidazole Injection 842
 Tinidazole Suppositories 842
 Tinidazole Tablets 843
 Tioguanine 843
 Tioguanine Tablets 844
 Titanium Dioxide 941
 Tobramycin 844
 Tobramycin Sulfate Injection 845
 Tocainide Hydrochloride 845
 Tocainide Hydrochloride Capsules 845
 Tocainide Hydrochloride Tablets 846
 Tolazoline Hydrochloride 846
 Tolazoline Hydrochloride Injection 846
 Tolazoline Hydrochloride Tablets 847
 Tolbutamide 847
 Tolbutamide Tablets 848
 Total Organic Carbon in Water for Pharmaceutical Use A-73
 Toxicity Test of Sodium Stibogluconate A-130
 Tramadol Hydrochloride 848
 Tramadol Hydrochloride Capsules 849
 Tramadol Hydrochloride Injection 849
 Tramadol Hydrochloride Suppositories 850
 Tramadol Hydrochloride Sustained-release Capsules 850
 Tramadol Hydrochloride Sustained-release Tablets 851
 Tramadol Hydrochloride Tablets 852
 Tranexamic Acid 853
 Tranexamic Acid Capsules 853
 Tranexamic Acid Injection 854
 Tranexamic Acid Tablets 854
 Tretinoin 854
 Tretinoin Cream 855
 Tretinoin Tablets 855
 Triamcinolone 856
 Triamcinolone Acetonide 857
 Triamcinolone Acetonide Acetate 859
 Triamcinolone Acetonide Acetate Cream 860
 Triamcinolone Acetonide Acetate Injection 859
 Triamcinolone Acetonide and Econazole Nitrate Cream 858
 Triamcinolone Acetonide Injection 857
 Triamcinolone Tablets 856
 Triamterene 860
 Triamterene Tablets 860
 Triazolam 861
 Triazolam Tablets 861
 Trifluoperazine Hydrochloride 862
 Trifluoperazine Hydrochloride Tablets 862
 Trimethoprim 863

Trimethoprim Tablets 863
 Tropicamide 864
 Tropicamide Eye Drops 864
 Trypsin 865
 Trypsin for Injection 865
 Tryptophan 866
 Tubocurarine Chloride 867
 Tubocurarine Chloride Injection 867
 Tyrosine 868

U

Ubenimex 869
 Ubenimex Capsules 869
 Ultraviolet-Visible Spectrophotometry A-27
 Undecylenic Acid 870
 Urea 870
 Urea Cream 871
 Urokinase 871
 Urokinase for Injection 872
 Ursodeoxycholic Acid 873
 Ursodeoxycholic Acid Tablets 873

V

Valacyclovir Hydrochloride 874
 Valacyclovir Hydrochloride Capsules 874
 Valacyclovir Hydrochloride Tablets 875
 Valine 875
 Verapamil Hydrochloride 876
 Verapamil Hydrochloride Injection 876
 Verapamil Hydrochloride Sustained-release Tablets 877
 Verapamil Hydrochloride Tablets 877
 Vinblastine Sulfate 878
 Vinblastine Sulfate for Injection 878
 Vincristine Sulfate 879
 Vincristine Sulfate for Injection 879
 Vindesine Sulfate 880
 Vindesine Sulfate for Injection 880
 Vinorelbine Tartrate 881
 Vinorelbine Tartrate Injection 882
 Vitamin A 882
 Vitamin A and D Drops 883
 Vitamin A and D Soft Capsules 883
 Vitamin A Soft Capsules 882
 Vitamin B₁ (Thiamine Hydrochloride) 884
 Vitamin B₁ Injection (Thiamine Hydrochloride Injection) 884
 Vitamin B₁ Tablets (Thiamine Hydrochloride tablets) 885
 Vitamin B₁₂ (Cyanocobalamin) 887
 Vitamin B₁₂ Injection (Cyanocobalamin Injection) 888
 Vitamin B₂ (Riboflavin) 885
 Vitamin B₂ Injection (Riboflavin Injection) 885
 Vitamin B₂ Tablets (Riboflavin Tablets) 886
 Vitamin B₆ (Pyridoxine hydrochloride) 886
 Vitamin B₆ Injection (Pyridoxine Hydrochloride Injection) 887
 Vitamin B₆ Tablets (Pyridoxine hydrochloride Tablets) 887
 Vitamin C 888
 Vitamin C Effervescent Granules 889
 Vitamin C Effervescent Tablets 889

Vitamin C Granules 890
 Vitamin C Injection 890
 Vitamin C Tablets 890
 Vitamin D₂ 890
 Vitamin D₂ Injection (Ergocalciferol Injection) 891
 Vitamin D₂ Soft Capsules (Ergocalciferol Soft Capsules) 891
 Vitamin D₃ 891
 Vitamin D₃ Injection 892
 Vitamin E (Alpha Tocopheryl Acetate) 892
 Vitamin E Injection (Alpha Tocopheryl Acetate Injection) 893
 Vitamin E Powder (Alpha Tocopheryl Acetate Powder) 893
 Vitamin E Soft Capsules (Alpha Tocopheryl Acetate Soft Capsules) 893
 Vitamin E Tablets (Alpha Tocopheryl Acetate Tablets) 894
 Vitamin K₁ Injection (Phytomenadione Injection) 894
 Vitamin K₁ (Phytomenadione) 894
 Volumetric Solutions A-186

W

Warfarin Sodium 895
 Warfarin Sodium Tablets 896
 Water for Injection 896
 Water for Pharmaceutical Purposes A-200
 White Vaseline 942

X

Xanthinol Nicotinate 898
 Xanthinol Nicotinate Injection 898
 Xenon [¹³³Xe] Injection 898
 Xylitol 899
 Xylitol Granules 900
 X-Ray Powder Diffraction A-81

Y

Yellow Ferric Oxide 942
 Yellow Vaseline 942

Z

Zedoary Turmeric Oil and Glucose Injection 900
 Zedoary Turmeric Oil Injection 901
 Zein 943
 Zinc Acexamate 901
 Zinc Acexamate Capsules 902
 Zinc Citrate 902
 Zinc Citrate Tablets 903
 Zinc Gluconate 903
 Zinc Gluconate Tablets 904
 Zinc Oxide 904
 Zinc Oxide Ointment 905
 Zinc Sulfate 905
 Zinc Sulfate Granules 905
 Zinc Sulfate Oral Solution 906
 Zinc Sulfate Tablets 906
 Zinc Undecylenate 906
